Electric Products Co., Cleveland, Ohio, manufacturer of controllers, switchboards, battery-charging motor generators and rheostats, has opened a branch office in the Dime Bank building, Detroit, Mich., in charge of E. H. Bridge.

General Electric Co., through its Fort Wayne (Ind.) branch, has opened a night school for the benefit of its employes who are working for better wages and promotion. The enrollment is much larger than last year, and the keenest interest is being taken by employes of the Fort Wayne works.

The Norma Co. of America, 1790 Broadway, New York, at a recent meeting of its board of directors, elected O. P. Wilson to the presidency of the company. Mr. Wilson has been assistant manager of this concern for several years. W. M. Nones continues as president and treasurer, in executive charge of the company's affairs.

The American Conduit Manufacturing Co., with general offices anud factory at New Kensington, Pa., announces the leasing of its rigid conduit business to the General Electric Co., who will continue operations at New Kensington by its Sprague Electric Works. Plans are being prepared for the enlargement of the plant and additional equipment will be installed, to the end that the users of American and Galvanite brands of rigid conduit will have the advantage of exceptional service under all conditions. There will be no change in the personnel of this company, but the name will be changed to the American-Wiremold Co., which will concentrate upon the manufacture of Wiremold surface raceway and Wireduct non-metallic tubing, at Hartford, Conn.

H. B. Kirkland, the vice-president of the American Conduit Manufacturing Co., will divide his time between the Sprague Electric Works and the American-Wiremold Co., and will continue to give his personal attention to his old customers. Other officers of the company are D. Hayes Murphy, president, and Guy M. Stewart, secretary. These men have a wide experience in this field, and it is to be expected that with the concentration of their energies upon Wiremold and Wireduct valuable results to the industry will accrue. The former company has established for itself an enviable record and the development of the American-Wiremold Co. at Hartford, Conn., will be watched with considerable interest by all those actively engaged in the industry.

Bailey Meter Co., Cleveland, Ohio, is making distribution of Bulletin No. 30 descriptive of "Fluid Meters for Low Pressure Gas and Air," which points out in a clear and concise manner the advantages of this product. It describes in detail the numerous parts entering into the construction of the Type C10 meter and deals at length with the principles of operation. The text is accompanied with excellent illustrations, including both halftones and line drawings. Four pages of the bulletin are devoted to chart records of Bailey fluid meter installations and partial list of users given, indicative of the wide range of industries which has adopted this type of meter and found it to give complete satisfaction. These meters have been developed and perfected during the past ten years and are particularly adapted to the many and varied needs of modern power plants, gas works, steel mills, chemical works, and in fact all large producers of users of power. In addition to this line, the Bailey company manufactures many other types of meters, including fluid meters, for recording and integrating the flow of steam to turbines, engines, heating systems, low pressure steam, exhaust, etc.; boiler meters, weir meters and radiimeters.

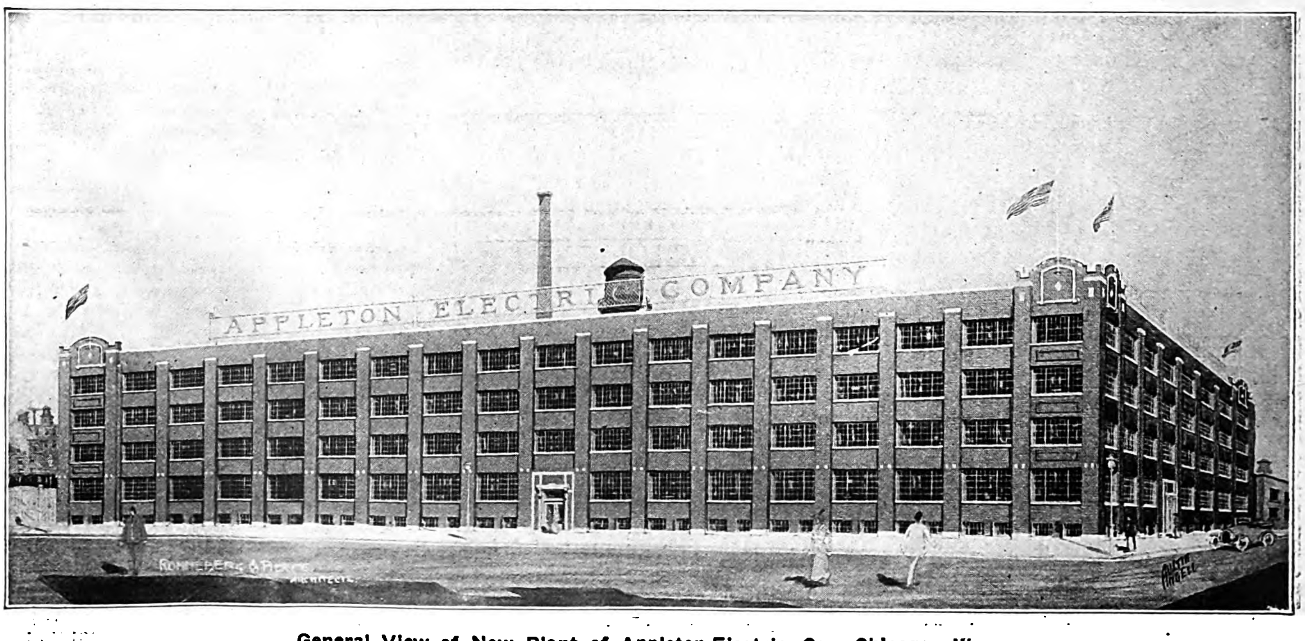
The Electrical Alloy Co., Morristown, N. J., manufacturer of high-grade resistance wire and strips, is sending out a folder relative to its nickel and nickel alloy wire and strips. The company has manufactured these materials exclusively for many years and has established for itself a world-wide reputation. The pamphlet briefly describes its resistance material among which are included electrical alloy calido, electrical alloy rayo, electrical alloy comet, electrical alloy phenix, electrical alloy ideal, electrical alloy lucero, electrical alloy magno spark point nickel, electrical alloy pure nickel and grade "A" Monel metal, and illustrates a few of the articles which contain this wire. The company maintains an export department provided with every facility for promptly despatching ocean shipments to its customers abroad, and a staff of electrical and metallurgical engineers which is capable of assisting the manufacturer in developing his apparatus or to solve any resistance problem with which he may have to contend. The products of the Electrical Alloy Co. have been adopted as a standard specification by many of the largest American companies, the following being perhaps the most representative; General Electric Co.; Edison Electric Appliance Co.; Westinghouse Electric & Manufacturing Co.; Western Electric Co.; Taylor Instrument Co.; General Motors Co., and the Champion Spark Plug Co. The company has now available for distribution the new edition of its bulletin catalog, a copy of which will be furnished upon request.

Appleton Electric Co., Chicago, Ill., manufacturer of conduit fittings, in order that it may adequately meet the large demand for its products, has now under course of construction a new plant, which it is claimed will double its present capacity and result in greatly increased production. The main building, which will be L shaped, is to be a four-story and basement structure covering an area of over 45,000 cq. ft. A building to care for the press room will also be erected. In addition, the company will erect a power house, which will provide 140,000 ft. of floor space. The new plant will be modern in every respect and will be equipped with new and up-to-date machinery. It will be located at Paulina and Wellington streets, with a switch track from the Chicago & Northwestern railroad, affording excellent shipping facilities. The products of the Appleton company are meeting with increasing popularity and the erection of this large plant may be regarded as indicative of the company's optimistic view of the future. A. I. Appleton is president and treasurer of the company; F. H. Merrill, vice-president, and J. V. Painter, secretary, and under their leadership marked progress has been made. Branch offices are maintained by the Appleton Electric Co. in New York City and San Francisco.

Harvey Hubbell, Inc., Bridgeport, Conn., has issued a new catalog of Hubbell reflectors for industrial plant lighting. This catalog carries out the unique scheme inaugurated by this firm nearly two years ago of listing the various sizes and types of reflectors and accessories in systematically arranged columns and rows. At the top of the page are shown the different sizes and types of reflectors with their corresponding distribution curves. In the left column are shown various types of screw collar holders, brass clamp holders, keyless porcelain sockets, extensions, etc. By following the horizontal row to any vertical column there is found an illustration of each particular size and type of reflector equipped with the particular holder or other accessory. Eighteen pages are devoted to this very effective pictorial arrangement. A few pages are also devoted to the company's medium base and mogul base porcelain sockets, also half reflectors and parabolic reflectors. These various reflectors are made with three different types of finish, matte aluminum, porcelain enamel and white paint enamel.

Swiss Mission Visits Westinghouse Plants.—On Friday, Oct. 3, the plants of the Westinghouse Electric & Manufacturing Co., at East Pittsburgh and Wilmerding were honored by a visit from the Swiss Mission for economic studies in North America. This mission is visiting various cities in the United States and Canada, for the purpose of studying American methods and practices, in order that they may apply these methods where practical to their own various lines of business.

The mission was met in Pittsburgh by representatives of the Westinghouse Airbrake Co., and the Westinghouse Electric & Manufacturing Co., and escorted to Wilmerding on special cars attached to one of the regular Pennsylvania railroad trains. Following the reception a trip was taken through the Airbrake Works, where the various processes involved in the manufacture of the airbrake were explained in detail to the visitors, who expressed much interest in the manufacturing methods pursued by the company. After completing the inspection tour, the party was escorted to the Welfare building, where luncheon was served. Immediately following the luncheon A. L. Humphrey of the Airbrake company welcomed the visitors, and turned over the meeting to W. S. Bartholomew, vice-president of the Airbrake company, who extended a further welcome and told of some of the activities of the company in the manufacture of railway equipment. Response was made to these addresses by Commissioner Zweifel of the mission, who expressed his very great appreciation of the reception tendered the mission. He also took occasion to say that the Westinghouse interests need no advertisement, as every man, woman, and child in Switzerland knows Westinghouse from having seen it on the airbrakes which are used on all of the trains in Switzerland. The visitors were then conveyed in special cars to East Pittsburgh. On their arrival in East Pittsburgh, the visitors were met by Acting Vice-President T. P. Gaylord, and other Westinghouse officials, and a number of guides speaking French and German, both of which languages are extensively used in Switzerland. The visitors were then shown through the immense electric and machine works constituting the East Pittsburgh plant. After having completed a tour of the works, the party left for Pittsburgh at 4:40 p. m., having expressed themselves as being particularly delighted with the reception accorded them by the Westinghouse companies. They even went so far as to say that it was the most elaborate reception that had been given them since their arrival in this country.



General View of New Plant of Appleton Electric Co., Chicago, Ill.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Rutland, Vt.—Contract has been awarded to the Western Vermont Power & Light Co. by the New York Consolidated Slate Co. for furnishing additional electric power for the operation of its plant to the amount of about 100 hp., which will include hoists and compressor motors. It is understood that the Consolidated company is planning for the opening of a new quarry for increased operations.

Chicopee, Mass.—Springfield Coach Works has had plans prepared for the erection of a new boiler plant at its works in connection with alterations and improvements to be made in the existing plant. The work will cost about $15,000.

New Britain, Conn.—Landers, Frary & Clark have completed plans for the erection of a six-story factory building, 120x300 ft.

Binghamton, N. Y.—Binghamton Light, Heat & Power Co. has commenced the installation of a new turbine unit at its local plant as well as new condensor equipment.

Binghamton, N. Y.—Johnson City Water Co. is arranging plans for the construction of a new local pumping station to have a capacity of 12,000,000 gal. The pumping equipment will comprise the installation of six 100-hp. capacity motors, electric service for operation to be furnished by the Binghamton Light, Heat & Power Co.

Buffalo, N. Y.—City commission is considering plans for the installation of a new street lighting system in William street. Rapid progress is being made on the installation of new aerial lights in Hertel avenue.

Buffalo, N. Y.—Ericson Manufacturing Co., 1100 Military road, manufacturer of telephones, magnetos, and kindred equipment, has filed notice with the Secretary of State of an increase in its capitalization from $500,000 to $1,200,000, to provide for general business expansion.

New York, N. Y.—United Machine Works, 57 West Third street, will install an electrically driven ice-making plant of 25-ton capacity.

Rome, N. Y.—Rome Wire Co., Railroad street, manufacturer of electrical wires, etc., has had plans prepared for the construction of a new addition to its plant on Railroad avenue. The structure will be one-story and will cost about $30,000. Contract has been awarded to H. C. Beebe, U. C. N. Bank building, Utica.

Annandale, N. J.—Clinton township committee is considering plans for the immediate installation of a new electric street-lighting system throughout the municipality. Electric service will be furnished by the Hunterdon Power & Electric Co., High Bridge.

Dover, N. J.—New Jersey Power & Light Co. has recently commenced the installation of new boiler instruments at its local plant. Rapid progress is being made on the installation of new coal handling equipment and the construction of coal bunkers, to facilitate operations.

Hilton, N. J.—Plans have been completed by H. Boker & Co., New York, for the erection of the proposed power plant, to be constructed in connection with the new local plant of the company to comprise a group of factory buildings. Gilbert C. Higby, 207 Market street, Newark, is architect.

Irvington, N. J.—Irvington Manufacturing Co., 122 Coit street, has had plans prepared for improvements in the boiler plant at its works to facilitate operations.

Jersey City, N. J.—Announcement has been made by Armour & Co., Chicago, that plans are in progress for the construction of the proposed packing plant to be located on a local site comprising two square blocks bounded by Jersey avenue, Monmouth, Seventeenth and Eighteenth streets, advanced some time ago, but deferred due to war conditions. It is said that an appropriation has been made to cover the cost of a large power plant and refrigerating works to be located at Coles and Seventeenth streets, estimated to cost with equipment installation in excess of $1,000,000.

Newark, N. J.—Megaro Electrical Co. has filed notice of organization to operate a general electrical contracting establishment at 11 Clifton ave. T. and C. Megaro, 21 Clifton avenue, and James Megaro, 1131 Broad street, head the company.

Newark, N. J.—Prest-O-Lite Co., Indianapolis, Ind., manufacturer of acetylene tanks, etc., has had plans prepared for the construction of a large new local plant on property recently acquired on Doremus avenue, to comprise a group of about eleven structures. The buildings will include a charging structure, one-story, about 31x351 ft., one-story boiler plant, for works service, about 48x64 ft., as well as main manufacturing building and other structures, the entire project being estimated to cost $140,000.

Newark, N. J.—Board of Freeholders has taken bids for electrical work in connection with the construction of new extensions to nurses' quarters, etc., at the county institution at Overbrook, the low bid being submitted by the Beaver Engineering Co., 59 Mechanic street, Newark, at $14,387. John W. Hooley, 95 Liberty street, New York, submitted the low bid at $26,800 for the installation of new engine and generating equipment at the institution. It is understood that a quantity of new electrically operated laundry equipment will also be required.

New Providence, N. J.—Borough council is arranging for the completion of the installation of new lighting units for the local street lighting system.

Westville, N. J.—Pennsylvania Railroad Co. has had plans prepared for the installation of new boiler equipment at its local power plant. Contract for the construction of the settings has been awarded to Albert Doak, Philadelphia, Pa.

Carlisle, Pa.—J. F. Rogers Co. will erect a one-story power plant, 45x80 ft.

Colfax, Pa.—Duquesne Light Co. is making rapid progress on the construction of the proposed power station at Colfax, to have an initial capacity of about 60,000 kw., which will be increased ultimately to 120,000 kw. It is said that the new station will be one of the largest and most modern in the country.

Easton, Pa.—Pennsylvania Utilities Company has filed notice with the Public Service Commission of the issuance of bonds for $68,500, to be used for general business expansion.

Philadelphia, Pa.—Boyer & Crawford have awarded a contract to the William Steele & Sons Co., 1600 Arch street, for the erection of a new one-story brick engine and boiler plant, about 49x62 ft., at J and Venango streets. The structure, with equipment installation, will cost $40,000.

Philadelphia, Pa.—In connection with the construction of the proposed local buildings by the Sears, Roebuck & Co., Chicago, to be located on the Northeast boulevard, plans have been prepared for the erection of a one-story power house, about 150x183 ft. The other structures will comprise a nine-story brick and concrete warehouse, about 360x442 ft., with two wing extensions, and six-story administration building, about 82x303 ft.

Pittsburgh, Pa.—Fire recently damaged the plant of the Stimple & Ward Co., 518-20 Sandusky street, manufacturer of electrical goods, to the extent of approximately $7000. The company is planning for immediate rebuilding of the destroyed portion.

Pittsburgh, Pa.—Duquesne Light Co. is having plans prepared for the construction of a two-story brick, concrete and steel local substation. Estimated cost $50,000.

Reading, Pa.—Metropolitan Edison Co. has completed arrangements for a bond issue for $96,000, a portion of the proceeds to be used for general business expansion. Notice has been filed with the Public Service Commission.

Sayre, Pa.—Sayre Stamping Co. has recently completed the electrification of its entire plant, the installation comprising about 100 hp. Electric energy for operation is furnished by the Sayre Electric Co.

Wilkes-Barre, Pa.—Wilkes-Barre Light Co. has filed application with the Public Service Commission for a certificate of valuation preliminary to the issuance of bonds for about $1,000,000.

Williamstown, Pa.—Lykens Valley Light & Power Co., operating in upper Dauphin and the western section of Schuylkill counties, has filed notice with the Public Service Commission of an increase in its rates for service. The new schedules also provide for the elimination of the coal clause from contracts as well as the discounts.

Annapolis, Md.—The Bureau of Yards and Docks, Navy Department, Washington, D. C., will erect a power and boiler plant at the local naval academy at a cost of $45,000.

Baltimore, Md. — Samuel T. Williams, 223 North Calvert street, is in the market for a 100 to 200-kv-a. turbine generator, 3-phase, 60-cycle, 2300 volts; one or two 150 to 200-hp. boilers, 135-lb. pressure. Water-tube condenser is preferred for the above unit.

Clearspring, Md.—Clearspring Light & Power Co., recently organized, is planning for the construction of a new electric transmission line from Dam No. 5 on the Potomac river, to Clearspring and Big Spring, with distributing system.

Ware Shoals, S. C.—Ware Shoals Manufacturing Co. will erect an ice plant, 100x125 ft., of 15-ton capacity. It will be of reinforced concrete and standard mill construction. Electrical equipment will also be installed. J. E. Sirrine, Greenville, S. C., architect.

Barwick, Ga.—An election will be held upon issuance of municipal bonds for establishing electric light plant. Address mayor.

Fort Gaines, Ga.—Georgia-Alabama Power Co. has completed negotiations for the purchase of the electric plant of the Cridelle-Fowler Co. It is said that the new owner is considering the enlargement of the plant and the construction of a new dam across Patsual Creek near Cridelle mill, increasing the present capacity to about 1000 hp., as well as make extensions in its transmission system, the entire work being estimated to cost $250,000. Dermott Shemwell is president.

Moore Haven, Fla.—Gladys Telephone Co. will install magneto outfit with 100 instruments.

NORTH CENTRAL STATES.

Barnesville, Ohio—The city contemplates the erection of a power house at the municipal water works.

Fairmount, Ind.—Rigdon Electric Co. has been incorporated by William H. Markle and others to provide light and power for rural districts near Fairmount.

Indianapolis, Ind. — Indianapolis Methodist Hospital will erect nurses' residence to cost $300,000.

Muncie, Ind.—W. E. Wood Co. 1005 Ford building, Detroit, has the general contract to erect a power and assembly building for the Chevrolet Motor Co. Dynamos, motors, and transformers will be purchased.

Portland, Ind.—A petition has been presented to the Public Service Commission for permission to build a new light and power plant and to create a bonded indebtedness against the city in the sum of $120,000 to raise funds to carry out the proposed plans.

Chicago, Ill.—Ed V. Price & Co. will erect a twelve-story building, 100 x200 ft., at the southeast corner of West Jackson boulevard and South Throop street, at an estimated cost of $800,000.

Clinton, Ill.—Plans for the erection of a modern building to house the local telephone company's plant and for the complete reorganization of the system have been submitted to the city council.

Elgin, Ill.—At the November election the question of issuing $200,000 municipal light bonds will be submitted to vote. Address city clerk.

Litchfield, Ill.—The council is considering ways and means to secure ornamental electric lighting.

Quincy, Ill.—An ordinance is before the council providing for improving East Main street by electroliers and underground wiring. Address city clerk.

Springfield, Ill.—Nov. 4 the question of issuing $400,000 electric light extension bonds will be submitted to a vote. Address city attorney D. A. Stevens.

Springfield, Ill.—Sangamo Electric Co. will erect an $80,000 addition to its plant at Converse avenue and Eleventh street. The building will be 80x140 ft. and be of brick and steel construction.

Sterling, Ill.—The council has renewed the contract until May 1, 1920, with the Illinois Northern Utilities Co.

Streator, Ill.—Residents on South Monroe street from Main to Bridge streets are desirous of having that block improved by the installation of boulevard lights. Address city clerk.

Urbana, Ill.—Erection of $50,000 McKinley Memorial Hospital has been authorized by the trustees of the University of Illinois.

Urbana, Ill.—The contract for the central lighting system has been awarded to the Freeman Sweet Co. of Chicago on its bid of $34,300. This company has two contracts already signed in Urbana, one of the Green street lighting system and the other for the Southwestern lighting system.

Bay City, Mich.—Hanson-Ward Veneer Co. has purchased a building to be equipped with additional machinery which will be operated by electricity. F. B. Ward is president of the company.

Detroit, Mich.—Architect G. W. Geares, 41 John Rush street, has prepared plans and will let contracts for a $15,000 power house to be erected by the General Aluminum & Brass Manufacturing Co. The building will be of brick construction, steam heating, plumbing, to be equipped with power house equipment.

Kalamazoo, Mich. — Engineers Woodmansee & Davidson, 208 South La Salle street, Chicago, have prepared plans for $200,000 electric light plant to be erected by the city. Address A. Leuderenk, City Hall, Kalamazoo, Mich.

Saginaw, Mich.—W. E. Wood Co., 1805 Ford building, Detroit, Mich., has the general contract to erect an $800,-000 power building and gear grinding building for the Chevrolet Motor Co. Power house equipment, generators, switchboard, etc., will be purchased. Address C. M. Bigale, president, Flint, Mich.

Hartford, Wis.—Plans are in progress for a city power plant costing $60,000. Architects Cahill & Douglas, Gross building, Milwaukee, have prepared plans.

Oshkosh, Wis.—Oshkosh Gas Light Co. recently entered into a contract with the county to supply light and power to the county home, asylum and sanitorium at Winnebago, which will permit of farmers along the line having electric service. The company is also planning to extend its lines to the rural districts.

Osseo, Wis.—The city council contemplates the purchase of the local electric light plant and the installation of a waterworks system. Address J. W. Smith, city clerk.

Racine, Wis.—The city is planning

DATES AHEAD.

Illuminating Engineering Society. Annual convention, Chicago, Ill., Oct. 20-23. General secretary, Clarence L. Law, 29 West 39th street, New York City.

Illinois State Electric Association. Annual convention, Chicago, Oct. 22 and 23. Secretary-treasurer, R. V. Prather, Springfield, Ill.

Empire State Gas and Electric Association. Annual meeting, Buffalo, N. Y., Oct. 24. Secretary, Charles H. B. Chapin, 29 West 39th street, New York City.

Jovian Order. Annual convention, Chicago, Nov. 5 and 6. Headquarters, Hotel Sherman. Acting Mercury, Eli C. Bennett, St. Louis, Mo.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

Electric Power Club. Meeting, Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

an expenditure of $500,000 for enlarging the waterworks plant.

Murdock, Minn.—City council has petitioned to build an electric light plant. Bonds will probably be issued. J. F. Ashbaugh, clerk.

Cedar Rapids, Iowa—An improvement that will cost approximately $40,000 will be the building of an addition to C. R. I. & P. railroad boiler house in this city and the installing of two additional power boilers. Joseph E. Nelson & Sons, Chicago, have the contract and some of the material is now on the ground to start work immediately.

Cameron, Mo.—A number of new motors have been installed and others are to be installed soon at the Cameron electric plant.

Greenfield, Mo.—Colin K. Lee and Jay R. Lee, both of Kansas City, Mo., have purchased a controlling interest in the Greenfield Electric Light Co. and are planning extensive improvements to the plant, including the installation of oil engines, the maintenance of 24-hour service and the extension of lines to other towns in the territory.

Rocheport, Mo.—An electric light plant and a white way are to be installed.

St. Louis, Mo.—Additions to the plant of the Union Electric Light & Power Co., estimated to cost in excess of $7,000,000 will be started next spring to keep pace with the industrial growth of St. Louis and the expansion of the city. Sites for additional power plants are now being surveyed and an announcement of the locations of the buildings will be made as soon as they are decided upon. The contemplated extensions will have an initial capacity of 60,000 kw. a day, with provision for an ultimate output of 100,000 kw. The new plant is expected to provide for the needs of the next five years.

Wellsville, Mo.—Mexico Light & Power Co. has purchased the electric plant here. The Mexico plant will transmit power to Wellsville over a line now under construction.

Arkansas City, Kans.—An election is contemplated to vote bonds for a municipal electric light plant.

St. Francis, Kans.—The council has accepted plans prepared by the Hennington Engineering Co., for an electric light plant. Estimated cost, $50,000.

Kansas City, Kans.—The Kansas City commissioners awarded a contract for the installation of ornamental lights at a cost of $43,988.

Guide Rock, Neb.—Bond issue of $12,000 carried at election for electric lights. Address town clerk.

Mullen, Neb.—The city contemplates bond issues for an electric light system. Address town clerk.

Venango, Neb.—Plans and specifications for a light and water system for Venango have been completed by the Hennesey Engineering Co., Omaha.

Herrick, S. D.—The issuance of bonds for the purchase of the private electric light plant to be converted into a municipal system was authorized at a recent election. New machinery and other equipment will be added.

Carson, N. D.—Election will be held soon to vote on bonds for installing municipal light plant. Address town clerk.

SOUTH CENTRAL STATES.

Benton, Ky.—Electric light bonds have been authorized by vote.

McKenzie, Tenn.—The city will improve and extend its light and water systems. Bonds in the sum of $10,000 have been voted. Address the mayor.

Pascagoula, Miss. — Pascagoula Street Railway & Power Co. will rehabilitate the light and water plant.

Lake Charles, La.—Lake Charles Implement Co., recently chartered, will erect a two-story, fireproof building, 80x80 ft. and will install an electric elevator.

New Orleans, La.—New Orleans Railway & Light Co. is understood to be considering plans for the installation of a new cable system across the local river, estimated to cost $10,000.

Wilmar, Ark.—Arrangements are being made by D. C. Smith for the installation of an electric light and power plant in Wilmar. Electric street lights will be maintained by the town.

Fargo, Okla.—The city contemplates the installation of a water and electric light plant to cost $26,000. Address the mayor.

Enid, Okla.—Enid Pipe Line Co. is planning for the construction of a new electric power plant at its works.

Hooker, Okla.—City commission is arranging plans for the installation of a new electric light plant, to be used for municipal service. Estimated cost, $40,000.

Jenks, Okla.—Oklahoma Gas & Electric Co. is considering the construction of a large new electric generating station on the Arkansas river, to cost in excess of $1,500,000.

Miami, Okla.—The council is preparing to install an ornamental lighting system. Address mayor.

Albany, Tex.—The city proposes to install an ice and electric light plant. Address the mayor.

Fort Worth, Tex.—Dallard-Martin Electric Co. has been granted a permit for the erection of a new building at Macon and North streets to cost $100,000.

Fort Worth, Tex.—Permit has been granted for the improvement of the Texas Power & Light Co., to cost $135,000. A new boiler room is included in other improvements.

Huntsville, Tex.—Huntsville Cotton Oil Co. has purchased the plant and franchise of the Huntsville Electric Light & Power Co. and has taken charge of the concern.

Lyford, Tex.—The installation of an electric plant is contemplated by the Stevenson Motor Co. A. W. Stevenson, president.

San Augustine, Tex.—The city contemplates the purchase of the electric light plant and will make improvements. Address the mayor.

Wichita Falls, Tex.—Wichita Falls Electric Co. has had plans prepared for the erection of large additions to its local generating station, including extensions in its transmission lines to a number of cities and towns. The entire work will cost in excess of $750,000.

WESTERN STATES.

Klemmer, Wyo.—The electrical equipment of the Cowry Coal Co. was destroyed by fire recently. Loss $10,000.

Ririe, Ida.—Utah Power & Light Co. has recently been issued an order by the Public Utilities Commission providing for the extension of its power lines to Ririe.

Mina, Nev.—P. A. Simon has made application to the state engineer for permission to use the water of East Walker river for generation of electric power. It is planned to create 6000 hp. by means of an impounding concrete and rock dam to cost approximately $600,000.

Hardin, Mont.—The Hardin electric plant has been sold by the Hardin Electric Co. to F. V. B. Collins, of Forsyth, Mont., at $35,000.

Missoula, Mont.—Missoula Light & Water Co. has completed arrangements for the remodeling of its power dam in the Missoula river, near Milltown. The work is estimated to cost $85,000. H. L. Bickenbach is in charge of the work.

Chehalis, Wash.—The city commissioner plans the establishment of a new street lighting system in the main business district. Resolutions for the improvements are being prepared.

Chehalis, Wash. — Washington-Idaho Light & Power Co. has filed a bill of sale conveying its Chehalis interests to the Sherman County Light & Power Co. of Oregon. A. Welch, Portland promoter, signed the papers as manager of the first named corporation. Last April the city voted the Welch company a franchise for a duplicate light and power plant here, but the option to operate under it has never been exercised.

Chehalis, Wash.—Property owners of the new street lighting district will be asked to petition for a new improvement district under the law, estimated cost of the change being $10,000, city to furnish the lights.

Hoquiam, Wash.—City commissioners have been petitioned by property owners to improve and extend the lighting systems on Eighth and I streets.

Seattle, Wash. — Thompson & Castleton are installing 600 hp. in motors for the Ferry-Baker Lumber Co. of Everett, Washington; also an electric crane. They are installing about 500 hp. in motors at the Everett Flouring mill, which is being remodeled.

Seattle, Wash.—The city council has appropriated $19,000 to buy motor trucks for the city light department, and $20,000 to finance construction work.

Spokane, Wash.—County commissioners have awarded a contract to F. E. Martin for the immediate construction of a new power plant at the Edgecliff sanitarium. Estimated cost $21,000.

Bandon, Ore.—Plans are under consideration by the city hall for the early construction of a large new local electric plant to be used for municipal service.

Florence, Ore.—Fire recently completely destroyed the local electric plant operated by G. G. Bushman, Eugene, with total loss estimated at about $10,000. Plans are being arranged for immediate rebuilding.

Roseburg, Ore.—Mayor W. S. Hamilton has completed the location of a power site on the North Umpqua river above Rock Creek. Survey was made by Ford Frearer, city engineer. Location of the dam was placed above the larger falls. The plan contemplated by the mayor is to have the power to pump the city's water supply. The estimated cost of the plant contemplated is considerably less than $500,000, and it is believed the amount will be agreed upon by the voters.

Corcoran, Cal.—San Joaquin Light & Power Co. is having plans prepared for extensive improvements in its local electric system to cost about $80,000. Work will be inaugurated at an early date. J. B. Carter is manager.

Durham, Cal.—Pacific Gas & Electric Co. has recently been authorized to negotiate for the purchase of the plant of the Durham Light & Power Co. for a consideration of about $25,000. The plant is owned by J. A. and E. Foster, of Durham.

Los Angeles, Cal.—Fire recently damaged the local shops of the Pacific Electric Co. at Seventh and Alameda streets to the extent of approximately $150,000. It is understood that the company is considering plans for immediate rebuilding.

Los Angeles, Cal.—Electrical Products Corp. has purchased property on which it proposes to erect a new building. The structure will be of brick and steel construction and will cost approximately $30,000.

Modesto, Cal.—Following a resolution recently adopted jointly by the Modesto and Turlock irrigation district directors, a special election will be held for the purpose of voting on the issuance of bonds for $609,000, the proceeds to be used for the construction of a new power plant to have a capacity of about 40,000 hp., sufficient to handle the full capacity of the proposed Don Pedro dam.

Oroville, Cal.—Preliminary work has been inaugurated by the Great Western Power Co. on the construction of a new power line extending from Las Plumas to San Francisco.

Rio Vista, Cal.—Great Western Power Co. has had plans prepared for the immediate construction of a new 22,000-volt power line to extend from Hood to Franklin, with distributing lines to cover approximately twelve miles. Estimated cost $20,000.

PROPOSALS

Electrical Equipment.—Bids will be received by the town clerk of Gunniston, Miss., for 10 miles electric wiring with poles.

Welding Machine.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for one electric welding machine, for delivery at the Washington navy yard (Schedule 4588).

Press and Pumps.—The Bureau of Supplies and Accounts, Navy Department, Washington, D. C., will receive bids for one motor-driven washer press, delivery at Brooklyn navy yard (Schedule 4719), and 8 turbine-driven pumps, to be delivered at Brooklyn and Mare Island (Schedule 4586).

Electrical Equipment.—Bids will be received until Oct. 30 by Frank A. Vanderlip, 7 Wall street, New York, president of the board of managers, for the construction of eight cottages at the local institution, Letchworth Village, Thiells, N. Y. Considerable electrical equipment will be required in connection with this work.

Electrical Supplies.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for the following: 60 junction boxes; 3 telephone panels, 1 telephone switchboard, 16 switches, for delivery at Boston navy yard (Schedule 4744); 75,000 ft. cable, delivery at Brooklyn (Schedule 4684); 1604 ft. single-conductor cable, delivery at Philadelphia (Schedule 4728); searchlight carbons, delivery at eastern and western yards (Schedule 4660); steel conduit and fittings, delivery at Boston (Schedule 4746); electric cable, delivery at Boston (Schedule 4745), and turbogenerator sets, delivery at Puget Sound navy yard (Schedule 4855).

FOREIGN TRADE

[*Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.*]

Electrical Apparatus, Telephone, Telegraph and Alarm Service (30,853).—A business man in Norway desires to secure an agency for the sale of food products and kindred lines, textiles, dry goods, notions, men's and women's clothing, vehicles, leather, boots and shoes, chemicals, tobacco, building supplies, iron and steel, electrical apparatus, telephone, telegraph and alarm service, photographic supplies, rubber, rubber goods, etc. Quotations should be given c. i. f. Norwegian port. Payment through banks. References.

Motors, Cables, Etc. (30,858).—The president of an American trading corporation is soon to sail for the Balkan countries and desires to secure agencies for the sale of automobiles, marine motor boats, motors, agricultural machinery and implements, belting, boots and shoes, perfumery, mowing machines and blades, light motor plows, small electric motors, magnetos, machinists' tools, armored cables, steam engines, and boiler supplies. References.

Electrical Apparatus (30,870).—An organization for the construction of new hotels in a city of France proposes to construct in the near future a hotel of 420 rooms, and desires to get in touch with American firms interested in the export of interior furnishings, such as electric lighting, heating, plumbing, ventilation and sanitary appliances, kitchen equipment, refrigerators, laundry installation, washing and drying machinery, elevators, telephone installation and insulating material.

Power Plants (30,889).—An American consulting engineer located in Japan and acting as buyer for several Japanese dockyards, one steel works, and several government contractors, is prepared to receive catalogs, and prices from manufacturers with a view to establishing agencies for mining machinery, railway and dockyard equipment, power plants and machine tools. Reference.

Electrical Goods (30,891).—A commercial agent from Bolivia will be in the United States for the next few weeks for the purchase, from manufacturers only, of plumbing material and supplies, bathroom fixtures, hardware, tools, paints, zinc, tinware, tin, iron and steel goods, electrical goods and supplies, glass, hardwood flooring, medical and surgical instruments and appliances, tractors, agricultural machinery, paper and machinery for the manufacture of tile flooring. Correspondence should be in Spanish. References.

Electric Torches (30,899).—A municipality in Colombia is in the market for fire department equipment, such as canvas life chute, life nets, telescoping fire ladders, motor chemical engines, motor fire engine tender, gas and smoke masks, uniforms, helmets, fire gloves, etc., suction hose (armored), wheel-mounted hand fire pumps, stretchers, leather hose binders, firemen's tools in complete sets, hand oil lanterns, electric torches, chemical fire grenades, speaking trumpets and whistles. Quotations should cover an equipment for a city of 120,000. Correspondence should be in Spanish. Catalogs are requested.

Electrical Appliances (30,900).—A company in South Africa desires to secure agencies from manufacturers of glass tumblers, wide-mouthed glass fruit jars, domestic electrical appliances, such as cookers, toasters, irons and kitchen stoves. Payment, cash against documents in New York. Reference.

Wire and Wire Rope (30,910).—A firm in England desires to purchase wire and wire rope, specifications of which may be had on application to the Bureau or its district offices. Quotations should be given f. o. b. American port or c. i. f. English port. Payment, cash against documents through bank. Reference.

Personals

John B. Fisken New President of Northwest Association—E. C. White Manager Lighting Department Western Electric

ROBERT P. MCCARTY, formerly connected with the Knox Motors Co., Springfield, Mass., is now associated with the Electric Boat Co., Groton, Conn.

W. E. JONES, district manager for the Economy Fuse Manufacturing Co., Seattle, is visiting the distributing offices of the company at Salt Lake and Denver.

JOHN T. ELLIOTT, for the past 14 years associated with the Commonwealth Edison Co., Chicago, has resigned his position as assistant to chief engineer at Station 11 of the company, to become chief engineer of the Wisconsin Light, Heat & Power Co., Berlin, Wis.

CLARENCE J. BERRY, who for the last six years has been connected with the National Lamp Works of the General Electric Co., Cleveland, Ohio, has tendered his resignation to become associated with Brandt & Fouilleret, Paris, France, in the capacity of electrical engineer.

J. P. SCHROETER, for the past two years connected with the School of Engineering of Milwaukee, has accepted the appointment of designing engineer for the mechanical and electrical equipment of the new food plant to be erected by the Uihlein interests on Port Washington Road, North Milwaukee. The plant is being designed by A. W. Hoffman, 410 Berlin Arcade building, Milwaukee.

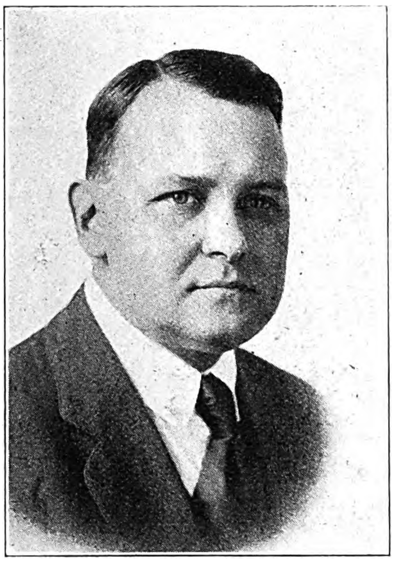
FREDERICK K. COPELAND, president of the Sullivan Machinery Co., Chicago, has been elected first vice-president of the Western Society of Engineers, succeeding Kempster B. Miller, resigned. Mr. Copeland was elected to membership in the organization in 1892, and since that time has zealously worked to promote the interests of the society. He is also chairman of the general committee of the Technical Societies of Chicago.

CHARLES E. WARWICK, superintendent of railway for the Eastern Wisconsin Electric Co., Sheboygan, Wis., has tendered his resignation and will remove to his former home at Hamilton, Ontario. Mr. Warwick entered the public service industry about 24 years ago and his experience in this field of activity has been quite varied, but devoting particular attention to the management of street railway and electric systems. His specialties in the work are the handling of transportation difficulties and the promotion of efficiency and safety for the public as well as the employes. He joined the Wisconsin company as superintendent of railway in May, 1918, and continued in this capacity until the present time. Mr. Warwick will be succeeded by Arthur Kolste, who has been serving the company as chief dispatcher.

FRANK M. EASTMAN has been appointed superintendent of the Montpelier & Barre Light & Power Co., Montpelier, Vt., succeeding Charles J. Cookson, who is now manager of the company.

IRVING E. TUTTLE, formerly associated with Meyer, Strong & Jones, consulting engineers, has become president of the Nate-Earle Co., New York, engineering contractor in power plants, heating and ventilating systems and piping of all descriptions.

E. CANTELO WHITE has been appointed manager of the electric lighting department of the Western Electric Co., New York. This department has recently been added to the general sales organization of the company for the purpose of fostering the propaganda for better lighting in factories, offices, hotels, clubs and residences. Mr. White's experience in the electric lighting field covers a period of almost fifteen years, during which time his activities have covered both the United States and Canada as a salesman and designer of lighting equipment. Particularly in Canada, many of the most important lighting installations have been planned and sold by Mr. White and installed under his supervision. Mr. White is also well known to the electrical industry as the originator and designer of the "Duplexalite" line of lighting fixtures. In this connection Mr. White has done a great deal of standardization work and it will be his aim to carry on this standardization of lighting fixtures to such a degree that planning efficient lighting installation and merchandising the equipments will be greatly simplified.



E. Cantelo White.

C. C. WILCOX, until recently in the service of Hodenpyle, Hardy & Co., as assistant to consulting electrical engineer, has become chief engineer of the Durant Building Corp., Detroit, Mich.

FRED J. QUERIPEL, formerly with the Electric Furnace Construction Co., Philadelphia, as chief draftsman, is now engaged in plant engineering work for the National Aniline & Chemical Co., Marcus Hook, Pa.

R. E. BURGER has tendered his resignation as president and general manager of the Richland Public Service Co. of Ohio, to become chief engineer of Henry L. Doherty & Co., New York, public utility operators.

J. R. PERKINS has recently been appointed assistant to J. S. Pevear, general manager of the Birmingham Railway, Light & Power Co., Birmingham, Ala. Mr. Perkins is an engineer and an expert operating man who has been connected with the operating department of the American Cities Co. since 1913.

G. P. GOODMAN, for several years representative of the Hisey-Wolf Machine Co. in the East, has joined the staff of F. H. Niles & Co., Inc., and will take charge of their portable tool department. The latter company not only handles the Hisey-Wolf line of electric machine tools, but the Canton pneumatic hammers and drills manufactured by the Pittsburgh Pneumatic Co.

MISS M. GRACE BUXTON, who has been engaged in a secretarial capacity with the Westinghouse Electric & Manufacturing Co. and recently returned from its New York office, has been appointed registrar at the school of social work, Duquesne Unversity. While at the Pittsburgh offices of the company Miss Buxton was in charge of the commercial department of the vocational school for girls, conducted by the Westinghouse interests at Turtle Creek.

CHESTER A. GAUSS, until recently advertising manager of the Crocker-Wheeler Co., Ampere, N. J., has resigned his position with that company to become a partner in the newly formed firm of Robertson, Gauss & Co., engineering sales and advertising counsellors, with temporary offices at 59-61 Pearl street, New York. Mr. Gauss is a graduate electrical engineer with over seven years' experience in electrical advertising, sales investigation and promotion work and trade-paper editing. Among his former connections, before joining the Crocker-Wheeler Co., were the General Electric Co.'s publication department and the editorial staffs of the ELECTRICAL REVIEW and the *Electrical World*. Mr. Robertson has specialized for over eighteen years in the illustrating of mechanical products and in the printing of engineering literature. The newly formed firm will specialize in engineering advertising accounts of all descriptions and formulate engineering sales-promotion plans for its clients.

GORDON CAMPBELL, president and general manager of the Edison Light & Power Co., York, Pa., was recently re-elected president of the Pennsylvania Railway Association. Mr. Campbell has been identified with the management of the activities of the association since December, 1916, first as a member of the executive committee, then as vice-president and as president since June, 1918. Prior to joining the York company in 1908 he was associated with public utilities in Denver, Colo., Newark, N. J., Providence, R. I. and Washington, D. C. He is also president and general manager of the York (Pa.) Railways.

COMMANDER FREDERICK G. SIMPSON has returned to civilian life and resumed his duties as vice-president and general manager of the Kilbourne & Clark Manufacturing Co., Seattle, Wash., manufacturer of radio apparatus. Early in the war he volunteered and was commissioned lieutenant-commander of the Boston navy yard, and shortly after was promoted and made district radio material officer with the rank of commander. He was later placed in charge of all radio material activity on the coast from Connecticut to Novia Scotia. Prior to entering the service Commander Simpson won renown as the inventor of the radio telegraph system now being produced by the Kilbourne & Clark Co.

R. H. RUTH has opened up a business in Rochester, N. Y., which will probably be known as the "Ruth Electric Shop," and will specialize on household electrical appliances. Mr. Ruth was for 15 years with the Benjamin Electric Manufacturing Co., working in contact with the New York office of the concern at 247 West 17th street, New York City, but in complete charge of the Pittsburgh territory. He has spent many years in traveling in western New York State and Pennsylvania, and his thorough acquaintance with the trade should stand him in good stead in his new business venture. Mr. Ruth has had large experience in merchandising electrical goods and his knowledge of household appliances, and lighting and wiring devices, should prove to be of great value in the business which he is entering.

JOHN B. FISKEN, chief engineer of the Washington Water Power Co., Spokane, Wash., who was elected president of the Northwest Electric Light & Power Association, at the annual convention held at Seattle in September, was born near Glasgow, Scotland, Nov. 2, 1861. He received early training in a private school, and after obtaining valuable experience in office work he took a four-years' course in the College of Science and Arts at Glasgow, and the City and Guilds of London Technical Institute course in electric lighting, graduating in 1886.

Soon after graduation, he came to the Pacific Northwest, engaging in electrical work in Seattle, Wash., and Victoria and Vancouver, B. C. He served as manager for the Victoria Electric Illuminating Co., and later supervised the installation of the lighting system in the C. P. railway hotel, then under construction at Vancouver. He has been a resident of Spokane since 1887, and during the years that have intervened he was engaged successively by the Spokane Falls Electric Lighting Co., by its successor, Edison Illuminating Co., then by the Spokane Street Railway Co. and the Washington Water Power Co., the last named having absorbed the other concerns. During a 12-months' interim in 1905-6, he was construction engineer for the Consumers Light & Power Co., and then reentered the employ of the Washington Water Power Co., and has continued his connection therewith since that date.

Mr. Fisken's work for the Washington Water Power Co. has comprised engineering, construction, maintenance and operation, affording a wide range of practical and technical experience. He was made chief engineer in June, 1918. His membership in the American Institute of Electrical Engineers began in 1903, and he assisted in organizing the Spokane section at a later date. For several years he has been a member of the Hydroelectric and Technical Committee of the Northwest Electric

John B. Fisken.

Light and Power Association. The presidency of that association, to which he has been elected, entitles him to a membership in the executive committee of the N. E. L. A. He is vice-president of the Employers' Association of the Inland Empire, and is a member of the University club of Spokane.

GEN. GEORGE H. HARRIES, after 27 months' active service in the Army, has returned to civil life and resumed his duties as vice-president of H. M. Byllesby & Co. in its eastern offices, 111 Broadway, New York. General Harries was released in August from the exacting duties which he filled in Berlin as the United States representative of the Inter-Allied Commission for the Repatriation of War Prisoners. With the American Expeditionary Forces General Harries for the third time served his country with distinguished success. As a boy his first military experience was received as a scout under Generals Miles and Crook in the Indian campaigns and so well did he grasp frontier problems that he was made a member of the Sioux Commission, having in charge the final adjustment of the differences with the Indians. In the Spanish War he led the First District of Columbia Volunteers as colonel, and was retired with the rank of brigadier general. He entered the Great War in command of three regiments of the Nebraska National Guard, brought them to war strength, at Deming, N. M., and after a short time at an Atlantic Coast port, sailed for France in command of a brigade, arriving early in 1918. His brigade was sent to the front near Verdun where it served gallantly. General Pershing, however, called upon General Harries for service as commandant of the port of Brest, where his organizing and executive ability established a record in the disembarkation of troops and the handling of both men and munitions.

When the armistice was declared General Harries, as assistant chief of staff to General Pershing, was a member of the Armistice Commission, and upon its conclusion was sent to Berlin, enjoying the distinction of being the ranking American officer first in the capital of the enemy. His position in Germany, having in charge the repatriation of war prisoners—American, Roumanians, Serbs and Russians—was one of extreme peril for months calling for the utmost resources of firmness and tact. The measure of success which rewarded his efforts is reflected by the following among other decorations: From General Pershing General Harries received the Distinguished Service Cross; from the French he received the rare distinction of the order commander of the Legion of Honor; the Russian government conferred upon him the order of St. Stanislaus; the Serbs, the order commander of the White Eagle; Italy made him a commander of St. Maurice and Greece presented him with the Grand Cross of George I. With all of his honors modestly borne, General Harries expresses unfeigned gladness to return to the field wherein he has long been prominent—the operation, engineering and financing of public utilities.

Obituary.

DAVID PERCY HARTZELL, Cumberland, Md., secretary and treasurer of the Cumberland & Westernport Electric Railway Co., died recently at his home at the age of 54 years. Mr. Hartzell was connected with the company for 14 years.

WILLIAM HARRINGTON ANDERSON, Brooklyn, N. Y., a well known electrical engineer and formerly connected with the Brooklyn Rapid Transit Co. and the Public Service Commission, died recently at the home of his parents, 1358 President street, at the age of 30 years.

WILLIAM SOFFE, vice-president of the Inland Electric Co., Chicago, Ill., died Oct. 10 after an illness of only a few days. Mr. Soffe was 32 years old and began his electrical career with the Illinois Electric Co., Chicago, remaining with that company until 1910, when he joined the sales organization of the Harter Manufacturing Co., Chicago. In 1917 he entered the employ of the Emergency Fleet Corp., acting as western buyer of supplies, and in February of this year became connected with the Inland Electric Co. Mr. Soffe was widely known in the electrical field and his many friends regret his untimely death.

For Hauling Materials From the Stock or Receiving Rooms to the Machines the Electric Industrial Tractor Offers Many Advantages.

Industrial Electric Trucks and Tractors in Machine Shops

Special Advantages of This Apparatus in Increasing Efficiency and Reducing Costs in Machine Shop Work — Its Application for Such Work—Special Opportunities for Adoption at This Time

By BERNARD J DILLON

MODERN machine shops are perhaps a better illustration than any other line of industry of the practicability and advantages of up-to-date efficiency methods. Already the majority of such shops have adopted these methods to some extent at least, and almost daily the use of them is increasing. For in order to compete economically with the newer shops the older ones are forced to adopt every conceivable method to increase production and reduce costs.

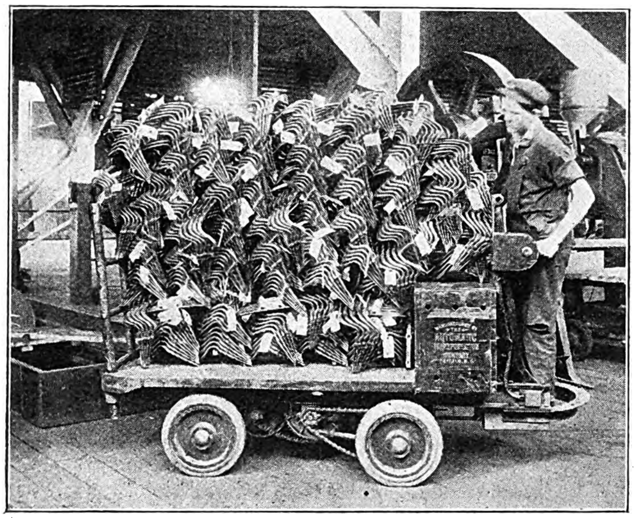
Compared with shops of a few years ago the modern shop is a revelation of progress. Efficient machines driven by the most efficient power methods take the place of many hands. These machines are so arranged or grouped as to facilitate production as much as possible.

Such machinery, however, represents a considerable investment. In order to secure an adequate return on this investment they must be operated to their fullest capacity. Specialized workmen are employed for this purpose. Such workmen are highly paid, which adds to the necessity of obtaining the utmost production. In a word, the machines and operators must be kept busy.

Formerly, when the average working day or week was considerably longer than it is now this was not so essential, for machines could be run from 10 hours per day to practically continuous operation. Under present conditions with labor everywhere demanding shorter hours, more pay, and also comparatively scarce, this feature must be considered carefully for it constitutes one of the most difficult and important problems facing such industries.

The application of an electric industrial truck or tractor offers one of the best means of solving this problem. By their use handling costs are, of course, reduced, but, more important than this, machines and their skilled operators can be kept constantly supplied with material and tools and no time is lost in waiting or going for such articles.

In most machine shops the handling may be roughly divided into two classes.



The Elevating Platform Truck Is Used Extensively for All Kinds of Handling In and Around Machine Shops.

First, bringing the material from the storerooms or receiving room to the machines or stockrooms and taking from the machines, completed, to the shipping or assembly rooms.

Second, taking it from one machine or operation to another.

Application of Electric Industrial Trucks and Tractors to Machine Shop Handling.

In the first of these the problem is simply one of handling and is similar to that of many other industries. Receiving or storerooms are located at points convenient for unloading. From here the material must be transported either directly to the machines or to stockrooms. The use of industrial electric for such work reduces the labor necessary for it, relieves congestion, is quicker and safer and in general provides many economical and productive advantages.

Likewise in hauling from the machine shop to the shipping room the problem is more often one of handling, although here the ability of the electric to handle heavy loads without any unnecessary jarring or extra handling is often a decided advantage.

The electric industrial tractor or elevating platform truck is generally used for such work. By loading the materials directly upon skids or trailers to be picked up and taken to the proper unloading point a large amount of hand labor can be eliminated. Where the haul must be made between different buildings and steep grades are encountered in the route, their advantages are particularly desirable.

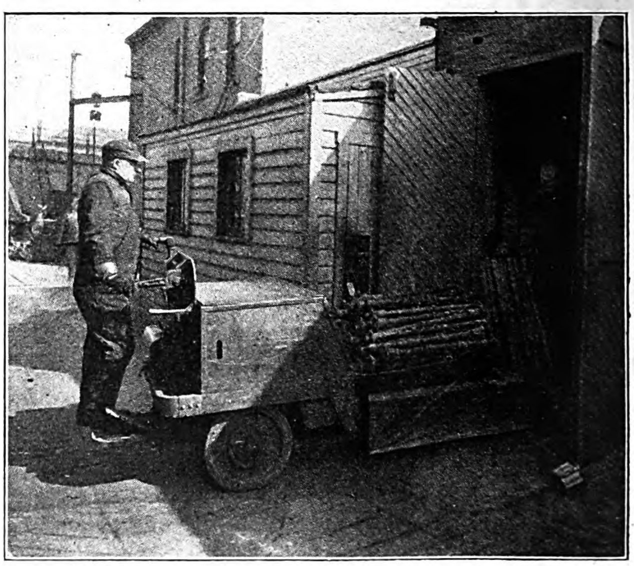
The lift truck can handle loads weighing up to two tons at a speed of from 2 to 6 miles per hour. An electric tractor can haul a trailer load of 10 tons or more at about the same speed. Either of these can negotiate ordinary grades easily.

The steering and control of all types of this apparatus is very flexible and positive. Narrow aisles and passageways can be negotiated as easily as with a hand truck and as the operator has more power at his command than the hand trucker and can stop or start without any effort on his part, there is less danger from collisions or unnecessary jarring.

In the transporting of materials from the stockrooms to the machines and from one machine, operation or department to another the application of industrial electrics as a means of increasing production and efficiency is especially important. By their use there is no necessity of the operator leaving his machine to go to the stockroom or another machine for materials and delays or lost time due to lack of materials can be eliminated. By giving proper consideration to the routing and operation of the electrics and employing good, reliable operators the lower cost obtained by increased efficiency will often pay for the cost of the apparatus, leaving the saving in handling as profit.

Any type of apparatus may be adopted for such work but the lift truck or tractor is particularly desirable. With the former a number of skids can be made for a very small amount which can be arranged to accommodate the materials. These skids are loaded in the stockroom, picked up by the truck and carried to the machine. Here they can be placed in the most advantageous position for the machine operator. After completing the work on the material it can be placed in another skid which in turn is picked up by the truck and taken to the next machine. In the meantime another skid loaded with material can be brought to the first machine and the emptied skid used to receive its load.

When a tractor is used, trailers replace the skids. Heavier loads can, of course, be hauled but they can not be spotted as accurately as the skids. The selection of the type of equipment will depend largely upon local conditions. Where the quantity of materials to be handled is large, such as when a group of machines must be served at once or when the material to be handled can not be readily loaded onto skids, the electric tractor with trailers is perhaps most desirable. Where the materials consist of rather small pieces



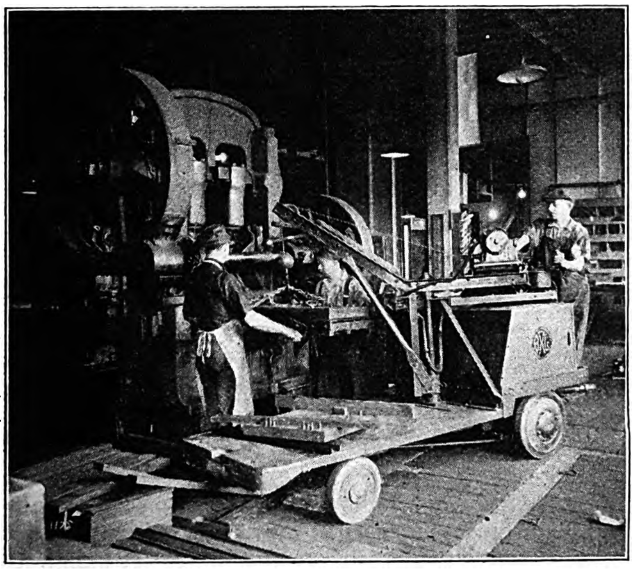
The Utility Truck Can Also Effect a Saving in Handling Costs.

that can be dumped or loaded onto skids the lift truck is preferable. In addition, the utility or load carrying truck can also be used to advantage, especially in the smaller plants where the amount of work is small and the general utility features of this type desirable. When heavy materials must be lifted up on machines an electric truck equipped with a crane can be used. These cranes are operated electrically and have a capacity of one ton or more.

The general utility features of any type of electric are also valuable in machine shops. These features include the hauling of extra heavy materials, moving machinery, the spotting of freight cars, etc.

The question of passageways and the average length of haul must, of course, be given consideration. But the mere fact that the passageways appear difficult or crowded or the length of haul exceptionally short does not necessarily prohibit their use. As already stated, most of these machines can be operated wherever a hand truck is used. The steering arrangement is very flexible and the machines can be driven in either direction. This allows them to be driven into small corners, unloaded and backed out. Moreover, the handling of materials efficiently and profitably by electrics depends more upon the quantity and type of material handled than upon the distance over which it is to be carried.

Most manufacturers of the equipment maintain capable engineering staffs who can be called upon in difficult cases to explain the features of their apparatus and point out the features and saving of an installation. Machine shop officials who are contemplating changes or additions to their plant or equipment should avail themselves of this service.



An Electric Truck With a Crane Attachment Can Be Used for Lifting Heavy Materials Onto Machines.

Opportunity for Electrical Men at Present.

At present the opportunities for promoting the installation of electric industrial trucks and tractors by electrical contractors and engineers and central-station men are particularly good. The majority of machine shop managers are now seriously considering all sorts of methods of increasing efficiency and reducing costs. Many of these methods involve changes of power, installations or additions. For example, increased lighting facilities are being required by a great many such shops. In considering such methods electrical men are usually consulted. In this capacity they are given an opportunity to study conditions in the shop and their suggestions are given great consideration.

For the central-station company the installation of electric trucks or tractors offers a most desirable load. The machines are generally charged at night when the rest of the plant is idle, which makes this an off-peak load and one for which central-station service offers many advantages. To the electrical engineer or contractor they offer an opportunity to perform a real service for the customer which will result in added profits for both. It is therefore important that these branches of the electrical industry should encourage the adoption of these machines wherever there is an opportunity to do so.

GERMAN ELECTRIC POWER NATIONALIZED.

A law nationalizing the electric power of the German Empire has been published by the government. Germany has over 4000 power establishments, and the splitting up of their activities is held to cause serious waste. The scheme is made imperative by the loss of the Saar coal fields and the obligation to supply coal to the Allies. The water power, which is mostly to be found in south Germany, is primarily to serve local industries, but an agreement will be made with those generating electricity from coal in central Germany. Power stations belonging to states and municipalities will not be disturbed, but the large plants belonging to private capital will be taken over and nationalized by the central government. The government will buy up shares, so that the present organizations can remain intact. The nationalized works are not to be considered as a source of revenue, as the government holds that cheap power for industry is more important than fiscal interests. The private capital in electrical power works in Germany is estimated at 1,000,000,000 marks and the use of electrical power in that country has increased from 4.43 billions of kilowatt-hours in 1907 to 22 billions in 1917.

ADDITIONAL GENERATING CAPACITY FOR NORTHERN STATES POWER CO.

The industrial growth of Minneapolis, St. Paul and southern Minnesota is brought into sharp relief by the action of Northern States Power Co. which will install an additional 40,000-hp. steam turbine unit in its Riverside station, Minneapolis. Within the past few weeks a new 40,000-hp. unit has been completed and placed in operation, but the electrical demands during the coming winter in the Twin City district will probably absorb this new capacity to the limit. No additions to the present Riverside station building will be necessary to house the generating and condensing equipment and boilers as ample reserve space was provided during the construction of 1918-19. This station in 1911 had a total capacity of 16,000 hp.; it will produce 116,000 hp. when the unit now authorized is completed in September, 1920. The 1918-19 addition has been referred to variously as a 33,000-hp. and 35,000-hp. unit. Under load it has tested out to 40,000-hp. capacity.

ROCHESTER SECTION, A. I. E. E., MEETS.

A meeting of the Rochester (N. Y.) Section, American Institute of Electrical Engineers, was held Oct. 24. E. B. Craft, assistant chief engineer, Western Electric Co., was the chief speaker, his subject being "Wartime Electrical Communications." He described some of the accomplishments and developments made by the army and navy in means of communication.

Central-Station Rates in Theory and Practice

Sixteenth Article — The Block Meter Rate and Its Combination with Other Rates—Customer Charges—Detailed Studies of Block Rates and Combinations — Average Charges with Meter Rates

By H. E. EISENMENGER

This is the sixteenth article of this series, which began in the issue of July 12. In the first seven articles, constituting Part I, the cost of rendering electric service was discussed. The next six articles, Part II, dealt with the general policy to be followed in selection of a rate system. Part III began in the Oct. 11 issue and will include three more articles in the next few weeks treating with the various rate systems in more or less common use. The remaining articles of the series will appear weekly until the close of the present volume (Dec. 27). They will comprise Parts IV to VI and discuss rate analysis, accuracy of rates and rate regulation by commissions.

PART III—SYSTEMS OF CHARGING—Continued.

II. The Various Types of Rates—(Continued).

B. Rates Based on Energy Consumption Only.

2b. Methods for Applying Lower Average Kilowatt-hour Prices for Larger Consumers.

3. The Block Meter Rate.

SECTION 122. The block meter rate is the third method we can use to make the average kilowatt-hour charges lower for the larger energy consumer. The range of kilowatt-hours, beginning from zero, is here also divided into a number of ranges corresponding to the steps of the step meter rates. These ranges are in this case called "blocks." A certain unit charge per kilowatt-hour is made for all energy used within the first block, and that part of the energy which reaches into the second block is charged at a certain lower rate per kilowatt-hour. After the number of kilowatt-hours which are contained in the second block and are charged at that lower rate, the excess of energy over the second block is charged at a still lower rate until the third block is filled, etc. The difference from the step rate is that the charge connected with a certain block applies only to the kilowatt-hours within that block and not to those of the preceding blocks, whereas with the step rate the total bill is always calculated at one single rate.

Let us assume, for instance, that the first 100 kw-hr. be charged at 10 cents per kw-hr. and all excess energy over 100 kw-hr. at 5 cents per kw-hr. We have then in the range of 0 to 100 kw-hr. a straight meter rate of 10 cents per kw-hr.; for the consumers of 100 kw-hr. and more the charges (total bill) will be as given in the second column of the following table:

1. Kw-hr. consumed.	2 Charges. Block rate.	3 Charges. Straight meter rate, 5 cents per kw-hr.
100	$10.00	$5.00
101	10.05	5.05
102	10.10	5.10
103	10.15	5.15
.......etc.......		

Supposing now for a minute we had a straight meter rate of 5 cents per kw-hr. in the range both below and above 100 kw-hr., then the amounts will be those of column 3 of the above table. The block rate (column 2) is just $5 higher in every instance than the 5-cents-per-kw-hr. straight meter rate (column 3), regardless of the amount of energy consumed (provided, of course, that we remain within the second block). We can say, therefore: This block rate corresponds in the range of its second block to a combination of a straight 5-cent meter rate with a customer charge of $5. Where we have more than two blocks in the rate schedule the same general rule applies for all blocks: The block rate is equivalent to a combination of a straight meter rate with a customer charge. The customer charge is zero in the first block and increases with every successive block, whereas the energy charge decreases. This is more fully and more generally discussed in Insert XII, which also describes the resulting simplification of the method of figuring the bills of the block meter rate.

The block meter rate furnishes us with the first examples of what might be called a "concealed charge" or a "disguised charge." This means that one of the three "fundamental charges" (energy, demand, customer) is expressed by one or both of the other two charges so that it is not visible on the surface.

The block meter rate is the most frequently found

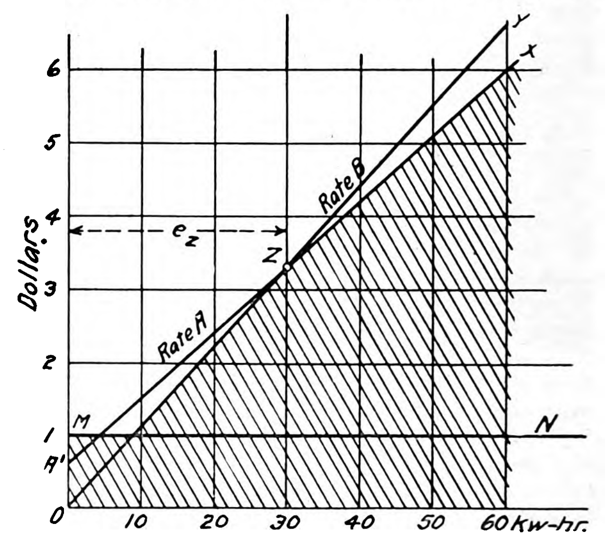


Fig. 7.—Stipulation of a Maximum Charge per Unit Results in the Equivalent of a Block Rate.

type of the pure meter rates. The number of the blocks does not go up as high as that of the steps in case of step rates; it ranges generally between two and eight, a larger number is a rare exception and no greater number of blocks than eleven[1] has been found in a very large number of schedules examined.

The block meter rate is also found combined with a minimum charge or a customer charge.

A block meter rate is sometimes briefly described by simply stating the successive kilowatt-hour charges and omitting for the sake of brevity any mention of the size of the blocks. Thus the Sacramento rate described and analyzed in Insert XII would be called "a 6-5-4-3-cent block meter rate." The same applies to step meter rates.

4. Combinations of Block Meter Rates With Step Meter Rates and Straight Meter Rates.

123. A block meter rate may be combined with a step meter rate in such a way that the lower energy consumptions are charged under the block meter system and anything above a certain amount of energy consumption is charged under the step meter system. The step rate may also contain one single step only, which means that it reduces to a straight meter rate. The order can also be reversed, which means that the step rate applies to the lower range of kilowatt-hours and the block rate to the higher one. (If we again consider the special case of the step rate comprising one step only, that is a straight meter rate, every plain block meter rate can be considered as a combination of a straight meter rate with a block meter rate, where the unit charge of the straight meter rate equals the unit charge of the first block of the block meter rate and where the straight meter rate extends over a portion, but not the whole, of the first block.)

These combinations do not occur frequently. Examples and their full discussion are given in Insert XIII.

5. Explicit Customer Charge.

124. A further method of doing away with or reducing the inequity which lies in the use of equal unit charges per kilowatt-hour to large and small consumers alike by the straight meter rate is to make an explicit customer charge in addition to either a straight meter rate[2] or a step rate[3] or a block rate[4]. This combination with a customer charge (especially if applied to the block system) can make the curve of actual charges follow very closely the curve of the theoretical charges as demonstrated in Section 4 of Insert XII, and is the most accurate pure meter rate, especially for small energy consumers. Notwithstanding this it is not very popular, probably because the public has not yet been educated to understand the equity of a fixed customer charge.

c. The Average Charges per Kilowatt-hour for Various Customers.

125. It has been shown (Section 117) that it is desirable to get lower average charges per kilowatt-hour for larger energy consumptions than for smaller ones. It will, therefore, be of interest to see how with the different systems discussed above (Sections 118-124) the average charges per kilowatt-hour vary as the amount of the energy consumption increases. This is fully discussed in Insert XIV, to which the reader is herewith referred.

Insert XII—Appendix to Section 122.

GRAPHICAL REPRESENTATION AND ANALYSIS OF THE BLOCK METER RATE.

1. A graphical representation of the block meter rate gives a most vivid insight into its nature. Let us take as an example the Retail Power schedule of Fort Wayne, Ind.:

---

[1] General Power Schedule, Salem, Mass.

[2] Battery Charging rate of Springfield, Ohio; customer charge 60 cents, energy charge 3 cents per kw-hr.

The General Lighting Rate of the New York and Queens Electric Light & Power Co. (customer charge 60 cents, energy charge 9 cents per kw-hr.) is only an apparent example of this combination because this rate contains a stipulation that the average rate per kilowatt-hour shall not exceed 11 cents per kw-hr. This makes the rate in effect a block rate. This example will be treated more fully here as it is typical for those schedules which make a stipulation that, no matter what is said elsewhere in the schedule, the average rate shall never be more than a certain specified amount per kilowatt-hour (compare Section 109).

Fig. 7 illustrates this rate. *OA'* is the customer charge of 60 cents and *A'χ* is the 9-cent-per-kw-hr. rate added to this customer charge. This combination will be called Rate A hereafter. *Oy* is the straight 11-cent-per-kw-hr. meter rate (Rate B) which limits the amounts of the bill under Rate A. The drawing shows that Rate B is lower than A for all points to the left of the intersection point *Z* between the two rates. This means Rate B will apply for all energy consumptions smaller than the energy consumption e_z belonging to that point *Z* and A will apply to all energy consumptions exceeding that amount; e_z can either be read off from the drawing Fig. 7 directly, or with greater accuracy and as a check it may be figured out arithmetically as follows: The amount of the bill for e_z kw-hr. under the Rate A is $60 + 9e_z$ and under Rate B it is $11e_z$. These two amounts are equal to each other because the point *Z* is situated on both rate curves and we have $60 + 9e_z = 11e_z$, from which $60 = 2e_z$ and $e_z = 30$ kw-hr. The combination of Rates A and B is therefore identical with a block rate as follows: 11 cents per kw-hr. for the first 30 kw-hr.; 9 cents per kw-hr. for the excess over 30 kw-hr.

In addition to this the rate states that a minimum charge will be made of $1 per month, which is represented by the straight line *MN* and applies to the equivalent block rate as well. The resulting curve is shaded in Fig. 7.

[3] General Lighting, York, Pa.: Customer charge 10 cents per month (this is the smallest customer charge the author could find in any rate) plus an energy charge of 10 cents per kw-hr. The bill is reduced by stepped quantity discounts as follows:

5% on bills from $1.01 to $ 2.00
20% on bills from $2.01 to $ 5.00
25% on bills from $5.01 to $10.00
etc.

These discounts change the apparent straight meter rate into a step meter rate as explained at the discussion of the step rate (Section 120).

[4] General Service Schedule of Lincoln, Neb.: Customer charge 40 cents per month plus an energy charge of
5 cents per kw-hr. for the first 10 kw-hr.
4 cents per kw-hr. for the next 30 kw-hr.
3.5 cents per kw-hr. for the next 460 kw-hr.
3 cents per kw-hr. for the excess over 500 kw-hr.

The General Lighting rate of Memphis, Tenn., is interesting in this connection: Customer Charge 30 cents per month plus an energy charge as follows:

$$\left.\begin{array}{l}\text{6 cents per kw-hr. for the first 80 kw-hr.}\\ \text{5 cents per kw-hr. for the next 120 kw-hr.}\\ \text{4 cents per kw-hr. for the next 300 kw-hr.}\\ \text{3 cents per kw-hr. for the excess}\end{array}\right\}\text{To be called Rate I.}$$

Now the rate further provides that no customer's bill for service through one meter shall exceed 7.5 cents per kw-hr. on the average in any calendar year. If this clause could be read "on the average per month" we would have a case parallel to that of the New York & Queens Co. treated in the preceding footnote and the above rate would be simply reduced by that clause to a block rate as follows:

$$\left.\begin{array}{l}\text{7.5 cents per kw-hr. for the first 20 kw-hr.}\\ \text{6 cents per kw-hr. for the next 60 kw-hr.}\\ \text{5 cents per kw-hr. for the next 120 kw-hr.}\\ \text{etc., as above.}\end{array}\right\}\begin{array}{c}\text{Rate II}\\ \text{(monthly average)}\end{array}$$

As the clause applies, however, to the *yearly* average charge it is possible that the monthly bill of a certain customer exceeds this average charge of 7.5 cents per kw-hr., without reduction, for instance during the summer months, if his winter consumption is large enough to bring the yearly average charge below 7.5 cents per kw-hr. (It can easily be shown that this is the case if the average monthly consumption of the consumer over the whole year is greater than 20 kw-hr. See preceding footnote, third paragraph.) This means that the reduction of the bills by the maximum of the average energy charge takes place in more cases if the maximum energy charge applies to the monthly average than if it applies to the yearly average. The monthly average for the maximum energy charge is on the whole more favorable to the customers than the yearly average.

The maximum-average-charge clause is in a certain measure the opposite of the minimum-charge clause (see Sections 107 and 108). The former is a guarantee on the part of the *electric service company* that the average charge per kilowatt-hour over a certain period shall never be *greater* than a specified amount in cents per kilowatt-hour and the latter is a guarantee on the part of the *customer* that the payment for a certain period shall never be *smaller* than a specified amount in cents or dollars. That period may be a month or a year, and the choice of the larger period (the year) will have the opposite effect in the case of the maximum-average-charge clause than in case of the minimum-charge clause. Whereas, for instance, a yearly minimum charge of $12 has the tendency to make the customers' bills, as a whole, lower than a $1 monthly charge (see Section 107, first footnote), a maximum-average charge of, for instance, 10 cents per kw-hr. will tend to make the payments of the customers, as a whole, higher, if applied to the yearly average than if applied to the monthly average.

The first 50 kw-hr. are charged at 5 cents per kw-hr.
the next 100 kw-hr. are charged at 4 cents per kw-hr.
the excess over 150 kw-hr. at 2 cents per kw-hr.

We choose as horizontal axis the number of kilowatt-hours consumed and step off vertically corresponding the amounts of the customer's bill (Fig. A). A vertical line *I* drawn at the distance 50 kw-hr. from the vertical axis and another one *II* 100 kw-hr. further to the right will then give us the various blocks. In the first block we have a straight meter rate of 5 cents per kw-hr., which is represented by a straight line Ox, where x is, for instance, the point corresponding to 100 kw-hr. and \$5. From the point A, where that line crosses the dividing line between the first and the second blocks, every additional kilowatt-hour is charged at 4 cents only and consequently we have to proceed from this point along a line with a smaller angle of elevation, corresponding to 4 cents per kw-hr. We can get this angle by joining O with, for instance, the point y (100 kw-hr., \$4). Drawing a parallel to this line Oy through A will give us the amount of the bills in the second block, line AB. It is evident, if we produce this line backwards towards A_o that the rate in the second block corresponds to a straight 4-cent meter rate increased by a constant amount OA_o, that is by a customer

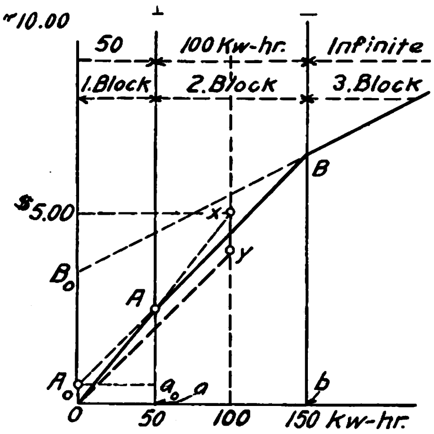

Fig. A (Insert XII).—Block Rate.

charge. It is obvious from the drawing that with every successive block this equivalent customer charge increases as the kw-hr. charge of the block rate decreases. It is also evident that the kilowatt-hour charge of the straight meter component of the equivalent rate is identical with the kilowatt-hour charge of the block meter rate in the respective block.

2. The numerical value of the equivalent customer charge in a given case can be found either by measuring the values OA_o, OB_o, etc., in the chart, or by purely arithmetical operations in the following way. The customer charge of the second block in Fig. A is OA_o, which obviously equals aa_o. Now $aa_o = aA - a_oA =$ (50 kw-hr. × 5 c/kw-hr.) — (50 kw-hr. × 4 c/kw-hr.) = 50 cents. Similarly we get the customer charge for the third block as: (50 kw-hr. × 5 c/kw-hr.) + (100 kw-hr. × 4 c/kw-hr.) — (150 kw-hr. × 2 c/kw-hr.) = 350 cents or \$3.50.

In general, to find the equivalent customer charge of the n^{th} block, figure the products of each preceding range in kilowatt-hours by the energy charge in the respective range and from the sum of all these products subtract the product of the sum of all ranges in kilowatt-hours, preceding the n^{th} range, in kilowatt-hours, by the kilowatt-hour charge of the n^{th} range.

An example will make this clear. Take, for instance, the Commercial Light rate in Sacramento, which is a block meter rate charging:

6 cents per kilowatt-hour for the first 50 kw-hr.
5 cents per kilowatt-hour for the next 400 kw-hr.
4 cents per kilowatt-hour for the next 600 kw-hr.
3 cents per kilowatt-hour for the excess over 1050 kw-hr.

How large is the equivalent customer charge in the 4^{th} block? Answer: (6 × 50) + (5 × 400) + (4 × 600) — 3(50 + 400 + 600) = 1550 cents or \$15.50. We can thus figure the bill of any customer with more than 1050 kw-hr. simply as \$15.50 plus 3 times the total kilowatt-hour consumption of that customer. For instance, if the customer has used 2000 kw-hr. his bill will be \$15.50 + (3 × 2000 cents) = \$75.50.

This method is a simplification of the obvious method of computing the bills by figuring out the charge for the energy in each block and adding them, as this method does away with the subtraction of 1050 from 2000.

We can therefore make up a little table as follows:

Range in kw-hr.	0—50	51—450	451—1050	1051 and over
Customer charge ...	\$0	\$0.50	\$5.00	\$15.50
Energy charge (cts. per kw-hr.)	.06	.05	.04	.03

From this table we can calculate any bill with not more than one multiplication and one summation, without any subtraction.

Algebraic Analysis of the Block Meter Rate.

3. An algebraical investigation for those readers who are familiar with algebra will supplement this. Calling c_1 the energy charge per kilowatt-hour in the first block, that is from 0 to e_1 kw-hr., c_2 the energy charge per kilowatt-hour in the second block, that is between e_1 and e_2 kw-hr., etc., we get the amount of the bill in the first block (less than e_1 kw-hr.) as

$$a_1 = c_1e \quad \text{.....................} \quad (1)$$

where e is the number of kilowatt-hours consumed. If the customer's energy consumption e reaches into the second block we have to pay for the first e_1 kilowatt-hours at the rate of c_1 cents per kw-hr. and for the balance of $(e - e_1)$ kw-hr. at the rate of c_2 cents per kw-hr., so that the whole bill a_2 becomes

$$a_2 = c_1e_1 + c_2(e - e_1)$$
$$= (c_1 - c_2)\,e_1 + c_2e \quad \text{.....................} \quad (2)$$

The constant term $(c_1 - c_2)e_1$ is obviously the customer charge and the part which is proportional to e is a straight meter rate. The unit charge of that straight meter rate is the factor by which e is to be multiplied, that is c_2.

If the energy consumption e becomes greater than $(e_1 + e_2)$ and therefore reaches into the third block we have first to pay for $(e_1 + e_2)$ kw-hr. as per equation (2), that is $(c_1 - c_2)\,e_1 + c_2\,(e_1 + e_2)$ and for the remainder of $e - e_1 - e_2$ we have to pay at the rate of c_3 cents per kw-hr., in other words

$$a_3 = (c_1 - c_2)e_1 + c_2(e_1 + e_2) + c_3(e - e_1 - e_2)$$
$$= (c_1 - c_3)e_1 + (c_2 - c_3)e_2 + c_3e$$

In the same manner we get

$$a_4 = (c_1 - c_4)e_1 + (c_2 - c_4)e_2 + (c_3 - c_4)e_3 + c_4e$$

. . . . etc. . . . .

The terms in brackets are constant and represent always the customer charge in every one of these equations, whereas the co-efficient of e (that is c_1, c_2, c_3, . . . etc.), is the energy charge of the straight meter rate component of the equivalent combinations of rates. If we write this in the form

$$a_4 = c_1e_1 + c_2e_2 + c_3e_3 - (e_1 + e_2 + e_3)\,c_4 + c_4e$$

we see that the result is the same as the one obtained above for a special numerical case. The results can also easily be verified graphically.

4. We see from the figures of Insert XI on the one hand, and from a comparison of Fig. A of this Insert with Fig. A of Insert X on the other hand, that the block meter rate follows the theoretical requirements of the pure meter rate more closely than the step meter rate. Especially if we add an explicit customer charge to the block meter rate[1] (which would mean that the duct of straight lines of Fig. A of this Insert will have to be raised parallel to itself by the amount of the customer charge) we see that we can with a very limited number of blocks approach the theoretical curve to any degree of approximation which is desirable in practice.

Insert XIII — Appendix to Section 123.

Combinations of Block Meter Rates with Straight Meter Rates and Step Meter Rates.

These combinations do not occur frequently. An example for the combination of a block meter rate with a straight meter rate is the General Lighting schedule of Cambridge, Mass. This rate charges

9 cents per kw-hr. (net) for the first 500 kw-hr.
8 cents per kw-hr. (net) for the next 500 kw-hr.
7 cents per kw-hr. (net) for the next 1094 kw-hr.
3.875 cents per kw-hr. (net) for the next 2856 kw-hr.
5.5 cents per kw-hr. (net) for 4950 kw-hr. or over.

The last line of this table is a straight meter rate. The price per kilowatt-hour in this rate is chosen in such a way that we arrive at the same bill for the limiting number (4950 kw-hr.) of kilowatt-hours, whether we figure it according to the last, or to the last but one line. The curve of the rate (see also Insert XII) is shown in Fig. A.

The Municipal Wholesale Power rate of Fort Wayne, Ind., is a combination of a block rate in the lower ranges of energy consumption and a straight meter rate in the higher

[1] See Section 124 of the main text.

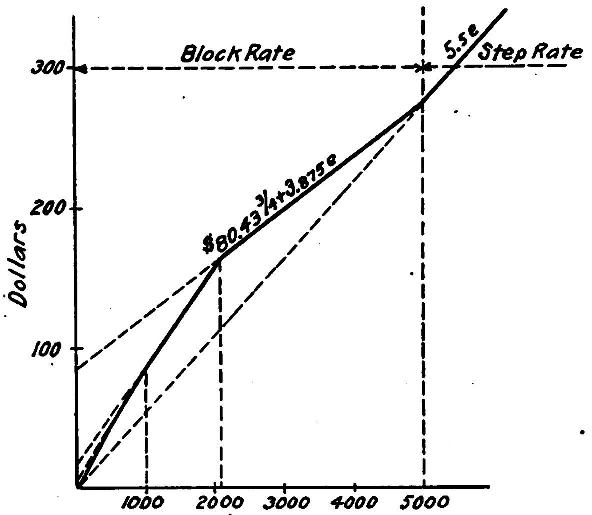

Fig. A (Insert XIII).—Block Rate Followed by Step Rate.

ones. Steps are worked into the rate by discounts which extend back into the range of the block rate as follows:

The rate charges: 3 cents per kw-hr. for the first 350 kw-hr.
2 cents per kw-hr. for the excess over 350 kw-hr.
If over 5000 kw-hr., 2 cents per kw-hr. for all the energy consumption.

Quantity discounts: 10% on bill of $ 25
15% on bill of $ 50
20% on bill of $ 75
25% on bill of $100
30% on bill of $150

Fig. B shows the curve of this rate and Fig. C that of the Retail Power rate of New Britain, Conn., which is the reverse of the rate just discussed, inasmuch as it contains a step rate in the lower, and a block rate in the higher ranges. The last one of the 15 steps charges 2.5 cents per kw-hr. in the range from 4000 to 5000 kw-hr. The block rate begins nominally at 5000 kw-hr., charging in the first block (5000-10,000 kw-hr.) the same unit rate of 2.5 cents per kw-hr. as the last step of the step rate. Therefore the curve is an unbroken straight line from 4000 to 10,000 kw-hr. and we might choose any point between 4000 and 10,000 kw-hr. as the end of the step rate and the beginning of the block rate. The block rate has very large blocks (5000 kw-hr. each) and the difference between the unit charges of successive blocks is only 0.1 cent, so that the curve of the block rate is very nearly an unbroken straight line.

Insert XIV — Appendix to Section 125.

Average Charges per Kilowatt-Hour with the Pure Meter Rates.

The only graphical representation of pure meter rates

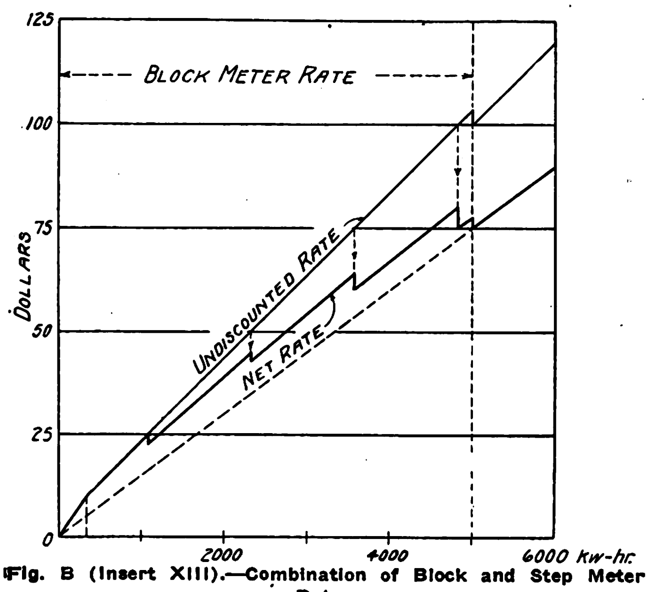

Fig. B (Insert XIII).—Combination of Block and Step Meter Rates.

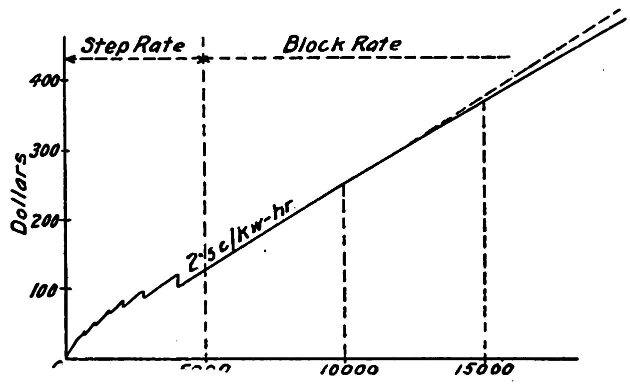

Fig. C (Insert XIII).—Step Rate Followed by Block Rate.

used so far was that of showing the amount of the customer's bill with varying energy consumptions (Inserts X-XIII and Figs. 4-6 of the main text). In this method of representation we get ducts of straight lines for the block and the step meter rate, and each of these straight lines is the equivalent of a combination of a straight meter rate with a customer charge. The energy charge of the schedule in cents per kilowatt-hour is given by the angle of elevation ϵ of the respective straight line from the horizontal[1]. (Fig. A) The larger the energy charge, the steeper the line will be. This energy charge can also be defined as the increment cost (to the consumer) per kilowatt-hour, that is, the price of every additional kilowatt-hour and must not be confounded with the average price per kilowatt-hour. This average price is given by the total bill divided by the number of kilowatt-hours consumed. If we connect a point P of the rate curve (duct of straight lines) with the origin O (Fig. A) the angle α which this connection line includes with the horizontal is a measure of the average price per kilowatt-hour. The steeper that angle is the higher is the average price[2].

We can thus by a glance at the rate curve easily form an idea how large the average price per kilowatt-hour is for every number of kilowatt-hours and how it varies. We need only estimate the variation of the angle α.

In many cases we find employed curves of the average price per kilowatt-hour rather than of the total bill. The curve of the total bill is, however, not only more instructive as regards the nature of the rate, but generally also simpler, because it almost always consists of straight lines only. Nevertheless, since, in spite of this, the curve showing the average price per kilowatt-hour is still frequently being employed, it will be shown in the following how the average price per kilowatt-hour varies in case of the block rate and of the step meter rate.

It has been shown that both the block rate and the step meter rate are composed of the two elements of the straight meter charge and the customer charge, and no other elements. These two elementary charges will be treated first and their combination afterwards. The total bill under a straight meter charge is represented by Fig. B_a. The average price per kw-hr. is, of course, constant. It is therefore represented by a straight horizontal line (Fig. B_b) the height of which above the axis is given by the kilowatt-hour charge. (The full lines in Figs. B_a and B_b belong to one another, likewise the dotted lines and the dash-and-dot lines.) In the other one of the two elementary rates, consisting of a pure customer charge, the curve which represents the customer's bill is a straight horizontal line (Fig. C_a), the height of which above the horizontal axis corresponds to the amount of the customer charge in dollars or cents. The curve for the average charge per kilowatt-hour is less simple (Fig. C_b).

[1] Speaking accurately and in mathematical terms: By the tan ϵ.

[2] Speaking accurately and in mathematical terms: The average price is given by tan α.

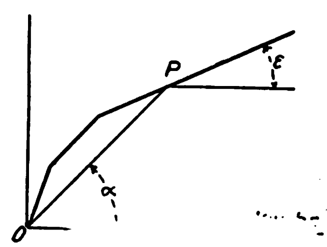

Fig. A (Insert XIV).

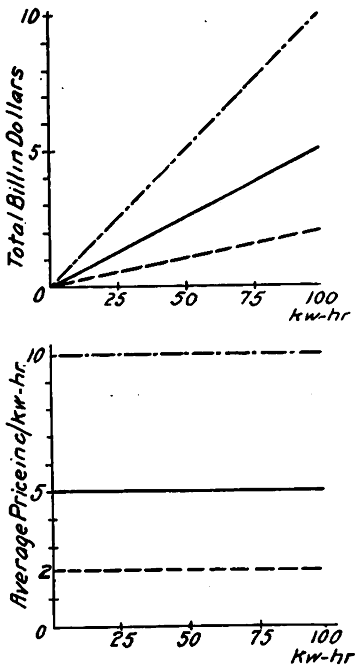
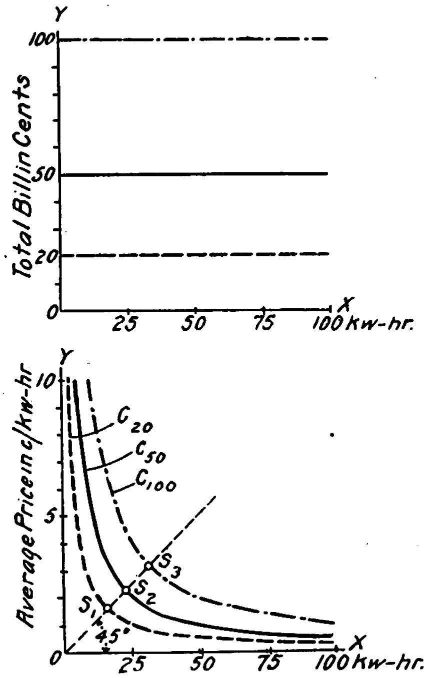


Figs. B_a and B_b.



Figs. C_a and C_b.

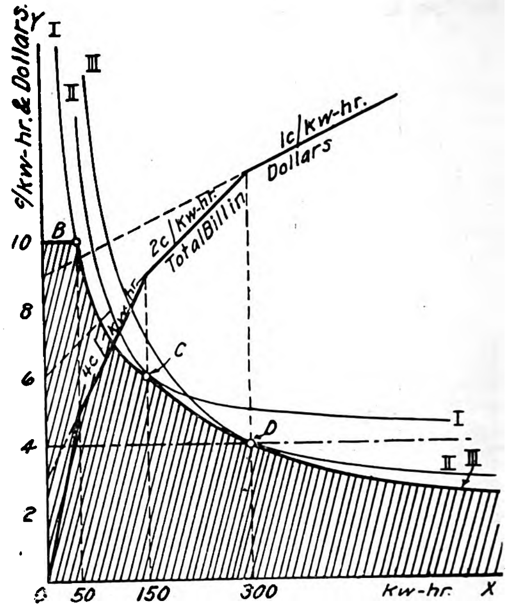


Fig. D.

If the bill is constant, for instance 50 cents (full line) the average price per kilowatt-hour will be

10 cents per kw-hr., if energy consumption is 5 kw-hr.
5 cents per kw-hr., if energy consumption is 10 kw-hr.
2 cents per kw-hr., if energy consumption is 25 kw-hr.
1 cent per kw-hr., if energy consumption is 50 kw-hr.

The curve which results from plotting these values is shown as curve C_{50} in Fig. C_b. The other curves for $1 and for 20 cents customer charge are also shown in the same figure. All these curves are equilateral hyperbolas with asymptotes OX and OY; this means that the curve steadily straightens out from O towards X and towards Y and it approaches the axes OX and OY more and more the further out we extend it, but it never touches them.

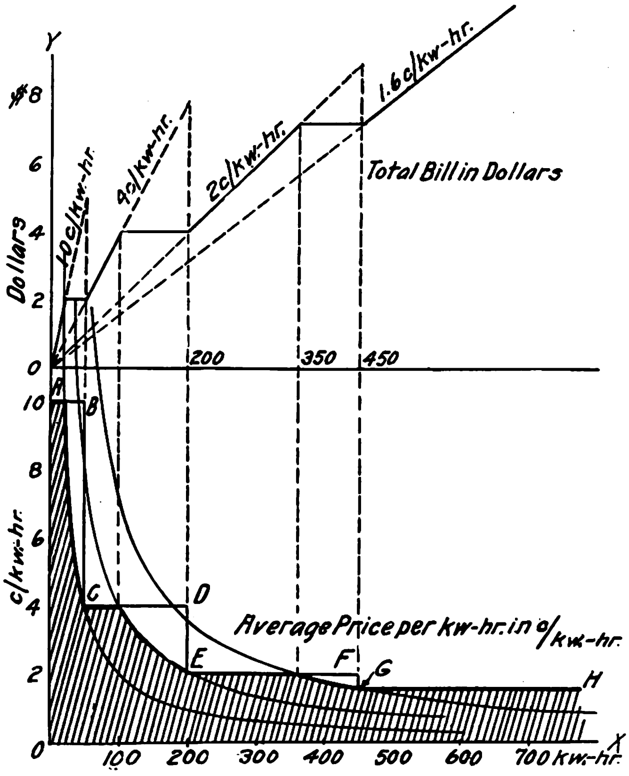

Fig. E.

If we now add these two elements, the straight meter charge and the customer charge, as in the block rate, the average-price curve will be a summation of the respective curves of the two elements, Fig. B_b and C_b, this means we will get the hyperbola in Fig. C_b, but the horizontal line of Fig. B_b will express itself by raising the hyperbola into a higher position. We thus get the curve of the average price per kilowatt-hour for a block rate (Fig. D, shaded area). It consists in the first range of the block rate of a horizontal straight line as the block rate itself in that range is nothing but a straight meter rate. In the following ranges a series of hyperbolas will result (*I, II, III*), one for each range. The axis of ordinates is the common vertical asymptote for them all and the respective horizontal asymptotes are located at distances above the horizontal axis which are given by the energy charge in the respective block. Thus, for instance, the horizontal asymptote of the hyperbola *I* (dash-and-dot line) is located at 4 cents per kw-hr. above the axis OX[3].

As regards the unmodified step rate, the average charge per kilowatt-hour is evidently indicated by the curve (duct) *ABCDEFGH* (Fig. E) resembling steps on a flight of stairs (hence probably the name "step rate"). Where we modify the step rate by the requirement that no greater total charge shall be made for a smaller number of kilowatt-hours than for a larger one the corners at *B*, *D* and *F* are cut off by hyperbolas, the asymptotes of which are always given by the axes OX and OY, as will be easily understood from the foregoing.

(To be continued.)

JAPAN'S ELECTRICAL INVESTMENT.

According to Y. Ishikawa, manager of the commercial department and chief engineer of engineering department of the Kyoto Electric Light Co. of Kyoto, Japan, that country has now a total electrical investment of $500,000,000. At present Mr. Ishikawa states, hydroelectric plants are capable of producing a 1,000,000 hp. but in the near future they will be enlarged to five times that capacity. He says that nearly every ship now sailing for Japan has about 150 Americans aboard; many of them are investing capital in Japan or are helping to direct industries in that country.

[3]It could be easily shown with a little mathematics that the length of the "axis" of the hyperbola (OS_1, OS_2, OS_3, respectively, in Fig. C_b) is proportional to the square root of the customer charge. This means that as the shape of the hyperbola is the more rounded off, the larger is the equivalent customer charge.

Equipment for Handling Coal and Ashes in Power Plants—II.

Influence of Methods Upon Plant Operation—Classification of Mechanical Methods of Handling Coal and Ashes—Power Calculations

By ROBERT JUNE

Mechanical Engineer.

THE power plant owner, who is considering the installation of mechanical coal and ash handling systems, is confronted by a number of fundamental problems which must all be solved correctly if he is to make a satisfactory decision. If the solutions require time and study, he will do well to refuse to be hurried in his investigations.

Prominent among the questions to be answered, are the following:

(a) What type, or types, of equipment are best adapted for the conditions in the industrial plant under consideration?

(b) Shall the coal and ash handling systems be divorced?

(c) Granted that questions (a) and (b) are correctly answered, will the equipment chosen meet the requirements of the $O\ M\ I < H$ formula; that is, will the operating costs O, which include power, labor to operate, oil, etc., plus the maintenance costs, M, which include repairs of any nature, labor to make repairs, depreciation, etc., plus interest, I, on total money invested, which must include not only equipment and parts purchased from manufacturer, but cost of labor to install, cost of foundations, bunkers, and other changes, be less than the cost of doing the same work by hand, H?

In order to arrive at some understanding of the factors entering into the first of these three problems, a brief survey of the different types of coal and ash handling equipment appeared last month. Continuing this description.

Apron Conveyors.

The apron conveyor was developed with the idea of obtaining a self-supporting continuous belt for handling heavy material. It consists of a double strand of roller chains, on which are mounted steel plates, the width of which corresponds to the pitch of the chain. These plates are beaded or curved over each other to form a closed joint. The sides are also made overlapping so as to produce a closed trough.

Apron conveyors are commonly used for conveying coal from track hoppers to the main conveyor and elevator. Only end discharge, of course, is possible, and thirty degrees inclination is the practical limit in elevation. Owing to its construction, this type of conveyor is comparatively expensive to install. However, since the load is carried and not dragged, less power is required than with the scraper type, and the maintenance is lower.

In estimating power requirements, the formula previously given for flight conveyors may be used with a reduction of 10% in the final figures.

In the pan conveyor, the flights are omitted, and the trough itself is made in sections and mounted on the chains. By this change the material is carried, with consequent reduction in wear.

This type of conveyor is used where pans, deeper than those of an apron conveyor, are required, as on inclines too flat for elevators and too steep for efficient operation of flight, or apron conveyors. The usual speed is 30 to 50 ft. per min. when supported by self-oiling roller wheels, the power consumption is but little above theoretical load requirements. For purposes of estimate, the power may also be assumed as 10% less than that of the formula previously given.

In passing, it should be noted that on account of the abrasive character of the materials, the employment of pan and apron conveyors for ashes is apt to result in excessively high maintenance costs.

V-Bucket Conveyors.

In this type the buckets are rigidly fastened to the conveyor chain, with the result that on the vertical runs, the material is lifted, whereas on horizontal runs, it is dragged through the trough ahead of the bucket.

V-buckets are one of the less expensive forms of chain conveyors, and should be given consideration in the smaller power plants, while not as popular as in the past there are a goodly number of fairly representative medium sized plants that employ them to good advantage.

Power requirements may be approximated from the following equation, supplied by courtesy of Professor Gebhart.

$$HP = \frac{AWL^1S}{1000} + \frac{BL_1T}{1000} + \frac{TH}{1000} + \frac{1}{2}x^1$$

in which

A,B = constants as in Table II.
W = weight of conveyor per ft. of run, lbs.
S = speed of conveyor, ft. per min.
T = capacity of conveyor, tons per hr. (Note, figure 50 lbs. coal per cu. ft. and 40 lbs. of ashes.)
L^1 = horizontal length of conveyor, ft.
L_1 = total horizontal length traversed by the loaded bucket, ft.
H = total vertical traverse, ft.
x^1 = number of 90° turns to the conveyor.

Pivoted Bucket Conveyors.

This is the most popular form of chain conveyor for both medium and large sized power plants. The pivoted bucket carrier is composed of a continuous series of malleable iron buckets, pivoted between two strands of roller chain, of approximately 18-in. pitch. There are several different forms of this carrier on the market. The differences in these carriers are principally in the method used to empty the buckets at the discharge point, the method used to close the gaps between adjacent buckets to prevent spillage, and the method of driving the conveyor. In one form of carrier, the buckets are made with an overlapping lip, in a second, a roller is introduced between adjacent buckets, etc. The roller chain is carried and guided by a track composed of standard tee-rails. This rail is mounted on special cast-iron rail chairs, both horizontal and vertical runs. The buckets can be dumped at any desired point by means of an adjustable dump mechanism, which may be set wherever desired.

As the buckets are pivoted and always remain in the horizontal position, except when being dumped, this conveyor can be used for handling material both horizontally and vertically. The pivoted bucket carrier is generally installed in power plants, so arranged as to handle both coal and ashes in the same carrier. It is installed in the form of a loop, running through the basement up one end of the boiler house, over the top of the overhead coal storage bunkers and down the other end to the basement. Coal is discharged from the receiving track through a track hopper, feeder and crusher, into the pivoted carrier in the basement, and carried up to the overhead storage bunkers. Ashes are dropped from the ash pits into the horizontal run in the basement and carried up to an overhead bunker for storage.

Pivoted bucket conveyors possess the following advantages:

1. The material is carried and the buckets are supported by rollers. Destructive friction and injury to the material itself is therefore eliminated, and the power required for operation reduced to the minimum.

2. The ability of the one machine to elevate and convey avoids transfers, which are always troublesome, take up valuable space, and necessitate deep pits. The driving connections are also correspondingly simplified.

3. The material is readily discharged at any desired point.

4. The operation is comparatively silent, and as they are run at slow speed, there is little vibration.

One type used is the Peck Carrier pivoted bucket conveyor, as manufactured by the Link Belt Co. Coal is fed to the crusher by the "reciprocating feeder" which is usually placed directly under the track hopper. The feeder consists of a heavy steel plate, mounted on rollers, and having a reciprocating movement, effected by a crank mechanism from the carrier. The amount of coal delivered depends upon the distance the plate moves, and this can be varied by changing the throw of the eccentrics. The number of strokes corresponds to the number of buckets. Any size coal can be readily handled. When the distance from the track hopper to carrier is so great that the reciprocating feeder is not practicable, a continuous or "belt" feeder is used to supply the crusher with fuel. The "equalizing gear" is designed to impart a pulsating motion to the driving wheel, which will counteract the natural pulsation to which long pitch chains are subject, producing violent increase of the normal strain at frequent intervals. This is accomplished by driving the spur wheel with an eccentric pinion, causing the pitch line to describe a series of undulations, corresponding to the number of sprockets on the chain wheel.

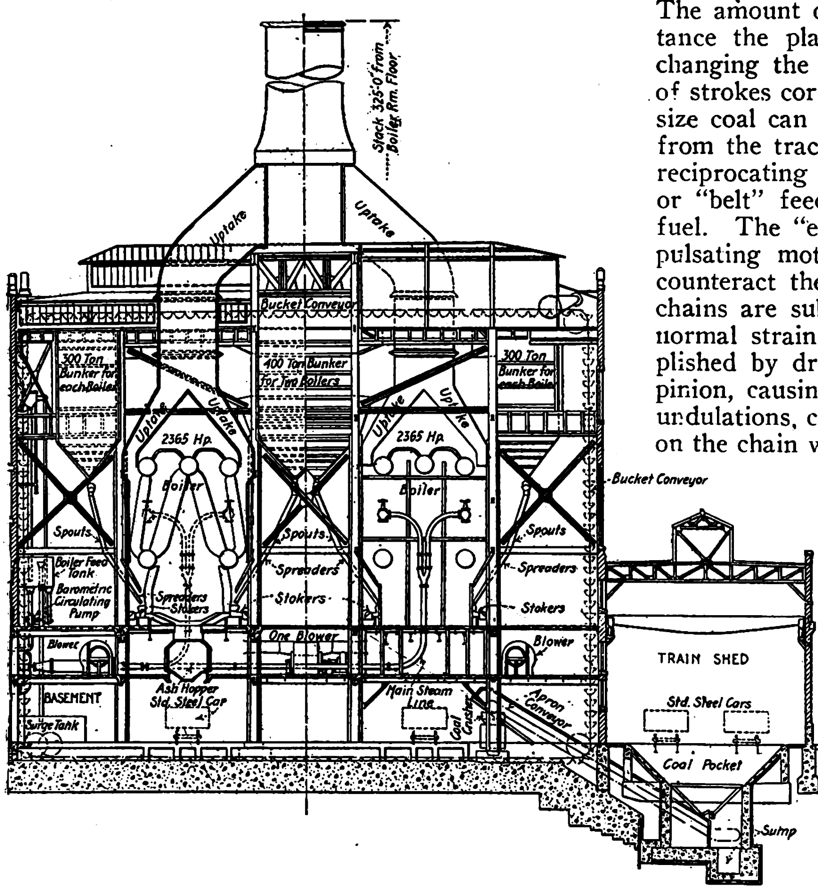

Fig. 1.—Combination of Coal-Handling Systems at Detroit Edison Co.'s Connors Creek Station.

In Fig. 1 is illustrated the use of a combination of conveying systems at the Connors Creek Plant of the Detroit Edison Co. The coal enters the train shed in drop-bottom cars, usually of the 50-ton size. The cars dump into the hopper under the tracks in the train or coal shed, there being one hopper for each unit of one turbine and two boilers. A motor driven variable speed flight conveyor with a capacity of 120 tons per hr. receives coal from the hopper, carries it up a rather sharp incline and discharges it into a four-roll motor driven crusher of similar capacity. This crusher breaks from 18-in. cube to 100%, through a 1¾-in. ring.

The crusher discharges into a motor driven variable speed hopper bucket conveyor, with 30 by 36-in. buckets. This conveyor forms an endless chain which entirely encloses the section of the boiler house. It carries the coal up on the side nearest the coal shed and discharges it into any one of the three coal bunkers which serve the two boilers of one unit.

The hopper, pan conveyors, crushers and bucket conveyors for each unit of one turbine and two boilers, are so located that they can deliver through chutes to one adjacent range of bunkers, serving thus as a spare for that range.

An estimate of the power required for any proposed installation of pivoted bucket conveyors can be obtained by reference to the formula given for V-bucket conveyors, subtracting 10% from final figures.

(To be continued.)

COURSE IN COMBUSTION ENGINEERING TO PROMOTE FUEL CONSERVATION.

Central Stations and Others Given Chance to Reduce Fuel Consumption Through Education.

Coal may never be cheap again. In any case it will be a long time before such is the case; and meanwhile every influence is exerting pressure toward fuel-saving measures.

Every user of fuel, of coal, oil and gas, can help save it. Saving it, as understood at the present time means minimizing waste. Minimizing waste in turn, means eliminating the preventable losses and therefore needless losses, and reducing to the lowest possible value the unpreventable losses. The first thing to do toward this end of fuel saving, is, obviously, to understand the characteristics and properties of fuel and the chemistry of burning it. The next requirement is to understand the art or science of applying the heat obtained by the chemical reaction of combustion, that the heat so obtained may be most fully utilized.

In other words, knowledge of combustion and its applications and a thorough understanding of the principles involved, are the requirements for conserving fuel by using it most usefully. And everyone concerned in the use of fuel can help conserve it by possessing a knowledge of fuel. Some can do more than others toward this end, of course. Executives, and power-plant designers, plant owners and managers are morally responsible for the fuel consumed in their plants. Combustion and efficiency engineers, superintendents, watch engineers and firemen are the ones most closely and directly instrumental in saving fuel. To all alike, knowledge is power.

Keeping Up the Good Work of the U. S. Fuel Administration.

In the winter of 1917, the fuel situation necessitated heroic steps being taken by the U. S. Fuel Administration to reduce fuel consumption, to relieve congested and overtaxed railroads and keep rate of consumption down to rate of production. Everything was done to strike at the root of waste of fuel. The less necessary plants were shut down. Assistance was given to help improve plants that were wasteful through ignorance and poor maintenance. But perhaps the greatest saving in fuel was brought about through education and inspiration. Moreover, this was the most permanent way of saving because forced shutdowns could be only temporary whereas education is permanent in effect.

Education through publicity in newspapers, bulletins and letters was the master stroke of the Fuel Administration toward fuel saving. As an example, the administrative engineer for Illinois, Joseph Harrington, sent out personal letters of instruction to every one of the 10,000 power plants in Illinois. These letters were simply, tersely and interestingly written, and to the point. Each letter covered some specific subject. Each letter was studied hungrily by plant owners and operators alike—for each needed desperately to save fuel.

The startling results obtained in the way of power-plant betterment and the manner in which request was made from all quarters for these letters and more letters brought realization in an amazing manner as to the need these letters of instruction were filling. Instruction by mail thus aided in fuel conservation.

When the armistice came, the purpose for which the Fuel Administration had been formed ceased to exist, legally. The intensive methods previously employed could no longer be continued. On the other hand, while the war's demands had ceased, the demands of peace are just as real and just as exacting, with the difference that the requirements of peace are permanent while those of war were transient. With no prospect of fuel going down in price—all conditions favor rising prices—and with a better understanding gained of what a valuable asset are our natural resources, sufficient incentives and economic factors combine to make it worth while, nay imperative, to continue to save fuel.

Those closest in touch with the fuel situation, and the ways of consuming it, wasting it and saving it, obviously would know most about the best way to tackle the pressing problem of making true conservation practical and effective. And no one better than they can appreciate the urgent need for saving fuel now; and of making fuel saving permanent. This means that the men who did so much to save fuel when the insatiate demands of war made saving vital, could still do what they did before to save fuel.

Joseph Harrington. Joseph W. Hays. David Moffat Myers.

And now a few of the men who made the Fuel Administration what it was, men whose work and skill enabled them to stand out in those days when it was said that coal would win the war, have tackled this problem of making fuel conservation permanent. These men have adhered to the policy that brought success before. They have found a way to keep up many of the tactics that have been proven successful, namely, distribute knowledge and instruction in combustion and the consumption and utilization of fuel. The course in combustion engineering has been named after its author, Joseph W. Hays, known to Electrical Review readers for his famed little book "Combustion Efficiency" and his numerous articles on combustion problems. Those collaborating and co-operating with him upon the educational staff are David Moffat Myers, Joseph Harrington, Prof. S. W. Parr, Fred R. Low, A. L. Rice.

Each of these men has placed his skill, his knowledge and reputation upon this course on combustion engineering without charge. Each has devoted his time and effort toward making possible the education of thousands most closely concerned with the purchase and use of fuel, without payment. Each states that he considers his part in this educational movement, as his contribution to the cause of fuel conservation. Each looks to the results obtained—fuel conserved through knowledge in its use—as his full reward.

It is but natural that those best appreciating the urgent need for fuel conservation should have taken the initiative in this movement to save fuel by knowing how to use it.

Each has co-operated not for financial gain but because they have seen the vital need for some active steps being taken to save coal now. The standing of these men, each a master of his subject, should be a guarantee that the subject of combustion is treated in an effective manner.

Course in Combustion Engineering.

The course is divided into twelve sections. Each section must be mastered before the subsequent lessons or sections are tackled. Moreover it is necessary to attain a marking of 75% in any section before passing on to the next lesson. The course covers its subject gradually, at first by taking up the subject in a broad way. Gradually the matter becomes more and more specialized, the later lessons each having a special subjective.

A better idea can be obtained by naming the various lessons in the order in which they will be taken up by the student. The first is an introduction on the history of steam and economical steam production. The second deals with boiler furnaces and general rules of practice, a discussion of the plain furnace and its many modifications and stoker types. Third is a lesson embracing a general discussion on drafts, natural and artificial. The fourth lesson takes up natural fuels and all about them, including methods of coal, oil and water analysis. Physics and the chemistry of combustion and combustion analysis is covered in the fifth lesson. In the sixth, operation of boiler plants is taken up; also applied combustion analysis. Smokeless combustion and applied combustion analysis occupies lesson seven. The eighth lesson deals with testing of boiler and furnace and applied combustion analysis. In the ninth lesson is taken up in detail such important specific matters not fully covered in preceding lessons. Industrial gases and the gas producer and applied combustion is dealt with in the tenth lesson. In the eleventh lesson, gas and oil engines and applied combustion analysis for this phase of the application is covered. In the twelfth lesson the work of the combustion engineer, and the keeping of charts and cost data are fully covered. The above is only a bare outline of the course, but suffices to show the length and thoroughness to which the author has gone.

The aim of the course is to equip men concerned with the application and use of fuel with the knowledge of how best to use it. Only when this obtains will the interests of fuel conservation be best served. Several interesting features of the course assist toward this end.

Everything has been done to make combustion attain the prominence and encouragement it deserves. Graduates and students may, if they choose, register for positions. In this way openings and positions may be filled and employers gotten quickly into touch with good men, graduates of combustion engineering. Skilled combustion engineers thus are offered every opportunity for improving themselves; plant owners of obtaining men that can be trusted to use up their fuel, safe in the knowledge that they come to them meeting a definite standard of fitness. The choice of a combustion or efficiency engineer need no longer be a hit or miss process.

As a further incentive, provision is made, when desired, to notify employers from time to time as progress in the course is made. In this way remuneration or position may keep pace with ability, a personal interest between employer and employe develops and pay tends to go up with worth. By taking such a course, a graduate is able to know his own worth based upon a standard rating and can thus capitalize his training equitably.

The course, when completed, will enable anyone to have acquired a very complete and practical training in the combustion and application of fuels. The course, so far as we can ascertain, is the only one in existence that deals exclusively with combustion engineering. The diploma won upon graduation is the only standard of merit awarded at the present time in this important branch of the engineering profession. The conclusion is obvious and inescapable. It is inevitable that such a course must prove a prominently vital factor in furthering fuel conservation by creating men who are vastly more valuable to themselves and to the country. The greater the number that take up this course, the greater will be the fuel saving, and the greater the gratitude of the country and of everyone to those that have fitted themselves to consume a national resource, and to those who have enabled them to do so from patriotic motives.

Knowledge is power. Power brings ability to do. And never was the need for fuel saving greater than it is today. The course in instruction on combustion engineering fathered by Joseph Hays and his collaborators is a radical and most hopeful forward step taken toward reducing the colossal and needless waste of three of our most valuable natural resources, coal, oil and gas. To save fuel by teaching its use seems to be the soundest method of conservation yet advanced. Education has done more for the advancement of the race, for the uplift of nations and formation of habit than all legislation, threat and punishment combined. And in education rests the only hope for fuel conservation. Interested readers should address the Hays School of Combustion, Chicago

Editorial Comment

The Illuminating Engineering Society

IF evidence were needed of the distinctive need for the Illuminating Engineering Society and the soundness of its organization, it was furnished by the thirteenth annual convention held in Chicago this week. A somewhat extended report of this gathering is given on other pages of this issue. The large and very representative nature of the attendance and the eagerness with which the papers and addresses were absorbed and discussed showed conclusively that the field of illumination is a very broad and attractive one and that the society is the only forum where its problems can be discussed on an unbiased basis, regardless of the source of light and the commercial origin of the lighting equipment. For over thirteen years the society has held steadfast to fair and scientific consideration of lighting questions free from commercialism. Its success in this field has stimulated the formation of similar societies in three other countries: Great Britain, Germany and Japan. Members of two of these societies addressed the Chicago convention.

At times it has been advocated in this country that the work of the society could readily be taken over by the National Electric Light Association and the similar gas organization. These latter associations, however, have as their main function the discussion of public utility problems, among which is the extension of the sale of their respective services. It has been shown that the Illuminating Engineering Society is not interested in selling more light but in urging better lighting practice. Of course, this involves in many cases use of more artificial light, but the distinction is a vital one that we are glad to see is being recognized.

The incoming administration of the society under President S. E. Doane has splendid plans for extending its educational work and co-operation with other organizations concerned with lighting. This is no reason why these broadened activities may not be undertaken with profit to all if they are conducted on the broad plane of freedom from commercialism so well carried out by the society in these many years.

Combustion Engineering

CONSERVATION of fuel, and of coal especially, is a pertinent matter at this time because of the threatened strike of the bituminous coal miners at a season of the year when the demand and need for coal is approaching its height. However, the urgent need for saving fuel—some of our most precious buried treasure—is a pressing matter at all seasons. It is with us always.

The higher cost of all fuels and the threatened shortage of coal brings the problem of coal saving very close to most of us. But the gradual diminishing supply, while one that appears to be less near, is, nevertheless, one that will affect us all commercially and economically some day, not by extinction, of course, but by increased costs due to having to go deeper into the ground for it and because of other causes contributing to higher costs. Fuel in some form or other enters into so many phases of our industrial, commercial and economic life that it is one of the vital factors in our lives today. Fuel conservation is, therefore, not a partisan matter. It is one that concerns each and every one of us, and closely.

The best way to save fuel—coal, oil and gas—is to thoroughly understand how to use it. That this may be accomplished, a knowledge of the characteristics of fuels, the chemistry of combustion, the science of applying the heat of combustion and the engineering knowledge necessary to choose equipment best fitted for the purpose and operate it at all times so as to obtain high combustion efficiencies and utilize to the full the heat obtained is implied. On the surface, the problem appears simple. Actually, the problem is complex.

Knowledge is power. Knowledge, in the case of the use of fuel, is the power to save. It is to the combustion engineers and to those versed in combustion engineering to whom we must look to save our fuels by using them efficiently and without waste.

Ice and the Hydroelectric Development

ICE IS one of the banes of the hydroelectric plant located in northern latitudes during the cold season. Its form and quantity are so uncertain, as also are its severity and its duration. It may cause stoppage or restriction of water flow. It may reduce output by changing the effective head. It may injure the wheels and cause even more extensive damage.

Frazil ice forms in large quantities on open water under moderate degrees of coldness. It often forms at temperatures of 20° F. and even higher when there is sufficient wind to cause agitation. When the operator sees ice of a leaden hue like saturated snow floating in patches over the water he looks for trouble, for frazil ice clings tenaciously to metal parts such as racks, wheel guides, the wheels and gates. The collection of this spongy mass always restricts and frequently obstructs entirely the flow of water to the wheels, and this condition persists until the sun's rays or artificial application of heat to the metallic parts or rising temperature of the water cause a thaw. Fortunately this trouble disappears as soon as surface ice forms in the forebay, as anchor and frazil ice passing under water have less affinity for metal than when they are exposed to currents of air. Anything done to reduce the circulation of air around metallic parts is just so much gain, therefore, toward eliminating the difficulties of frazil ice.

Loss of output often occurs because the discharge becomes clogged with ice, the tail-water backs up and the effective head is reduced. Boulders, shoals and similar obstructions in the river channel on the upstream side are other frequent causes of reduced output, since these act as nuclei for the formation of ice, which in turn obstructs the channels, causing the backing up of water and variation of stream flow. Effort made to clear river channels and keep them free is effort well made at this time, and may prevent much concern when the ice commences to "come down."

Where a whole river is dammed, and a series of rapids exist above the dam, difficulty in maintaining flow of water may be expected because of decreased area under the surface ice due to the formation of frazil ice and the combining of anchor ice from the rapids with the floating ice. Dams installed to drown out the rapids and sluices to permit the impounded water to be drawn off from the river's bottom are sound practices and ones that eliminate many troubles. Where protecting works cannot be built, channels should be cut in the surface ice of sufficient width to permit the frazil and anchor ice carried down underneath the surface ice to rise and discharge through the dam. Power-house openings should, preferably, not be used for this purpose as the ice may cause trouble to the wheels.

Where only a part of the river is dammed, considerable variation in water flow may result from floating ice, a condition made worse by some wind conditions. The wind may blow the surface ice against the surface ice along the forebay entrance. Here floating ice may be drawn under the surface ice, to become frozen to it. Then the ice begins to increase in size downward, gradually reaching the channel bottom. Often the channel may become so blocked that little water can flow. In such cases uniform cross-section at the entrance to the channel and for some length thereafter, low velocity of the water and a surface of water free from obstructions all tend to combat cause and effect. Channels, forebays, sluices and dams cannot be built in a day. But channels can be cleared of obstructions before the ice appears, booms can be installed and tugs can sometimes be kept at work in long channels to help keep the ice moving and the channel open.

The time will soon be here when frazil ice, floating and anchor ice, ice jams and allied troubles will be with us again. The time to take most effective action to minimize these troubles is, of course, when designing the hydroelectric development. Precautions taken now, however, and during the next two months in anticipation for what may come with the coming of cold weather may later save much concern for reduced outputs, damaged wheels and structures and service interruptions.

Wireless Telephony and the Transmission Line

WIRELESS telephony for making possible communication between power plants and substations separated by long distances, by difficult and rugged country, has long been recognized, and now that the restrictions that came with the war are lapsing, one may expect the wireless telephone to be taken advantage of more fully as time goes on.

Many are the transmission lines that traverse country where river gorges and inaccessibility by foot make a telephone line expensice to install and difficult to maintain. Extreme weather conditions, sleet and ice, long spans with consequent expensive construction, are other conditions that combine to work disfavor with the telephone line and add to its cost and uncertainty of reliability. The fact that in cases of trouble, which is the time the telephone is most used and most urgently wanted, the metallic telephone line is usually out of service is a powerful factor and an immensely favorable argument for wireless telephony.

As far back as 1913 telephony through the air was employed on the Pacific Coast instead of along the metallic telephone line paralleling the transmission line, and since that time a number of installations have been made and operated with perfect satisfaction. Nor is the wireless telephone installation confined for use with the long-distance transmission lines traveling over sparsely populated and rough country. In fact one company operating a transmission line of only some 30 miles and traversing a well-populated territory with its receiving station within city limits, took to wireless before the war put a prolonged stop to its use. Even now, preparation is being made by several large transmission companies to adopt wireless in their systems.

In some cases the topography of the country traversed makes wireless very advantageous. In some cases there may be a very real financial balance in favor of telephony by air instead of by wire. But the supreme advantage to the operating company of telephoning wirelessly is that communication can be carried on regardless of electrical or mechanical troubles to the transmission line, whereas such troubles usually interfere with, if not preclude altogether, the use of telephony over wires. Wireless is more reliable, it is more safe, and may be more economical financially, than metallic telephony.

Current Events

Section Meetings of Electrical Manufacturers—Illuminating Engineers and Inspectors Hold Successful Conventions

ELECTRICAL MANUFACTURERS DISCUSS STANDARDIZATION.

Association to Appoint General Committee on Standards—Tariff and Exports Also Considered at New York Meeting.

The regular fall section meetings of the Associated Manufacturers of Electrical Supplies were held Oct. 14-15 at the association headquarters, 30 East Forty-second street, New York City. The membership of the sections combined is approximately 300 and this number was in attendance.

In addition to the general work of the sections in standardization of various materials and devices coming under their special attention, much time was given to the matter of the adoption of the standards approved and recommended by the different sections and to the suggestions that these standards should be issued as the standards of the association. A desire to this effect on the part of the sections has been somewhat encouraged by the fact that other bodies have from time to time suggested joint meetings for the consideration of subjects of mutual interest, these suggestions coming from such associations as the American Institute of Electrical Engineers, Standards Committee, N. E. L. A. Wiring Committees, the Underwriters' Laboratories, Western Association of Electrical Inspectors, Compressed Air Society and others. This led to the suggestion that a general committee be formed from the sections, same being approved by the board of governors and counsel, the duties of the committee to be to represent the association in matters of standardization and to evolve procedure by which section standards may become standards of the association and generally to centralize the association's standards work to the end that all interested parties may be advised of proposed action and the necessary provision for same made. Subjects which may come under consideration are substantially as follows:

1. The determination of the relation of the Bureau of Standards at Washington to the initiation of codes, etc.
2. The proposed broadening of the American Engineering Standards Committee.
3. The proposed legislation conferring on the Bureau of Standards the power to establish standards of quality for manufactured product.
4. The desire of other national associations, such, for instance, as the American Institute of Electrical Engineers, to confer and co-operate with the association in the adoption of standards in which there may be mutual interest.
5. The determination of what shall be a standard of the association and the evolution of an orderly process by which, when desirable, the standards adopted by a section may become the standards of the association.
6. The desirability of the collection and preservation of standards already adopted by the various sections in form which shall make them readily available.

All such work would naturally come under the advice of counsel and every possible means taken to avoid complications or anything which might be considered illegal. Work of this kind has been done heretofore, notably in the case of the American Society of Mechanical Engineers in the adoption of a standard for special threads of fixtures and fittings, and it would seem that work of this kind would be of inestimable value to the manufacturers and to the public generally in the adoption of the very best and the elimination of superfluous types, etc.

The matter of the tariff schedule was also considered by all the sections and in arriving at a fair basis for fixing tariff many figures as to costs of material and labor were considered. At a meeting of the chairmen of the tariff committees as appointed from the various sections a resume of the work accomplished was gone over and new plans made for the future advantage of the supply industry.

The matter of exports was also taken up and considered under the supervision of the international trade committee of the association, in which special committees for both tariff and export are doing progressive work.

A dinner meeting of the Wire and Cable Section was held Oct. 15 at the Yale Club, about 65 members attending. As is usual at the meetings of this section, much constructive work was arranged, followed by a most enjoyable dinner and get-together entertainment.

INDIANA CONTRACTORS HOLD PROFITABLE CONVENTION.

State Association Has Interesting Program of Papers and Addresses at Convention.

The Indiana State Association of Electrical Contractors closed its annual convention, held at the Claypool Hotel, Indianapolis, last week, with increased interest in every phase of the work. Electrical dealers and contractors from all parts of the state attended the conference.

Some of the important addresses at the conference were as follows: "The Heating Device License Schedule," by Charles A. Payne; "Live and Let Live," by Samuel Adams Chase, Westinghouse Electric & Manufacturing Co.; "The Work of the National Association," by W. H. Morton, New York, general manager of the National Association of Electrical Contractors and Dealers, and "Electrical Merchandising—Address and Exhibit," by William L. Goodwin, of the General Electric Co.

Members of the executive committee, which is the governing body of the organization, were elected as follows: A. L. Swanson, Evansville, chairman; G. M. Sanborn, Indianapolis, and A. B. Harris, Gary.

Chicago Convention of I. E. S. Proves Most Successful

Large Representative Gathering at Four-Day Meeting on October 20-23—Wide Range of Lighting Topics Discussed

REVIVAL of keen and widespread interest in lighting was shown by the large attendance, close attention at sessions and active discussion of many live illumination topics at the thirteenth annual convention of the Illuminating Engineering Society, which was held at the Hotel Sherman on Monday to Thursday of this week. About 400 members and guests were registered and many others in attendance. All parts of the country, also Canada, England and even distant Japan were represented. The attendance comprised not only illuminating engineers, representatives of lighting equipment manufacturers and purveyors of lighting service, but also numerous public authorities, educators, architects and others concerned with lighting matters.

Over twenty-five papers and addresses were presented in five busy technical sessions held during the four days of the convention. Judiciously interspersed between these sessions were several delightful entertainment features, affording relaxation, good fellowship and pure fun. The convention was not only successful but one of the most profitable ever held by the society.

Opening Session.

The convention was opened Monday afternoon by Homer E. Niesz, chairman of the General Convention Committee, who called on Louis A. Ferguson, vice-president of the Commonwealth Edison Co., to deliver the address of welcome. Mr. Ferguson spoke of Chicago as a big engineering laboratory where many innovations are tried out on a large scale. Some of these, like the use of steam turbines in power generation, the introduction of Mazda lamps, differential rates for central-station service and the campaign for better industrial lighting were referred to. The advance in these lines, as well as in lighting particularly, since the society's last convention in Chicago eight years ago has been very great and the city's lighting interests felt pleased to have the society come here to observe it. In replying on behalf of the society, Louis B. Marks, of New York, dwelt on the prominent part taken by Mr. Ferguson's company in calling attention to the value of productive lighting.

Dr. Hoadley's Presidential Address.

In his presidential address G. A. Hoadley referred to the last two conventions held under the stress of war and he reviewed in a general way the lessons of the war. First was its injustice in devastating so many lands, whereas those of its instigators were scarcely touched by the scourge of war. Another was the miscalculation of the would-be conquerors of the world in assuming their plans would be executed before there could be any formidable opposition. Still another lesson was the splendid co-operation of all our people when we finally became involved in the war.

The I. E. S. membership contributed 101 men to active military service and of these four made the supreme sacrifice. The society's Committee on War Service was very active and through various subcommittees comprising 43 members all told it handled a great variety of lighting problems of great importance in the conduct of the war. These included design of lighting of aviation training camps and buildings thereon, lighting of balloon hangars and grounds, lighting of navy gun and machine shops, protective lighting of various grounds and works, lighting of government workmen's cottages, war-time lighting economies, factory lighting, hotel lighting restrictions, lighting of coal mines, metal conservation in reflectors, etc.

Of the various efforts to combat high prices Dr. Hoadley pointed out the effectiveness of doing so through increase of production and how this may be largely brought about by changing the present inefficient lighting systems in many factories into those that are really good. As an outcome of both men of means and men of toil being thrown into camp together during the war, Dr. Hoadley looked forward to an era of better feeling between capital and labor, an era of real peace but which will have its own old problems largely in new form. Their solution will devolve upon the thinking men, such as compose the major part of the membership of technical and scientific societies.

"The fundamental purpose of this society is to teach the people of this country the necessity for good lighting," said Dr. Hoadley. To those who know the influence proper illumination has upon the mental and moral attitude of those who make use of it, this is a matter of the greatest importance. Good lighting has as its foundation the work done in research laboratories. Research has had a wonderful development in the last 20 years. Modern investigators not only find the truth of any matter being studied, but proceed to show how it can be carried out and applied in practice. Everyone connected with lighting should be keenly interested in the work of the society, which co-operates with all agencies, from the manufacturer of the light source to the user of the light, and which is interested in the discovery and improvement of light sources and the proper use of light.

President S. E. Doane, Cleveland, Ohio, was called on for a few remarks. He touched on the importance of the lighting developments in Chicago and the society's possibilities for doing good in bringing to the attention of the public the need for better lighting. Formerly the matter of lighting was looked upon just as janitor service—a desirable but very minor feature. Now we recognize it as an essential element in production. Its value in this line is shown by the fact that about 65% of incandescent lamp output is used in places where the productive value of good lighting has immediate benefit.

Clarence L. Law, New York City, general secretary, presented the report for the council of the society. The membership is 1145, a slight decrease from last year, due to the abnormal conditions prevailing. The four sections have maintained their regular activities. Aside from their meetings, there were held several group meetings by local representatives distant from the centers of the regular sections. The finances of the society are in excellent condition.

Report on Progress.

F. E. Cady, Cleveland, Ohio, as chairman of the Committee on Progress, presented the annual report on this subject which as usual was a classical review of the most important developments of the year in the illuminating field. The report also had its customary completeness, comprising 78 printed pages. Among especially noteworthy features mentioned was the growing use of tungsten lamps and decrease of carbon filament lamps. Miniature tungsten lamps have made surprising increases. Two tungsten lamps for motion-picture work are now standardized. Among new units are the 50-watt white Mazda and the 25 and 50-watt mill type Mazda. In England standardization of lamp voltages is now actively proposed.

Some new types of vapor arc lamps are reported, among them another neon lamp. Much headway has been made in searchlights. Electric headlights are being rapidly installed on locomotives and an effort is under way to standardize them. A new arc of considerable promise is being developed for motion-picture projection. Important developments in electric miner's lamps are reported in England.

War restrictions on lighting are reviewed in the report, especially as enforced abroad. Many ingenious expedients were resorted to. Numerous new or changed installations of street lighting are referred to. Unique effects have been produced in spectacular illuminations connected with victory celebrations in New York, Chicago, Portland, Ore., etc.

The campaign for better industrial lighting conducted in Ohio has had good results. Interesting uses of colored lighting are being introduced in numerous theaters. The unfortunate use of the term "fixture" for lighting fittings is being recognized. Fixtures giving several varieties of lighting effects are becoming popular. The report also touches on developments in photometry, physics of light sources, legislation and lighting codes, physiology of lighting, daylight saving, gas lighting, etc.

The progress report was discussed by P. S. Millar and D. McF. Moore, of New York; J. R. Cravath, Chicago; C. M. Masson, Los Angeles; C. O. Bond, Philadelphia; L. C. Porter, Harrison, N. J.; Dr. Louis Bell, Boston, and Geo. H. Stickney, Harrison, N J. Mr. Masson asked for suggestions on lighting of golf links and Mr. Stickney recommended high towers such as formerly used in Detroit. Mr. Porter called attention to the Society of Motion Picture Engineers as eagerly studying lighting problems of their industry and worthy of aid from the I. E. S.

Automobile Headlighting.

A report of the Committee on Automobile Headlighting Specifications, C. H. Sharp, New York, chairman, was presented by W. F. Little, of New York City. At the instance of this committee a three-day session was held in January of all interested in the automobile headlight problem. The outcome of this was that the committee drafted a model headlight law which was slightly revised by the Committee on Lighting Legislation. Further consideration was given to the subject of specifications for acceptability tests for headlights. Four test positions were recommended as follows:

Position 1.—Some point between road level and a point on a level with the lamps in the axis of the car—4800 cp.

Position 2.—In the axis of the car 60 in. above the roadway at 100 ft.—2400 cp.

Position 3.—60 in. above the roadway, 7 ft. to the left of the axis of the car at 100 ft.—800 cp.

Position 4.—At 100 ft. at some point between road level and a point on a level with the lamps and 7 ft. to the right of the axis of the car—1200 cp.

At the suggestion of the authorities in Connecticut these new specifications were offered. Within the past month the authorities in Pennsylvania have requested the committee for specifications to be used in that state. It was suggested that each device manufactured and sold must be accompanied with adequate instructions as to installation. Both Connecticut and Pennsylvania have established an inspector system in which their inspectors use a foot-candle meter.

The discussion was opened by J. R. Cravath, Chicago, who pointed out that positions 1 and 4 give minimum requirements. The work of the committee is of a pioneer character; formerly no one had a conception of what the requirements should be. Educational work on this matter is extremely necessary and in some parts of the country it has been carried out much further than in others. The inspector system should be a valuable means of improving the headlight situation. The use of test stations in connection with garages or oil-filling stations may prove desirable. Dr. Louis Bell, Boston, urged testing with standardized lamps properly adjusted. He believed that it will be possible to get a much better class of headlights through use of the new specifications.

H. P. Gage, Corning, N. Y., spoke of the necessity for teaching three classes that are interested in this matter, namely, the manufacturers of these devices, legislators and users. The manufacturers will be glad to produce better devices if told how to do so. The committee's report should prove of great value of legislators and he believed the public should be educated through garage men, distributors and dealers of headlight devices. L. C. Porter, Harrison. N. J., spoke of the desirability of uniform laws in the different states. The report should help in making the same more effective. He commended a pamphlet published by the Motor Vehicle Department of California in instructing the public on this matter. The difficulties in making lamps uniform were described. Some flexibility in the specifications is therefore necessary. G. B. Nichols, Albany, N. Y., said that lenses vary greatly in quality, some being very highly developed and others very inferior. He felt that the New York legislators will gladly improve the existing law. Norman Macbeth, New York City, believed there is great need for improving the lamp assembly as a whole. Ward Harrison, Cleveland, Ohio, thought it might be desirable to have all headlights tilted down slightly as this would permit use of a simpler lens. Mr. Little said that the greatly varying practice of different automobile manufacturers has prevented this. Therefore, the horizontal setting was assumed to be standard. F. H. Murphy, Portland, said that Oregon is trying to make regulations similar to those of California. He believes that the public is anxious to meet any requirements that solve the problem properly. To secure uniform legislation it may be necessary to have Federal legislation. L. C.

Norton, Los Angeles, said that oil-filling stations in that city frequently have test stations for the use of their patrons. J. A. Hoeveler, Madison, spoke of the new law in Wisconsin which holds that headlights not in accord therewith are prima facie evidence of the unsafe use of highways. This has put "teeth" into the law. C. O. Bond, Philadelphia, said it was possible to use road signs as convenient test stations.

Mr. Little closed the discussion by explaining the inspector system used in Connecticut. Motorcycles are used and when a driver is held up for the first time the headlight situation is explained to him in considerable detail. In Pennsylvania inspectors are to be trained for similar service. He thought that it would be desirable to have an expert adjust the head lamps in all cases.

Street Lighting.

On Tuesday morning three papers dealing with street lighting were presented, the first being by C. A. B. Halvorson, West Lynn, Mass., and A. B. Oday, Harrison, N. J., and entitled "Street Lighting with Low-Mounted Units—Kensico Dam Roadway." The Kensico reservoir is one of the storage reservoirs connected with the water supply of New York City. It includes a massive dam behind which the waters are impounded. At the top of the dam is a roadway 2200 ft. long and 26 ft. wide with a 4-ft. sidewalk on one side and a stone parapet wall 4 ft. high forming the border. This dam is of imposing architectural design and it was desired to illuminate the roadway along its top without use of the ordinary lighting standards. After considerable study it was decided to use lighting units imbedded in cast-iron boxes placed in the parapet wall. This involved special designs for these boxes, for mounting of the lamps, reflectors and a baffle to cut off the direct light of the lamps, which were 6-volt, 108-watt, Mazda C units. The lamps were staggered on opposite sides of the wall and give quite a uniform and pleasing illumination of the entire roadway. The installation is unique in this respect and has been found entirely satisfactory.

The second paper, entitled "Recent Developments in Street-Lighting Units (Electric)," by A. D. Cameron, Schenectady, N. Y., and C. A. B. Halvorson, was read by the former and supplemented by illustrations described by Mr. Halvorson. In pendent units for series Mazda lamps an important addition is the combination of dome refractors and stippled or rippled outer globes. These have some advantage over the use of the refractor alone, on account of appearance and making it easier to clean the single outer surface. A new form of bowl refractor is being brought out with a closed diffusing base. In ornamental units the tendency is strongly toward single units of high candlepower instead of clusters and the standards are being made more slender and unobtrusive. An installation is being made in Saratoga, N. Y., of duplex units in which within the single outer globe there are two lamps superposed. The lower lamp is 600 or 1000 cp. and is expected to burn until midnight, whereas the upper lamp is 100 or 200 cp. and by means of a simple cutout replaces the lower lamp after midnight, thus reducing the operating cost from then on. In parkway and residential lighting there is no need for having upward light as in case of white way lighting. Hence, the use of dome refractors and suitable globes is becoming more common. A new type of one-piece molded porcelain unit is being developed which includes a radial wave reflector and refractor holder. For luminous arc lamps electrodes are now being made under pressures of 500 tons per inch, which give 30 to 40% more light than the standard electrode and an increased life of from 30 to 40%. It is also expected to use glass mirror reflectors with these lamps to still further improve their efficiency. This should make it possible to use rippled outer globes in place of the clear globes now so common. The increased efficiency of the electrodes also permits the use of a lower wattage adjustment on each lamp, thus saving 40 watts per lamp and increasing the capacity of the rectifier. In Detroit 90 to 94 lamps are now operated on each 75-light rectifier. The paper concludes with a warning that the very simplicity and flexibility of the Mazda lamp, which has made it so popular in street lighting, tends toward neglect of proper cleaning and maintenance.

The third paper in this group was presented by F. V. Westermaier, Philadelphia, and was entitled "Recent Developments in Gas Street Lighting." It was pointed out that the police value of street lighting is its greatest importance to the public, and municipalities usually look to this protective value rather than to the illumination secured. Although this should be a municipal concern, the matter is left largely to the utilities furnishing the lighting service. Street-lighting rates are usually on a unit price contract basis and the specifications are rather infrequently changed. A constant tendency is toward cutting down expense. Taking up gas street lighting particularly, the author showed that this is usually separated into supply of the fixtures and operation and maintenance. He described several new types of muutiple mantle lamps and high-pressure lamps. The latter, although considerably used abroad, have found little application in America due to the expense of separate mains and the low revenue derived from street lighting alone. Other units described were traffic guide posts, lamps for viaduct lighting and the interchangeable units used in Milwaukee.

The discussion was opened by Dr. L. Bell, Boston, who showed that both the Mazda and the luminous arc are keeping on developing although it was predicted that one of these would gain ascendency. Both have distinctive fields of their own, that of the luminous lamp being for high-intensity lighting. This lamp has also increased the efficiency considerably and, moreover, has the advantage that it must be cleaned regularly, whereas incandescent units are so commonly neglected. F. R. Mistersky, Detroit, said that in that city the use of the newer magnetite electrode enabled the city to add 1100 new lamps to the former 7000 without adding to the capacity of the station. Ward Harrison, Cleveland, said it is necessary to impress on the authorities that cleaning must be done regularly, regardless of the type of lamp used, and efforts should be made to make cleaning easier. It has been found that the absorption of light by the globes is negligible as compared with that due to dirt. He also called attention to a study made in Cleveland of the relation between street lighting and accidents; the article describing this appeared in the Electrical Review of Oct. 11, 1919. H. B. Vincent, Philadelphia, emphasized the need for discarding lamps that had been blackened from long use just as is the practice in interior lighting. J. W. Cowles, Boston, dwelt on the value of sparkle in street-lighting units. One objection formerly raised to incandescent units was that they lacked this, but this is now taken care of by the new ripple glass which gives the unit life and animation. Cleaning cannot be laid down in a definite schedule applicable to all streets since it depends on the amount of traffic and dirt met with. Others who discussed the subject were C. O. Bond, Philadelphia; W. T. Dempsey, New York; G. G. Cousins, Toronto, Ont., and C. M. Masson, Los Angeles.

C. A. B. Halvorson closed the discussion on the electrical papers by stating that the lighting of the Kensico dam has been found very satisfactory and meets all requirements. Naturally, he would not recommend it for universal application because the presence of crowds on sidewalks would obviously shut off the light and mud and dirt spattered by passing traffic would likewise obstruct the light. In the particular installation neither of these conditions existed. Mr. Westermaier briefly closed the discussion by calling attention to the fact that stret lighting has not developed as fast as other branches of lighting, especially in the matter of maintenance.

Military Matters.

At this point Gen. Geo. H. Harries was presented to the convention to give some impressions of his experiences in service abroad. He was the first American officer to enter Berlin after signing of the armistice and said that the much-talked of Germany military efficiency, which was supposed to have provided for everything, did not provide for possible defeat. Consequently when this came the army was almost completely demoralized and everything seemed to go to pieces. He told of the lack of records, especially as to prisoners. The conditions in the war-torn countries to the east of Germany were far more deplorable than the American public has any conception of. He said that the German people apparently did not seem to realize that they met defeat. They need light to show that they sinned in making war and to expose their folly in thinking that they were even partial victors. On the other hand, we also need illumination to remind us that the laws of supply and demand and the survival of the fittest still hold, and that the folly of wastefulness, the need to be industrious, loyal to our government and to respect the law and its officers should not be forgotten.

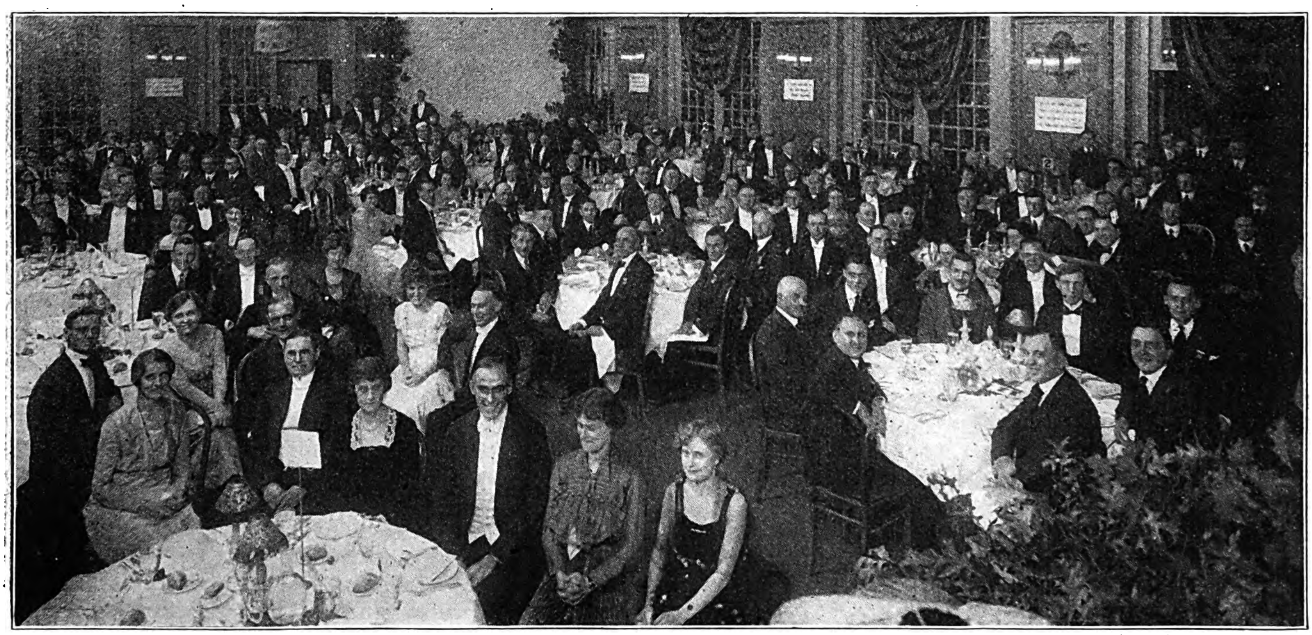
Capt. Chester Lichtenberg, Washington, D. C., presented a paper entitled "Military Searchlights," in which the recent developments in this important line were reviewed at considerable length and many illustrations show. Great advantages were made in this line in making searchlights more powerful, lighter in weight and more portable. Methods were described for testing searchlights. The searchlights in use by the Germans were comparatively clumsy and heavy. Those developed by the Allies and the United States were frequently mounted on light chassis which could be quickly rolled upon a motor truck and transported. This truck carried the generator for furnishing the current. Searchlights were not used close to the front because they could so easily be detected and smashed by heavy gun fire. They were used chiefly back of the lines for finding hostile airplanes at night. frequently in conjunction with parabolic listening devices which picked up the general direction in which the plane was likely to be found.

Two papers on photometry prepared for the convention were read by title only due to the lateness of the hour. They were "A Universal Photometric Integrator," by Frank A. Benford, Schenectady, N. Y., and "A Photoelectric Photometer," by Arthur H. Compton, East Pittsburgh, Pa.

Glare Tests.

The session on Wednesday morning opened with the presentation of a paper on "Glare Measurements" by Ward Harrison, Cleveland. This paper gave the results of tests made with a considerable number of observers viewing an opening illuminated by a lamp until this opening became objectionably glaring. Fair consistency was found in the results, and among the conclusions reached was that the use of an opalized bulb cut down the glare, as compared with a clear lamp, by half as much as an opal inclosing ball. One of the most important findings that the results indicate is that the total light flux that reaches the eye from a source is the most important single factor in the production of glare.

The discussion was opened by J. R. Cravath, Chicago, who said that there have been three kinds of



Members and Guests of the Illuminating Engineering Society in One of Their Lighter Moments During the Thirteenth Annual Convention in Chicago, Oct. 20-23.

glare tests, the first being test of eye fatigue after long exposure; the second, interference with vision, and the third, momentary or snap judgment tests. These latter that Mr. Harrison tried are worthy of being seriously considered on account of their simplicity, speed and convenience. A. J. Sweet, Milwaukee, said it is necessary to judge between the ocular discomfort and the actual depression of visual power. It is interesting in observing that Mr. Harrison found the total flux much more important in glare production than intrinsic brilliancy. F. C. Caldwell, Columbus, Ohio, reported having made similar tests and believed that by using many observers results of considerable value can be obtained. G. H. Stickney, Harrison, N. J., emphasized the need for setting up glare standards so as to permit of drawing a dividing line between what is objectionable and passable in this respect.

Symposium on Industrial Lighting.

L. B. Marks, New York, chairman of the Committee on Lighting Legislation, opened the symposium on application of industrial lighting codes that took the rest of the session. Six states (New York, Pennsylvania, New Jersey, Wisconsin, California and Oregon) have now enacted such codes. Ohio, Massachusetts, Oklahoma, Utah and some ten others either have already provided codes or are seriously considering the subject. This committee has been actively co-operating with the Divisional Lighting Committee of the National Council of Defense and with representatives in practically every state. It is difficult to draw the line as to what is ample for safety and health and as to what is desirable for vision and protection. The society has hesitated to draw a definite line as to just what the glare and other standards should be and has left it to the states to try out various novel features. Many years ago there were made quite a few installations of productive lighting and it was found that many manufacturers were eager to adopt better lighting when its value was called to their attention.

John A. Hoeveler, Madison, Wis., presented a paper on the application of the Wisconsin Industrial Lighting Code. The 1913 lighting rules adopted in the state were completely revised in the 1918 code which now applies to new installations only but after July 1, 1920, will also apply to existing installations. Provision is included for either natural or artificial lighting and suggestions are made for both in the second part of the code. Plans for new factory buildings must be approved as to lighting. Suggestions have freely been made for betterment in such plants and the illuminating engineer also visits existing plants and offers suggestions for lighting. The inspectors try to secure voluntary compliance in existing installations. An effort is being made through meetings, conferences and lectures to educate the contractors since to them is left much in the matter of the designing of an installation. Lectures are also given to factory managers, superintendents and foremen. The factory inspectors hold monthly meetings. Lighting surveys were made in different factories while the code was under revision and these were successful in improving the lighting in all cases. Difficulties may be met when it comes to putting the code in full effect as regards shading local lamps and emergency lighting in existing installations.

John H. Vogt, Albany, N. Y., said that the state labor laws of New York were greatly strengthened after a very disastrous factory fire in New York City in 1911. While the state code was in process of formulation about 18,000 tests were made in various factories during a comprehensive survey. The New York Code in its revised form includes recommendations not only for minimum but recommended practice for various industries. These intensity requirements as to work spaces become mandatory after July 1, 1920, the remainder of the code as to general spaces being already in effect. The inspectors meet frequently and receive instructions through lectures. About 68,000 industrial plants are involved in New York state.

A. L. Powell, Harrison, N. J., read a paper prepared by R. H. Leveridge, of the Department of Labor, Trenton, N. J. In order to make the lighting code effective in New Jersey it was felt that education of the factory inspectors was necessary and therefore a special course of lectures was given in 1918. Meetings of contractors were also addressed at which the code was explained and the essentials of good factory lighting set forth. In all of this work the public utility companies have very freely co-operated. There is being undertaken the education of manufacturing companies so that they may have a more complete grasp of what the problem is, and the advantages to be derived therefrom by good factory lighting. In connection with a safety exhibit it is proposed to have some displays of good industrial lighting.

J. S. Spicer, of the Pennsylvania Department of Labor and Industry, read a paper describing the application of the code in that state where the effort to improve factory lighting has been carried on for about five years. Many accidents showed the need for this work and then the question arose as to what is "adequate" lighting. Adoption of the state code based on that of the I. E. S. cleared this up. Now the manufacturers accept it as a valuable aid in laying out good lighting systems and the inspectors find it invaluable in bringing definite information before the industries, especially in foundries where the need for good lighting was so urgent. The labor interests are showing pleasure at seeing the improvement in lighting. Some complaints have been made of "too much light." These invariably were due to excess glare. The improvement in lighting of plants within the last five years is quite impressive, even to a casual observer looking at the same from passing trains. Some plants find tungsten lamp installations more economical in operation and maintenance than the former arc lamps. Six districts have been established for carrying out factory inspection as to lighting. The details of the work of the inspectors was explained. The code has been found very effective in lighting betterment but it will take several years before all factories are well lighted.

F. H. Murphy, Portland, explained how Oregon secured the law giving the labor commissioner authority to draft a lighting code. Both labor interests and employers' organizations took kindly to the proposed law, which includes a broad definition of places of employment to cover offices also. The commissioner appointed a committee to draft a code and it has reported one which became effective last July. Its enforcement is not drastic.

Romaine Myers sent a letter that the California code is being printed and will become effective Nov. 1, 1919.

A. H. Taylor, Washington, D. C., read a paper by M. G. Lloyd, of the Bureau of Standards, describing the Federal Code. It includes not only intensity requirements but also definite statements as to cleaning and maintenance, and gives many suggestions as to proper practice. Dr. Lloyd described many installations in arsenals, navy yards and other government plants showing that compliance with this code is not yet what it might be, but it doubtless will be much more complete in the future.

F. C. Caldwell, Columbus, Ohio, described the status of the Ohio Code, which now is in its third proposed form and has been turned over by the committee to the commission. Doubtless it will be made effective in the near future. It includes comprehensive tables of recommended lighting intensities. Professor Caldwell noted that all the codes are almost exclusively educational at present. Their legal aspects have not yet been called into effect, and it may not be necessary to resort to very drastic measures to convince manufacturers of the value of doing the work voluntarily.

Dr. Louis Bell, Boston, described the progress of preparing a code in Massachusetts. The commissioner of labor and industry is very sympathetic and the factory inspectors are also exceptionally keen to have something done. Dr. Bell was requested to draw up the code, which he did, based on that of the I. E. S. After certain hearings it can be adopted with the force of law.

R. E. Simpson, Hartford, Conn., presented a brief paper entitled "Insurance Inspectors and the Code." In this he set forth that the object of all lighting codes is to make conditions safe as to lighting. Experience of the inspectors is that the greatest need for betterment is respecting reflectors on drop lamps and the better illumination of stairways and unfrequented places. The dark surfaces on stairways require much higher illumination than ¼ ft-cdle. Data show there are more fatal accidents due to falls on stairways than are due to traffic accidents on streets. During the war all our military casualties amounted to about 400,000, but at home there were more casualties due to poor lighting alone.

George C. Keech, Chicago, spoke briefly of the prospect of initiating action on a code in Illinois.

Dr. E. P. Hyde, Cleveland, a member of the International Commission on Illumination, said that an American committee composed of P. S. Millar and J. R. Cravath had prepared a very voluminous report to the commission on what has been done by our various states and the I. E. S. in the matter of lighting codes. It was intended to present this to the European countries that have been torn by war as an aid in their reconstruction work.

G. B. Nichols, Albany, N. Y., spoke briefly on the difficulty of getting appropriations for additional activities by state departments; consequently he warned against making the work of enforcement of the codes too expensive.

Prof. C. E. Clewell, Philadelphia, submitted a written communication strongly recommending educational work in extending the influence of the codes rather than strict legal enforcement.

Commercial Aspects of Lighting.

The Wednesday afternoon session was devoted to commercial possibilities, the first address being by R. M. Searle, Rochester, N. Y., on "Opportunities for Extending Lighting Through New Applications." He called attention to the opportunity for bringing up the lighting of side streets to approximately the standard of main streets so as to reduce the danger of accidents from automobiles. Highway lighting is only in its infancy and presents wide opportunities for electric lighting companies. All-day lighting of store windows has extremely high commercial value not only to the lighting company but to the merchant. Mr. Searle also touched on color lighting to reproduce the effects desired in millinery and cosmetic shops. Stairways need much more lighting than has ever been used to reduce accidents. Large possibilities lie in floodlighting of banks, monuments, playgrounds, etc. A very favorable load can be developed from lighting of railroad freight classification yards. Higher candlepower lamps with their higher efficiency should be applied with suitable screening devices. Many other fields for lighting business development were pointed out. Mr. Searle said that perhaps less than 25% of the lighting possibilities have as yet been developed. Lighting companies have shown too much of an effort to keep down the bills of their customers instead of pointing out to them what may be done by greater use of lighting.

Discussion was opened by L. Friedman, Chicago, who called attention to the timeliness of boosting highway lighting. J. D. Israel, Philadelphia, spoke of the high advertising value of store lighting, especially that in display windows. It is necessary to show the merchant that the use of more light pays. J. R. Cravath, Chicago, said that store-window lighting requires higher candlepower to overcome street reflections by day than have hitherto been used. N. Macbeth, New York, spoke of a merchant who reported window lighting as giving him better returns than newspaper advertising; the latter cost him $10,000 a year against $500 for all-day lighting for the windows. He spoke of the possibilities of using daylight lamps in millinery stores and in many other places. O. B. Oday, Harrison, N. J., said that railroad lighting offers a large field for color matching in car painting, for large classification yards and large erecting shops.

Lighting in England.

F. W. Willcox, London, England, made an address on "Lighting in England." When he came to London from this country some eight years ago he found lighting conditions very backward and almost deplorable. These slowly improved but there is still room for a very large improvement. The people are more conservative and not ready to take up innovations. During the war in the effort to minimize the destruction from air raids it was necessary to resort to drastic restriction of all outdoor lighting especially and at first this was done in an unfortunate way with serious results. Later the advice of illuminating engineers secure some modifications of the depressing conditions. Mr. Willcox showed a large number of views of war-time lighting in government munition and airplane works and also in commercial establishments and institutions. Numerous special fittings were shown that were devised to meet Admiralty specifications in some of these plants.

The discussion of Mr. Willcox's address was opened by E. D. Tillson, Chicago, who was glad to see that rugged fittings were being used in at least one country. Here excessive competition leads to the use of light and insubstantial fittings in many places, such as foundries, where they are entirely unsuitable. S. G. Hibben, Pittsburgh, reported some of his observations both in France and in England while in military service the last few years. He also said that the first impression one has is the extreme backwardness of these countries as to lighting, and yet on closer study he finds many innovations that are worthy of being given serious consideration. At any rate, it is valuable to get the viewpoints on this subject of other countries. Others who discussed the subject briefly were G. H. Stickney, Harrison, N. J., and F. H. Bernhard, Chicago.

Mr. Willcox in closing said it was possible to use air-tight instead of ventilated fittings if ample provision is made for radiation of heat. In English cities one finds higher intensities than are the general practice here, but there is practically no highway lighting. Locomotives are run without headlights; therefore, if abundant road lighting were provided, automobiles could do so likewise. He briefly described the use of adjustable drop and rise lamps which are very popular in England and give no trouble. He hopes to see an industrial lighting code of national scope adopted in that country. He also spoke of the British Illuminating Engineering Society and the possibilities of further development through its existence.

R. O. Eastman, Cleveland, Ohio, presented a paper entitled "A Survey of Industrial Lighting in Fifteen States." This survey was carried out for the National Lamp Works, of Cleveland, in the effort to study the lighting conditions actually prevailing in factories throughout the country. It was carried out by laymen to get commercial results. It involved the study of 446 plants and was intended to be qualitative rather than quantitative. Very valuable data were presented in the paper, which will be reproduced in an early issue of the ELECTRICAL REVIEW.

The discussion of this subject consisted chiefly of questions by H. B. Vincent, Philadelphia; F. W. Willcox, London; P. C. Burrill, Milwaukee; A. B. Spaulding, Harrison, N. J.; M. Luckiesh and E. A. Anderson, Cleveland. Mr. Eastman answered these questions in closing.

E. W. Leeper, representing the Chamber of Commerce of the United States, made a brief address asking the Society to co-operate with the Chamber in extended propaganda aiming to help solve the most important business problems now before the country.

Closing Session.

On Thursday morning, the first paper presented was by O. R. Hogue and J. J. Kirk, Chicago, entitled "Factory Lighting—A Central-Station Problem." This paper gave the experience of the Commonwealth Edison Co. in a campaign for better industrial lighting. During this campaign a very extensive survey of the conditions in Chicago industrial plants was conducted, the results of which are given. A more extended abstract of this paper will appear in an early issue. This paper was discussed by C. M. Masson, Los Angeles; O. L. Johnson, Chicago; R. E. Harrington, Harrison, N. J.; J. E. Hoeveler, Madison, Wis.; A. L. Arenberg, Chicago, and Mr. Hogue.

A paper on "Illumination of Artistic Interiors Without the Use of Pendent Ceiling Fixtures," by A. D. Curtis and J. L. Stair, was then presented. It showed that recent developments in the use of cove lighting, wall boxes and special brackets, floor lamps and pedestals, urns and special devices make possible the lighting of interiors by equipment that is practically concealed. Many unique effects are thereby obtainable and the architectural scheme frequently enhanced through the absence of the customary ceiling fixtures. Numerous installations of this method of lighting were illustrated and described, these dealing with theaters, hotels, banks, homes and the new House of Parliament Building in Ottawa, Can. The paper was discused by A. L. Powell, Harrison, N. J.; F. W. Willcox, London, and Mr. Curtis.

Utilization Coefficients.

A paper by Ward Harrison and E. A. Anderson, Cleveland, Ohio, entitled "Coefficients of Utilization" was presented by Mr. Anderson. It described a simple method for the direct determination of these coefficients applying to installations of all types of lighting units in rooms of varied proportions and different ceiling and wall colors. Data were tabulated from a series of several hundred illumination tests made in a room with reflectors having three fundamental forms of light distribution. Typical coefficient of utilization tables as determined for different reflector types in common use were included.

The last paper presented was by V. R. Lansingh, Cincinnati, on "Walls and Floors—Their Effects on Lighting." The paper was read by W. F. Little, New York. It gave the results of experimental tests in a small room to determine what influence walls and floors of different colors have on utilization factors. Conclusions reached were that the floor color may affect the illumination as much as 15% and the wall color may produce as much as 25%.

The last two papers were discussed by A. H. Taylor, Washington, D. C.; J. L. Stair, Chicago; N. Macbeth, New York; W. Harrison, Cleveland; A. L. Powell, Harrison, N. J.; F. W. Willcox, London, and Messrs. Little and Anderson.

Prof. Gitaro Yamakawa, of Tokio, Japan, made a brief address on lighting conditions in that country. In illumination Japan is far behind but is trying very hard to catch up. A few years ago an illuminating engineering society was formed in Japan. It has about 750 members. Japan is very much indetbed to America for science in general and for facts regarding lighting.

D. McF. Moore reported the findings of the Committee on President's Address and J. D. Israel presented the report of the Committee on Resolutions. M. B. Webber, Boston, in moving the adoption of the resolutions, said that it was the most successful convention ever held by the society. Before adjourning the convention, Dr. Hoadley turned over the stewardship of the society to President S. E. Doane, who also spoke of the convention as the most valuable one yet conducted by the society.

Entertainment Features.

For relaxation there were provided a number of entertainment features. These included the president's reception and dance on Monday evening, a visit to the Chicago Electrical Show on Tuesday afternoon, a theater party Tuesday evening, a special automobile tour and luncheon for the ladies on Wednesday, the annual banquet Wednesday evening, and inspection trips to lighting installations on Thursday evening. Each of these features was marked by numerous innovations and heartily enjoyed by all who participated. The theater party on Tuesday was made a celebration of the fortieth anniversary of Edison invention of the incandescent lamp—Oct. 21, 1879.

On Tuesday President Doane gave a luncheon to the officers of the society, at which plans for the year's work were discussed.

N. A. E. I. Holds Convention at Springfield

Revision of National Electrical Code from Field Data Principal Topic at Reconstruction Meeting

AMONG the subjects under consideration at the reconstruction convention of the National Association of Electrical Inspectors, held at Springfield, Mass., Oct. 13-14, were those concerning the relation and value of electrical inspection to the various branches of the industry, and the necessity of obtaining information from the field regarding the working out of the rules of the National Electrical Code so that the revision may be consistent with practice. The subject of polarization and protective grounding received consideration along with other papers, discussions on all of which were at some length.

The convention was called to order Monday morning, Oct. 13, by Allen W. Hopkins, past president of the Western New England Section, National Association of Electrical Inspectors. He introduced Arthur A. Adams, mayor of Springfield, who welcomed the association and its friends to the city. Response was made on behalf of the association by President Washington Devereux of Philadelphia.

Past-president Thomas H. Day, chairman of the committee on arrangements, gave a brief explanation of the different committee activities and plans for the routine business of the convention and for the entertainment of the members and their friends.

Beginnings of the Code.

President Devereux then introduced F. Elliot Cabot, secretary of the Boston Board of Fire Underwriters, who gave an address upon "The Beginnings of the National Electrical Code." He was the first chairman of the electrical committee and, with C. M. Goddard, secretary of the New England Insurance Exchange, made the initial efforts toward bringing into existence the National Electrical Code. Mr. Cabot told the convention of these early efforts. There was a brief discussion initiated by A. E. Braddell of the Sprague Electric Co., who was one of the earliest inspectors in the field, after which on motion of Mr. Day a committee consisting of H. S. Wynkoop, A. E. Braddell, Washington Devereux, G. S. Smith and E. S. Francis was appointed to draw up a suitable set of resolutions recognizing the past services of Messrs. Cabot and Goddard in the creation of the Code, to be engrossed and presented to the above-named gentlemen in the name of the association.

Clarence D. Tuska, Hartford, Conn., read a very interesting paper on "Radio Developments and Their Relations to the Code." At the close of the paper it was voted that the secretary forward to the secretary of the electrical committee, National Fire Protection Association, the recommendation of the association that wherever in the Code the words "wireless telegraph apparatus" appear they be replaced by the words "radio apparatus" and that the word "antenna" be similarly substituted for the word "aerial."

At the Monday afternoon session T. Commerford Martin read a paper on "Electrical Inspections and Their Beginnings," which was largely reminiscent and brought out many interesting facts in connection with bygone days. The speaker exhibited a selection of antique fittings which occasioned much interest; there were wooden cleats, cutout bases, receptacles and similar curiosities. He stated that it was proposed to establish a museum of relics in New York to perpetuate the methods of early days. If any of the association members or others have in their possession any of such or other interesting samples of bygone fittings and appliances it is much desired that they communicate with Mr. Martin and if possible send such to him for the above purpose.

Symposium on Electrical Inspections.

Gilbert S. Smith of Philadelphia, president of the Pennsylvania Association of Electrical Contractors and Dealers, read a paper on "Electrical Inspections and the Electrical Contractor." He outlined from the contractor's point of view the relations existing and which should exist and gave a very interesting description of the methods of promoting good relations, clear understanding and co-operation among the contractors, wiremen and inspectors by Washington Devereux in Philadelphia through the workings of his weekly conferences.

"Electrical Inspections and the Power Company" was the title of a paper by Percy H. Bartlett, engineer of installations of the Philadelphia Electric Co. He began by stating that he could present only his own personal viewpoint and that he felt one of the association's principal aims should be to iron out differences of interpretation of the Code. He spoke of the possibility of some "safety inspection" by the state or similar body unless the present inspection authorities control this as well as fire dangers. As to inspections by power companies, he felt that being in the business primarily to manufacture and sell electrical energy, these should confine themselves closely to that business and could do it better if inspections were not included in the companies' functioning. He stated that out of 8000 reports of interruptions of service in one month by his company, 7000 were found to have originated in fuses blown by domestic appliances improperly operated.

Mr. Bartlett told the method by which the Philadelphia Electric Co. was kept informed of inspection progress. After an application for inspection was received by the department the inspector made his visit and sent a copy of his report not only to the contractor but the company as well; similarly when any defects found were corrected and when a temporary certificate of approval was sent the contractor a copy was left in the main service switch box, which was the direct authorization for the company's representative to connect the service. He stated that he approached the question of municipal versus insurance inspection with some diffidence, but that in his opinion on account of the financial leverage (among other reasons) the insurance departments were the more logical and suitable of the two.

The next speaker was Ralph Sweetland, assistant secretary of the New England Insurance Exchange and secretary of the electrical committee, National Fire Protection Association, who addressed the convention on "Electrical Inspections and Their Value." He made six subdivisions: value to the property and owner, to the municipality, to the insurance company, to the manufacturer, to the jobber, and to the contractor.

Under the first head he stated that although some owners of property at first looked upon it as a hardship it was usually not the case with the larger owners and that when it was the owner was regularly brought to see the immediate value to him not only in security but in proportionate increase in income-earning power of the property. Although large buildings were built under supervision of an engineer and strict specifications, still the engineer was strongly impressed with the value of an outside and wholly unprejudiced inspection.

As to the municipality, it has a very direct interest because the use of electricity is so widespread, and there is the probability that faulty equipment in one building may have an injurious effect upon neighboring holdings and may further cause innocent citizens damage, as well as expose the municipality as a whole to fire hazard. The importance of the work of electrical inspection was frequently overlooked and minimized by the public because, while the police department was always on view, the fire department more or less spectacular, the electrical inspection department was distinguished by the fact that when its work was well done nothing happened, so that the more efficient it was the less it appeared before the public at large.

As to the insurance company, it would be enough to compare the permit for the use of electricity as it formerly was written in the policy with the simple form used today which was practically "permission is granted for the use of electricity for light and power purposes in the insured property," the broad, unconditional form being largely due to the results of careful inspection.

The manufacturer is assisted because through careful inspection he is furnished with a mass of field data and similar information which materially assists him in the detection of weaknesses and in the maintenance of standards.

The jobber is benefited because he does not have to carry in stock a lot of cheap material in order to meet thoughtless demands or keep business, since he knows that poor grade non-approved material will not be passed and therefore need not be carried in stock, however beguilingly the salesman may present it to him.

Inspection is of value to the contractor who does high-grade work because he is protected therein. It is also of value to the cheap fellow because he is either forcefully pulled up into the other class, where he becomes a credit to himself and makes a success of his business, or he is on the other hand rapidly eliminated from the field, to the great benefit of others and also to himself as he is prevented from losing what little money he may have through his slipshod methods.

Lastly, Mr. Sweetland disagreed with the preceding speaker in that he believed electrical inspection was distinctly the function of the municipality; he did not believe in a single state inspection, however, keeping in mind that the closer most things are kept to the community interested the better. He realized that there were many small towns which could hardly afford to employ a competent man for this purpose, but saw no reason why several should not combine and employ one jointly, precisely as they do today in the case of a superintendent of schools.

In the discussion which followed there was a very interesting argument over the matter as to how far a power company would be justified in refusing to supply current to installations which they believed dangerous. President Devereux stated that this right was established and that they had the full power; in fact, would be held criminally liable if current was supplied to a service known to be dangerous to life and property. Mr. Devereux cited a case in the New York courts to substantiate his proposition. Harry Blood disagreed and cited a case, also in New York, where a company decided to cut off certain bad risks and the Public Service Commission of the Second District said this was not the company's affair and ordered it to supply current. After some argument, A. M. Paddon, Syracuse, N. Y., took a hand and lucidly distinguished between the two cases. First, in Mr. Devereux's case, there had been serious trouble in the risk and the company had given warning and received a promise that the difficulty would be corrected. This was not done, however; the company thereupon cut off the supply and was, as Mr. Devereux stated, sustained by the courts. In Mr. Blood's case the company suspected some bad risks, ordered all its customers to have their installations inspected and that if this was not done within 30 days current supply would be cut off. As a result the Public Service Commission made the ruling precisely as Mr. Blood stated.

Outside Wiring and Building Services.

The final paper of the afternoon was presented by Dr. Morton G. Lloyd, Bureau of Standards, upon "Outside Wiring and Building Supply and Services." Dr. Lloyd discussed the present regulations of the Code from the standpoint of the sub-committee of the electrical committee, National Fire Protection Association (which must have prepared any proposed revision by Dec. 1 of this year), of which President Devereux is chairman. The following questions were expounded:

Shall the service switch be invariably inclosed? If so, shall the switch or the service fuse come first? Should there be a fuse at the service end of the service conduit? What should be the proper protection for the service conduit and service wires?

In outside wiring cleats are not allowed; knobs are allowed where wiring is not exposed to the weather and petticoat insulators where it is exposed. How about iron racks with porcelain cleats and brackets? Is there any field experience that these are not safe and allowable? If permitted, what should be the limitation?

What requirements should be specified and what regulations for the use of multiple-conductor cable for service? Are the present requirements of Rule 12*b* satisfactory or onerous? Are they being strictly followed or are they not? If not, why not?

At present all line wires must be insulated. Is this desirable, and, if not wholly so, then to what extent? Should the limit be, say wires for 2300 volts and under? What is the field experience and opinion?

Rule 13 is obsolete and in process of revision.

What information can inspectors in the field give that will help?

Finally, how about oil-filled transformers in buildings or attached to the walls outside? What light can be thrown on Rule 14 and others in this connection?

It is strongly felt that the inspectors of the country are in possession of a very great mass of information which would be of material help in the revision of the Code. It will be too late to present this in March. Such material must be in the hands of the committee by Dec. 1. It is very hard to get it from the men in the field. Opinions are not wanted so much as facts—what actually happened in the field and what were the circumstances. Anything that members of the association and others have, not only on the matters specially mentioned above but on any others, they are urgently asked to send promptly, either to the secretary (addressing Prof. William Lincoln Smith, Northeastern College, Boston, Mass.), who will forward it to the proper authority, or directly to Ralph Sweetland, secretary, electrical committee, National Fire Protection Association, 141 Milk street, Boston.

At the Tuesday morning session H. S. Wynkoop, electrical engineer of the Bureau of Gas and Electricity of New York City, read a paper on "Inter-building Service Connections." This practice is found where a block of buildings separated each from each by a fire wall is put up as a unit. Each individual would require, say 15 amperes from a three-wire service, and usually it is found that the installation of individual service for each unit from underground mains would be prohibitive; therefore the company installs a single service manhole with fuses and switch at one corner, the builder runs a conduit straight through the basements of the block, and in each unit is placed a branch service with fuses, switch and meter. The question as to how much this construction or similar schemes are being used throughout the country and whether it should be encouraged is one on which the electrical committee desires as much information as possible.

Code Problems.

Dana Pierce, vice-president of Underwriters Laboratories and chairman of the electrical committee, National Fire Protection Association, presented a paper on "Some Code Problems of Present Interest." He explained the development of the Code from a pamphlet of 36 pages in 1895 to one of 132 pages in 1905 and further to one of 210 pages in 1915, and stated that this roughly measured the increase of use of electricity in 20 years and the increase in hazard; further, that now the size and complexity of the Code had reached a point where these were the principal causes of present Code problems.

The chief problem is how to obtain data and field experience absolutely necessary to keep the Code in the forefront of the profession. It is imperative that the committee receive results of field experience in the form of facts as to the working of the Code—not opinion as to what one or another would like to see inserted or omitted, but facts as to how a given rule has worked or failed in a particular case, with exact information as to the conditions and then a suggestion to improve this condition. Mr. Pierce outlined the new form of procedure of the electrical committee which has been fully and widely detailed in the technical press and with which every inspector is supposed to be familiar by this time. It is the hope and purpose of the committee to make the Code rather a record of good practice than an imposition of requirements upon the business.

Standards are of two kinds. There are, first, inspection rules, such as *26j*, "must be rigidly supported, etc.," and, second, "weasel rules," such as "borders must be suitably stayed and supported, etc.," and as in 37A*c*, "installed in a workmanlike manner." Great judgment must be used in framing these rules. There are the following points among the many which arise:

Heaters—How can the flatiron problem be dealt with? There are now 100 fires a day in the United States due to these alone.

Gas-Filled Lamps—How does its hazard compare with that of the old type? Does it need all the present precautions, or others? How about its use in dusty places?

Varnished Cambric, Paper Cable and Similar Insulations—How about their use in buildings? How support them for risers? What are the difficulties? What rating shall they have compared to older types?

Renewable Fuses—How shall they be handled?

Insulating Joints—This question is being handled by a sub-committee of which J. C. Forsyth of New York is chairman.

Grounding—This matter was supposed to have been settled but now is more vital than ever. One of the largest hotels in New York wired in strict Code accordance had a measured maximum demand last year of only 27%. There is copper in that installation which, as one might say, never sees an ampere. Consider the economic question of tying up all that copper and the financial burden, and then try to visualize the economic responsibility of the makers of the rules. Again take the case of 200 closely adjacent buildings for government housing, each calling for only about 11 outlets for light, all fed from one bank of transformers, with 200 No. 6 service grounds and 200 separate No. 6 service conduit grounds—400 in all; there probably is more copper in the grounds than in the circuits.

Mogul Sockets—How can a mogul socket rated at 1500 watts be used when the present inside branch circuit is limited to a maximum of 1320 watts by special permission? How can one use 500-watt lamps when the 660-watt circuit will only take one and the special 1320-watt circuit but two? Is it reasonable or what sort of circuit should be allowed?

Motor Fuses—Does the Code require that motors shall be protected by fuses? If the answer is "yes," then where is the prescription to tell what fuse should be used to protect a motor of given rating?

Low-Voltage Limit—The committee has been requested to raise the low-voltage limit from 550 volts or less to 750 volts or less. What does field experience say?

Farm-Lighting Plants.—These usually operate at about 33 volts, requiring light insulation and considerable cross section of wires. If insulated suitably for this, and later power from a public service supply is substituted, there is the question of new wiring and scrapping of the old; on the other hand, if originally insulated and installed for 110 volts, there is the burden of higher cost useful only if certain future events come about. What sort of rules shall be made?

The committee, through its several sub-committees and technical sub-committees, urgently desires field experience bearing on these and kindred matters.

J. C. Forsyth, chief inspector of the Board of Underwriters of New York City, presented a paper on

"Insulating Joints; What of Their Future?" As Mr. Forsyth is chairman of the sub-committee on this subject, which was to meet the following day, the paper was more of a running commentary on the matter in general and did not contain matter of a definite nature so much as a probe for information. Mr. Forsyth's committee is earnestly seeking for field experience in this matter and all members of the association and others are urged to help out again with facts and conditions found in the field.

A paper on "Time Lag in Motor Protective Devices" was presented by F. A. Barron, electrical engineer, wiring sales department, General Electric Co., and dealt principally with the methods of protecting small motors individually from overload when the motors are grouped together under the line protection of one set of fuses in accordance with the provision of Rule 8*c*.

George C. Lawler, electrical engineer, Associated Factories Mutual Insurance Companies, read a paper on "High Potential Wiring." This was too detailed and technical to be summarized here, but probably will be published in full in one of our coming issues.

Polarization and Protective Grounding.

Tuesday afternoon W. J. Canada, electrical engineer, Stone & Webster Co., Boston, read a paper upon "Polarization and Protective Grounding." Mr. Canada, as is well known, has given many years of study to this subject and the result was a paper replete with detailed information. The discussion which followed was prolonged and participated in by many present, turning principally upon the question of polarization. Thomas H. Day suggested a rule to the effect that "on secondary systems having five or more grounded services connected thereto, service conduit grounds may be connected to the service ground wire."

Dana Pierce commented in detail upon the whole economic question of the present (but temporarily suspended) polarization rule. He touched upon the hinted cost to the manufacturer for changes in the machinery, as to whether all types and sizes of wire should be marked or only the small branch wires, spoke of the customary manner of buying wire and installing circuits, of sizes like 500,000 circular mils purchased almost inch by inch. He suggested trying the plan for a year or so of marking the wires on the job at the outlets. He thought the provision must be justified economically and said that while manufacturers generally were ready to accept it, they felt that before making changes they should be sure it would go into effect and be strictly enforced. Again there was the question of the marking of devices.

Dr. M. G. Lloyd said the difficulties were much exaggerated, that the wires of whatever size could be amply polarized by banded marking at outlets, or at very small expense colored braids could be used, as has been done for years in telephone work, where one can go anywhere and always identify the wire. For bare wire there could be black and gray rubber; for Bx or duplex wire two dyes, and as to the cost of marked fittings how much would a plus and minus sign on the die or mold cost.

Visual Marking of Fuses.

The final paper, which was presented by Past-president Thomas H. Day, dealt with "The Visual Marking of Fuses," excerpts from which appear on other pages of this issue. The speaker brought out the faults of the present system. It is frequently the case that the pasted label or ferrule marking on cartridge fuses is not visible without turning them in the clips, which, because of the rivet heads, tends to spring and loosen the contact. The marking of plug fuses is often obscured by the size and amount of other stamping, trademarks, etc., and there is often objection to inspectors opening the circuit even long enough to examine the fuse bottoms. Several methods of improved marking were discussed and the matter recommended to the Underwriters Laboratories for further consideration.

The association annual banquet, held Monday evening, was attended by 130 members and friends. A. E. Braddell presided as toastmaster and responses were made by H. W. Blood, Boston; J. C. Forsyth, New York; Washington Devereux, Philadelphia; Thomas H. Day, Hartford, and G. S. Smith, Philadelphia.

LARGE ATTENDANCE AT CHICAGO ELECTRICAL SHOW.

Exhibitors Pleased with Merchandising Results at Show and Vote to Hold Another One, Probably Next Year.

Attendance figures for the Chicago Electrical Show, which opened Oct. 11 at the Coliseum and closes Oct. 25, indicate that over 80,000 people paid to see the show. The crowds, especially in the evenings, taxed the capacity of the immense auditorium, and demonstrators were kept busy introducing to the public the many electrical devices on display at the show.

At a meeting of the exhibitors held this week, E. W. Lloyd, manager of the show, asked for expressions of opinion concerning the exhibition. Replies from representative manufacturers, jobbers, and contractors emphasized the success of the affair from a merchandising point of view. It was the concensus of opinion that another show be held, probably next year.

One of the features that attracted a great deal of attention at the show was the wireless telephone apparatus. A government aeroplane was equipped with wireless telephone and the words spoken by the flyer were received in the booth of the Signal Corps at the show. So that the visitors to the show might gain an idea of the unlimited opportunities of the wireless telephone, the Signal Corps exhibit arranged a number of microphones through the hall in order that the words of the flyer be heard distinctly all over the Coliseum.

DISCUSS TRACTION PROBLEMS AT NEW YORK MEETING.

Speaking at a monthly luncheon meeting of the New York Electrical League, held Oct. 14, Lewis Nixon, New York Public Service Commissioner for the First District, indicated that a compromise between the New York City traction companies and the city authorities might be reached whereby the companies would relinquish some of their special privileges in return for an increased fare. Mr. Nixon stated that he believed the solution of the problem lay in the application of a flexible fare. The zoning system, he believed, is impractical in New York City because much of the city's growth and industrial expansion was effected on the principle of a universal transit fare.

Commercial Practice

Sufficient Outlets Advocated — Enormous Market for Electric Household Devices—Electrical Dehydration of Oil

CENTRAL STATION ADVOCATES USE OF SUFFICIENT OUTLETS.

Canadian Company Advertises to Contractors and Dealers to Urge Customers to Provide for Additional Outlets.

The doctrine urging the home builder to provide sufficient outlets for all demands is one that is being preached by all branches of the industry. In a recent advertisement, the Toronto Hydro-Electric System made these suggestions to contractors and dealers:

"When wiring buildings don't cut the size of wires to a minimum. Educate your customers to provide spare capacity for the increasing demands which are sure to follow. Show the consumer, say by means of alternative prices, the small cost of providing for future demands in the original installation. Nor does your interest in a customer end when the wiring is completed. He is still a prospective customer, and a satisfied customer is the best advertisement—an unsolicited testimonial, a talking sign, that walks, too!

"When wiring residences don't fail to urge an adequate number of outlets, and be sure they are conveniently located. A customer may not be sure just what he needs in advance, therefore sound advice is welcomed, and when it works out in practice as you promised, the customer will tell his friends of your ability.

"Standardize your outlets. It means efficiency and true economy, which benefits you in the long run."

ENORMOUS MARKET FOR ELECTRICAL HOUSEHOLD DEVICES POINTED OUT.

Address Before American Washing Machine Manufacturers' Association Emphasizes Opportunity.

Speaking before the American Washing Machine Manufacturers' Association on October 16, Raymond Marsh pointed out the vast field existing now and in the future for electrical household appliances. In part he said, after telling of the number of wired houses, rate of increase in wired houses per year, and the number of appliances sold annually: "At the very outset I ask you to note that present day conditions make 'electrical household specialties' a necessity—and not a luxury—in every one of the seven million homes wired for electricity. In addition, the remaining fifteen million homes in this country are now demanding household specialties, not electric, such as hand, water, and gasoline-power washing machines, gas ironing machines for household use, etc.

"'The electrical household specialties' industry is still in its infancy. Americans are noted for the ingenuity they have used to develop labor-saving devices and machinery; but, although leaders now in the development of household labor saving devices, their reputation in this respect is as nothing compared to what it will be five or ten years from now.

"In 1919 there were 3000 manufacturers of electrical devices.

"Out of about 15,500 hardware dealers rated at over $5000 in this country only about 2500 or 16% are selling electrical household appliances.

"In the early days of the washing machine business the manufacturers distributed a large proportion of their production through the hardware trade, jobber and dealer. The relation which was developed between the hardware dealer and jobber and the manufacturer was, and still is, equitable and profitable to all parties concerned.

"During the last several years, however, the proportion of the production of the washing machine industry distributed through the hardware trade, dealer or jobber, has declined and not increased. This is an unfortunate condition; and, yet, it is a fact which you gentlemen should face and endeavor to remedy. If the manufacturers are at fault for this condition, they would like to know it. If the hardware trade is at fault, then, surely, you, gentlemen, would like to know it.

"The present demand for household labor saving devices, electric or driven by other kinds of power is far in excess of supply. Numerous manufacturers of these devices have doubled their producing capacities and deliveries within the past year. They are using every intelligent, legitimate effort to increase production and they are getting results in spite of handicaps merely suggested by the phrases—labor problem, transportation difficulties, shortage of basic materials such as motors, wringers, polished and trimmed copper sheets, etc. In our industry, alone, we can show results in the way of increase of deliveries, by units and not money, of over 95%—comparing our deliveries by units second quarter 1918 to second quarter 1919. These are facts beyond dispute which show that the household specialty industry is a growing one which you gentlemen cannot and dare not neglect.

"Today, with all of the increase in production, the manufacturers of household labor saving devices are far behind on orders. The demand for these devices has just started. The hardware trade, to some extent, is cashing in on the demand, today, but it must prepare itself to meet the demand of tomorrow and the conditions of tomorrow.

"What will the demand be tomorrow and what will the conditions be tomorrow?

"Every user of a hand, water or gasolene power household labor-saving device is an excellent prospect for an electric power device as soon as the home is wired. The rate at which homes in this country are being wired is remarkable.. On this point, I suggest that you get in touch with the Society for Electrical Development from which you will get figures which will astound you. Here is a perpetual motion proposition; and one on which you should plan to make money. You have already made money in selling the hand, water, gasolene power devices; now turn around and sell the same customer the electric power device.

"The women of this country are directing their energy toward the factory and the office and away from the household duties. 'Uncle Sam' is urging increased production to reduce the cost of living. Women are doing more than their bit in this job to increase production; and as the scope of their work develops and broadens they will have less time to devote to household drudgery—and, under present conditions, drudgery is exactly the word to use in describing household work. These women are learning about machinery, production, labor-saving machinery, the planning of factory work—and they are fast losing their fear of machinery of any kind or description.

"Who or what will clean and iron the clothes, wash the dishes, clean the rugs, cook the meals, etc.? Household servants and washwomen are now so scarce, in a relative way, that they are demanding and getting fortunes for their services. The sky only is the limit by which they set their daily wage. The answer is—washing and ironing machines for household use, electric dish washers, vacuum cleaners, toasters, ranges, etc.—the whole series of electrical household specialties for use in the city and in farm homes by reason of individual farm-lighting plants.

"The demand for these devices will greatly expand because we are not developing a servant class in this country. Unlike in England and in France your wife or my wife cannot find a servant who is or will be proud of her job and proud of the fact that she works for you or for me. Servants' and maids' unions may be formed here as they have been in England and France, their hours of work and rates per hour may be standardized here as they have been in England and France; but the fact remains that, in a relative way, good household servants are as scarce as hen's teeth and that we are not developing a servant class in this country.

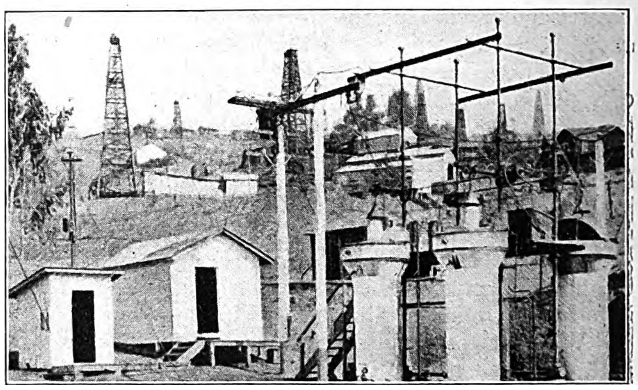
"Household servants are making it a condition that the home be furnished with labor-saving machinery if they are to stay. The housewife, if she has no servants, now realizes how much more of a necessity these labor-saving devices are. On the point of solving the problem of clean clothes for the family, she knows, only too well, that the most economical and the most sanitary way of getting clean clothes for the family is to have the washing and ironing done in her own home. She has had all she wants of the public laundries.

"The jobber or the dealer handling most of these articles today is in a position to pick and select his customers. Demand exceeds supply. Deliveries because of shortage of certain basic raw materials in many cases are slow and uncertain. The jobber or the dealer who takes his discounts is getting the better service. He, in turn, selects the customer who takes the discount and who pays cash. The whole industry is being placed on a more solid basis and foundation. Plans for financing customers who purchase on deferred payment plans have been developed which will adequately and properly protect both dealer and customer. Here is an industry with unlimited powers of expansion, with possibilities indescribable. Its product is an absolute essential under modern living conditions. Properly planned, the industry will develop on a most solid foundation. Manufacturers of automobiles now sell their product cash against documents. Why should not the manufacturers of these electrical household specialties do likewise? By so doing they will develop for themselves a most responsible group of jobbers and dealers who can adequately cover their respective territories and who will make out of their distributive function real profits commensurate with the opportunities now open in this great field of industrial endeavor."

ELECTRICAL DEHYDRATION OF CRUDE OILS SUCCESSFUL.

Removal of Water from Crude Oils by Electrical Method More Efficient Than Former Methods Used by Oil Producers.

Petroleum producers have been confronted with the problem of removing water from crude oils ever since oil was discovered. It can be accomplished by the application of heat, centrifugal force or by chemical action, but electrical dehydration has proven so



Electrical Apparatus for Dehydrating Crude Oil.

much superior to the other methods that its adoption is virtually a necessity, says H. N. Sessions in an article in *Edison Current Topics,* published by the Southern California Edison Co., Los Angeles, Calif.

The presence of water in crude oil is natural and inevitable, and is caused by the infiltration of water into the strata of oil-bearing sands. Water may be present in crude oil in the form of large free globules which settle out in time if allowed to stand, due to their greater specific gravity, or small particles of water may be held in suspension or trapped in emulsion with the oil and these will not settle out at normal temperatures and pressures even if the mixture is allowed to stand indefinitely.

The weight and volume of the water particles carried in suspension depends upon the viscosity, temperature and gravity of the oil; hence there is no fixed ratio between the water held in the free globules and that contained in the particles of water in emulsion. Some producers dispose of their crude oil without extracting the water from it and the purchaser is allowed a rebate on the percentage of water he is able to prove the oil contains. Such practice is characteristic of the early-day wastefulness in the oil fields, when little regard was given to economy and efficiency in handling and marketing crude oil.

Not to dehydrate at the wells works an injustice to all concerned. The carload freight rate on crude oil from Bakersfield to Los Angeles is 4 cents per bbl. and the shipment of a 12,500-gal. car of undehydrated oil which carries 35% water in emulsion means that some one must stand the transportation expense for 4000 gal., or 30,000 lbs., of water in the car. This reduces the useful capacity and purpose of expensive rolling stock and makes the freight cost of the oil delivered, less the water, 6 cents per bbl. The oil could be dehydrated electrically before shipment, including all costs and royalty, for less than 2 cents per bbl. with electricity at 2 cents per kw-hr.

There are 17 electrical dehydrating plants now operating in the Whittier district in California. The first electrical dehydrator was installed by the Standard Oil Co. in 1913 on the Murphy-Coyote lease. The oil companies using the electrical equipment are enthusiastic over the results obtained and in many cases oil heretofore unfit for use and rebellious to other methods of dehydration is made marketable by the process of electrical dehydration.

The oil treated in the above-mentioned 17 plants ranges from 15 to 50% water, and the average amount of oil net after treating is approximately 18 bbls. per kw-hr., or one-ninth of 1 cent per bbl. for electricity at the rate of 2 cents per kw-hr. Electrical dehydration causes practically no loss of gasoline and the records show that after treatment the gravity of the oil is raised from one to two degrees, giving it in consequence an increased market value. This increase in market value in some cases is enough to pay the cost of dehydrating. The opposite is true in the heating process because crude oil containing any appreciable gasoline will suffer evaporation under the temperature necessary to break down the emulsion, and naturally the loss of gasoline means less dehydrates, less gravity and less market value.

The heating process necessitates close watchfulness, the electrical practically none. The heating process discolors the oil, impairing its market value; the electric dehydrator clarifies the oil, leaving its natural color. The low fire hazard with electricity is also important.

A record run of 7000 bbls. of the same grade of crude oil was made, first by the heating process, then by the electrical, 18 hours being required with the heating process and only 7.5 hours with the electrical. The net amount of oil was 5150 bbls. with the former process and 5160 bbls. with the latter. The total cost of the heating process for this run was $387, or 7.5 cents per bbl., while the entire expense with electricity, even including a royalty of 0.5 cents per bbl., was $102, or slightly less than 2 cents per bbl.

The electric dehydrator effectively treats oils of different grades at the same time without in any way impairing their efficiency. On a test, 28 gravity crude oil containing 25% emulsion at a temperature of 70° was cleaned simultaneously and separately with 13 gravity oil containing 30% emulsion at a temperature of 180° by the same electric dehydrator and the dehydrates showed only 1.3% water and foreign matter in suspension, a limit of 2% being permissible.

Oil containing 85% emulsion has been successfully dehydrated electrically. The Quintuple Oil Co. in the Whittier district electrically dehydrates oil as it comes from the well from a mixture of 12% water to only 0.1%.

The electric dehydrating plant is made up of units called treaters. The usual size is a four-treater plant and the cost installed is about $2000 per treater. The cost of installation is generally borne by the oil companies and the ownership of the dehydrator is retained by the manufacturers, who also exact a royalty from the oil companies on each barrel of dehydrate produced. There are several successful electric dehydrators on the market. One manufacturer claims to have placed machinery which is now cleaning about 2,000,000 bbls. of emulsion per month.

In general, the electric dehydrator operates on a single-phase alternating current at a pressure of 11,000 volts. The emulsion is passed between highly charged electrodes and in this electrostatic field the small globules and particles of oil, by static attraction for each other, form in chains which in turn coalesce into free water that readily settles to the bottom of the treater and can be drawn off. In certain leases where water is very scarce, the water electrically removed from the oil is of considerable value.

Due to the condenser effect caused by the highly charged electrodes, the electric dehydrator operates at about 98% leading power-factor. The average maximum demand per hydrator is 4 kw., the average load-factor 50%, and the average gross income approximately $25 per month.

LAST ISOLATED PLANT IN CITY OF PUEBLO GOES OVER TO CENTRAL STATION SERVICE.

Arkansas Valley Railway & Light Co. Takes Over Plant That Had Been Landmark.

The last isolated plant to operate in the city of Pueblo, Colo., has gone over to central-station service, a process that has been going on surely and steadily for a long time. One by one the isolated plants have shut down and purchased service from the Arkansas Valley Railway & Light Co., until only one isolated plant—isolated in every sense of the word—remained. Now there are no more isolated plants, the last one to go having a capacity 138 hp.

Word also comes from Pueblo that an interesting development in the new business being taken on is an increasing demand for electric ranges. One 36-apartment building to be constructed soon will have an electric range in every kitchen. The electric appliance business of the company and dealers continues to break records.

A canvass recently made of the prospective new business in the territory served by the company shows that during the next 12 months more than 4500 hp. of additional business will probably be added to the company's lines, of which amount 1450 hp. is for the city of Pueblo for water pumping. The balance is divided among the industries of Pueblo, irrigation and power and lighting in the valley districts.

EFFICIENCY IN PUBLIC SERVICE SHOULD BE REWARDED.

Ruling of Illinois Public Utility Commission Points Out Mutual Benefits Should Accrue.

The Illinois Public Utility Commission in a case involving the Monmouth Public Service Co. has made the following statement:

"It would obviously be improper to base rates for utilities service upon a hard and fast rule of the actual expenses of operation and fixed rates of return without regard to the efficiency displayed in the conduct of the business. Such procedure would offer no incentive for improvement and no reward for accomplishment. The public has the right to expect efficiency of operation of utilities engaged in public service and has the right to share in its benefits, but accomplishment merits a tangible and genuine compensation for its achievements."

Operating Practice

Neutral Resistor in Four-Wire Three-Phase Feeders—Locking Circuit-Breakers Open Safely—Welding Trash Racks

REDUCING DAMAGE AND DISTURBANCE DUE TO CABLE BREAKDOWNS ON FOUR-WIRE FEEDERS.

Experience Indicates Correct and Incorrect Location for Current-Limiting Resistor.

When an underground conductor breaks down there are several forms the breakdown may assume. The failure may have occurred between phases, being then a three-phase or single-phase failure, as the case may be; or it may be that the breakdown has taken place between any one phase and the cable sheath.

In cases where the cable is four conductor, serving four-wire three-phase supply, a very common form of cable failure is between any of the three phases and the fourth conductor or neutral. When the former forms of breakdown occur the potential difference at the location of failure just previous to the breakdown is about 4000 volts, with the latter forms of breakdown about 2300 volts.

One operating company having a very large number of four-wire three-phase feeders in use and employing about three hundred induction type feeder regulators, decided to take steps to limit the flow of current in a fault when it occurred. Experimentation showed that there were two aspects to the case, one to limit the current when breakdown occurred between phases or any phase and the neutral conductor, between which exists a pressure of 2300 volts, and the other to limit the current when the breakdown occurred between any phase and the cable sheath. Limiting the current when the breakdown occurred between phases, at 4000-volt potential difference was only a matter of relay adjustment. On the other hand, the setting of the relays for the phase-to-phase failure

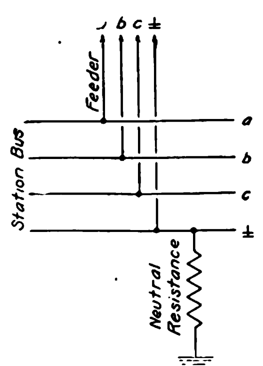


Fig. 1.—Diagram Showing Station Bus, One Four-Wire Feeder and Earthing Resistor.

also was effective for the phase-to-neutral and phase-to-sheath failures.

The circuits of this company has a cross-section corresponding to No. 0 copper; each feeder has a rating of 150 amperes at nominal full load and 4000 volts delta pressure. The relays were adjusted to trip the circuit-breakers instantaneously at 500 amperes, this value having been decided upon as one that would not cause needless service interruptions, and yet would not ordinarily open up transformer banks in the station nor cause excessive disturbance to the station pressure.

At first attempt, a resistance of various values was inserted in the neutral or fourth conductor, between

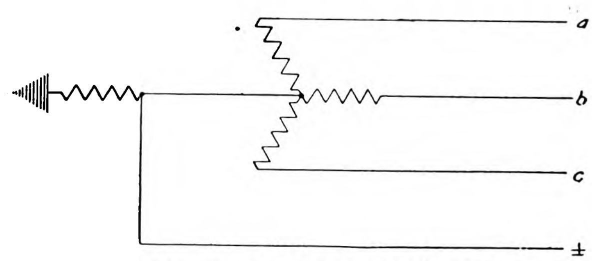

Fig. 2.—Diagram Showing Location of Resistor With Respect to Station Transformer Bank, Neutral Conductor and Transformer Neutral Point and Earth.

the neutral bus and the neutral point of the station transformer banks. With this arrangement, all current passing through the neutral conductor passed through the neutral resistor, causing voltage unbalance, the magnitude of which increased as the current in the neutral conductor increased, which it does as the unbalance in the various circuits increases. This unbalance not only interferred with voltage regulation, but made parallel operation of static transformers on the 60-cycle system with frequency-changers operated from a 25-cycle system almost impossible at times.

The position of the neutral resistor was then changed, as shown in the accompanying diagrams, so that instead of being inserted in the system neutral between the neutral bus and the neutral point of the station transformer banks, it was in circuit between the neutral point of the transformers and the ground. In this way the normal current flowing in the feeder neutrals back to the transformer neutral point was not affected at all, but only that current which flowed through earth back to the transformer neutral. Current can only so flow when a phase conductor breaks down to the cable sheath, because the neutral conductor is earthed at only one place, namely, the station, and then through the resistor; likewise the cable sheaths of the various feeders are rigidly grounded at the station, at various manholes through bonds, and more or less through their contact with the duct line, water, etc.

The accompanying diagrams indicate the final scheme of connections. Fig. 1 shows the station 4-wire bus, one 4-wire feeder and the grounding resistor. Fig. 2 shows the station transformer bank, the neutral resistor and its location with respect to the transformer and feeder neutrals. The resistance eventually adopted has a resistance of 0.8 ohms, a value that was found to suffice for limiting the magnitude of current rushes in time of trouble, yet not sufficient to raise to a dangerous value the potential above earth of the transformer or feeder neutrals.

The location of the resistor, as shown, does not affect the current rush when a cable breaks down between phases or between any phase and neutral. But it does limit the current when a failure occurs between phase and cable sheath, hence reduces the damage done to the cable and disturbance caused the system. The effect of this location is to lessen the current rush that previously occurred when an overhead phase wire supplied through an underground conductor fell to ground.

MECHANICAL BLOCKS FOR BLOCKING DIFFERENT TYPES OF OIL SWITCHES.

Forms Employed by Philadelphia Electric Co. to Enforce Safety.

The Philadelphia Electric Co. has spared no effort and thought to make conditions safe for its employes and the public. Many ingenious methods and devices have been evolved by which the hazards of electricity have been reduced so that accidents can be prevented. In the operation of its circuits and machines, the company has adopted several precautions to accomplish the same thing, increasing thereby the factor of safety.

In the manipulation of oil current-breakers the company not only compels tags or cards to be placed,

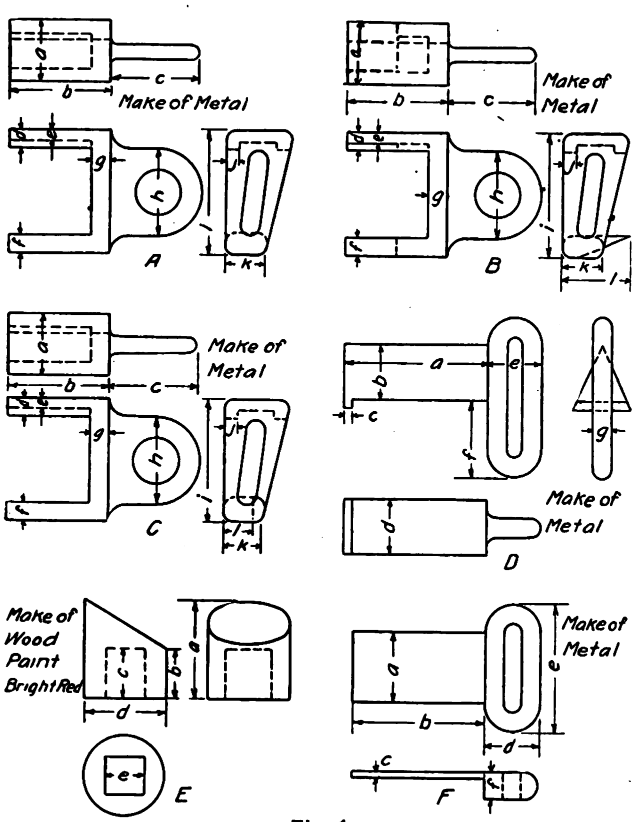

Fig. 1.

stating why and for whom and by whom a circuit-breaker is opened, but it also employs a green light to indicate at the circuit breaker when it is open, in addition to the usual pilot lights on the switchboard. As a further precaution to prevent a circuit-breaker being inadvertently closed, the company uses blocks so that once a circuit breaker is opened it cannot be closed again until these blocks have been deliberately removed. Removing these blocks must be a deliberate act, their design being such that they cannot fall out

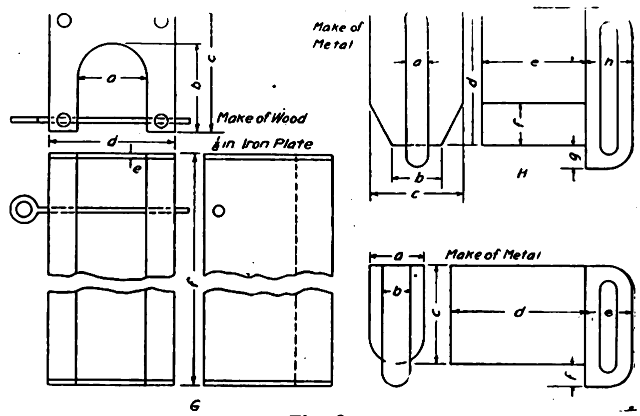

Fig. 2.

of position by vibration, accident, or any other inadvertent cause.

Different types of circuit breakers require different forms of blocks.

Figs. 1 and 2 show the different forms of blocks employed by the Philadelphia Electric Co. The different blocks have been made for the different forms of circuit breakers as shown in the accompanying tabulation:

Block specification.	Type of Circuit-breaker.
A	G. E. Co.'s K5.
B	G. E. Co.'s K5.
C	G. E. Co.'s remote control lever type.
D	G. E. Co.'s K5.
E	Conduit oil switch.
F	Conduit oil switch.
G	G. E. Co.'s H2, H3 and H6.
H	Westinghouse Type B.
I	Westinghouse starting switch.

The above mechanical blocks were described, as were also many other phases of the safety movement as carried on by the Philadelphia Electric Co., in a paper entitled "Tagging, Barriers, Markings and Practices of Operators" presented before a recent meeting of the National Safety Congress at Cleveland by Walter C. Wagner.

WELDING OF CORRODED TRASH RACKS PROVES ECONOMICAL.

Electric Welding Preferred to Other Forms of Welding in Georgia Hydroelectric Plant.

Because of corrosion that had taken place, it became necessary to renew the trash racks protecting seven water turbines at the Morgan Falls hydroelectric plant of the Georgia Railway & Power Co. Altogether seven trash racks required being rebuilt.

The manner of making repairs consisted of cutting off all the corroded bars, in fact all bars, and welding new bars in their place. The welding was done electrically, energy being obtained from the station, of course. The company has found that electric welding is cheaper and less troublesome for work under existing conditions than welding by oxy-acetylene.

Where oxy-acetylene is used, transportation, storage and handling precautions have to be taken which are absent when using electricity.

Contracting-Construction

Suggestions for Marking Fuses — Industrial Lighting Exhibit at Safety Congress — Tennessee Contractors Meet

THE VISUAL MARKING OF FUSES.

Excerpts From a Paper by Thomas H. Day at the Reconstruction Convention of the National Association of Electrical Inspectors.

If necessity is the mother of invention, then the fuses in an electrical installation may be considered as being one of its many children. We cannot consider any phase of applied electricity more important and the evolution of which is fraught with greater interest and more perplexities than the fuses of today.

The final inspection of an installation is frequently made after it is connected to the electric supply and its complete equipment in operation. The inspector is concerned as to the sizes of the several conductors for a given amount of current, and the rated capacity of the fuses installed to protect the conductors and the equipment to which they are connected.

That his final certificate of approval may be accepted as something more than a mere piece of paper, he makes a conscientious effort to examine the visual markings on the fuses. The equipment, power or light, or possibly both, is in use, and to remove each fuse from the cutouts, which he must do so that his inspection may be complete and intelligent, brings a vigorous objection from the manager or superintendent of the plant, building or store, because of the shutdown, even if it be of only short duration.

Difficulty of Reading Fuse Ratings.

This is one of the perplexing experiences of the field, it frequently being impossible for an inspector to quickly ascertain the markings of the rated capacity of fuses. There is no reason for it, but it is nevertheless true that the labels on cartridge fuses of a rated capacity of 30 amperes or less are most frequently on the under side of the fuse when installed. An examination of almost any cabinet will make any one recognize the difficulty of the inspector when he endeavors to ascertain the rated capacity of cartridge fuses.

Emphasis should be laid on the possibility of shock when one is standing on grounded conducting material, or from contact, through the hand and arm, with the side of a metal cabinet which is grounded, in which fuses under examination are installed. The ferrules of some makes of cartridge fuses are secured to the fiber tubing by means of small round-headed pins which project beyond the ferrules. Endeavoring to ascertain the rated capacity of the fuse, the printed label of which was on the under side of the fuse, I have turned the fuse around and, in so doing, have spread the opening between the two clips of the cutout base, thus making a poor contact with the fuse ferrules.

While the personal accident hazard is not so great with the inspection of installed plug fuses, the difficulty in reading the rated capacity with, perhaps, but three exceptions, is readily apparent. Some of the manufacturers are greatly concerned in taking up the greater part of the top of the fuse cup with an announcement of their patent rights, date of granting, etc. This is their legal right, against which it would be unwise to object. The exercise of this right, however, renders it extremely difficult for the inspector to ascertain the rated capacity without removing the fuse from the cutout base. Still, the inspector feels that he should know, while the plant superintendent refuses to have his operations disturbed and instructs the inspector to call after the plant has ceased operations. The temptation to make an incomplete inspection presses down heavily upon the human side of the inspector and who shall blame him if the fuses are not examined.

If I am correct in my analysis of the present requirements for the marking of fuses, there would then seem to be no opportunity for criticising the present practice of the manufacturers. The willingness of the manufacturers to come abreast of the needs of the day is manifest and their present markings on the plug fuses, bewildering as they sometimes are, and the printing of the rated capacity on the required labels of the cartridge fuses, even though the most of the labels are on the under side of the fuses and readable only with an effort, are purely gratuitous on their part, which leads one to think that they would consider any suggestion that would benefit the science and thus assist the inspector.

It is somewhat easy to outline a condition but rather difficult to suggest a remedy. It can hardly be conceived that any one would object to the need of marking fuses with their rated capacity. The opinion is expressed that many desire the marking be such as to make it visual whenever the fuse can be seen. I seriously question the use of small figures stamped on the ferrulese of the cartridge fuses or the printing of the capacity on the labels, because labels do fall off in time.

Color Scheme to Distinguish Capacity of Fuses.

That cartridge fuses of the several rated capacities from 0 to 30 amperes might be readily recognized, the following color scheme is proposed, the color to be permanently applied to the fiber casing when the latter is in the making. These colors might be applied as follows:

0 to 6 amperes, yellow.
8 to 10 amperes, black.
12 to 15 amperes, red.
16 to 20 amperes, brown.
20 to 25 amperes, gray.
25 to 30 amperes, green.

For cartridge fuses from 31 to 60 amperes a similar color scheme could easily be evolved, the difference between terminals indicating that the fuses belonged to the second classification. For cartridge fuses of great capacities there is not the same difficulty of identifying them and the present method of marking would seem adequate.

The color scheme would not work so well with plug fuses, although the vacant center of the top of the fuse could be marked with the selected color for its capacity. In the absence of a color, it is suggested that the rated capacity of the plug fuses appear in large figures in the center of the top, similar to the method adopted by at least three makers of plug fuses.

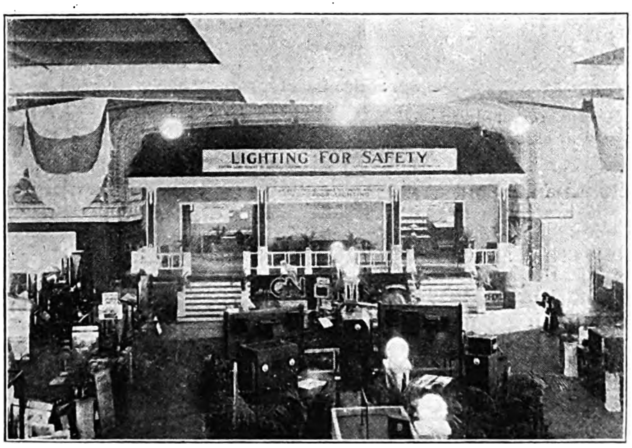
While there is an element of personal accident hazard in examining fuses which are in use, indistinct markings will hardly introduce a fire hazard. Over-fused wires will create a fire hazard but we have not endeavored to contest that fundamental. If we are facing a possible personal accident hazard when examining the fuses in an installation, should it be the function of the standards in the National Electrical Code to reach out and correct such possibility, more especially when it is becoming so difficult for an inspector to separate the two hazards when applying the principles of the Code?

It cannot be claimed that the above will solve the problem completely, but bringing up the subject and suggesting a possible solution may lead to clearing up the situation.

PREVENTING ACCIDENTS WITH GOOD INDUSTRIAL LIGHTING.

Exhibit at Cleveland Meeting of National Safety Congress Shows Value of Good Lighting in the Prevention of Industrial Accidents.

"Twenty-four per cent of 91,000 accidents analyzed by the Travelers Insurance Co. of America have been shown to be directly or indirectly due to inadequate lighting." With these figures in mind, the most prominent space in Grays' Armory, Cleveland, where the National Safety Congress Exhibition was held during the week ending Oct. 4, was set aside for a "lighting for safety" exhibit. This demonstration occupied the entire stage and overlooked all other exhibits on the main floor. It was arranged under the joint auspices



General View of Lighting Exhibit at Cleveland Meeting of National Safety Congress.

of the Edison Lamp Works of General Electric Co. and the National Lamp Works of General Electric Co.

Appreciating the effectiveness of contrasting lighting conditions in bringing out the value of "better lighting," the exhibitors modelled the display after the N. E. L. A. exhibit at Atlantic City earlier in the year, which was described in the July 12 issue of ELECTRICAL REVIEW. Three systems of lighting were installed to show poor lighting, fair lighting and very good lighting. The poor lighting system consisted of bare lamps on drop cords, so commonly found in small shops. The fair lighting system, such as installed

Exhibit of Industrial Lighting Which Showed Contrast Between Good and Poor Lighting.

by the individual who realizes the necessity for better light but who does not know how to get it, consisted of a combination of general illumination and localized lighting using enameled bowl reflectors. The third system of very good lighting consisted of standard RLM dome reflectors equipped with "C" lamps with opal cap diffusers and bowl-frosted lamps, giving general illumination of good quality and productive intensity.

An interior view of the "shop lighting" room is shown in an accompanying illustration. Each lighting system was on a separate circuit with an automatic switching device which alternately connected each system for a short period, thus making an effective contrast and showing to advantage the value of better lighting.

Supplementing this feature on shop lighting was an educational room showing the latest developments in factory, office and home lighting units. Due to its scope, the lighting exhibit created much general interest. It brought before the safety engineers in attendance at the show the fact that good lighting in a shop or factory is very effective in reducing the number of accidents as well as in increasing the productiveness of the workmen.

TENNESSEE ELECTRICAL CONTRACTORS MEET AT MEMPHIS.

With 65 electrical contractors from Tennessee and adjoining states in attendance, the tenth annual convention of the Tennessee Electrical Contractors' Association was opened last week at the Hotel Gayoso, Memphis, with S. P. Watson, president, in the chair.

The convention was addressed by Samuel A. Chase, Westinghouse Electric & Manufacturing Co., on "Modern Practices in Electrical Merchandising"; J. A. Fowler, Memphis, secretary of the association, on "The Electrical Contractor and the Club Plan of Selling"; W. R. Herstein, Memphis, on "The Jobbers' Job," and William L. Goodwin, General Electric Co., on "Live and Let Live."

New Appliances

Sprague Electric Works Brings Out New Line of Dead-Front Panelboards and Cabinets — New Soldering Stick

New Design of Safety Panelboards and Cabinets.

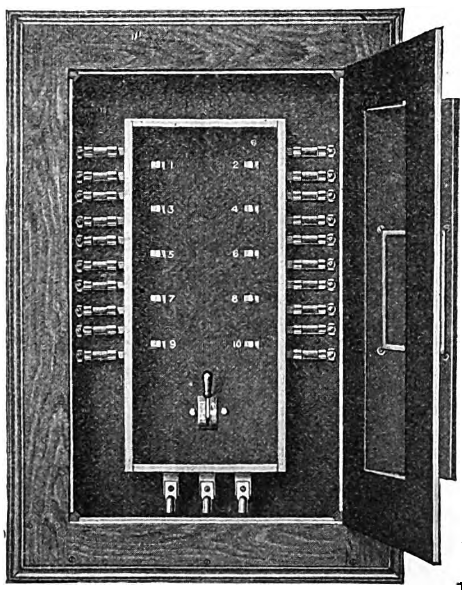
To meet the increasing demand for devices providing for a maximum amount of safety to the operator, the Sprague Electric Works of General Electric Co., 527 West 34th street, New York City, has developed a new line of panelboards which are designed to be applicable wherever the live-front type of panelboards has heretofore been used.

The distinctive features of these panelboards are the branch circuit switches and the main switches, both types of which are simple in design, of strong construction and positive in action. They were designed especially for safety panelboard use. The accompanying illustration shows the type of tumbler switch used for the branch circuits. The blades of these switches make direct contact with the branch connection bars and the brushes of the main switches make direct connection with the main buses, providing a minimum number of electrical joints. The main switches are of the laminated brush contact design, with the toggle locks and with non-retardable, quick-break, double-break action. The brushes are of curved construction, providing a wiping contact when closed, and are designed similar to circuit-breaker brushes. A secondary contact tip and removable control plate is provided for each contact to prevent burning of the main brush. All steel parts used are galvanized to prevent corrosion. The branch circuit switches are rated at 30 amperes, 125 volts, and are of the two-pole tumbler type, with indicating molded handle and of quick-made and quick-break design.

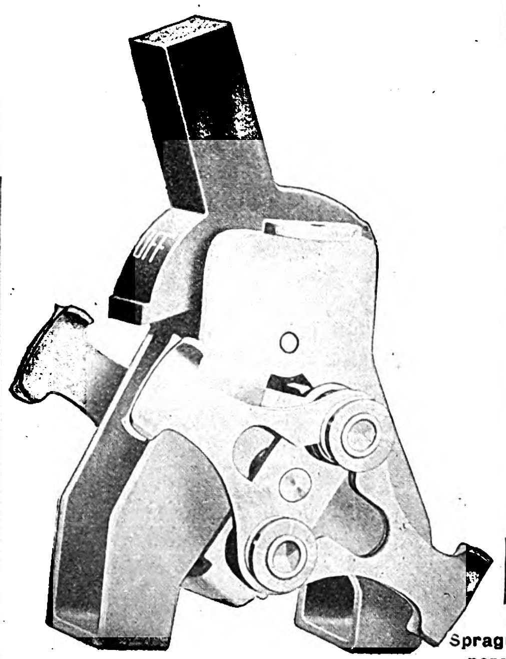
Fuses are placed between the switch and outgoing circuit, and consequently the switch and fuses are dead when the switch is open. The manufacturer also makes this panelboard with plug fuses in branches between the main bars and the branch switches.

Parts which are subject to wear are removable from the front of the panel and can be replaced without adjustment. The panelboards are manufactured to meet the requirements of the National Board of Fire Underwriters.

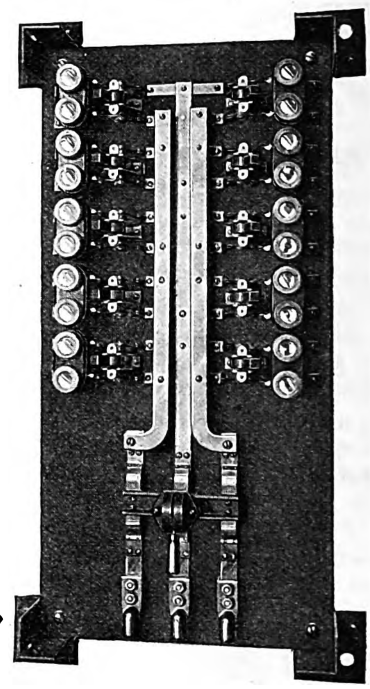
The line of cabinets is made of No. 14 U. S. gage sheet steel with doors and trims of No. 12 gage sheet steel, except boxes over 48 ins. in height which are made of No. 10 gage sheet steel with doors and trims of the same thickness. Doors are furnished with rabbet and substantial flush butt hinges. Doors 48 ins. in height and over have a three-way catch. Cabinets are furnished with one row of ½-in. conduit knockouts, top and bottom, or may be drilled for conduit. Cabinets for panelboards with plug fuses in the branches, with main plugs or unfused main switch, have a single door opening over the entire panel, this door being equipped with a spring catch. Cabinets for panelboards with N. E. C. inclosed fuses in the branches have a door covering the entire panel and a small door hinged on this door to cover the compartment containing the operating handles of branch switches and main switch. The large door is equipped with a combination lock and catch and the small door with a spring catch only. Cabinets for panels with plug fuses in the branches, with main fuses or with fused main switch, have one door equipped with spring catch covering the compartment containing the branch switches, main switch and branch fuses, and a separate door equipped with a combination lock and catch covering the main fuses. Boxes, doors and trims for these cabinets are finished inside and outside with black enamel.



New Type of Sprague Safety Panelboard.



Tumbler Type Switch Used on New Type of Sprague Safety Panelboard.



Sprague Safety Panelboard with 30-Ampere, Tumbler Switches in Branches Arranged for Plug Fuses Outside of Switches.

New Soldering Stick Combines Solder and Flux.

The firm of Hess & Son, 2910 North Sixteenth street, Philadelphia, Pa., has recently developed a new soldering stick known as the Tinol tinning stick. It is a new form of solder and flux combined; when the stick begins to melt it deposits a film of tin which enables the solder to flow freely. This has the advantage of not only fluxing the surface to be soldered, but tinning it as well. This feature enables any one to make a perfect solder joint without previous tinning, it is said.

This new stick can also be used for tinning all kinds of metal surfaces without the use of solder. The flux contained in the stick is of the same composition as that used in the company's other Tinol fluxes and can be used on all metals without any danger of after corrosion, it is claimed.

Trade Activities

Anderson Electric Specialty Co. Extends Facilities—Hurley Machine Conducts Co-operative Campaign for Dealers

Joseph L. Skeldon Engineering Co., Cleveland and Toledo, Ohio, builder of complete steam, electric and hydraulic plants, announces the appointment of W. N. Brown as sales engineer. Mr. Brown will make his headquarters at Cleveland.

McAlear Manufacturing Co., 1901-7 South Western avenue, Chicago, manufacturer of specialties for all steam heating and power plants, is making distribution of a new catalog (No. 25) covering high-grade and modern steam, water and air specialties for high and low pressure heating and power plants. Another catalog on "25 Years of Know How" dealing with vacuum, vapor and air line heating specialties has also been prepared by the company.

The Trumbull Electric Manufacturing Co., Plainville, Conn., announces the appointment of M. L. Spaulding as manager of its Chicago office, 40 South Clinton street. Mr. Spaulding was formerly a member of the sales force of the Chicago office, having left two years ago to accept a position as general sales manager of one of the large electrical supply jobbers in the Middle West. Mr. Spaulding has been in the electrical business for many years and is widely known among the trade of the Middle West.

Change in Name of Universal Battery Service—Considerable confusion among purchasers has been caused through similarity in trade names of the Universal Battery Service Co., adopted by James B. Shafer, Chicago, dealer in automobile storage batteries, and the Universal Battery Co., the name of a previously established Illinois concern. In order that the general public may not be further deceived and misled, the Federal Trade Commission has ordered the former company to discontinue use of the word "universal" in connection with the manufacture or sale of storage batteries.

Alamo Light Plant & Machinery Co., Memphis, Tenn., has been organized for the purchase, sale, manufacture and repair of all kinds of machinery, hardware, specialties, electrical supplies and accessories, and for conducting a general merchandise business in wholesale and retail quantities. Offices and warerooms for distributing electric plants and machinery for store lighting have been opened in the McCall building. The territory of this company will embrace Arkansas, north Mississippi, and middle and west Tennessee. L. E. Curtis, of Calhoun City, Miss., is president and general manager; J. R. Runnels, of Memphis, vice-president, and L. G. Milan, Tupelo, Miss., secretary-treasurer.

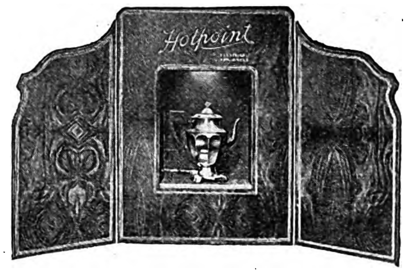
Sherwin-Williams Co., Cleveland, Ohio, has established an Atlanta division in its arrangement of sales territory, with offices at 52 North Broad street, Atlanta, Ga. The new division includes Georgia, Florida, South Carolina and a portion of North Carolina. Warehouses are maintained by the company in both Atlanta and Savannah.

Anderson Electric Specialty Co., Chicago, in order that it may care for its rapidly expanding business, has leased from the Ilg Electric Ventilating Co., the six and seven-story building, 100x100 ft., at 154-160 Whiting street, Chicago, for 15 years from May 1, 1921. The Anderson company had 3000 sq. ft. of space three years ago, and later moved to its present quarters at 118 South Clinton street, which provide 18,000 sq. ft. This space has proved entirely inadequate and has necessitated the leasing of the Ilg plant, which will provide 75,000 sq. ft.

Edison Storage Battery Co., Orange, N. J., has commenced the quarterly publication of a house organ to be known as "The Grid," whose purpose, in the words of the company, is "to disseminate some sense and a little nonsense among users of storage batteries." The initial number, dated October, comprises 25 pages and is gotten up in an attractive manner. A feature of this edition is an interesting article by Ellwood Hendrick, entitled "The Road to Arcad." Item of interest regarding storage batteries are included, interspersed with choice bits of humor.

Allis-Chalmers Manufacturing Co., Milwaukee, Wis., has issued bulletin No. 1104 which has for its subject "Steam Turbine Blading." The design and construction of turbine blading is of prime importance and is a feature to which the Allis-Chalmers organization has devoted much time and thought. Considerable research work has been involved in producing its present efficient and reliable unit, and the manner in which this has been attained is described in detail. It was the aim of the company to devise some means for securing the blades which would largely eliminate the human element and insure uniform accuracy and resulted in its adoption of the swaging method. Further progress has been made in this connection by the Allis-Chalmers Co., which may be briefly summarized as follows: The channel shroud protection, followed by the brazed lacing strip, which it is claimed materially increases the life of the blading; brazing the channel shrouds to the tips of the blades, resulting in blade sections and affording great strength and ability to resist vibration, also the process of casting the foundation rings around the ends of the blades. This, together with its present method of securing channel shrouding to the blades results in a blading construction superior to many. The bulletin is replete with illustrations and present conclusive evidence of the efficiency of the swaging method of blading construction.

Edison Electric Appliance Co., Chicago, advises that in view of the constant need of its distributors for a display which will serve as a more or less permanent background for its window display of appliances, this company will have ready for distribution by Nov. 15 the display illustrated herewith. It consists of a center panel, 23 ins. wide by 30 ins. high, with hinged wing side pieces 15x30 ins.; size over all, 53x30 ins. The center panel has an opening which provides



Window Display for "Hotpoint" Appliances.

a niche with a very substantial floor on which nearly any appliance may be displayed. An ordinary Mazda lamp may be inserted behind the display to illuminate the appliance displayed in the niche. As this company manufactures both the Hotpoint and Edison line of appliances, this display is also available with the name "Edison" shown instead of the name "Hotpoint."

The Hurley Machine Co., Chicago, manufacturer of the well known Thor line of electrical labor-saving devices, is conducting a co-operative advertising campaign for the benefit of its dealers throughout the Middle West. The principal feature of this campaign is a series of advertisements to be run in the attractive rotogravure section of the *Chicago Sunday Tribune*. The first of this series appeared on Oct. 19 and will continue to appear until Dec. 17. Another series of advertisements similar to the *Tribune* also has been prepared for use by dealers of Thor appliances in towns reached by this paper. These are specially arranged to tie in with the former advertisements. Two portfolios, one containing the *Tribune* ads and the other the dealer's advertisements, have been distributed in order that all Thor dealers may have sufficient time to make the necessary arrangements for newspaper space, etc.

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Lewiston, Me.—Work has been started upon an additional development at the Deer Rips power station of the Androscoggin Electric Co., which will increase the available horsepower by 2500, making a total development at this plant of approximately 8500 hp. of electrical energy available for the needs of Lewiston and Auburn. The cost of this development will be $200,000.

Belchertown, Mass.—The Commission on Mental Diseases, State House, Boston, has taken bids on miscellaneous contracts in connection with the construction of the local hospital building to be located on the Boston & Maine Railroad. The new institution is estimated to cost $500,000, and large quantities of electrical equipment will be required in connection with its erection. Kendall, Taylor & Co., 93 Federal street, Boston, is architect.

Worcester, Mass. — Worcester Pressed Steel Co. plans the erection of a one-story, 90x150-ft. storage building to be equipped with an electric traveling crane.

Lewiston, N. Y.—Plans are under consideration by the town council for improvements in the electric street-lighting system. Service to be furnished by the Lewiston & Lake Shore Power Co.

New York, N. Y.—Import Sales Co., 27 West 20th street, has filed notice with the secretary of state of a change in its corporate name to the Diamond Electrical Specialties Corp.

New York, N. Y.—Western Electric Co. has completed negotiations for the leasing of the entire second floor of the building at 141-45 West 17th street.

Port Henry, N. Y.—Port Henry Light, Heat & Power Co. is considering plans for the construction of a large local hydroelectric power plant, estimated to cost $150,000. The company has filed notice with the secretary of state of an increase in its capitalization from $150,000 to $350,000.

Salamanca, N. Y.—About $5000 will be expended to extend the electric light system.

Elizabeth, N. J.—In connection with the proposed local plant of the Willys-Overland Corp., to be located at Newark and Frelinghuysen avenues, preliminary plans are being prepared for the construction of a large power plant to be used for general factory operation. The proposed plant will comprise a group of buildings, including main manufacturing structure and assembly works, 4-story, steel and reinforced concrete, about 120x440 ft.; four-story and basement stock building, 320x400 ft., a number of shop buildings, one and two-story, with power plant, as well as other small auxiliary structures. Considerable electrical equipment will also be required throughout the entire works, including motors for individual drive, mechanical equipment, etc. The project is estimated to cost $1,000,000. The company maintains offices at 52 Vanderbilt avenue, New York.

Kearny, N. J.—Ford Motor Co. is having plans prepared for the construction of a one-story brick and steel power and heating plant, about 140x160 ft., at its local assembly works. The structure will cost about $150,000, including equipment installation.

Newark, N. J.—Kaltenbach & Stevens, Inc., has awarded a contract to Frederick Kilgus, Inc., 13 South 6th street, for the erection of a new one-story power plant, about 47x75 ft., at 46-56 Bigelow avenue. Plans have also been arranged for the construction of a garage building on the site, the entire work being estimated to cost $35,000.

Newark, N. J.—In connection with the construction of the proposed laundry plant of the New York Linen Supply & Laundry Co., 232 East 32nd street, New York, to be located on High street, Newark, extending to Summer avenue, considerable new electrical and mechanical equipment will be required. The works will cost about $45,000.

Newark, N. J.—Holophane Co., 340 Madison avenue, New York, has developed plans for extensions in its lighting survey work in different cities of New Jersey. The activities include broad investigations of industrial plants and public buildings, with view to increasing the efficiency of the lighting installation.

Newark, N. J.—Colonial Stamping Co., 63 New Jersey Railroad avenue, has had plans prepared for the construction of a new one-story brick boiler plant addition, about 25x32 ft., to be located at the foot of Brill street. Frederick Nobbe, 142 Market street, is architect for the company.

West Long Branch, N. J.—Western Electric Co. has recently completed negotiations for the leasing of property on Whalepond road, and has started the construction of a large wireless plant, estimated to cost in excess of $400,000.

Cheltenham, Pa.—Town council is understood to have completed arrangements for the installation of an electric street lighting system on the Old York road.

Jenkintown, Pa.—Town council is said to be considering plans for the installation of an electric street lighting system.

Johnstown, Pa.—Penn Public Service Co. will issue $20,000,000 of bonds for improvements. Thus far the construction of a large power house in Johnstown is the only improvement planned, but others will follow soon. The Penn Public Service Co. now furnishes power to Cambria, Somerset, Indiana and Westmoreland counties. Extensions throughout the present districts are contemplated and when these are completed it will make the local company one of the largest in the state. Address General Manager P. J. Morrissey.

North Catasauqua, Pa.—Borough council is considering arrangements for the installation of an electric street lighting system throughout the municipality, power to be furnished by the Lehigh Valley Light & Power Co. It is understood that the plans call for the completion of the work by the middle of December.

Philadelphia, Pa.—City has awarded a contract to the Ames Iron Works, Commercial Trust building, with works at Oswego, N. Y., for the furnishing and installation of four turbocentrifugal pumping units at the Queen Lane pumping station of the city waterworks plant, at $127,390. The new units will have a capacity of 40,000,000 gals. of water per 24 hrs.

Philadelphia, Pa. — Breyer Ice Cream Co. has awarded a contract for the construction of a one-story brick boiler plant, about 49x78 ft., to be located at Eighth and Cadwallader streets. The structure is estimated to cost $10,000. William F. Koelle & Co., 26th and Oxford streets, are the contractors.

Smethport, Pa.—M. S. Geary desires data and prices on small plant for light and power.

Wilmington, Del.—In connection with the construction of the municipal paving plant located on Thatcher street, between 12th street and Brandywine creek, the city has arranged for the immediate installation of the necessary boiler equipment for operation.

Baltimore, Md.—Consolidated Gas, Electric Light & Power Co. has completed plans for alterations and improvements in its buildings at 22-30 South Eutaw street and at 1050-90 Front street.

Federalsburg, Md.—Eastern Shore Gas & Electric Co. has recently completed work on the rebuilding of its lines between Federalsburg and East New Market, changing it from a single-phase to a 3-phase system, to provide for increased operations. The company has arranged for the purcase of property on the state road, near the city limits, and is planning to utilize the site for the construction of a new outdoor substation. In connection with the expansion plans of the company, work is being pushed on the installation of considerable additional equipment at its Hurlock and East New Market stations.

Ocean City, Md.—Charles A. McGregor desires prices on electrical equipment.

Martinsburg, W. Va.—Fire, originating in the boiler and engine plant of the C. H. Whiting Milling Co. works at Shepherdstown, near Martinsburg, completely destroyed the plant, with a total loss estimated at approximately $125,000.

Lenoir, N. C.—Falls Manufacturing Co., Granite Falls, will establish an additional hydroelectric plant. It will be located on Middle Little river, about two miles from Granite Falls. The plan calls for a dam 54 ft. in height, and will cost about $40,000. A two-mile transmission line is to be built to connect with the present line, making the total distance 12 miles and the total cost $65,000. The new plant will generate about 600 hp.

Denmark, S. C.—Edison Public Service Co. contemplates increasing the capacity of its lighting plants.

Atlanta, Ga.—Thomas F. Seitzinger's Sons, operating a local foundry, are considering plans for the rebuilding of their works, including boiler plant, recently destroyed by fire, located at North avenue and Marietta street.

Columbus, Ga.—It is proposed to install at the Goat Rock station of the Columbus Power Co. an 8000-hp. horizontal water wheel with direct connected 6250-kv-a., 500-kw. generator, complete, with penstock, electrically operated headgate and switchboard extension. A new 11,000-volt transmission line will be constructed from Goat Rock to Columbus, about 11 miles. The line is to be insulated and spaced for 33,000 volts. Estimated cost, $358,000. G. F. Harley, constructing superintendent. Stone & Webster Engineering Corp. will be in charge of the work.

Homestead, Fla.—The city plans to enlarge the capacity of its electric light and water plant. An issue of $15,000 has been voted for the purpose.

Tampa, Fla.—Peninsular Telephone Co. will improve the lines at Ybor City and Seminole Heights. Address W. G. Brobein, president.

NORTH CENTRAL STATES.

Berea, Ohio—At the November election the question of issuing $48,000 in bonds for the construction of a municipal light plant will be submitted to vote. Address city clerk.

Chillicothe, Ohio—Plans have been completed by officials of the Chillicothe Railway, Power & Light Co. for extensive improvements to their plant in this city.

Independence, Ohio—At the November election the question of issuing $20,000 in bonds for a municipal light plant will be submitted to vote. Address city clerk.

DATES AHEAD.

Jovian Order. Annual convention, Chicago, Nov. 5 and 6. Headquarters, Hotel Sherman. Acting Mercury, Eli C. Bennett, St. Louis, Mo.

Electrical Supply Jobbers' Association. Semi-annual meeting, Cleveland, Ohio, Nov. 18-20. Headquarters, Hotel Cleveland. Secretary, Franklin Overbagh, 400 South Clinton street, Chicago.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

American Institute of Chemical Engineers. Annual meeting, Savannah, Ga., Dec. 3-6. Secretary, J. C. Olsen, Brooklyn, N. Y.

Electric Power Club. Meeting, Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

Minerva, Ohio—Engineers Froelich & Emery, Second National Bank building, Toledo, Ohio, are preparing plans for erecting a $50,000 power plant and distributing station for the village of Minerva. Specifications include brick and concrete construction, plumbing, electric lighting and composition roofing. Address H. A. Pennoth, manager, Minerva, Ohio.

Hillsdale, Mich. — Alamo Farm Light Co., manufacturer of farm lighting outfits, is enlarging its present plant by an addition, 200x240 ft. Contract has been awarded to the Austin Co., Cleveland.

Garrett, Ind.—Important changes in the management and maintenance of the municipal light, water and steam heating plans will be made, following recommendations of the Indiana Public Service Commission. The company will probably purchase new equipment consisting of a boiler and connections, employ a manager with complete authority to operate the plant and place all service on a meter basis.

Wabash, Ind.—Service Motor Truck Co. will begin work at once on a new building, 75x775 ft., to cost $150,000.

Chicago, Ill.—Apex Appliance Co. will erect a two-story plant to cost $135,000.

Chicago, Ill.—Chicago Electric Manufacturing Co., 2811 South Halsted street, will build a two-story plant, 100x133 ft., to cost $60,000. E. S. Preston, president.

Chicago, Ill.—Electric Machinery Equipment Co., 714 West Van Buren street, plans to install a 50 to 75-kw., 440-volt, 60-cycle, 3-phase, direct connected unit.

Jacksonville, Ill.—Jacksonville has voted to issue bonds in the sum of $210,000 to pay off the floating indebtedness, build a filtration plant and remodel the municipal lighting plant.

Peoria, Ill.—Central Union Telephone Co. will erect four-story telephone exchange building to be ready for occupancy July 1, 1920.

Urbana, Ill.—A contract for the installation of two 500-hp. boilers in the new power plant of the University of Illinois has been let to the Laclede-Christy Boiler Co., St. Louis, Mo. Complete installation is expected by Dec. 15. At present the four new boilers are being used in connection with the two old ones in the old power house. When the two new boilers are installed only the new plant will be used. The new boilers will increase the capacity of the plant 50%.

La Crosse, Wis.—Architect J. R. Law, Strand Theater building, Madison, Wis., is preparing plans and will let the contract for erecting a $150,000 power house and office building for the P. Lourland Co., La Crosse, Wis. Specifications include power house equipment, steam heating, plumbing and brick construction. The building will be 50x300 ft.

Osseo, Wis.—Augusta Light & Telephone Co. has taken over the Osseo electric light plant and franchise from J. N. Lee & Son. The new owners will take possession just as soon as the new line can be built from Augusta to Osseo, which will carry light and power from the Wisconsin-Minnesota main line.

Milwaukee, Wis.—Res Manufacturing Co., 2907 Meinecke avenue, is taking bids for a two-story plant addition, 30x75 ft., and is in the market for some new equipment.

Chaska, Minn.—The city council has ordered 3 street lights to be installed on Augusta road. Address J. M. Aretz, city clerk.

Minneapolis, Minn.—The installation of an additional 40,000-hp. steam turbine unit in the Riverside station has been authorized by the board of directors of the Northern States Power Co. The engineering and construction department of H. M. Byllesby & Co. will have charge of the new work.

Montevideo, Minn.—Contract has been secured by the Northern States Power Co. covering the electric energy required for the operation of a grist mill at Sacred Heart, Minn. A 20-hp. motor will be installed at once for feed grinding, and a larger motor will be installed later to operate flour milling machinery.

Red Lake Falls, Minn.—Red River Power Co. will make improvements to the local plant. Specifications include generator, exciter, panel on switchboard and water wheels. Address E. F. Wheeler, manager.

Beatrice, Neb.—Farmers and business men of Rockford, Filley and Virginia have pledged $9000 for the proposed electric line from Holmesville through these three towns.

Plymouth, Neb.—The sum of $21,000 has been raised by business men for a lighting system. The town and local electric company will build a line from Beatrice to this point.

Hankinson, N. D.—H. L. Cotry, of Aberdeen, has completed estimates for a $200,000 light and water system for this town.

Beresford, S. D.—Considerable progress is being made in the construction of a new municipal electric light plant. Poles are being set preparatory to the stringing of wires.

Watertown, S. D.—The city council has authorized the erection of a municipal power plant. Site has been purchased and will be rebuilt for a power plant.

SOUTH CENTRAL STATES.

Louisville, Ky.—Commercial department of the Louisville Gas & Electric Co. during the week ended Oct. 7 secured 62 new electric light and power customers with 43-kw. of lighting and 31 hp. in motors, and took orders for wiring 7 already built houses. New business connected shows an increase of 57 customers with 52 kw. of lighting. There was a temporary loss of 33 hp. in motors. Electric energy output was 12.7% greater than during the same week of 1918. During the week the company and dealers combined sold 79 electric vacuum cleaners, 54 flat irons, 31 washing machines and 54 miscellaneous household appliances.

Carthage, Miss.—Establishment of municipal electric light and light plants is contemplated; Williams & Lebby, engineers, Yazoo City, Miss. Address the mayor.

Pascagoula, Miss. — Pascagoula Street Railway & Power Co. is arranging plans for extensions and improvements in its local light and water plants, to facilitate and increase the present operations.

Broussard, La.—The village has let a contract to A. C. Boyd to furnish a 25-hp. generator for furnishing electric current. The Lafayette Electric Co. will install the wire and erect the poles.

Horatio, Ark.—City council is arranging plans for the installation of an electric light and water works system for municipal service.

Fargo, Okla.—The council contemplates the installation of electric light and water plant. Cost $26,000. Address mayor.

Miami, Okla.—Plans are under consideration by the city council for the installation of an ornamental street lighting system.

Nowata, Okla.—The council will make electric and water work improvements. Burns & McDonell, engineers, Interstate building, Kansas City, have made estimates.

Ochelata, Okla.—An election will be held Nov. 4 to vote on bonds for the building of a water works system and an electric light plant in that city. The water works system will cost about $13,000 and the light plant about $7000.

Sapulpa, Okla.—Sapulpa Electric Co. has closed two-year contract with the Sapulpa Refining Co., covering all its power and light requirements. The connected load is estimated at 225 hp. motors.

Tulsa, Okla.—Oklahoma Gas & Electric Co., Oklahoma City, contemplates the extension of its electric transmission lines from Kiefer to Bixby to Jenks. Estimated cost, $70,000.

Dallas, Tex.—E. P. Turner, of Dallas, and associates plan to construct an interurban electric railway between Ranger and Eastland, as a part of a through line that is planned to run between Dallas and Abilene, about 175 miles.

Dallas, Tex.—Burt C. Blanton, of Dallas, and associates are promoting the construction of an interurban electric railway between Sherman and Whitesboro, with branch line to Gainesville and possibly a number of other towns of North Texas. It is stated that the proposed road is to be financed by Eastern men. The project involves the construction of an electric power station.

Fort Worth, Tex.—Fort Worth Light & Power Co. is installing new boilers and other equipment in its plant at a cost of $135,000.

San Antonio, Tex.—The commissioners court of Bexar county has granted a permit to Lieut.-Col. F. G. Chamberlain, construction quartermaster at Camp Travis, to build a high-tension electric transmission line from San Antonio to Camp Stanley and Leon Springs, 18 miles, for the purpose of supplying these places with light and power.

San Augustine, Tex.—Plans are under consideration by the city council for the purchase of the local electric light plant, to be converted to municipal service. It is understood that extensive improvements and alterations will be made to facilitate operations.

Wichita Falls, Tex.—Wichita Falls Electric Co. will improve the central power station and enlarge the transmission lines. Furnish electric power to Burkburnett district and will purchase engine.

WESTERN STATES.

Livingston, Mont.—Western Power Smelting Co., owning extensively developed copper properties and a 250-ton copper matting plant that is almost completed at Cook county, has commenced the survey of the route for its electric power transmission line, a distance of four miles from its completed power plants to the smelters and mines.

Thermopolis, Wyo.—Hot Springs Light & Power Co. has sold the plant supplying Thermopolis with electricity to M. Singer and B. V. Hole, representing a New York concern. The new owners of the plant will at once reconstruct it, adding machinery required to give better light and power service to Thermopolis.

Seattle, Wash.—A steel pump and power house, 16x64 ft., will be constructed by the Petroleum Co. at 1710 16th avenue.

Richmond, Cal.—Western States Gas & Electric Co. has closed contract with the California Wine Association for 150 hp. in motors for the Fresno Cooperage Co., which is establishing a plant at Richmond to employ about 200 men.

Sespe, Cal.—Sespe Light & Water Co. proposes to develop 35,000 hp. electric energy for irrigating purposes. Address Frank Buren, president.

FOREIGN TRADE

[*Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.*]

Boiler-House Machinery, Etc. (30,856).—The electrical commissioners of a city in Australia desire to receive quotations and full information for the purchase of boiler-house machinery, including boilers, economizers, etc.; coal and ash handling machinery; coal-mining machinery; turbogenerators; condensing plants; electrical storage batteries; machine tools; traveling cranes, electrical instruments; switch gear; switches and all accessories; synchronous condensers; water turbines for direct coupling to generators; briquetting machinery; gas producers; and coal-pulverizing machinery. Description of machinery and equipment required may be had on application to the bureau or its district offices.

Railway Equipment (30,918).—Material and equipment for a railway to be built in one of the Scandanavian countries, including construction machinery, rails, rolling stock, etc. Locomotive power may be steam or electrical traction (probably the latter). Track and rolling stock will be standard gauge (1.435 meter). Information, description, illustrations, etc., are earnestly desired. Reference.

Electrical Goods (30,932).—An engineer in Italy desires to secure an agency for the sale of mechanical and electrical goods and industrial chemical products. Correspondence may be in English. References.

Power Equipment (30,939).—The English representatives of a worsted spinning firm in Poland desire to purchase scouring, carding, combing, drawing, twisting, and spinning machinery for short and medium wools; also motive power machinery, boilers (Lancashire and tubular for steam raising 240°), engines and turbines for a 2000-hp. plant. This machinery is needed for the reconstruction of mills in devastated regions formerly occupied by the enemy. Reference. Further information may be had upon application to the Bureau or its district offices.

Engineering Supplies (30,964).—A Russian civil engineer desires to represent in Latvia (Lettland) American manufacturers of automobiles, typewriters, elevators, engineering supplies, cement, concrete machines, machine tools, etc. Correspondence may be in English. References.

Motors, Pumps (30,966).—The purchase is desired by a manufacturing company in Belgium of motors, 3 phase, 40 cycles, 220 volts; controllers, starters, resistances, distribution tables, transmission equipment, railroad equipment, narrow gauge (60 centimeters); centrifugal pumps, steel cables, steel balls for grinding, lime and cements, and office equipment and supplies. Quotations should be given c. i. f. Antwerp. Correspondence may be in English.

Electrical Fixtures (30,992).—A firm in Norway desires to secure an agency for the sale of automobiles and supplies, tires, engineering and building supplies and equipment, heating furnaces, electrical fixtures, elevators and hoisting machinery, painting and decorating supplies, and brewing machinery. Quotations should be given c. i. f. Norwegian port. Terms, preferably 90 days. Reference.

PROPOSALS

Street Lighting.—Bids will be received by J. A. Fitzgerald, village clerk, Newburgh Heights, Ohio, on Oct. 28, for the lighting of the streets and public highways within the village, in accordance with plans and specifications on file.

Electric Light Plant.—Bids will be received until Nov. 15 by the town council, Vona, Colo., for installing a waterworks system and electric light plant, to cost about $25,000. R. D. Salisbury, 1415 East Colfax avenue, Denver, engineer.

Boiler.—Bids will be received until Oct. 28 by the Treasury Department, Washington, D. C., for installing a 200-hp. water-tube boiler at the Bureau of Engraving and Printing. J. A. Wetmore, supervising architect.

Generator, Motor.—Bids will be received until Oct. 27 at McRae, Ga., for a 90 or 150-kv-a., 3-phase, 60-cycle, 2300-volt engine type alternating current generator with exciter and switchboard; 35 to 40 hp., 3-phase, 60-cycle, 2200-volt slip ring motor with overload relay panel and ammeter. Plans, etc., may be secured from W. H. Singleton, engineer, 915 Chandler building, Atlanta. C. A. Ryals, mayor.

INCORPORATIONS

New York, N. Y.—Build-Craft Electric Manufacturing Co. Capital, $10,000. To manufacture electrical appliances, etc. Incorporators: C. Kriser, F. Sauozuk, and V. J. Lohn, 25 Church street.

New York, N. Y.—Brooks-Harrington, Inc., Capital, $20,000. To manufacture engines, boilers, and kindred equipment. Incorporators: A. S. Marselis, R. E. Brooks, and W. G. Harrington, 50 Church street.

New York, N. Y.—Atlantic States Electric & Supply Co., Inc. Capital, $10,000. To deal in engines, motors, electrical supplies, etc. Incorporators: B. W. Sandback, W. Poklop, and S. Graham, 108 West 95th street.

New York, N. Y.—Radio Bulb Co. Capital, $25,000. To manufacture electric bulbs, reflectors, and kindred specialties. Incorporators: H. H. Walter, G. Boger, and J. H. Taylor, 644 Eighth avenue.

New York, N. Y.—DeMatteis Boiler System Co. Active capital, $24,000. To manufacture boilers, etc. Incorporators: E. Fasani, A. DeMatteis, and C. L. Zucca, 118 West 49th street.

New York, N. Y.—The Talty Corp. Capital, $50,000. To engage in a general electrical engineering and contracting capacity. Incorporators: J. J. Alexander, I. B. Canfield, and T. W. Burke, 240 Riverside drive.

New York, N. Y.—Solar Light Corp. Incorporated under Delaware laws with a capital of $10,000,000. To manufacture gas arc lights and electric and gas fixtures, etc. Incorporators: Cornelius A. Cole, Hackensack, N. J.; Arthur R. Oakley, and Robert A. Van Voorhis, New York.

New York, N. Y.—Stander-Lindenbaum Co. Capital, $20,000. To manufacture electric and gas fixtures, etc. Incorporators: P. Lindenbaum, and B. and L. E. Stander, 819 Hunts Point avenue, New York.

Syracuse, N. Y.—Onondaga Auto Electric Service, Inc. Capital, $75,000. To manufacture electric apparatus, automobile accessories, etc. Incorporators: W. H. Craig, W. N. Henderson, and J. M. Dunne, 704 Midland avenue.

Newark, N. J.—Newark Armature Works, Inc. Capital, $15,000. To manufacture electrical specialties, etc. Incorporators: Fictor A. Rohner, Adolph W. Sherriff, and James K. Elderkin.

Baltimore, Md.—Thomas Engineering Co., 211 Key Highway, Capital, $50,000. To engage in a general electrical contracting capacity. Incorporators: M. H. White, Thomas W. Thomas, and Irvin Griggs.

Shull's Mill, N. C.—Boone Blowing Rock Light & Power Co. Capital, $50,000. To operate a local plant for the generation and distribution of electric energy. Incorporators: W. S. Whiting, Shull's Mills; and George P. Hageman, Boone.

Allentown, Pa.—C. M. Walter and associates have incorporated the following electric companies, each with a nominal capital of $5000: Allen Township Electric Co., Northampton; Hanover Township Electric Co., Lehigh; East Penn Township Electric Co., Carbon; Mahoning Township Electric Co., Carbon; Mauch Chunk Township Electric Co., Carbon; North Whitehall Township Electric Co., Lehigh; and Washington Township Electric Co., Lehigh.

Hampton, S. C.—Twin City Light & Power Co. has incorporated with a capital of $30,000. Incorporators: R. H. Gibson and others.

New York, N. Y.—F. W. Billet, J. A. Trimble, and R. A. Barton, 2024 80th street, have incorporated the Syracuse X-Ray Laboratories, Inc., the Utica X-Ray Laboratories, Inc., and the Rochester X-Ray Laboratories, Inc., each with a capital of $10,000, to operate X-ray laboratories, etc.

New York, N. Y.—Horace G. Cooke, Inc. Capital, $100,000. To manufacture exhaustors, pumps, blowers, and kindred equipment. Incorporators: B. N. Bishop, G. P. Breckenridge, and H. G. Cooke, 300 West 109th street.

New York, N. Y.—Fox-Reynolds Co., Inc. Capital, $10,000. To engage in a general electrical contracting capacity, etc. Incorporators: F. L. Reynolds, Henry E. Fox, and Samuel F. Frank, 170 Broadway.

Amenia, N. Y.—Amenia Electric Light & Power Co. Capital, $25,000. To operate in Dutchess county. Incorporators: L. F. Eaton, E. J. Chaffee, and E. B. Thompson.

Newark, N. J.—Niola Electric Manufacturing Co. Capital, $50,000. To manufacture electrical goods. Incorporators: Albert Niola, August B. Gutman and Joseph R. MacLear.

Philadelphia, Pa.—Willys Light & Power Co. Incorporated under Delaware laws with a capital of $250,000. To manufacture light and power appliances, etc. Incorporators: David H., Alfred S., and Alfred Harner Miller, all of Philadelphia.

Washington, D. C.—Washington Electric Co. Incorporated under Delaware laws with a capital of $50,000. To manufacture electrical goods. Incorporators: Charles D. Kenny, Harry Kapneck, and Leonard A. Block, Washington.

Norfolk, Va.—Norfolk Electric Manufacturing Co. Capital, $15,000. To manufacture electrical supplies, etc. Joseph E. Johnson is the principal incorporator.

Charleston, W. Va.—Kalmerten-Warner Electric Co. Capital, $10,000. To manufacture electrical goods. Incorporators: J. A. Herman, D. C. Warner, O. W. Kalmerten, J. E. Hanley, I. W. Belcher, and G. E. Warner, Charleston.

Lynchburg Va.—Neld-Electric Corp. Capital, $25,000. To manufacture electrical specialties. Charles B. Easley is the principal incorporator.

East Alton, Ill.—East Alton Public Service Co., has been incorporated with capital of $25,000 by F. W. Olin, J. M. Olin, and J. L. Donnelley.

Ashley, Ind.—Farmers Light & Power Co. has been incorporated for $10,000 to distribute electric light and power. The directors are I. D. Deller, Walter Mortorff and E. Hissong.

Quincy, Ill.—Quincy Battery & Electrical Testing Co. has been incorporated with capital of $10,000 by Milton E. Breder, Albert W. Henry and Bessie M. Henry.

Hammond, Ind.—Hammond Manufacturing Co. has been incorporated with capital of $75,000 to manufacture and construct machinery. The incorporators are Thomas A. Munro, Harry P. Munro and P. J. Foy.

Indianapolis, Ind.—Milholland Machine Co. has been incorporated with capital of $1,200,000 to manufacture machinery of every kind. Address H. T. Benham.

Personals

F. H. Bethell Becomes Vice-President of White Oil Corp. — U. N. Bethell Retires from Business — Other Changes

C. C. WILCOX, assistant to consulting electrical engineer of Hodenpyle, Hardy & Co., Jackson, Mich., is now chief engineer of the Durant Building Corp.

F. W. LEAHY has resigned from the Emergency Fleet Corp. to assume charge of the marine department of the Diamond Power Specialty Co., Detroit, Mich.

CHARLES D. EMMONS, formerly manager of the Northern Indiana Railway Co., South Bend, Ind., has been made president of the United Railways & Electric Companies, Baltimore, Md.

WIRT J. WILLS, who has been connected with the Memphis Artesian Water Department for over 13 years as chairman of the Commission and general superintendent, has resigned, resignation to take effect Nov. 1. Mr. Wills will devote his entire attention to the manufacture of the "Wills Pumping System" of which he is the patentee.

E. W. WAGENSEIL, engineer of the stoker department, Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., on October 20 gave a very instructive address on combustion and an illustrated lecture on mechanical stokers as applied to stationary steam boilers, before the mechanical engineer members of the Duluth Engineers' Club.

CURTIS M. LINDSAY, manager of the advertising and sales promotion department, Edison Electric Appliance Co., Chicago, has resigned to join the McGraw-Hill Publishing Co., New York. Mr. Lindsay is a graduate in electrical engineering of Armour Institute of Technology. After several years with the J. G. White Engineering Corporation, he joined the Hotpoint Electric Heating Co., Ontario, Calif., in 1912. Two years ago he came to the Chicago Hotpoint office.

FRANK H. BETHELL, first vice-president of the New York Telephone Co. and active head of the eastern group of telephone companies of the American Telephone & Telegraph Co., has resigned his office to become vice-president in charge of finances of the White Oil Corp., a new combination of oil interests recently formed by a group of New York bankers. Mr. Bethell has been connected with the Bell system since 1890, when he entered the Newark office of the New York & New Jersey Telephone Co. Some years later he removed to New York, serving in the auditing department of the Metropolitan Telephone & Telegraph Co. In 1899 he became a salesman, and from 1901 to 1904 was contract agent for the New York Telephone Co. In 1904 he was made general manager of the Chesapeake & Potomac Co., and held positions with other companies until 1911, when he became vice-president of the New York Telephone Co.

FRANK TALBOT, Danville, Va., superintendent of local public utilities, has been elected city engineer, to succeed J. O. Magruder.

HARRY C. BUFFINGTON, formerly motor engineer, Minneapolis Steel & Machinery Co., Minneapolis, has accepted the position of chief engineer of the Holt Manufacturing Co., Peoria, Ill.

A. H. KEHOE, for the past eight years connected with the United Electric Light & Power Co., New York City, has been appointed superintendent of transmission and distribution of the company.

H. B. BRYDON, of the engineering department of H. M. Byllesby & Co., Chicago, has been appointed a member of the Prime Movers Committee of the Technical and Hydroelectric Section, National Electric Light Association.

CARLETON A. ORR, formerly connected with the Arkansas Valley Railway, Light & Power Co., Pueblo, Colo., in the capacity of superintendent of power plant and shops, has become associated with the Baker Steam Motor Car & Manufacturing Co., Inc., Pueblo, Colo.

THOMAS A. EDISON, West Orange, N. J., visited New York on Oct. 11 to view a bronze tablet placed at 257 Pearl street in 1917 in commemoration of the building of the New York Edison Co. station at that location in 1882, when electric lights were introduced in New York. It is set forth that upon the unveiling of the tablet two years ago, Mr. Edison was too engrossed in war problems to journey to New York, this being Mr. Edison's first visit to the city during this length of time. On the same day, Mr. Edison attended a luncheon held in honor of Cardinal Mercier at the Waldorf-Astoria Hotel.

J. E. MELLETT, commercial engineer, electrical department of the Georgia Railway & Power Co., Atlanta, Ga., has become associated with the Carter Electric Co., Atlanta, Ga., in an executive capacity. His long experience in public service and his previous technical training in electrical engineering eminently qualify Mr. Mellett for his new position with one of the largest wholesalers and retailers of electrical supplies in the South. Previous to joining the Georgia company, he was manager of the Chattanooga office of the Georgia Power Co., prior to which time he was manager of the General Electric Co.'s branch in the same city.

UNION N. BETHEL, who resigned as senior vice-president of the American Telephone & Telegraph Co., has tendered his resignation as chairman of the board of directors. Mr. Bethell contemplated retiring from business life some time ago, but the war and its resultant claims upon telephone service and telephone experts called him to Washington as chairman of the Operating Board for the operation of the telegraph and telephone service under Government control. He was born in Newburgh, Ind., Sept. 12, 1859, and was graduated from Hanover College. He entered the telephone business about thirty years ago, when the telephone was in its early stage of development, and began his career at Brooklyn with the New York & New Jersey Telephone Co. In a short time he was elected secretary and treasurer of that company, and in 1893 was made general manager of the New York Telephone Co. In 1901 Mr. Bethell was made president of the company operating in Washington, Baltimore and surrounding territory, and later became president of the Philadelphia & Eastern Pennsylvania Co. By successive steps he assumed the management of the companies in New York state, New Jersey, Pennsylvania, Delaware and Maryland. In 1909, these companies, with Mr. Bethell at their head, were formed into an operating unit extending from Washington, D. C., to the Canadian border, and from New York as far west as Pittsburgh. In 1910 he was made vice-president of the American Telephone & Telegraph Co, and later became senior vice-president of that company as well as president of the New York Telephone Co. In December of 1911 he was elected chairman of the board of directors of the Bell system. Mr. Bethell is considered one of the world's leading authorities on questions of telephone policy, finance and management. In 1909, he was decorated with the Order of the Rising Sun by the Emperor of Japan for his services to science. N. C. Kingsbury, senior vice-president of the American Telephone & Telegraph Co., succeeds Mr. Bethell as a director and as a member of the executive committee.

Obituary.

CHARLES FRANKLIN SNYDER, for 14 years superintendent of light, heat and power with the Bloomington & Normal Railway & Light Co., passed away recently at the age of 52 years. Mr. Snyder was born near Saybrook, Ill., Jan. 11, 1867. He began his public service career 28 years ago, entering the service of the old Bloomington Light Co. as arc lamp trimmer, and worked up through the various branches of the business and acquired an intimate knowledge of the power house and lines. By reason of his efficient and faithful service he was rapidly promoted from one position to another until his appointment as superintendent of light, heat and power 14 years ago. Coming into daily contact with people in all walks of life for many years past has given him a wide circle of friends and acquaintances who will regret to learn of his untimely death.

Factory Lighting—A Central-Station Problem

Results and Observations of a Year's Campaign for Better Factory Lighting Conducted by Commonwealth Edison Co.—Abstracted from Paper Before Illuminating Engineering Society Convention

By O. R. HOGUE and J. J. KIRK

Head Lighting Agent and Illuminating Engineer, Commonwealth. Edison Co., Chicago.

PROBABLY no other single lighting subject has received as much recent attention from the society at large and from the technical press as has that of factory lighting. It is not the purpose of this paper to go into the technical details of scientific illumination as qualified engineers have fully covered the subject. Our aim is, rather, to indicate the experience of the Commonwealth Edison Co. in an extensive campaign for better industrial lighting.

To the Illuminating Engineering Society is due the credit for first fostering the idea of better lighting in industrial plants. Many years of effort on the part of the society and its individual members have shown tangible results in the adoption of lighting codes by a number of the states. To merely have a code adopted has not been the single aim of the society, but persistent endeavor has been made to have the new codes as they are adopted reflect present practices of good lighting, as is evident from a comparison of the recent codes with the earlier ones.

A great deal of work has been done to educate the several reflector manufacturing companies and central stations to the value of good industrial lighting, but as yet the real object has not been attained—we have failed to carry this educational work to the average plant owner, who in the final analysis has the sole power to improve lighting conditions.

Impetus was given to better lighting by the standardization of lamps by lamp manufacturers, which has been furthered by a combined effort of the lamp manufacturers and reflector manufacturers in the adoption of a standard reflector. This standardization has made it possible for those who are called on to make recommendations to agree on types of equipment and thus avoid confusing the customer by a multiplicity of equipment. The confidence of the customer is thereby inspired and progress, which is dependent upon sales effort, made easier.

The central-station companies in general have been the ones who have failed primarily to "carry on," this failure on their part being due to a lack of appreciation of the value and extent of this business.

To demonstrate what can be done to consistently improve lighting conditions, it is only necessary to compare intensity and other values given in the paper on "Factory Lighting" by O. R. Hogue and A. O. Dicker, presented before this society at the Cleveland convention in 1914, with the values given in this paper.

In Table No. 1 are data on a number of the larger installations made by the Commonwealth Edison Co.

during the past year, which will serve to show the tendency toward improvement in artificial lighting. It will be noted that the average intensities are more than double those in the installations listed in the former paper. Very little local lighting is used and such local lighting in all excepting one case is a remnant of the old lighting and was not recommended by the central-station engineers. Of course we recognize that some local lighting is needed but it is our aim to reduce this to a minimum.

Where local lighting is needed at intervals, it is suggested that wall receptacles be provided and that extension cords be checked in and out of the tool room just like a special tool. In this way the superintendent is given a chance to control its use and to prevent its becoming a permanent part of the lighting arrangement.

To show the value to the central stations, we have included data on income. In every case the new installation resulted in an increased monthly bill although a few were new customers. This is the sort of business that is most profitable in that it adds no cost to metering and billing and but slightly to the cost of service. Since there is always some other lighting or power-consuming device in use, it is difficult to get an accurate figure on income, but the amounts given are the result of careful study of the customers' accounts before and after the new system was installed.

This indicates conclusively that illuminating engineering service not only benefits the customer, but renders his account more profitable to the lighting company.

The accompanying illustrations showing "Before" and "After" photographs of installations which we have made will help to show the change effected by our efforts.

Table No. II shows the business secured during the different months of the year. It will be noted that during those months which have the greatest amount of darkness, the average watts per unit are more than 200, and the average foot-candle intensity was over 6, indicating that industrial lighting is a seasonal business.

If the efforts of the society to promote good practice are to meet with tangible results, they must be supported by active selling campaigns. The central stations, through their present contact with the customer, are in a better position to push industrial lighting than anyone else. It has been the experience of those who have actively engaged in this work that the entire time of men with special illuminating engineering training must be given to the work if any real progress is to be made.

Although the services of our engineers are always available to architects and owners who wish advice as to the lighting of a new building, our field, as always, has been the established institutions with inadequate lighting. On this account we have the primary difficulty of convincing the customer that a change will prove profitable to him, and this requires a large amount of educational work. Next, he must be shown that the installation proposed is not unreasonable and that the company is not merely trying to get a big income at his expense. As a rule, we must convince

him that the drop cord is poor economy for general lighting. Then, having sold the idea and the layout, we come to the task of selling the installation, and in this we often fail, for the small contractor, uncertain of his costs at best and willing to hold profits to a minimum to keep his men working, is very likely to underbid us. However, as we furnish blueprints and specifications for each job, if the installation is made along the lines of our recommendations, we do not count the labor lost, for we have made a convert to good lighting and incidentally added a good load to our lines.

One sales point which we have found very effective and which may prove of value to someone is the figuring of the installation down to unit costs. The total price for the job or for the operation of the proposed system may be high enough to discourage the prospect but if it is figured on a basis of cost per square foot and compared with his rental charge, or as cost per employe per month and compared with the payroll, it assumes relatively minor importance.

Our rental and maintenance proposition for factory lighting has met with very gratifying results, appealing to the large as well as to the small plant. In this connection we feel that the maintenance is of great importance. Not only do we give the customer a good installation, but we keep it efficient during the two-year period of the contract and after that we aim to continue maintenance even though the equipment then belongs to the customer.

It has been found by experience that regular cleaning periods must be established, the frequency depending upon the character of the factory or shop, but in no case exceeding 30 days. Since this company uses a lock socket on all its equipment, it has complete control of the lamps, and after the equipment is turned over to the customer he is in a position to place the maintenance in the hands of one man, who should have entire charge of lamp renewals. This method not only prevents the theft of lamps, but also prevents the misuse of equipment by the installation of lamps of wrong size.

In order to raise the standard of lighting and induce plant owners to install systems with high intensities, it was necessary that we have data in the way of actual figures. With this end in view we selected a number of industrial plants where accurate cost records were kept and obtained permission to make a test. First a month's run was made with the old lighting system in use. Then a complete lighting system was laid out and installed by and at the expense of the company, and another month's test made. Finally, with a return to the original conditions, a third month's test was made. The results obtained were highly gratifying and in every case the customer was anxious to retain the new installation. In a number of cases we were not even permitted to go back to the old lighting for the third month's test, for the customer realized that it would mean actual financial loss to him. In making these installations we used so-called triple intensities; that is, about three times the intensity ordinarily recommended, and although few installations are now made with that high a standard, still the average illumination intensity has been very materially raised.

The figures in Table III show the advantage obtained by increasing from the ordinary low standard to a moderate intensity, and also the still further advantage of increasing to a real production intensity. With such facts before us, it seems certain that in productive intensities we have the greatest possibility of service to industry and wide adoption of such intensities is only a matter of getting the truth before the responsible executives.

TABLE III.

Class of business.	Old installation. Equipment.	Watts per sq. ft.	Foot-candles.	New installation. Equipment.	Watts per sq. ft.	Foot-candles.	Average increase in % production.	Total cost in % of payroll.
Iron pulley finishing shop.	Drop cords. 60-w. lamps. Bare or tin shaded.	0.27	0.2	200-w.-C. Reflectocap units..	1.90	4.8	20	5.5
Soft metal bearing machine shop.	25 100-w.-B. deep bowl reflectors.	1.00	4.6	25 200-w.-C. deep bowl reflectors	2.00	12.7	15	...

Central-Station Rates in Theory and Practice

Seventeenth Article—Rates Based on Demand—Flat Rates for Display Lighting and Small Consumers—Advantages of Flat Rate—Theory of Rates Based on Energy and Demand

By H. E. EISENMENGER

This article is the seventeenth of a series which began in the issue of July 12. The first seven articles dealt with the cost of central-station service and formed Part I of the series. Part II comprised six articles on the general policy governing the selection of a rate system. Part III, of which this is the fourth article, discusses the various systems of rates in use; there will be two more articles in this part. Parts IV to VI will treat of rate analysis, accuracy of rates and rate regulation by commissions. The articles will continue weekly until the last issue of the volume (Dec. 27).

PART III—SYSTEMS OF CHARGING—Continued.

II. The Various Types of Rates—(Continued).

C. Rates Based on Demand Only.

1. *Nomenclature.*

SECTION 126. Rates which are based on the demand only of the customer (in watts, kilowatts or some other unit or substitute) are called flat demand rates or simply flat rates.[1] The customer is charged simply in accordance with his maximum demand in watts, kilowatts, etc., and no explicit charge is made for the energy consumption in kilowatt-hours. The latter may be more or less strictly defined by the maximum demand, as in the case of display lighting (see later), or it may be only loosely connected with the maximum demand, as in some cases of residence lighting.

2. *Types of Service for Which Flat Demand Rates Are Used.*

a. Flat Demand Rates for Display Lighting, Etc.

127. The flat demand rate adapts itself most naturally to display lighting service, that is, advertising signs, outline lighting, store windows, etc. This kind of lighting is in use during a certain definite number of hours every day or month, either with all the lamps burning all the time or a certain prearranged percentage of the total capacity burning on the average (flashing signs). The number of kilowatt-hours per year (or per average month) is therefore, with a given kind of sign and use of the sign, proportional to the capacity of the sign, that is, to the maximum demand, and the energy charges can be most naturally averaged into the demand charges, thus doing away with the necessity of employing a meter.

Not infrequently the electric light company furnishes a patrol service for lighting and extinguishing the sign lights at the correct prearranged time. The lapms are, of course, lighted at dusk and they are extinguished usually at 11 o'clock, at midnight or at dawn, as local conditions warrant or the customer desires. The charges for this patrol service are then included in the flat rate charges.

The ways in which the payments are made to depend on, and vary with, the maximum demand are very diversified. One group of rate schedules makes the charges proportional to the capacity of the sign in watts. We may have then what might be called a straight demand flat rate, in analogy with the straight meter rate[2], usually with a minimum charge. Or the rate may be framed as a block demand rate, in analogy with the block meter rate[3]. An explicit customer charge may also occur[4].

Another group of display lighting schedules make the charges depend not directly on the number of watts connected, but they charge a certain specified amount for every standard size of lamp. This is not quite the same, if the charges per lamp are not exactly proportional to the wattage of the lamp. The charges

[1] In England the term "flat rate" is used to designate straight meter rates.

[2] Erie Pa.: 1.5 cents per watt connected, with minimum charge of 75 cents. East St. Louis: 0.85 cents per watt connected, with minimum charge of $3. Both rates are charges per month for lights burning from dusk to midnight.

[2] St. Joseph, Mo.:
8 cents per 10-watt lamp, first 100 lamps
7 cents per 10-watt lamp, next 100 lamps } from dusk to 11 p. m.
6 cents per 10-watt lamp, excess lamps
For another example see footnote 6 (Macon, Ga.).

[4] Rockford, Ill. (optional): Customer charge $12 per year added to the demand charge of
$ 5 per year per 25-watt Mazda lamp
$ 8 per year per 40-watt Mazda lamp
$12 per year per 60-watt Mazda lamp
$20 per year per 100-watt Mazda lamp
$30 per year per 150-watt Mazda lamp
$50 per year per 250-watt Mazda lamp
As the demand charges are strictly proportional to the wattages of the lamps, this rate is the equivalent of a straight demand rate with a customer charge superimposed.

[5] Peoria, Ill.:

Size of Lamp, Watts.	Cents per Lamp per Month. Dusk to 11 p. m.	Cents per Lamp per Month. Dusk to midnight.
5	5.1	6
10	8.5	10
20	17	20
25	21.25	25
30	25.5	30
40	34	40
60	51	60

This is a straight demand rate with exception of the 5-watt lamps where the charge per watt is greater than with the rest of the lamps.

South Bend, Ind.:

Size of Lamp, Watts.	Cents per Week.	Equals Cents per Watt per Week.
2.5	2.5	1
5	3	0.6
10	5	0.5
15	7.5	0.5
20	10	0.5
25	12.5	0.5
40	18	0.45
60	25	0.42
100	40	0.40
150	50	0.33
250	80	0.32
500	150	0.30

Minimum charge 25 cents per week. Here, as the last column shows, the charges per watt decrease pretty regularly from 1 cent per watt per week down to 0.3 cent per watt per week.

per watt of lamp capacity are generally smaller for the larger lamps than for the smaller ones.[5] This deviation from strict proportionality is occasioned by the fact that the charges in these cases include the renewals of burnt-out lamps. The price of a large lamp per watt is smaller than that of a small one, whereas the cost of labor for renewing the lamp is independent of the wattage of the lamp and this labor cost is by no means small on roof signs, etc. Moreover, the signs with the larger lamps are on the average the signs of greater total capacity and their users are therefore the larger consumers.

Some central stations diversify their flat rate schedules for display lighting according to the time during which the sign is being used, or, since all signs are lighted at dusk, according to the time when the sign is extinguished.[6]

The charges are generally figured per month, but occasionally display lighting schedules can be found which charge per year[7] or per week.[8]

In a few instances flashers on the signs are quoted in the schedules as bringing about a reduction of the charges.[9] From the theoretical point of view this is correct as it reduces not only the energy consumption of the sign but also the kilowatt demand on the central station and its lines on account of the diversity between a number of flashing signs. This means that the period of lighting of the sign will coincide with the period of darkness of some other sign, so that the total demand of all the flashing signs is smaller than the sum of the maximum demands of the individual signs in the ratio of the periods of darkness to the total time the flasher is connected, that is in the ratio of the energy consumption saved by flashing.

The great majority of electric light companies which have special schedules for display and sign lighting employ flat demand rates for that purpose.[10]

There are some other kinds of service which share the characteristic of the display and sign lighting service inasmuch as the number of burning hours per month can be predicted with a fair degree of accuracy from the size of the installation, so that for a given demand the monthly or yearly energy consumption is fairly well known without employing a meter. These services are chiefly commercial lighting[11] (stores) and all-night porch lighting.[12] The employment of flat demand rates based on the rated capacity of the installation is, however, by no means as general for these purposes as it is for display lighting; on the contrary, it is rather the exception than the rule.

b. Flat Demand Rates for Small Customers.

128. Flat demand rate schedules are used also for the service of residences, small stores, etc. Whereas with the display lighting customers, treated in the preceding Section 127, the advisability of the flat-rate lighting schedule is based on the fact that for every consumer the energy consumption is practically proportional to the maximum demand, no such statement can be made for the small customers, such as residences, etc. The energy consumption of various residence consumers with the same maximum demand may indeed vary within rather wide limits. The reasons which recommend the employment of a flat demand rate for small residences and stores are entirely different from what we saw in the case of display lighting.

The chief reason is the large reduction of the "customer cost" which can be effected by the flat demand rate through elimination of the customer's individual meter. From what has been previously explained (Sections 54-55) about the "customer cost," it is obvious that a large part of the "customer cost" consists of the expenses incidental to the meter, that is, capital charges on the meter, meter reading, meter maintenance, computing of the bills, etc., and this is eliminated by using a flat demand rate. Now the customer cost, as stated in Section 56, has the order of magnitude of 50 cents or one dollar per month per customer and therefore constitutes a large part of the total cost of serving a small customer. Consequently, if we are able to reduce the "customer cost" of the small customer, we will reduce the total cost of that customer's service in a proportion which is not much smaller than the percentage reduction of the customer cost. Therefore the charges to the small customer for a certain service can be made lower under a flat demand rate than under a meter rate, even though the profit to the company is not reduced or possibly even enhanced as compared to the profit from the same service if furnished under a meter rate. It has been shown before (Section 97) that cheapness of the service to the small customer is essential since money is of greater value to those customers as a class.

In addition to the cheapening of the service for the reasons just discussed, the flat demand rate permits of simplification in the office work of the company for the small flat-rate customers, especially if certain wattages are standardized for the capacity of flat-demand-rate installations to the exclusion of all

[6] Macon, Ga.:

Watts Connected.	Cents per Watt Connected. Burning till midnight.	Burning all night.
First 500	1.8	3.3
Next 500	1.4	2.5
Next 1000	1.1	2.0
Next 2000	1.0	1.8
Excess	0.9	1.6

See also footnote 5 (Peoria, Ill.).

[7] See for instance footnote 4 (Rockford, Ill.).

[8] See for instance footnote 5 (South Bend, Ind.).

[9] Topeka, Kans.: 5.5 cents per 5-watt Mazda lamp instead of 6 cents; Birmingham, Ala., states that a flasher discount is made in proportion to the current saved, usually about 40%.

[10] Among the few exceptions to this rule are the following: New York City (three of the companies operating in the territory); Rockford, Ill., (one of the optional display lighting rates); Sacramento, Cal., (Pacific Gas & Electric Co.). All of these employ straight meter rates for that purpose. Birmingham, Ala., has a step meter rate for display lighting, in which the lower kilowatt-hour charge takes place not after a certain energy consumption has been reached but after the connected load exceeds 3000 watts. Muskogee, Okla., has a block meter rate for display lighting.

[11] Commercial Lighting, Pueblo, Colo.:

Hours per Night.	Price per 100 Watts per Month.
6	$1.00
8	1.15
10	1.25
12	1.35
14	1.45
16	1.55

The company reserves the right to set check meters and to bill the excess at 5 cents per kw-hr.

Flat Rate Commercial, Canton, Ohio:

Tungsten Lamps.	Daily Use in Hours. 6	10	15
250-watt	$2.50	$3.30	$4.00
150-watt	1.75	2.00	2.50
100-watt	1.10	1.30	1.60
60-watt	.75	.85	1.00
40-watt	.50	.60	.75

[12] Flat Rate for Porch and Hall Lighting, Waterbury, Mass.:

$1 per 10-watt lamp per month.

Porch and hall lights, being intended as all-night lights for protection against burglars, etc., should be charged at lower rates—reduced per kilowatt-hour—than the ordinary residence lamps because otherwise no customer would avail himself of that rate and that kind of lamps would be burned under the ordinary residence rate, if at all. The electric light company can afford to give cheaper rates—reduced per kilowatt-hour—for that kind of service not only on the basis of the value-of-service principle but also because the cost per kilowatt-hour is lower on account of the good load-factor. A kilowatt-hour consumed in the regular residential lamps will be largely used during the peak hours of the central station, whereas if consumed in an all-night porch light the largest part of the energy will be demanded at off-peak hours. On the other hand, the cost will be enhanced by the cost of inspection, or in the absence of these, by the use—fraudulent or otherwise—of larger lamps than contracted for by some of the customers.

other wattages. Thus, for instance, it might be stipulated that the maximum demand of every flat-rate installation must be rated at a multiple of 25 watts between the limits of 75 and 300 watts. This would mean that the customer has ten different standard wattages to choose from if he wants to be served under the flat demand rate. Then we might have ten different sets of bills, receipts, etc., printed, each with the correct amount imprinted, thus saving clerical work.

The simplification can be carried to such an extent that neither bills nor collectors are sent out to the flat-rate customer. The flat-rate customer is required to take care himself that his monthly or quarterly payments reach the company before a certain day of the month (or quarter) without waiting for a bill as the other customers.[13] Payments can be made at the company's offices or at the agencies appointed by the company all over the city.

Finally the company's dealing with individual consumers on the company's books in the monthly routine work can be eliminated altogether, as far as the small flat-rate customers are concerned. This is done by assigning to each flat-rate customer an identification number within a group. Each group comprises all customers whose demand amounts to a certain one of the standardized numbers of watts (see above). Each customer of a certain group has then to pay the same amount per month as every other customer of the same group. The electric light company then deals only with the entire groups of customers on the company's books, at least in the regular course of operations, that is, if the customers pay regularly, or do not change their contracts, etc. Those customers who do not pay in time or who change their contract, etc., must of course always be singled out and dealt with individually, which causes extra expense; but even there the schedule could be framed in such a way that the customers who require individual dealing are charged a little additional fee in that month to cover the extra expenses.

These simplifications with their incidental cheapening of the service are not used as much in this country as they might be and as they are in Europe.[14]

Another advantage of the flat demand rate for small customers is the possibility of exactly and definitely foretelling to the prospective customer what amount he will have to pay every month for the lighting of his home with a given installation. This makes it easier to induce these small customers to try electric service than where they are to be served on a meter basis and where therefore no definite promise can be made as to the cost of the service.[15]

129. Nothing has been said so far about the method of determination of the customer's maximum demand for the residential flat demand rate. Simply using the number of the sockets connected for a basis and leaving it to the discretion of the customer what size of lamps he wishes to use would be too inaccurate for a flat rate; this method is at present nowhere employed for a flat rate in this country as far as the writer is aware. Using the connected load in watts as a basis for charging the residential customers, as in case of display lighting has also certain disadvantages. Whereas in case of display lighting the illicit exchange of lamps by the customer for larger ones or the unauthorized installation of additional lamps would be easily detected by an observer on the street, frequent surprise inspections would be necessary in case of residential consumers to be safe against unauthorized increases of the customer's wattage, whether fraudulent or unintentionally. These inspections would be, to say the least, cumbersome, costly, and inefficient, and would frustrate the object of the flat demand rate, viz., to make the cost of service low.

Special sockets into which the ordinary lamps would not fit have been tried, the lamps for these sockets which are not obtainable on the market being furnished by the electric light company. The disadvantages of this system are so great that to the writer's knowledge this method is no longer in use anywhere. In the first place dealers cannot easily be prevented from eventually selling lamps with bases to fit into these special sockets and in the second place lamp sockets have been standardized during recent years with an expense of work and money much greater than the outsider would suspect, so that every attempt to introduce nonstandard sockets nowadays means a step backwards.

Similar considerations apply to the use of low-voltage lamps (for instance 55 volts) for residential flat-rate customers to prevent the customers from buying higher wattage lamps and inserting them into the sockets. Strenuous and successful co-operative efforts are being made at present by the electrical industry to exclude all but a very few standard voltages (110, 115, and 120 volts) in order to reduce the cost of production.[16]

Monthly measurements of the actual maximum demand would bring accurate results, but they would necessitate just what we want to avoid with the introduction of the flat rate—the installation of expensive measuring instruments for every consumer which necessitate periodic reading, etc.

130. The best method is to prevent the small flat-rate consumer by automatic devices from using a larger wattage than he has contracted for. This is done by the use of an inexpensive instrument called "demand limiter" or "current limiter" or sometimes, though not quite as accurately, "demand indicator." As soon as the customer at any time switches on a larger wattage than he is allowed under his contract, that is, as soon as he uses a current in excess of what he has paid for, this instrument, which is connected in series with his entire installation, will rythmically break and make the circuit until the excess current is turned off again. The current is broken about 20 to 300 times a minute according to the make of the instrument. This causes a very disagreeable flicker of all the lights in the entire installation which warns the customer that he has—intentionally or otherwise—

[13] It is even feasible to require that these payments be made in advance, since their amounts are definitely known in advance. Losses from bad debts and expenses for collecting back payments can thus be restricted. The principle of prompt-payment discounts or delayed-payment penalties, respectively, (Section 110) can as readily be applied to the flat rate as to the meter rate.

[14] See also S. E. Doane: "The Successful Handling of the Small Consumer in Europe," Proceedings of the National Electric Light Association, 1914, also reprinted in Electrical World, May 23, 1914.

[15] As to the good results obtained by flat demand rates for soliciting the small consumer, see Earl A. Whitmore: "The Value of the Poor Man's Business," Electrical World, Jan. 22, 1916.

[16] Only very few examples of flat residence rates on the basis of the connected load could be found by the author. Dallas, Tex., charges per month:

$0.60 per 16-cp. lamp for 3 to 5 lights.
$0.50 per 16-cp. lamp for 6 to 8 lights.
$0.40 per 16-cp. lamp for 9 to 12 lights.
.... etc. ....

All the other instances found (three in number) are close together, in Connecticut, and apply to the use of low-voltage (55-volt) lamps, for instance: Hartford, Conn.: $1 per month for ten 10-cp. low-voltage tungsten lamps, 6 cents for each additional lamp; $1.50 for ten 20-cp. tungsten lamps, 12 cents for each additional lamp.

exceeded his allowance and which most effectively induces him to shut off the excess wattage. This kind of flat demand rate is sometimes called the "controlled flat rate."

This instrument acts on the principle of an ordinary electric bell. It is so adjusted that it does not work unless the current passing through it exceeds a certain amount, namely the equivalent of the wattage for which the customer has contracted. These instruments require no periodic inspection as the meter and they are much simpler in construction and therefore cheaper than the meter.

The customer may now have installed as many and as large lamps as he chooses, but he never can burn a larger wattage at any time than what the current limiter allows to pass, that is, what the customer's contract permits. The greater, however, the ratio is of the installed capacity to the contracted maximum demand the oftener the current limiter will come into action and this, of course, means annoyance and dissatisfaction to the customer. If, for instance, a customer sits downstairs in his home reading and his daughter turns on the light in her own room at a time when the entire contracted demand is being used, all the lights in the entire house will begin to flicker and thereby cause a certain amount of inconvenience. It is but human that the customer does then not blame himself for not having contracted enough wattage to cover his needs but that he curses the electric light in general and the electric light company in particular. Such a thing never had happened to him before he had electric light. To avoid this it seems good policy on the part of the electric light company to make a rule in the flat-rate schedule that a customer must contract for the entire wattage of his installation or at least for a certain stipulated minimum percentage of that wattage.[17] If the lights then begin to flicker it is a warning to the consumer that he has violated his agreement and it is brought home to him forcibly that he is doing something wrong so that he is the one to blame and not the electric light company.

The "controlled flat rate" is especially suited for the man of small means and by turning a large number of individuals into satisfied customers it contributes towards strengthening the good-will of the public towards the electric light company.[18]

D. Rates Based on Both Energy Consumption and Demand.

1. *Introduction.*

131. Since the cost of service to a certain customer depends, as we have seen, about as much on the energy consumption as on the maximum demand, a rate which contains these two elements will in general be more accurate than any rate which contains only one of these two elements; that is, the unintentional deviations of the charges from the cost (plus a fixed percentage of profit) can be avoided more effectively. (This will be explained in Part V, "Accuracy of Rates," Section 171). The charges from the two elements of energy consumption and demand may or may not be combined with a customer charge and in this manner we get either three-charge or two-charge rate systems under this heading.

2. *Determination of the Demand.*

a. Theory and General Remarks.

132. As shown in the theoretical part of this series of articles (Sections 27-29 and Insert VI), the exact evaluation of that portion of the central station's capacity which is determinative for the demand cost of a certain customer is so complicated an undertaking that an attempt to introduce it into general practice without far-reaching approximations would be hopeless.

The first step of approximation towards practical determination of the portion of the central station's capacity just mentioned and with that towards determination of the customer's demand cost and demand charge is the assumption that the demand cost is proportioned to the peak responsibility, that is, to the kilowatt load which the customer draws from the central station at the time of the peak-load of the latter, assuming as peak-load time of the central station not an instant, but a certain short interval of one or several minutes or hours duration. This latter assumption is necessary not only for practical reasons, inasmuch as the top of the central station's load curve is too flat to permit of pointing out one definite second of the year as bringing a heavier load on the central station than any other second of the year, but theoretical considerations prove it to be correct so that we would use it even if our measuring instruments were accurate enough to determine just at what second the absolute maximum of the central station has occurred. It has been shown in Insert VI that, whereas the customer's load at every single moment of time has a certain influence on the customer's demand cost, the influence of the customer's load is practically imperceptible during those moments of time when the central station's load, expressed in percentages of the central station's peak load, is not large. On the other hand, during those elements of time when the central station's load is near 100% of the central station's peak load the influence of the customer's load is paramount, so that these latter moments of time can be exclusively considered. But the decrease in the importance is a steady though rapid one as we go from the 100% limit downwards; in other words, the influence of the moment with the central station's real peak load (100%) is not of a greater *order of magnitude* than that of a moment with 99.9% or 99% load,[19] etc., and there are no *abrupt* changes in the degree of influence as we go down the scale of percentages on a continuous load curve.

We have therefore to take the customer's demand during a certain interval of time when the loads are near 100% and, as the customer's demand will in general vary during that interval, we will have to take

---

[17] The controlled flat rate of Scranton, Pa., specifies that the demand shall not be less than 75% of the total sockets installed at the rate of at least 25 watts per socket (with a few secondary exceptions).

[18] Examples of the controlled flat rate: Worcester, Mass.:

Watts Demand.	Net Charges Per Month.
100	$1.00
125	1.25
150	1.45
175	1.65
200	1.85
225	2.05
250	2.25
275	2.45
300	2.65
325	2.85
350	3.05

It is easily seen that this means a (net) charge of 0.8 cent per watt plus a customer charge of 25 cents (with exception of the 100 watts demand, which is 5 cents lower).

In Allentown, Pa., the charges of the controlled flat rate are diversified between residences and stores and in the latter class they are again diversified according to the time of closing in the following manner:

1 cent (net) per watt per month for residences.
1.5 cents (net) per watt per month for stores, etc., closing at 9 p. m. or earlier.
2.0 cents (net) per watt per month for drug stores, saloons etc.
2.5 cents (net) per watt per month for establishments open all night.

[19] The former (100% load influence) may even be smaller than the latter (99.9% or 99%) although as a rule it will be larger.

the average of all the customer's instantaneous demands during that interval.

We have then to define the "peak responsibility" as the average of the customer's instantaneous demands taken over a given or chosen interval of time. This term "average demand taken over a certain interval of time" is not as definite as it seems at first sight. This question, which is of secondary practical importance, has been dealt with in Section 34-37.

The question now suggests itself how large the interval should be over which the customer's instantaneous demands are to be averaged in order to furnish the most exact result. The solution of this question depends entirely on the shapes of the load curves. In order to solve that problem for a particular case we would first have to find out how large the correct unapproximated value of the demand cost is with the given shape of the customer's and central station's load curve (Insert VI). But the object of the whole approximation is to avoid just that complicated calculation of the true value. We will therefore have to select more or less by guesswork some standard length of interval over which the customer's demand is to be averaged.

Fortunately it does not make much difference generally whether we use those moments of time when the central station's load is above 95%, or when it is above 98%, or 99%, etc. It does make a difference with an individual consumer whose load curve has a freak shape containing large and abrupt rises and falls during the assumed interval of the central station's peak which are symmetrical to the latter, but with the ordinary shape of load curve the duration of this interval is not a matter of great importance.

What would be the effect of using too large or too small values for that interval? If it is chosen too short, this would mean penalizing a customer who once in a while, as an exception, or even as a consequence of an accident has a heavy but short demand. This short demand would as a rule not necessitate the electric light company keeping an additional equipment of the same capacity in readiness as the chances are that these exceptional demands do not occur during the central station's peak-load time. Even if they do, they will affect the central station's size in a much smaller measure than the amount of kilowatts of the maximum demand indicates, because these extremely short demands of a number of customers would not come all at the same moment but generally one after the other; in other words, the diversity-factor between these peaks would be very great on account of their short duration. This penalizing of the very short demands would result in a corresponding unjustified favoring of the customers with demands which are steady during a longer interval of time and thereby do not give the possibility of a large diversity so that they affect the central station's size in a much greater measure than the same number of kilowatts would for a short period. If we go to extremes, the customer might have to pay during the whole month, or even year, for the current occasioned by a short-circuit in his installation.

On the other hand, if the interval is chosen too great, the element called "peak responsibility" loses more and more the character of a real peak responsibility by approaching more and more the element of energy consumption. This is best illustrated by again assuming the extreme case, which now means that the interval within which the "peak responsibility" is to be measured (averaged), is no longer so small as to be measured in minutes or even hours, but extends over the entire 8760 hours of the year. In that case the rated "peak responsibility" would be the average demand of the customer over the whole year and would be proportional to the customer's yearly energy consumption.

133. The next step towards enabling practical application is the replacement of the customer's peak responsibility as basis for the demand cost (or for the demand charge respectively) by the customer's maximum demand, regardless of the time when the latter occurs. With this approximation we arrive at a method of general practical applicability.

The maximum demand of the customer is usually not defined as the instantaneous maximum demand, but the demand as averaged over a certain given interval of time, just as this has been done in the first approximation with the customer's peak responsibility and for the same reasons. That interval of the given length within which the demand averages to a larger amount than during any other interval of the same length is then selected and the average demand during that particular interval is the rated "maximum demand." The maximum instantaneous demand must not necessarily occur during the same interval.

(To be continued.)

ERRATA.

We have had our attention called to two errors in Mr. Eisenmenger's eleventh article, which appeared in the issue of Sept. 20. On page 474 there is an error in Fig. D. The abscissa OA' should equal m_0 and $A'B'$ should equal M_0. The corrected Fig. D is reproduced herewith.

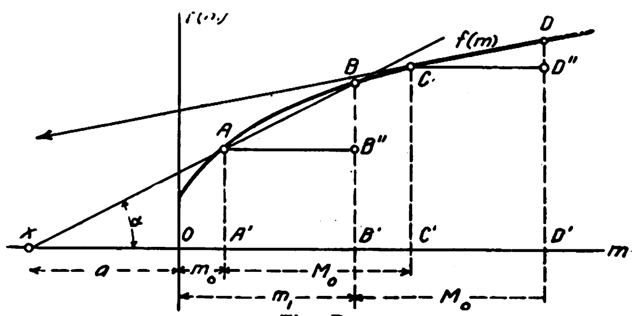

Fig. D.

On the same page a little below Fig. D, there is an error in the sign between the two parts of the modified relation (24). It should read as follows:

Multiplying by (-1) and adding $(b_1 - b_0)$ to both sides (24) becomes

$$(b_1 - b_0) - [f(m_1) - f(m_0)] \leqq$$
$$(b_1 - b_0) - [f(M_0 + m_1) - f(M_0 + m_0)]$$

FRANCE MAY USE POWER OF WAVES TO SAVE ITS COAL.

Practical experiments to determine the possibility of utilization of tidal power to make good for the coal shortage under which France is expected to suffer for a long time will be carried out under government auspices in St. Briac bay, on the north coast of Brittany. A committee has been appointed for the scientific investigation and study of hydroelectric power, and will undertake the experimentation by government orders.

Experiments are also being conducted to determine the possibility of replacing coal partly by gasoline.

Development of Favorable Public Opinion Toward Utilities

The Policy of Decrying Publicity and Information Has Changed to One of Taking Public Into Confidence—Employes and Stockholders Can Help—Paper Before Illinois State Electric Association

By JOHN F. GILCHRIST

Vice-President, Commonwealth Edison Co., Chicago.

A FEW months ago a prominent St. Louis banker spoke before a meeting called to consider the situation of the street railways, and stated that in the language of the street "they were getting just what was coming to them," or in more poetical language, "they were reaping the whirlwind." The well-informed men who listened to him felt that he was probably taking an extreme position to which he himself did not fully subscribe, in order to point a moral, or, if not, he was unreasonably severe, was not up-to-date and posted on the changed conditions which have prevailed during the last 80% of the time since public utilities came into existence, and that he had not analyzed the situation fairly. Furthermore, seriously or for effect, he was taking a view of the situation from the standpoint of an outsider, not appreciating the complicated fabric which linked his business with the one he was denouncing, which, if seriously injured, must injure his own business together with all others. In other words, he was sawing off the limb on which he was sitting—between himself and the tree—and yet this man's views typified the views of thousands of other people of like standing with himself as to intellect and judgment, and of tens of thousands of people not so well equipped to understand such matters, but who constitute the great rank and file of the people, who by their votes govern this great country of ours.

J. F. Gilchrist.

Early Appreciation of Public Utilities.

In the early stages of the public utility business people had not learned to give much thought to the rights of the public. The situation was quite different, and it was very natural that the managements of utilities, who looked upon their business as being private enterprises, should consider that they were conferring more of a favor upon the public than the public was conferring upon them. In the case of many public service corporations, all sorts of inducements in addition to liberal franchises were offered to encourage them to start in various communities. The people at those periods of the inception of the business having never enjoyed service of this kind apparently had the fullest appreciation of the value of utilities. Furthermore, they apparently recognized the fact that the public utility man was not the inventor of the systems newly discovered at that time, and that he not only had to pay more for patented apparatus (the inventors not being willing to forego their fair reward because the service was to be rendered to the public) but the future of the business was not assured and he had to pay high prices for money for investment purposes.

Starting in this way, utility managements have not appreciated the change which has taken place in the view of the people, and have not realized the importance of keeping the people informed. In fact, a well recognized policy, and unfortunately one which generally received the support and approval of the ablest managers, decried publicity and information. It adhered to the plan of sitting tight and saying nothing, regardless of the viciousness of attacks made upon them, apparently believing that this policy would result in such attacks wearing themselves out and charges being forgotten. Even at this date, when almost any body of intelligent men meeting for conference would agree that the best policy was to take the public into confidence, many managers will, as individuals, hesitate to be frank and open with the public, and if they put forth any statements at all, they will not make a full statement.

Now, it is common knowledge that differences between individuals almost invariably grow out of a lack of knowledge of what prompts certain acts. If two men doing business together know each other very intimately and they are both fair and honest, there is rarely any chance for trouble between them, but if they are not acquainted and attribute all kinds of motives to each other's acts, suspicion and distrust is likely to arise, which frequently leads to open rupture. The situation is no different as between a public utility and its customers, and there is much more chance for trouble in such a relationship because customers realize, generally speaking, that they can get the service rendered only from one source, whether they will or no, and they are much more likely to attribute avariciousness and wrong motives to the vendor under such circumstances than they are under any business relation where the purchaser can take his trade elsewhere if he is not satisfied.

Public Opinion All Powerful.

In this discussion we can assume that public opinion is all powerful, especially under a government such as ours, and that the cultivation of favorable public opinion toward any project which would succeed is not only desirable and necessary, but imperative. Public opinion generally builds up slowly. An adverse public opinion may reach serious proportions before pronounced evidence of its existence become particularly apparent, and when it has reached this serious stage it can only be overcome by a similar slow, painstaking process like the one which resulted in its creation; like a disease, it must run its course, and notwithstanding the application of remedies, it will generally go on to its crisis with attending disasters to those who have incurred its displeasure.

In every public utility, as in most undertakings, there are five principal factors—the public, the customers, the owners, the employes, and the management. In the development of favorable public opinion it is by efforts directed at or through these factors that all results will be obtained, and the attitude of these various branches toward each other will have most decided bearing on results. Let us assume that the management is honest and fair towards its customers, its employes, and the public, or at least that it intends to be, because many times the two things are not synonymous. A management may, from its viewpoint, believe itself to be most high-minded and most fair, but it is always dangerous to attempt in your business to administer justice, you being the sole judge of what is just. The wise management will miss no opportunities to see its motives and policies through the eyes of its customers and the public, and if in addition it will adopt the policy of considering in the investigation of all questions from the people that the customer is right and the company is wrong, until the contrary is proved, it will do much to establish fair methods and to set up in the community as a fair and popular institution.

Utilizing Employes to Build Up Favorable Public Opinion.

In the ordinary utility with a large number of employes, there is, in the building up of favorable public opinion, no more effective means than by utilizing the employes in all such activities. A careless, thoughtless, neglectful and surly body of employes can do more to injure the standing of a company than the management can by other means possibly offset, and if such a situation exists it is without question the fault of the management. Continuous work should be done, first, to make the employes realize that they and the management are all partners in an enterprise which, if successful, will be to the personal advantage of every one in the company, and, if not successful, will be to the disadvantage; second, to educate employes to realize what a factor each one of them is in establishing the company in the good graces of the public, and what a bearing their little every-day acts in their intercourse with the company's customers and the public have in developing public opinion. The employe who comes in contact with the public is the company from the standpoint of the customer, and the former's attitude is looked upon as the attitude of the company. If he is fair, courteous, faithful and painstaking he will make friends for the company; if the reverse is true he will make enemies, and, if anything, it is probably a little easier to make enemies than it is to make friends under such circumstances.

Aside from intercourse with the customers and the public in the ordinary course of his duties, the employe can do an incalculable amount of good to the company by talking about it on all occasions, praising its good qualities, explaining its difficulties and its ambitions, showing what it hopes to accomplish, and the ideals of service it believes in and is striving for. Too often in the public utilities this great factor is neglected; employes are not encouraged to support of their own company, and all too frequently are actually aligned against the company in its difficulties and relations with the community. This attitude must certainly grow out of a greatly neglected opportunity on the part of the management, as loyalty and pride in one's own institutions is not at all a rare human quality, and should be properly built up and directed. The mistake too frequently made by managements with regard to gaining the assistance of their employes is that they do not realize how small the opportunity of many employes is to learn the policy of the company and to learn enough about it and its affairs to appreciate what it is and what it is trying to do, and, consequently, how poorly equipped they are to explain these things to others. A management can hardly spend too much time and money in properly educating, cultivating and directing its employes along these lines.

Public Utility Should Have Personality.

A public service institution should have a personality in the same way that an individual or a firm has. We all have had the experience of seeing some popular young men who have joined in partnership develop a business. As long as the owners come directly in touch with their customers or are in daily contact with and supervise the employes who do come in contact with the customers, an atmosphere of service and courtesy is developed which makes for the success of the institution, but when it becomes so large that the management representing the owners and having high ideals as to the kind of service to be rendered to the customers becomes separated from the employes who are actually getting in touch with the customers, there is the gravest danger of a situation arising which may lead to misunderstandings, the lack of proper service, and trouble for the company. In all plans for the cultivation of the good will of your customers and the public the writer urges managements to be thoroughly alive to this danger and ever alert and diligent in seeing that there is no perversion of the company's policies towards customers going on without the knowledge of the management.

The stockholders, too, afford an opportunity for the spreading of information as to the fairness of the company, its desire to render the best service, its importance to the life of commerce and industry in the community, and such other information as may increase the value of a property by favorably advertising it and creating public favor toward it.

But no results from this avenue for favorable publicity can be expected unless it is properly organized, and by a long process of patient education, stockholders are shown that their active co-operation is desired, and furthermore, are shown how they can best be of service to the company. Much of the annoyance and embarrassment of companies, due to the fact that politicians firmly believe that corporation baiting is popular, would be choked off, and if the politicians or newspaper editors from whom they get their cue were, on the issuance of unfair criticism of deserving local enterprise, to receive a shower of communications, or even an occasional word of mouth quietly spoken, there would be established a doubt in their minds as to whether or not the chord on which they were playing was so popular.

Suppose, for instance, that 5% of the 200,000 public utility stockholders in Illinois should write a state representative, mayor or an editor advising him upon the occasion of his making an unfair statement that either he was misinformed or grossly unfair and that he was treading on the toes of a very large number of worthy citizens who were supporting the community by the taxes they pay, would it not have a very prompt effect? Merely to convince the average politician that 80% of the owners of $1,000,000,000 worth of securities of Illinois utility companies live within the state, principally in the communities served, and that most of them were people of small means, employes, savings banks, insurance companies and the like, would probably have the effect of making him very careful how he attacked such properties.

It does not seem impossible to build up and maintain in the minds of the utility stockholders of this state a knowledge of how they may help their own interests, as well as the interests of the community, to such an extent that 5% of them would promptly come to the front when any movement calculated to injure their interests was about to be promulgated.

Increasing the Number of Stockholders.

In this connection, the desirability of increasing the number of owners should not be overlooked. A public utility cannot have too large an ownership among the people of the community it serves. If it were possible that every customer could be a shareholder it would be most desirable. A prominent member of one of the utility commissions has said: "If you want to increase the popularity of private ownership increase the number of private owners." As an investment, what is more logical than the ownership of an interest in the public utility which serves the community in which you live? The tendency of investors, particularly new investors, too frequently is to invest in projects located far away. Distance seems to lend glamour. Too many people are skeptical of enterprises with which they come in daily contact.

Experienced investors are more and more given to the investment of money in places where their own personality and influence will be a factor in the prosperity of the project in which they invest. This thought should be in the minds of the small investor and he should carry out this policy. The public utilities of the country are enterprises which must exist for the good of all. There is not one, however high may be the cost of the service, where, if the utility did not exist, the citizen could render himself the same service and thereby conserve his time, strength, convenience and money except at a cost many times the charge made by the utility. Therefore, what is more logical than that the people joining together with their fellows in a community should own these utilities, than which there is nothing more safe, because the company's income is based on a service which is necessary to the welfare and existence of the people, and in connection with which each stockholder's influence, however small, may be used to the advantage of the property in which his money is invested.

Utility Securities for Small Investors.

Many utilites have made great progress in the wide distribution of their securities among the people of the communities in which they operate, but the possibilities are so great that the surface has hardly been scratched. Any company not vigorously exerting itself in this direction at the present time is neglecting, to the serious hurt of itself, the greatest opportunity which public service utilities have yet had a chance to take advantage of. There is a very wide distribution of wealth in this country—there is a lack of safe and suitable investments. With the letting down of the demand of our government to borrow money, the people who would be thrifty and save must find some other form of investment. The young man or young woman who, as a result of patriotically subscribing for the government loans, has learned to save and the fascination and satisfaction of owning securities will find some other place to put his or her money, and there is no better place than in the securities of a well-managed utility serving the community in which the young man or woman lives. Under the natural order of things the purchase of a share or two of stock by an embryo investor in a certain company will pledge him to this security as his favorite.

In the sale of these securities the services of the employes should be utilized. There is nothing which will equip the employe with information and give him faith in the soundness, integrity and progressiveness of his company like the acquirement of the information which he must have in order to explain to his neighbors and friends the workings of his company, the corporate structure, the property owned and the value of its securities, and what employe can go out and sell the company's securities and not be a booster for the company?

Good Will of the Press Important.

In the activities directed toward the public the approval of the press and such publications as circulate in the community is of great importance. The press is the natural medium to reach the people. As merchandisers of news the press is generally found to be fair and anxious to print information which will be interesting to its readers.

It is to the best interest of a community that the newspapers be unprejudiced, fearless and honest, and it is my belief that fundamentally a very large percentage of those who dictate the policies of the newspapers of this country are honestly trying to be all of the above in serving the best interests of their communities. But naturally they are in the newspaper business to make a living, which they cannot expect to do if they are not very active in taking up all kinds of inquiries which may lead to improvements.

There are very few newspapers in this country with which a broad-minded, fair utility manager can not work, not with any idea of squelching just and fair criticism of his properties but in an honest effort to improve the service which he is rendering to the community, and to keep the public fully informed as to matters of interest concerning the important enterprise in the community which he manages, advising it of his troubles and difficulties and the limitations which prevent the company's meeting any of the public views which from time to time spring up.

And thus you will probably reflect from the fact that so few of the utility managements are taking advantage of their opportunities in using the few mediums here referred to, that in view of the hundreds of other ways in which favorable public opinion may be cultivated, most of us have ourselves to blame if the public does not know as much as it should of our good work, our difficulties and our honest intention to render material service to them. If, lacking this information, they continue to listen to the slanderous statements of those who would advance their personal interests in such ulterior ways, then we have only ourselves to blame.

Electric Versus Hydraulic Drive for Steel-Mill Auxiliaries

Factors Affecting Choice of Equipment — Characteristics of Drives for Different Applications—Relative Costs—Paper Before Iron and Steel Engineers

By R. B. GERHARDT

Sparrows Point Plant, Bethlehem Steel Co.

CLIMATIC conditions as to atmospheric temperature variations affect selection to a very considerable extent. It is very desirable to eliminate all hydraulic power possible where mills are located in very cold climates or where it is not possible to protect a piece of apparatus from severe cold weather. Where a hydraulic system is already installed and hydraulic power is available, it is often more preferable, when considering an additional piece of apparatus which is considerably simplified by driving from a piston and cylinder, to hold to the hydraulic drive. Often good judgment dictates that an electric driven hydraulic plant for taking care of auxiliaries which are considerably simplified with hydraulic rather than with electric drive, is the best installation; as in the case of large bloom or slab shears which would require a flywheel motor-generator set and special driving motor if electric drive were used.

Location and Control.—From the control standpoint the electric drive almost always has an advantage over the hydraulic drive, for the electric controller is usually a more convenient piece of apparatus for an operator to handle than a hydraulic valve, and for adaptability to location it has a decided advantage over the valve.

The distance of the piece of apparatus under consideration from the hydraulic supply mains is quite a factor in making a selection between the two types of drive, as it is very costly to transmit hydraulic power any distance due to expensive piping, loss of power due to friction, and liability to leaks. On the other hand, such distance is no item whatever with electric transmission. The expense of operating a hydraulic system is very high if constant vigilance is not maintained to avoid leaks and to keep dirt and grit out of the water in the system.

Adaptability to Specific Equipment.—The main difference between the two kinds of power under consideration is that one more readily is transferred into a reciprocating motion and the other into a rotary motion. Considering two drives, one hydraulic and the other electric, for operating a certain piece of apparatus having a straight line motion, if the hydraulic engine and the electric motor were built under the same specifications as to capacity and ultimate speed of the apparatus they drive, without the specifications having outlined a complete duty cycle, the probable result would be that the speed of acceleration of the two equipments would be somewhat different for the following reason: with the electric motor drive the torque developed in the motor has considerable work to do in overcoming the inertia of the motor armature and other rotating members of the drive, while the force acting on the piston of a hydraulic drive usually has fewer parts to accelerate and considerable less inertia to overcome. The control of each equipment is a factor in the time of acceleration, since with the electric motor the torque is proportional to the current and the controller regulates the current to the motor; while with the hydraulic equipment the control valve admitting the water regulates the quantity of flow to the cylinder which affects the force acting on the piston. It should be pointed out in the one case the feature limiting the torque which can be developed by the motor is the mechanical and electrical limits of the machine itself, while in the other case the pressure on the hydraulic system limits the force available for doing work.

Efficiency.—With regard to efficiency, the electric drive has an advantage over the hydraulic drive. Pressure engines are very efficient at full load, but their efficiency decreases as the load decreases. With the electric motor the efficiency varies but slightly between wide limits of load.

Considering then each of the particular auxiliaries before mentioned which under present day practice are being installed with either method of drice, we arrive at the following detailed conclusions:

FURNACE DOOR HOISTS.

The operating mechanism for a furnace door is usually quite simple when hydraulic power is used. A cylinder and piston is supported above or behind the furnace for each door, and the door is handled by this piston through chain or cable which passes over a sheave attached to the furnace directly over the door. When electric power is used the cylinder and piston are replaced by electric motor, connected with suitable gearing to a crank which has a throw equal to the maximum lift of the door. Sometimes a special motor-driven drum is used instead of the crank as in the case of the electric door hoist. With the electric drive the door is usually counterweighted. In cases where the control for a great number of furnace doors is grouped in a pulpit, the electric drive has a decided advantage. Sometimes an electric operated valve is used with a hydraulic drive when this pulpit control is desired.

Table I gives a comparison between hydraulic and electric drive for a heating furnace door.

TABLE I—FURNACE DOOR HOISTS.

	Hydraulic.	Electric.
Initial cost	$703.00	$2009.00
Power per year	4.40	5.15
Maintenance and repair (labor)	93.60	10.40
Cost per year (material)	62.40	20.80
Depreciation and interest	70.30	200.90
Total expense per year	230.70	237.25

Furnace Covers.

The apparatus for handling a furnace cover is in a great many respects similar to the furnace door hoist except that in this case a motion of translation is required instead of a raising and lowering motion. The soaking pit furnace cover is usually carried on wheels and made to traverse back and forth over the furnace by means of a hydraulic cylinder anchored to the furnace at one end and connected through piston and a long rod to the cover. When the electric drive is used the cylinder is replaced by a motor and suitable gearing, meshing into a long rack which is attached to the cover. Sometimes the electric motor drives a long rod, attached to the cover, back and forth through a suitable friction, and in this way one motor can be used to handle more than one furnace cover.

The points as to convenience of control hold the same in this case as with the furnace door.

TABLE II—FURNACE COVERS.

	Hydraulic.	Electric.
Initial cost	$4020.00	$8150.00
Power per year	11.75	9.36
Maintenance and repair (labor)	105.00	24.00
Cost per year (material)	83.20	46.80
Depreciation and interest	402.00	815.00
Total expense per year	601.95	895.16

Elevators.

The elevator used in the steel mill very closely resembles the general freight elevator used in commercial work.

Table III gives data on each type of elevator for a particular installation.

TABLE III—ELEVATORS.

	Hydraulic.	Electric.
Initial cost	$41,000.00	$22,000.00
Power per year	1,944.00	691.20
Maintenance and repair (labor)	434.00	425.00
Cost per year (material)	890.00	720.00
Depreciation and interest	4,100.00	2,200.00
Total expense per year	7,368.00	4,036.20

Blooming Mill Manipulator.

The side guard manipulator for handling and turning steel during the rolling process in the blooming mill is at the present time the manipulator most commonly used. Essentially it consists of two long heavy steel plates carried vertically on edge directly over the mill live table rollers, one toward either side of the table. These plates are supported from independent movable beams located underneath the table, by means of arms extending up between the table rollers. The beams, of which there are usually two to each plate or guard, are carried on guide rollers and attached at the ends to hydraulic pistons, or through suitable rack and pinion to electric motors, which actuate the plate or guard back and forth in a direction parallel to the axis of the table roller. A piece of steel on the table can be caught between the two side guards and carried back and forth across the rollers to any desired position. To turn the piece, fingers are provided, which work vertically up and down just inside one of the guards. These fingers are carried with the guard on suitable supports and by means of a separate cylinder and piston; or electric motor and crank mechanism, acting through a lever, shaft, and bell cranks, receive the vertical motion mentioned.

Table IV gives a comparison between two such drives for a particular manipulator:

TABLE IV—SIDE GUARD MANIPULATOR DRIVE.

	Hydraulic.	Electric.
Initial cost	$22,566.00	$23,850.00
Power cost per year	2,308.80	898.56
Maintenance and repair (labor)	220.80	93.60
Cost per year (material)	271.00	145.20
Depreciation and interest	2,256.60	2,385.00
Total expense per year	5,057.20	3,522.36

Lifting Tables and Middle Roll Balance.

These two mechanisms are usually considered together on a three-high plate mill and will be so considered in this comparison. Essentially the hydraulic lifting table mechanism consists of a cylinder located under the table, having a piston and rod connected through a link to a suitable system of bell cranks which actuate the table vertically up and down according as the piston is forced into or out of the cylinder. With the electric driven lifting table the motor drives through reduction gearing to a crankshaft which through a connecting rod actuates the bell cranks above referred to. In each case the tables are usually counterweighed. The hydraulic middle roll balancing mechanism consists of cylinders carried on the mill housings, the pistons of which transmit a vertical motion through the rods to heavy link members connected at the lower ends to centers of beams which are attached through rods at one end to the mill housing in such a way as to give a straight line motion to the other ends which carry the middle roll. With an electric drive the motor is connected through reduction gearing to a crank shaft which imparts a vertical motion to heavy hollow weights open at the bottom, by suitable connection through rod, shaft, and bell cranks. These weights telescope over other weights pinned to one end of walking beams which are supported at their center on trunnions carried on pedestals under the mill housings. To the other ends of these beams are pinned yokes each carrying two vertical rods which support at the tops a shoe carrying the middle roll. Ordinarily the middle roll overbalances the weight on the end of the walking beams and stays in its lower position, but when the telescope weight is lowered on the top of this weight the balance is overcome and the middle roll rises to its top position. To prevent a severe shock when this telescope weight is lifted through the gearing, crank shaft, and levers, it is supported by a heavy spiral spring interposed between a rod carrying the weight and the actuating lever.

Table V gives data on the two methods of drive for a particular mill.

TABLE V—LIFTING TABLE AND MIDDLE ROLL BALANCE.

	Hydraulic.	Electric.
Initial cost	$36,370.00	$41,600.00
Power per year	14,030.64	3,895.00
Maintenance and repair (labor)	588.72	285.60
Cost per year (material)	787.20	518.40
Depreciation and interest	3,637.00	4,160.00
Total expense per year	19,043.56	8,859.00

Shears.

A hydraulic shear is probably the simplest piece of hydraulic machinery in the mill. It usually consists of a heavy frame carrying at one end in a suitable housing a knife blade, and at the other end a cylinder. The piston carries the other knife blade and works in and out of this cylinder producing a shearing action between the blades. Hydraulic shears are usually build up-cut or down-cut. The particular shear selected for this comparison is one of the latest design using a steam intensifier for securing pressure for the cutting stroke. With this arrangement there are two distinct hydraulic systems used, one a closed system directly between the cutting cylinder and the intensifier, and the other the regular mill system connected through suitable valves to cylinder for the return stroke. By using the steam intensifier greater economy is gained, as the expansive power of the steam is utilized also; it is possible to get up to working pressures of 6000 lbs. per sq. in.

The electric driven shear requires a considerably heavier frame casting. The lower shear blade is held stationary in this frame and upper shear blade receives its motion through either a crank, eccentric, or cam action. The driving motor is geared through countershafting to this crank, and a heavy flywheel is mounted on the countershaft. Usually the motor and flywheel are allowed to run continuously, the shear being operated by throwing in a clutch on the countershaft. More recently, on account of trouble encountered with such a clutch, the flywheel has been omitted and the motor geared directly to the shear, the motor being started and stopped in this case with each cut of the shear. Such a design of motor-driven shear is the one considered in the following calculations.

Table VI gives data on the two types of drive for a particular bloom shear application.

TABLE VI—SHEARS.

	Hydraulic.	Electric.
Initial cost	$22,640.00	$39,600.00
Power per year	5,723.47	4,310.70
Maintenance and repair (labor)	328.00	135.60
Cost per year (material)	385.76	334.00
Depreciation and interest	2,264.00	3,960.00
Total expense per year	8,701.23	8,740.30

SUMMARY.

With each of the foregoing comparisons, in the case of the initial cost of the hydraulic drive the proportional cost of an electric driven hydraulic pumping station is included.

The fixed charges are always one of the main items of expense, and this is taken in all cases as being 10% of the initial cost. Except in the case of the furnace door and cover drives the item of power is highest or second highest. The cost of a unit of electrical energy was taken as being 1 cent per kw-hr.

To obtain the cost of power with hydraulic drive a test was conducted on the pumping plant which consists of three 7½-in. by 24-in. horizontal, duplex, end-packed, plunger pumps, each direct-connected through reduction gearing to a 350-hp., a-c. slip-ring motor. An automatic governor is arranged to start and stop the motors one at a time, depending on the demands on the hydraulic system. By means of a large accumulator located outside of the pump house the pressure is maintained constant at approximately 750 lbs. The results of the test mentioned show a power consumption of 8 watt-hours per gallon of water pumped.

Under maintenance and repair costs are considered: with the hydraulic drive, cylinder and rod packing replacements, cup leather and valve renewals, and lubrication; with the electric drive, controller repairs and contact renewals, motor brush and pinion renewals, and lubrication.

It should also be remembered that the prices here shown do not hold good in general, as they are all war prices and cover a particular installation at a certain location. The figures are only given for the purpose of making a comparison.

Reviewing each of the tables the author draws the following conclusions: In the case of the furnace door hoists the expense of operation is about the same with hydraulic or electric drive. The initial cost of the electric drive is almost three times that of the hydraulic drive. With the furnace cover drives the advantage as to expense of operation and initial cost lies with the hydraulic drive. Ease of control has a decided advantage in the case of the electric drive, and the hydraulic furnace covers for a large mill might require more operators than electric covers, in which event the expense of one additional operator would more than offset saving indicated with the hydraulic drive.

The electric driven elevator has an advantage over a hydraulic elevator in both operating expense and initial cost.

For driving the side guard manipulator the electric motor has an advantage over the hydraulic cylinder in operating expense, and the initial cost of either drive is about the same.

The electric drive for lifting table and middle roll balance on a three-high plate mill costs considerably more than hydraulic drive, but has a decided advantage over the hydraulic in operation expense.

There is comparatively no difference in the cost of operation between an electric driven and a hydraulic bloom shear, but the initial cost of the electric drive is considerably higher than that of the hydraulic drive.

There is probably very little difference between the reliability of the hydraulic drive and that of the electric drive in each of the above mentioned applications however.

The hydraulic field covering large power presses and forges has not, up to the present time, ever been invaded by the electric motor, but this does not necessarily mean that the electric drive cannot be adapted to do this work. More than likely it is the prohibitive cost which has kept the electric motor out of consideration. The motor-driven intensifier, before mentioned, is the entering wedge for the electric drive in this field.

NEW HYDROELECTRIC PLANT NEAR WINNIPEG, MAN.

One of the largest hydroelectric plants in America is to be built at Little du Bonnet falls, on the Winnipeg river, near Winnipeg. It is proposed to expend $9,000,000 on the work and the expectation is that 160,000 hp. will be developed. The first step in the project will be the building of a concrete dam 2000 ft. long and of a maximum height of 70 ft. across the Winnipeg river at Little du Bonnet falls. The dam will create a reservoir from 50 to 70 ft. in depth, extending several miles up the river to the second McArthur falls, and, by raising the river's level will drown out Grand du Bonnet falls, where the river drops 35 ft. in four plunges. Eight turbines of 21,000 hp. each, of four-runner, horizontal shaft type, will be installed in pits in the concrete substructure. The water from the reservoir will pass directly into the turbines at 20,000 cu. ft. per sec. The power generated at the plant will be transmitted to Winnipeg by a double-circuit line supported on structural towers 54 ft. high. A second double-circuit line will connect the power house with the power plant at the Winnipeg Electric Railway at Pinawa higher up the river. A double-loop connection will thus be maintained between the city and the source of power.

FIFTIETH ANNIVERSARY OF THE WESTERN ELECTRIC COMPANY.

From Extremely Modest Beginnings in 1869 the Company Has Grown to Be One of the Largest Electrical Manufacturers in the World.

Half a century of continuous existence is no new thing in American business, but the significance of such a life in the electrical industry is indeed great because, properly speaking, the electrical industry belongs to the present generation of men.

In November of this year the Western Electric Co. celebrates the fiftieth anniversary of its birth. It began in 1869 as a small two-man concern, founded by Elisha Gray and Enos M. Barton. The firm was known as Gray & Barton.

As the telegraph was practically the only application of electricity which had been brought into any considerable commercial use in 1869, undertaking to manufacture electrical apparatus required not only vision but indomitable faith and energy together with sound business sense. Mr. Barton had these qualities and sensed the opportunity which was offered when he took over the Cleveland shop which the Western Union Telegraph Co. had decided to abandon. Soon after the new concern moved to Chicago.

Before the day of the telephone the little shop manufactured telegraph apparatus, signal boxes, registers, annunciators, call boxes and fire-alarm apparatus. After the advent of the telephone in 1875 the company was busy making equipment for the exchanges of the Western Union Telegraph Co. In 1879 the retirement of the Western Union from that field gave the control to the American Bell Telephone Co. This company had hitherto purchased its telephones from competitive manufacturers, but, recognizing the superiority of the equipment made for the Western Union, it entered into a contract with the Western Electric Co. which provided that the latter should make all the telephones for the American Bell's use.

The needs of this service quickened the inventive genius of the company's engineers and brought a corresponding and ever increasing expansion of its volume of business.

The common-battery lamp switchboard of today was evolved from the crude switchboard of the early seventies, the attractive desk stand telephone from the cumbersome box type. The paper-insulated lead-covered cable solved the problem of the necessary increase in the number of open wires as telephone service became popular, and the establishment of transcontinental wire communication and transoceanic wireless communication solved the problem of long-distance transmission. In the telegraph field the multiplex printer is an achievement of the Western Electric engineers in co-operation with others.

To meet an ever increasing demand for products which it did not make, the company bought such goods of the makers and resold them to the user. Out of this early relationship of buyer and seller has evolved the largest electrical jobbing organization in the world, operating from 42 distributing houses. These houses perform a two-fold function. By virtue of the supply contracts with the American Telephone & Telegraph Co. and associated companies, they supply all the apparatus and supplies for these companies, thus effecting tremendous economies as a result of being able to purchase greater quantities than each individual company could.

Further than this, each distributing house maintains large stocks of materials and electrical appliances for every possible electrical need. It is prepared to supply materials for building pole lines; for equipping and wiring homes, offices and factories, and for supplying electrical appliances for simplifying housework.

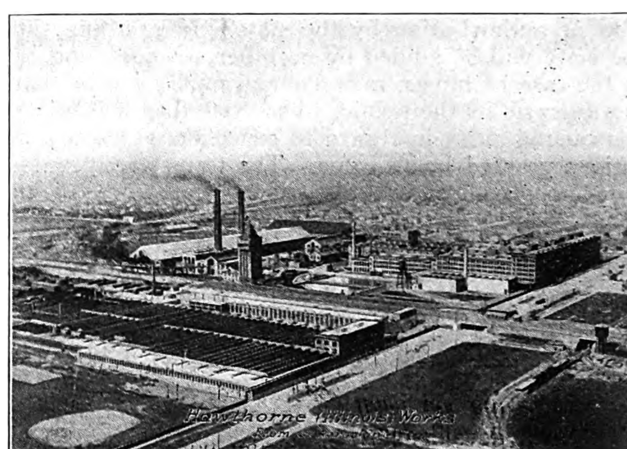
The company also maintains a large manufacturing plant built at Hawthorne, at the city limits of Chicago, Ill., in 1903. This plant is constantly being enlarged to meet the fast increasing needs of the telephone manufacturing end of the business. The employes of this plant, together with those from the 42 branch houses in the United States and the foreign houses, constitute a working force of over 30,000 men and women.

The telephone was an American invention and to the Western Electric Co. belongs the credit for having the foresight in 1879 to lay the foundations for an enduring business in foreign lands.

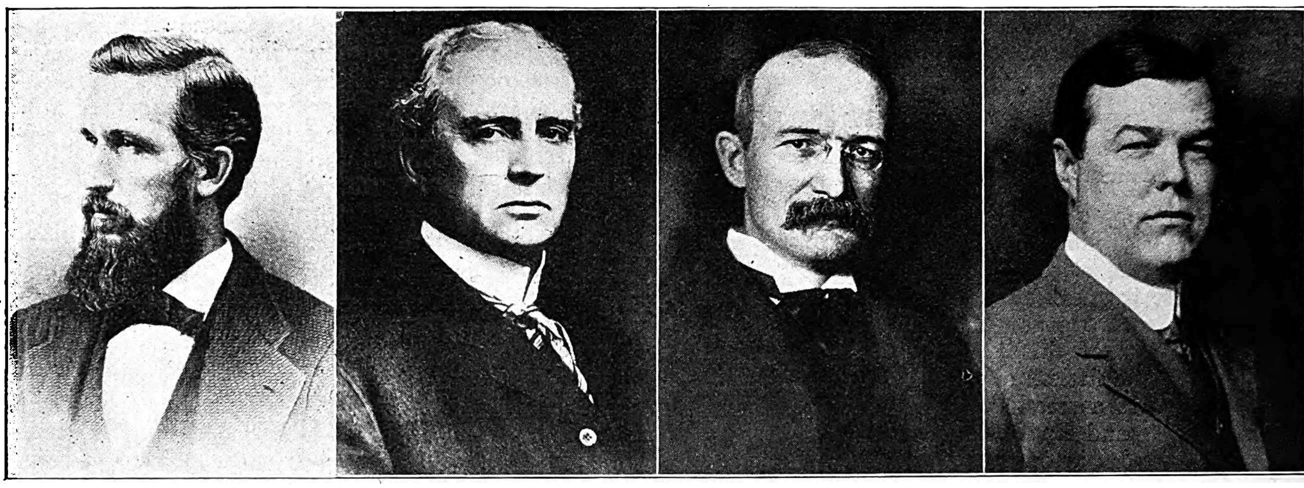
At the present time it has associated companies in Belgium, Switzerland, Argentine, Norway, South Africa, England, Italy, France, Australia, Japan and Holland, and allied companies in China, Russia, Austria and Hungary.

The Western Electric Co. played a prominent part in the World War. It has been said by experts that the American Army could not have functioned without the modern telephone system which was built in

Building on Kinzie Street, Chicago, Where the Company Established Its First Plant, Shortly After Organization of the Business in 1869 by Gray & Barton.



Hawthorne Works of the Western Electric Co.—This is Now the Principal Plant of the Company and One of the Largest Electrical Works in the World.



Successive Executives of the Western Electric Co. During Its 50 Years.

Elisha Gray, President, 1869-1887. Enos M. Barton, President, 1887-1908. H. B. Thayer, President, 1908-Dec., 1918. C. G. Du Bois, Became President in 1919.

France between the front line and the seacoast. The multiplex printing telegraph was put to the test in handling the armies of the Allies. In the air, the company did notable work in the development of radiotelephone equipment, particularly as applied to communication between airplanes and the earth, while on sea, in addition to the great practical utility of the radiotelephone from ships to the land, and from ships to each other, the submarine detecting equipment as developed by engineers both here and abroad undoubtedly was an important factor in defeating the submarine peril.

Apparatus was likewise developed for use in the locating of enemy artillery fire, and equipment for use in the listening posts in advance of the lines.

In addition to its work on telephone apparatus, the company was able to serve the Government in conspicuous fashion by assembling and shipping to the other side large quantities of electrical supplies of every character.

At the same time the foreign allied houses manufactured large quantities of equipment which were used by the allied armies.

NEW FRENCH WATER-POWER LAW.

The new law on water power in France provides that no one may use the power of the tides or of the water courses of whatever category without a concession or authorization by the state. In granting this the state will be guided by no other consideration, as in the case of mines, railways and public works, than the interests of the public. The state that will be the contracting partv in regard to concessions or authorizations granted in its name. The term water course is to include all natural or artificial waters, canals, or rivers, and even the mountain lakes which are frequently sources of energy.

While including within its discretion the use of the tides, the new law recognizes that the utilization of the varying levels of sea water as power generators is far from being efficient; in fact, that it has only been approached theoretically, no practical application thereof having yet been established. It is capable of subsequent development.

It is recognized that the water-power concessions will be made to great and small concerns; and in regard to the latter the new law embodies a novel idea. The factories that furnish current for the illumination of villages are often very small, and use only a few horsepower. In the basin of the Seine, for example, in 1910 there were 149 factories for community lighting, of which 36 possessed the normal power of 2 to 10 hp., 43 of 11 to 20 hp., 23 of 21 to 30 hp., 13 of 31 to 40 hp., and eight of 41 to 50 hp.

It appeared to the framers of the law that the state should not make its intervention too direct in these small concerns where such might become vexatious, and that the state need not in these cases exact certain costly formalities. The state proposes, therefore, to leave the law now in existence, as it is for concerns of which the maximum power does not exceed 50 kw., the effect of which provision would be to enable little factories, not using over 30 to 35 hp., to neglect concession formalities. The second category includes factories of a maximum power of over 500 kw. for whatever purpose.

PROPOSED RAILWAY ELECTRIFICATION IN FOREIGN COUNTRIES.

European and South American countries, with the exception of England alone, lack an adequate supply of fuel, but many of them, including Norway, Sweden, Switzerland, Italy, Spain and Brazil, have large amounts of water power, while France has a moderate amount. These resources, combined with the high cost of fuel, make extensive railroad electrification in these countries inevitable sooner or later. Switzerland has a well established program covering a term of years, while both Norway and Sweden are giving active consideration to definite projects. In England a considerable amount of electrification is in contemplation along with the general plan for the electrification of industry. A French commission, composed of government and railroad engineers, has already visited the United States in order to thoroughly familiarize themselves with American practice. The Italian government will continue its definite program as soon as financial conditions permit. An official Belgian commission is already planning to rehabilitate with electric power at least a portion of the railroads destroyed during the war. In Spain, Brazil and South Africa as well, railroad electrification is under active consideration.

Editorial Comment

The Coal Miners' Strike

AS WE go to press, it seems that no assembly of forces can be marshalled to avert the impending bituminous coal miners' strike. The public will again suffer heavily as the "innocent bystander." And in the individual sense it probably will be more concerned with the inconveniences caused than with the merits of either factor in the controversy.

As customary in public calamities of this character, curative treatment will overshadow the preventative. As we are being drawn into this thing, which should never occur in this great, rich country of ours, government officials are perfecting a program to meet the situation. This program, besides including steps to break the strike, will provide means to revive the Fuel Administration, to prevent hoarding and profiteering, to re-establish maximum prices, and to allocate and distribute coal to homes, railroad and essential industries.

The question that every central station faces is how long will the supplies of coal available suffice? This in turn depends upon how long the strike lasts or how long is required for conditions to settle down to those of one month ago. In circumstances such as these conservation is sound. Coal must be conserved in every way feasible. What is feasible depends upon the strike situation during the days to come. The central station must be prepared for the worst.

The present high price of coal causes operating economies to be quite generally maintained. Little therefore can be done now in this connection to save coal. Every little helps and every little that can be done should be done, should have been done long ago. If the rate of coal consumption is to be lowered appreciably it will be necessary to accomplish this not by only increasing the efficiency a small percentage, but also by curtailing load. Deciding just where load should be curtailed—bearing in mind that such is an emergency measure only—is not an easy matter, because there are so many aspects to the problem—financial, technical, commercial and legal.

If a coal shortage seriously threatens conditions will rapidly assume those existing during the worst period of the war. The revived Fuel Administration or similar agency will doubtless adopt the same effective tactics followed in those days of lightless nights, heatless Mondays and when the absolutely non-essential industries were closed down. The central stations can follow tactics similar to these upon their own initiative and according to the seriousness of their depleted coal supplies.

Dark days may be ahead, literally and figuratively speaking. We do not know. But we do know that once again has been brought home to everyone the wisdom of having coal stored away. Not long ago we said in these columns that the time to store coal was then. The days to come will prove that advice both sound and wise, for if needed the coal is there.

Without coal supply, manufacturing dwindles and transportation stops. Production is one of the crying needs today. Without coal the world shivers, sickens and starves. Coal is a vital, indispensable thing—the foundation of comfort, of industry, of modern civilization. It is a sad weakness of our industrial system that controversies over the remuneration or other details of employment cannot yet be settled amicably and with reason instead of resorting to stoppage of work, often involving violence, and thus depriving the public of one of the most vital necessities of modern life. The collapse of the national industrial conference, upon which everyone looked to help solve this problem, has therefore left the country at the mercy of the contending industrial factions.

The A. I. E. E. Publication Policy

THROUGH its Board of Directors, the American Institute of Electrical Engineers has launched a radical change in its policy respecting the publications it issues. Heretofore the monthly *Proceedings* and the annual *Transactions* have been issued at considerable expense out of the general funds of the Institute and in the last few years this expense has quite materially increased, as has that of all publishers without exception. Consequently the issuance of the publications has become more and more of a burden on the general resources of the Institute. Among the recommendations made a few months ago by the Development Committee, which was charged with making a thorough investigation of Institute affairs to the end that means be found for making the organization more valuable to the membership at large, was that a policy be adopted which would make the Institute's publications, especially its monthly, of much more value to the members than at present and yet make them self-sustaining and no longer a burden on the general resources.

A similar problem was presented to the American Society of Mechanical Engineers a year or so ago and it was solved by greatly expanding its monthly *Journal,* the expense thereby involved being met by taking on a great deal more advertising than before. It is reported that the enlargement of the *Journal* has not only proven very popular with the membership of that society, but that its advertising income has made it entirely self-sustaining.

In view of the evident success of this sister society's changed publication policy, it was but natural that the A. I. E. E. should follow this precedent. This has now been done. The action comes after considerable discussion and after quite a few members raised their protest against a national technical society falling back upon commercial support to relieve the membership from sharing equitably in meeting the increased costs of operation. Similar protest was made in the A. S. M. E. against thus lowering the society's ethics.

However, the majority rules and the only question remaining is to put through the new policy without further lowering of the dignity and standing of the Institute. If the income from advertising is put back entirely into the publication fund, but few will find fault. While the caution may not be needed, it should be emphasized that any attempt to use this income for the general needs of the Institute would immediately open it to the charge that it is no longer conducted "not for profit."

Minimizing Noise and Vibration in Substation Buildings

ECONOMY of investment in conductors and economy in operation because of line losses, as well as good voltage regulation, all favor the location of substations at the center of gravity of the load, present or prospective, as the case may be. As the result many substations are built in residential or commercial districts, where the population is comparatively dense and housings somewhat congested. Apparatus so located, whether for supplying power and lighting or street railways, should operate as noiselessly as is practically feasible.

Litigation has occurred in the past, although it must be said the cases are few and far between, because some property owner or some tenant has claimed damage was being done him on account of vibration or noise, these two either singly or combined being claimed to be giving rise to injurious effects. Apart from this aspect of the matter, which embraces matters of public policy and relations, electrical apparatus that must from necessity or from choice be located in residential districts especially, or anywhere else for that matter, should make a minimum of noise and commotion.

The manufacturers have done quite a lot toward making both static and rotating electrical apparatus operate more or less noiselessly. They have reduced vibration and noise due to loose laminations and the rattling of parts. They have very largely reduced humming at pole tips and air gaps due to high flux density and hysteresis loss. They have minimized whistling and singing due to windage. All these are influenced by design and all are contributing factors that go to make up the elusive but nevertheless very real "stray loss," so whatever is done to reduce noise and vibration is a movement in the direction of higher efficiency.

However, while the onus for making electrical apparatus noiseless may devolve upon the manufacturer, and whether apparatus is relatively noiseless is very largely a matter of unit cost—how much the purchaser is willing to pay for silent operation—the operator of equipment is not altogether lacking in opportunity to decrease noise. By proper installation, noisy apparatus may be so installed that noise and vibration are restricted instead of magnified, concentrated and dissipated instead of distributed. In other words, the method in which noisy apparatus is installed and the type of structure in which it is housed may be factors that decide whether certain apparatus is to make a noise that is objectionable or whether that same noise shall be unobjectionable. The responsibility for this rests with those concerned with the substation building and the installation of the equipment in it.

While the conditions to be met by the designer of the electrical apparatus may be complex, those encountered by the architect and construction engineer are comparatively simple and, in the main. self-evident. Windows, and especially needless windows, should be omitted from the substation walls to reduce the transmission of noise. What windows are used should be located so as not to be in direct path of air currents upon which noise is carried away. Walls should, where possible, be built with air spaces to form a cushion which will impede the passage of direct noise. The foundations for apparatus should be isolated and distinct from the walls of the station, thereby reducing the transmission of both vibration and noise. Where forced ventilation is employed the ventilating system should be so arranged that it does not act as a duct for air-borne noises to the outside of the building. These are all conditions that can be met by the architect once he appreciates the situation.

More specialized are those cases where forced ventilation is employed and where machines are totally inclosed either for purposes of shutting in noise or carrying away thermal losses; pads can be installed underneath transformers and induction regulators; soundproof rooms often are the indicated solution. These are matters for the electrical and construction engineers rather than the architect.

It may be pointed out that whereas the construction engineer can fairly readily adopt measures during and subsequent to the time equipment is installed to reduce existing noise and vibration, the architect must make his plans well in advance, since it is usually too late when a structure is erected to then commence to isolate foundations, build partitioned walls and change the location of windows. The moral from this is, of course, to familiarize the architect thoroughly with the problem of reducing noise and vibration from electrical apparatus and co-operate that the end may be eventually attained by prevention rather than eradication.

Current Events

Steinmetz on Power Supply — Radio Interests Combine — A.I.E.E. Publication Enlarged—Illinois Association Meets

STEINMETZ' CHICAGO LECTURE TELLS OF FUTURE POWER SUPPLY.

Crowded Joint Meeting Listens to Famous Engineer's Discussion of Power Supply and Generation.

On Oct. 29 Dr. C. P. Steinmetz, of Schenectady, N. Y., gave his annual lecture before the Chicago Section, American Institute of Electrical Engineers, and the Electrical Section, Western Society of Engineers when he addressed an overflow meeting at the Art Institute, Chicago, on "Power Supply and Generation of the Future."

In his typical manner Dr. Steinmetz first took up the question of what is the meaning of energy supply. There are two entities essential to the civilization of today. One of these is materials, the other energy. It is the characteristic of the age that these materials come not from the immediate vicinity where we use them, but they come from a distance. Where once a man produced his own leather and made his own shoes, today he purchases them or at best produces only one small part of the whole. This means that transportation by railroads, steamships, etc., is a vital factor in the civilization of today. Transportation is in part responsible for the high state of civilization as it is found now.

Energy is the ability to "do." It is energy in some form that transports the materials, as by trolley, by locomotive and truck. Just as our existence depends upon materials, so it depends also upon energy. It is essential if we are not to cease to see when night comes, it is required to create heat to keep us warm and to aid our limited muscular power. The question is how to obtain energy and how to supply it? It is very largely a matter of systematized transportation of materials.

Dr. Steinmetz then discussed the difference between energy and power, explaining that power is the rate of doing work. Lightning strokes are over in a fraction of a second; their power is enormous, their energy extremely small. Energy, like matter or materials, cannot be destroyed, but only converted or transformed into some other form. In obtaining this essential energy, man has called upon nature's most readily convertible sources of energy—coal (including oil and gas) and water power. The energy in these materials must be transported from where it is found in the raw state or material state to where it is to be used. This brings up the problem of transporting energy and converting that energy from a nonusable form or form not wanted to the form in which it is wanted.

Of the two forms of energy that may be transmitted, chemical and electrical, chemical energy for secondary distribution is excluded. For general distribution only electrical energy is available. It is electricity that makes the widespread supply of energy to civilization possible for any and every purpose. By a network of transmission lines the large industrial plant and the small individual household can alike obtain energy whether it be for operating the huge steel mill, for making steel, aluminum and carborundum or for operating the fractional-horsepower motor in the home.

In the early days electricity was used for light, supplied by local stations. Then came power and trolleys, with power plants farther separated. Today light, heat and power utilize electrical energy as the working medium generated in large stations. Where once each man produced himself his major necessities of life, today a man specializes in some one thing. Every industry is a combination of two industries—the production of goods and the production of power. But in this age of specialization power production and distribution has become a specialized industry. The first to realize the need for and possibilities of specialized power production was Samuel Insull, of Chicago, whose power generating system is the largest in the world.

This industry of power supply is covering the country with transmission and distributing lines. Primary distribution is in large bulk at high voltage to substations. Secondary distribution is in smaller bulk at lower voltages. Systems are being interconnected, as are also stations. Much chemical energy is transported by boat and rail and is then converted to mechanical energy and then into electrical energy, then transmitted. There are some generating stations at the coal mines and these eliminate the transportation of chemical energy. There might well be more.

In this country 800,000,000 tons of coal (including the equivalent in gas and oil) are consumed annually. If a wall were built of the size of the famous Chinese wall, only using one year's coal consumption as the building material, it would encircle the entire boundaries and coasts of the United States. The energy of all this coal would be sufficient to raise such a wall 200 miles into space.

Consideration of water power as an alternative source of energy shows that even if every drop of rain were utilized the water power would amount to only about one-quarter that already obtained from coal. The potential water power due to our annual rainfall is nearly 1,000,000,000 kw-yrs. Much of this is impossible of utilization for power purposes, however, because agriculture needs much water. Allowing for the requirements of agriculture, for losses by seepage, evaporation, etc., there would be left for power production through the use of lakes, dams, etc., sufficient water to produce a maximum of about 200,000,000 kw-yrs., or about 260,000,000 hp-yrs. On the basis that one ton of coal is equivalent to one kilowatt-year, and remembering that 800,000,000 tons of coal are already consumed each year with gradual increased yearly consumption, it can be seen that there is not enough water power to replace our coal and that the idea of doing so is an idle dream.

But water power should replace coal where possible. Water power is scattered widely; often sources of power are but small. These water powers should be harnessed and their energy collected, combined and distributed. Small powers, low heads and intermittent flow mean that these stations must operate without attendants, must be automatic so as to run when and according to the water available. Induction generators that come in upon the system when water permits and function without manual supervision offer the solution to economical utilization of the small water-power plants. In the New England states alone many old power sites of 100 hp. and thereabout could be put to use through linking up to a common system.

Turning to other sources of energy, Dr. Steinmetz next spoke of energy derived from wind, one of the first sources of power to be used by man. Wind is erratic and the energy available is relatively small. But so is the flow of water sometimes, although water is less irregular than wind. Wind could be utilized by installing wind mills upon transmission-line structures. Each structure would have also its transformer which would connect the generator to the transmission line. Wind-driven generating stations might prove more economical in the desert than a coal-burning plant.

Turning then to the utilization of tides and waves, Dr. Steinmetz pointed out that the amplitude of tides varies. Using tide would be like using a piston with a stroke every six hours. Tidal energy would have to be changed to ordinary hydraulic energy, equivalent to a low-head waterfall with a changing head.

Solar energy, obtained as radiant heat from the sun, is another method of making energy available to man, a method of vast possibilities for the future, but not feasible today. While from all available water power 200,000,000 kw-yrs. might be obtained annually, and from coal at existing rates of consumption 800,-000,000 kw-yrs., from solar energy 100,000,000,000 kw-yrs. could, theoretically, be obtained, or 100 times more than from coal and water combined. How this could be done economically, said Dr. Steinmetz, he would leave to the engineers of the future to say, since we must leave some problems for them to occupy their attention.

After the lecture Dr. Steinmetz for nearly an hour answered a large number of questions, embracing such matters as obtaining volcanic heat from the planet by shafts sunk into the earth, radioactivity and the energy of atoms, and divers other complex and academic aspects of the power production of the future.

RADIO CORPORATION OF AMERICA TO ABSORB AMERICAN MARCONI CO.

New Company, with Backing of General Electric, to Develop Active Competition with Cable Lines in Overseas Communication.

Plans for the establishment of a transatlantic wireless system that will compete with and not give merely a supplementary service to that of the cable companies have been announced in New York City. The Radio Corporation of America has been formed with the backing of the General Electric Co. to absorb the American Marconi Co. The plan is dependent upon the approval of the stockholders of the company.

The war, which led to a high degree of reliability in the workings of the long-distance wireless, put a pressure on means of communication which in the case of the cable lines in the Atlantic threatens to result in a permanent congestion of messages and involved temporary hindrances to the private wireless enterprise. An aftermath of war has been a demand from commercial interests that wireless facilities shall be developed on a scale commensurate with the need for means of rapid communication.

The plan of organization of the Radio Corporation of America is for an alliance of the American Marconi Co. with the General Electric Co. A substantial block of shares in the American Marconi Co. that are now held by the British Marconi Co. will be acquired by the General Electric Co. and will be part of its contribution to the capital of the Radio Corporation of America.

It is said that the new company will be exclusively American. An agreement is in negotiation with the British company by which the Radio Corporation will obtain enlarged wireless facilities abroad and new rights in the countries of South America. Because of patent agreements the operations of the American Marconi Co. have been limited to the United States and to Cuba.

The directors of the American Marconi Co. have approved the plan and appealed to stockholders to vote it into operation. A stockholders' meeting will be held Nov. 20.

It is planned to sell all the assets of the American Marconi Co. except its manufacturing plant at Aldene, N. J., and certain claims, including some against the United States Government arising from alleged illegal use of Marconi patents, to the Radio Corporation for 2,000,000 shares of common stock and preferred stock of a par value of $10,000,000. The proposal involves a 25-cent dividend on Marconi shares, payable on or about Jan. 2, 1920, and the leasing of the Aldene factory to the General Electric Co.

The plan does not involve the complete liquidation of the American Marconi Co. but does radically change the scope of its operations and relieves it of the conduct of wireless communication and the sale of wireless devices.

The capital provided by the proposed financing is believed to be ample for the fullest development of the company within its sphere. No offer of stock on the market is contemplated.

Research laboratories and the engineering force of the General Electric Co. have been at work for a number of years on radio matters. Apparatus of great value was developed and turned over to the Government during the war. The new company will have the technical assistance of the General Electric Co. and will retain the highly specialized staff of the American Marconi Co.

Edward J. Nally, who has been vice-president and general manager of the American Marconi Co., will be the first president of the Radio Corporation.

A. I. E. E. TO ENLARGE ITS MONTHLY PUBLICATION.

Board of Directors Approves Report of Special Committee on Publications—Scope of Monthly Proceedings to Be Increased.

At the last annual convention of the American Institute of Electrical Engineers the chief topic of discussion was the report of the Development Committee, one of the important suggestions of which dealt with making the Institute's publications more valuable to the membership without additional expense to the members. To further consider this matter a special committee was appointed and this reported to the Board of Directors, at the meeting held in Philadelphia on Oct. 10, as follows:

In accordance with the resolutions adopted by the Board of Directors on August 12 relating to the report of the Committee on Development, this committee has carefully considered the Development Committee's report and the communications relating to the publications of the Institute that have been received by the president, the secretary, the Development Committee, and this committee, up to the present time.

In general, the views expressed by the membership are overwhelmingly in accord with the suggestions in the Development Committee's report, including the publication of additional matter in the *Proceedings.*

In order to best meet the needs of the membership and to promote the objects of the Institute as expressed in our constitution, namely, the advancement of the theory and practice of electrical engineering and of the allied arts and sciences and the maintenance of a high professional standing among its members, this committee recommends the following as the policy to be carried out when and as the necessary funds become available:

1. *Transactions.*—That the annual *Transactions* be continued in accordance with the long established policy, *i. e.,* with no change in size or character of contents.

2. *Proceedings.*—That the publication of a monthly periodical, heretofore designated *"Proceedings,"* be continued.

3. *Contents of Proceedings.*—(a) That high-grade engineering and theoretical papers, in full or in abstract, shall continue to constitute the major portion of the monthly periodical and that the space devoted to such papers shall be limited only by the amount of material available and the permissible expense.

(b) That the substance of discussions at Institute meetings be published.

(c) That the papers and discussions, in full or in abstract, as presented before sections and branches, be published as may be selected by the committee in charge.

(d) That a portion of the monthly publication shall be devoted to material relating to the engineering art, other than that which is presented in Institute papers and discussions, such as descriptions of new developments characterized by notable advances.

(e) That the publication of items relating to activities of the Institute and other organizations be continued and expanded.

(f) That some form of descriptive index of electrical engineering literature be published, with due regard to the various indexes now published elsewhere and the avoidance of undesirable duplication.

4. *Title of the Monthly.*—That the name of the publication be changed from *"Proceedings of the A. I. E. E."* to a title that will better indicate the broader scope of the proposed contents.

5. *Size of Monthly Publication.*—That the size of the monthly publication be increased to 9 in. by 12 in., the generally adopted standard for technical periodicals, as soon as it is found commercially practicable.

6. *Advertising.*—That the Institute's practice of the past 25 years of carrying advertisements in the monthly publication be continued and that, as heretofore, the editorial and advertising policies be entirely independent of each other.

7. *Supervision.*—That the general supervision of the monthly and annual publications, including decisions regarding the publication of articles, papers, discussions and all other matter available for publication be assigned to a standing Publication Committee, and that the carrying out of the policies that may be determined from time to time by the Board of Directors be delegated to this standing committee.

The Board of Directors approved the report and authorized the president to appoint a standing Publication Committee to formulate and carry out plans in accordance with the recommendations embodied in the report.

AUGUST ELECTRICAL EXPORTS ABOUT AVERAGE.

Substantial Recovery Shown from Preceding Month and Big Gain Over Last Year.

Electrical export figures as shown in the monthly summary of the foreign commerce of the United States for last August issued by the Bureau of Foreign and Domestic Commerce, Washington, D. C., show that a healthy recovery took place in August as compared with the relatively low total of July. The August total was also nearly 50% greater than in the corresponding month of last year. It ran just about the average of the eight months ended August 31; for that period the electrical total is reported as $62,319,616, compared with $38,611,639 for the corresponding eight months of 1918.

The following table gives the classified figures for last August and the comparative figures of August of last year.

Articles.	August 1919.	August 1918.
Batteries	$ 587,951	$ 252,529
Carbons	106,823	123,926
Dynamos or generators	586.211	258,589
Fans	53,099	29,296
Heating and cooking apparatus	124,668	79,954
Insulated wire and cables	741,443	677,485
Interior wiring supplies, including fixtures	166,499	108,386
Lamps—		
Arc	3,373	2,135
Carbon-filament	10,135	5,474
Metal-filament	350,284	203,046
Magnetos, spark plugs, etc	230,403	181,347
Meters and measuring instruments	268,448	189,393
Motors	729,603	573,547
Rheostats and controllers	45,833	17,408
Switches and accessories	356,676	159,811
Telegraph appartus, including wireless	115,645	36,858
Telephones	324,755	259,185
Transformers	441,733	554,576
All other	2,472,641	1,627,980
Total	$7,716,228	$5,340,925

Not included in the above are electric locomotives, of which there were exported during last August a total of 29, valued at $27,215.

MEETINGS HELD BY ILLINOIS ELECTRICAL CONTRACTORS' ASSOCIATION.

Two meetings of the Illinois State Association of Electrical Contractors and Dealers were held Oct. 16-17 at the Coliseum, Chicago, when the Electrical Show was in progress. The first meeting was addressed by W. R. Leeper, representing the U. S. Chamber of Commerce, who outlined conditions existing in trade as a result of labor troubles, and who emphasized the necessity of co-operation in the business world in order to readjust matters satisfactorily. A round-table discussion, led by R. W. Poelma, chairman, and J. W. Collins, secretary of the association, followed. Conditions affecting the electrical industry, especially contractors and dealers, were considered.

The Friday meeting also was in the form of a round-table meeting, at which two definite policies were adopted. It was proposed that steps be taken to influence the contractor members of the association to become dealers as well in order to strengthen the merchandising power of the organization as a whole. The other policy related to improving the credit of contractors and dealers, in order that their buying powers be increased.

The meetings were attended by a large number of down-state members as well as a good representation from the Chicago district.

NEW YORK ELECTRICAL SOCIETY MEETS.

A joint meeting of the New York Electrical Society and the Metropolitan Section Society of Automotive Engineers was held at the Engineering Societies Building, New York, Oct. 29. Kingsley G. Martin, late lieutenant-colonel, Motor Transport Corps, A. E. F., addressed the meeting on "Motorization of the World's Traffic," reviewing the accomplishments of American vehicles during the war.

Illinois State Electric Association Has Profitable Meeting

Central-Station Representatives at Chicago Convention Hear and Discuss Papers on Many Subjects Vital to Industry—B. J. Denman Re-elected President

MARKED by an abundance of excellent papers and spirited discussions covering practically every subject of interest to the central-station man—from merchandising to operating—the first post-war convention of the Illinois State Electric Association, held at the La Salle Hotel, Chicago, Oct. 23-24, proved very profitable to the 150 delegates in attendance. Eleven papers were presented at the three sessions, and with the attendant discussions made an exceedingly busy and business-like meeting, from which the members gleaned a great deal of information. All papers were printed in advance of the meeting and leaders appointed for the discussion on each side. This arrangement succeeded in bringing out lively comment and amplification of the subject matter of the papers themselves.

President's Address.

In his presidential address B. J. Denman, Peoples Power Co., Moline, outlined conditions affecting the central-station industry throughout the state since the last meeting of the association. Emphasis was laid on the necessity of obtaining adequate rates to justify investment in public utilities. Central stations generally are too conservative in their attitude toward raising rates. The notion of the public that rates cannot go any other way but downward must be corrected because increased costs wrongly deemed temporary by central stations necessitate advances in rates. Maintenance of records and statistics are necessary to properly present rate cases before the Public Utilities Commission. Lack of fuel this winter will probably result in taking over numerous isolated plants by central stations, bringing up the question of extensions calling for investment which must be justified by adequate rates. In closing, President Denman said the most important work of the association had been in connection with state legislation, and he asked the co-operation of public utility interests at the coming Illinois constitutional convention.

The report of Secretary-Treasurer R. V. Prather, Springfield, indicated the extent of the work accomplished in legislative and Public Utilities Commission matters.

Presenting a Case to the Utility Commission.

Bert H. Peck, St. Louis, Mo., formerly electrical engineer, Illinois Public Utilities Commission, read a paper on "How to Present a Case to the Utilities Commission" which applied particularly to central-station companies of moderate size. Procedure in Illinois was given, and then the following advice as to fundamentals. The utility must be convinced that it has a just case or it cannot hope to convince the commission of that fact. The same arguments should be used to convince the commission as one would use in convincing himself, were he in the commission's place. It must be remembered the commission is human and may at times have difficulty overcoming prejudices incurred through neglect or abuse. Facts should be presented which the commission has by previous orders indicated worthy of consideration. All facts deemed pertinent, even including those which may be to some extent unfavorable, should be presented. Untrue statements should not be allowed to go into the record without contradiction by credible evidence to disprove them.

The discussion on this paper was led by F. A. Warfield, Illinois Traction System, Peoria, who said the advice regarding a just case was axiomatic, and that he had never heard of a utility presenting other than a just case or of a case that was not bitterly opposed on the theory that all petitions for increased rates were wrong. He advised that in presenting a case provision should be made for appeal. He thought rates should not depend on plant valuation, but if the valuation was necessary it should be based on replacement rather than on original cost or possible selling price. Variation from paths of procedure in presenting a case cause trouble and delay. It should not be taken for granted the commission is always right, but the central-station company should give all the evidence and express its own ideas as to the right and wrong of the case.

Lightning Protection.

A paper on "Lightning Protection for High-Tension Lines" was presented by A. Herz, Public Service Co. of Northern Illinois, Chicago, which gave an outline of over-voltage line conditions due to static electricity caused by lightning; it also included an outline of other causes for over-voltage. A history of the development of protective devices followed, special reference being made to the construction and operation of the horn-gap, multigap, aluminum cell and oxide film arresters, and to the practice of overbuilding the transmission line with a ground wire to afford lightning protection.

Discussing the paper, J. L. Buchanan, General Electric Co., said the growing complexity of distribution networks adds to the difficulty of affording protection against over-voltage, especially in design of an arrester which is not self-destroying. The oxide film arrester, which was brought out nearly three years ago, and in commercial use the past six months, may solve the latter problem. In his opinion the use of an overhead ground wire is good practice.

J. H. Sears, Mississippi River Power Co., Keokuk, Ia., thought the installation of an overhead ground wire a waste of money. His company operates a line that has no ground wire and also a 90-mile, 110,000-volt line that has an overhead ground wire the entire distance. There has been no perceptible difference in operation, and on the latter line the lightning discharges do not seem to prefer the ground wire to the uppermost conductor.

Harry Caldwell, Public Service Co. of Northern Illinois, Chicago, said about one-third of his company's system was built without ground wire and on this section one or two poles are shattered during a severe storm, while on other two-thirds, with ground wire, no shattering of poles is experienced.

E. H. Negley, Canton (Ill.) Gas & Electric Co., said his company had installed a bayonet on every pole on one of its lines and had more trouble with it than before the bayonets were put up. F. P. Bowen, Peoples Gas & Electric Co., Savanna, said he had the same experience, while John Leisenring, Illinois Traction System, Peoria, stated he had found bayonet installation afforded good protection against lightning.

Closing the discussion on this subject, Mr. Buchanan said the arrester could not be deemed a cure-all for lightning troubles and that the difference of opinion as to the use of a ground wire meant that the problem was different for different classes of line. Mr. Herz said it was a good plan to build a line without ground wire and later install one over sections of line on which trouble from lightning discharges developed.

Central-Station Statistics.

The uses and methods of obtaining statistics were brought out in a paper on "Value of Statistics in Central-Station Operation," presented by E. F. Fowler, Commonwealth Edison Co., Chicago. Statistics should connect up the engineering with the accounting and financial sides of the business and should deal not only with what has happened but with probable demands and tendencies. The manifold value of statistics indicates that central stations, even of moderate size, should have a department devoted to gathering them and pointing out their uses.

In the discussion, H. E. Weeks, Peoples Power Co., Rock Island, said it was regrettable smaller companies did not keep statistics because they are needed in controversies to obtain higher rates. Statistics effect economies and are necessary in arriving at operating costs.

President Denman emphasized the need of impressing a company's own employes as to their value.

S. B. Cushing, Public Service Co. of Northern Illinois, said that since so much had been done to make generation and distribution of electrical energy of high efficiency, the accounting department was a place to look to for future economies. Thus, it costs some companies 14 cts. per meter per month for billing, while others have brought this figure down to 7 cts. G. H. Lukes of the same company emphasized the value of submitting operating cost statistics to operators promptly.

Selling Goods and Service.

As a part of a symposium on the above subject, prepared by the Commonwealth Edison Co., O. R. Hogue, head lighting agent, read a paper on "Improving the Lighting Load." Obtaining new customers and educating present customers to new uses of electricity will produce increases in the lighting load. Promoting good industrial lighting, electrical signs and house-wiring are the big fields in which the central station can operate to advantage.

"Timely Power Loads" was the title of a paper by George H. Jones, power engineer. Central stations should specialize in building up load-factor by cultivating loads off-peak in character. Electric vehicles and trucks offer a big opportunity for such loads. Electric ice-making machines, steel and brass furnaces and electrochemical processes also offer excellent opportunities. Another class of off-peak service often overlooked is summer service for existing isolated plants.

Points regarding the routine of handling orders were brought out in a paper on "Modern Methods of Handling Customers' Orders," by Harold Wright, chief clerk. These were concerned with indexing of customers, receiving and entering orders, preparing and distributing copies of orders, and keeping progress reports on installations being made.

E. A. Edkins, manager of Commonwealth Edison electric shops, in his paper on "Merchandising Electrical Appliances," gave the basic principles of merchandising and then commented on such subjects as the sale of related lines of electrical accessories (like flashlights and batteries), deferred payment plans, and on specific methods of handling sales of the different kinds of appliances.

The completeness of the symposium left little room for discussion, but C. W. Johnson, Hodenpyl-Hardy Co., added a point when he said lack of building operations has been responsible for the increase in merchandising activities on the part of central stations.

John F. Gilchrist, Commonwealth Edison Co., said added impetus must be given to the commercial side of the central-station business. In the early development stage the most effort was put to the purely engineering side, but since that branch of the industry had become so efficient more effort is being made along financial, operating and merchandising lines. The answer to large merchandising sales is the deferred payment plan, which is particularly applicable to central stations selling electrical appliances because payments can be added to the monthly light bill. Low first payments will help develop a habit in customers of purchasing their electrical needs in this manner, and will stimulate many sales which would never be made otherwise.

Outdoor Substations.

"Modern High-Tension Outdoor Substations" was the title of a paper presented by H. W. Young, Chicago. He called attention to the standardization of outdoor substation equipment on the unit type basis, rendering capacity changes and repairs comparatively easy. Such equipment is simple in design and has no concealed parts carrying high voltage. The use of remote control affords protection to operators and material savings in aisle space. Comparing the performance of fused disconnecting switches with automatic oil circuit-breakers, it was stated, since the damage done to transformers during short-circuit condition is directly proportional to the energy flowing into the circuit before the transformers are disconnected, that high-tension fuses of good design will clear short-circuits in approximately 0.013 sec., or from 10 to 12 times as rapidly as an automatic oil switch, thereby affording greater protection against surges. The latter, however, can be used for switching as well as for overload protection. Also it can be closed, if in good condition, immediately after circuit interruption, while replacing fuses generally means somewhat lengthy service interruptions. Mr. Young's paper was illustrated with lantern slides showing various kinds of outdoor substations designed to meet practically any kind of service required.

The discussion was led by John Leisenring, Illinois Traction System, Peoria, and Harry Caldwell, Public Service Co. of Northern Illinois. The former called attention to the rapid development of outdoor substations, but said, from an operating standpoint, improvements were desirable, especially those allowing for easy renewals of equipment when damaged. Former practice was to place transformers 5 or 6 ft. above ground (to keep them out of reach) necessitating heavy structures; there was no reason why transformers could not be placed at ground level on a concrete slab, and make more sightly installations. For small substations, say 500 kw. or smaller, lightning protection is important, but perhaps the oxide film arrester will solve this difficulty. Fuse protection in small stations, he said, of, say 10 kw., was not entirely satisfactory.

Mr. Caldwell said that comparing proportionate costs of wood and steel construction of outdoor substations, excluding transformers and arresters, showed the wood to cost about one-half that of steel construction, but the latter probably made up the difference in permanency and sightliness. It was his opinion that the expense of arresters is not warranted on small installations; at 15 of his company's substations only two transformers had been burned out, due to lightning, over a period of years, though a number of bushings had been burned off. He considered it good practice to have insulators on switches have 25% more capacity than line insulators.

G. H. Lukes, Public Service Co. of Northern Illinois, expressed the need of an inexpensive outdoor automatic oil switch as well as a lightning arrester.

In closing the discussion on Mr. Young's paper, Alfred Alsaker, of the same company, brought out some additional points. Wood structures should be provided for operators to stand on when opening air-break switches. Electrolytic arresters are satisfactory but too expensive for small substations. The trouble with the resistance type is that it is usually set wrong; twice line voltage is about right.

Testing of Meters.

Data tending to show installation tests could be eliminated on some types of meters and the time between periodic tests could be materially increased was presented in a paper by R. A. Keller, Central Illinois Light Co., Peoria, on "Installation and Periodic Meter Tests." Tests made by this company during the first eight months of this year on 2500 meters (of several different makes and sizes) showed 81.3% were within 2% correct and 95% within 4%. Cost of making these installation tests was 48 cts. per meter. It was recommended that installation tests on single-phase meters up to 25 amperes capacity could be eliminated. The requirements of a number of states as to periodic tests were tabulated and showed considerable variance. Test figures indicate the accuracy of the small capacity induction type meters and it was Mr. Keller's opinion that the period of tests could be made as long as five years on this type without appreciable inaccuracies.

Commenting on the paper, R. B. MacDonald, Peoples Power Co., Rock Island, said the factors of vibration, shock and temperature were more important than making installation test 30 or 60 days after laboratory test. It is difficult to conduct field testing because it is hard to get competent help. Periodic tests should be based on character of load in each instance. One period for all is not consistent.

After some discussion, the convention passed a resolution to place a petition before the Illinois Public Utilities Commission asking for an extension of the 30-day limit for test after meters are installed.

W. R. Leeper, representing the United States Chamber of Commerce, addressed the convention and requested the co-operation of the association in destroying radicalism against business, harmonizing relations between employers and employes, equalizing foreign trade conditions, and creating the viewpoint of every citizen as to the national aspect of each individual business.

Rural Electric Service.

A paper on "Extensions of Electric Service to Rural Customers" by D. W. Snyder, Bloomington & Normal Railway & Light Co., Bloomington, contained some pertinent information regarding the necessity of providing rural service, the adoption of standard plans of rendering service and the correction of present systems of rate making. Most farmers do not use sufficient energy to make the business remunerative unless they pay for maintenance cost and core losses. The widespread use of farm-lighting systems show farmers want electric service and are willing to pay for it, so that the demand for central-station service appears to be on the rise, and managers should prepare for it.

E. H. Negley said group farmer business should be compared to that of a small village, say of 400 inhabitants, where a great deal of expense is involved per kilowatt-hour sold, and that the remedy as to income was proper apportionment of charges.

B. H. Peck urged the appointment of a committee to study the question, prepare service standards and rates and submit same for the approval of the Public Utilities Commission.

Development of Favorable Public Opinion Toward Utilities.

Under this title John F. Gilchrist, Commonwealth Edison Co., presented a paper, read by B. J. Mullaney, which discusses methods of influencing the public's attitude in favor of utility companies. It is published on other pages of this issue. Mr. Mullaney, who is secretary of the Committee on Public Information, N. E. L. A., outlined the publicity work that had been accomplished throughout the state in connection with newspapers.

The election of officers resulted as follows: B. J. Denman, Moline, was re-elected president; Adam Gschwindt, Rockford, vice-president; R. V. Prather, Springfield, re-elected secretary-treasurer. The executive committee will consist of B. J. Denman; H. E. Chubbuck, Peoria; D. E. Parsons, East St. Louis; R. S. Wallace, Peoria; Frank J. Baker, Chicago; H. V. Channon, Quincy; W. A. Baehr, Chicago, and M. E. Sampsell, Mattoon.

KANSAS CITY JOVIANS ELECT OFFICERS.

The Jovian Electric League of Kansas City held its annual meeting Oct. 17, with the election of officers resulting as follows: President, J. E. Launder; first vice-president, W. B. Satterlee; second vice-president, F. F. Rossman; third vice-president, H. C. Blackwell; fourth vice-president, Sam Furst; secretary, P. L. Lewis. New members of the executive committee are J. D. Todd, W. M. Hand, R. W. Hodge, H. P. Wright, and holdover members are Sam Furst, A. P. Denton, P. J. Kealy and F. M. Bernardin.

WASHING-MACHINE MANUFACTURERS DENOUNCE PREMIUM PLAN.

American Washing Machine Manufacturers' Association Prepares Arguments Against Practice of Giving Premiums to Encourage Sales.

In considering the premium plan of selling electrical appliances, especially washing machines, at present employed to some extent in the industry, the American Washing Machine Manufacturers' Association, under recent date, adopted the following resolution: "The association condemns as unfair and not good business the practice of giving 13 machines for the so-called price of 12; or the practice of giving a premium or premiums of any kind or description with or for the sale of washing machines."

This resolution expresses the attitude of washing-machine manufacturers on the subject of the premium merchandising plan of selling washing machines. Every effort is being used to have the premium practice discontinued and the following summary of arguments has been drawn up by the association to urge the discontinuance of the so-called premium plan of merchandising of household electrical devices.

Electrical household appliances and electrical household labor-saving devices, properly merchandised, offer to public utility corporations a channel or a means of developing a decent relation between themselves and their customers. Electric ironing machines, washers, toasters and ranges offer a means of satisfaction, comfort and happiness to their users which may and should be used by the public utility corporations to develop the right sort of confidence in them.

At present there is a question in the minds of the executives of the public utility corporations and of their national associations as to the future of the public utility corporations as merchandisers of electrical devices. In the early days electrical devices were sold at any old price in order to obtain the revenue from the sale of current to operate them. No effort was made to really sell electrical devices on their own merit and on a legitimate merchandising basis or plane. The idea was to get the devices in use, no matter how, so that additional current would be used and paid for by the public. The results of such a so-called sales policy have been two-fold. Electrical dealers were hampered in their sales of electrical devices because they could not do business without a profit. This class of dealers—many of them real merchandisers—resented the sales policies of the public utility corporations. Manufacturers producing electrical devices sought channels of distribution other than the public utility corporations because their products were not sold on a legitimate basis.

Information now comes to hand that many of the public utility corporations have decided on a new policy as to sales of household electrical appliances. Some of them are employing real merchandisers to sell these devices on the right sort of basis. Such public utility corporations will probably develop into real distributors of washing machines, the sales records of which will equal those of some of the best specialty dealers in the country. Other public utility corporations are still, practically, giving away electrical devices or premiums with them. Their argument for this policy is about as follows: "The giving away of a premium with the device or the sale of the device below current market price reduces our profit per unit but it whips up our volume of sales so that the bulk profit—including revenue from increase of sales of current—is greater. We are in business to make money. We are making it and more of it. Therefore, our policy justifies itself from the money point of view."

Some years ago the premium plan of selling goods was quite the fashion. Every housewife and every tobacco user was saving stamps or coupons under the belief that they were going to get something for nothing. Then the savers of stamps and coupons began to wonder where the fortunes came from which the owners of stamp and coupon corporations were displaying; it dawned upon them that they were paying for the stamps they saved, and in addition some one was making a profit out of their stamp-saving proclivities. The reaction came and is here.

In the second place, many have lost sight of the fact of the extremely rapid development of the whole household electrical devices industry. How can any one prove that the increase in the volume of their sales of household electrical devices is due to the premium plan of merchandising? As a matter of fact, the increase in their volume of sales of household electrical appliances is probably due to the enormous increase in the demand all over the country for household labor-saving devices, electrically driven or otherwise. Washing-machine manufacturers need not be again informed on this point. They know how great the demand is for their product and they know that this demand has been created by conditions in this country which are far removed from any premium—lamps, stamps or anything else—plan of merchandising.

Executives of all public utility corporations should be fully informed that they should not use the sales records of corporations using the premium plan of merchandising electrical devices as a basis for judgment on the question as to whether or not they should use the premium plan. The sales records and increase in revenue from increased sales of current of a public utility corporation using the premium plan now do not prove or mean anything as to the merits of the premium plan. Such sales records only show whether or not the public utility corporation has followed the tide in increases of sales of household electric devices by all classes of dealers. All of the manufacturers are behind on orders.

The dealer who gives trading stamps, vacuum cleaners, or anything else with the sale of a washing machine is only creating trouble for himself which is sure to react and for the whole electrical industry. Now is the time, if there ever was a time, when the public should be thoroughly educated to the view that when a household electrical device is purchased no premium goes with it; but that the purchaser does get one hundred cents worth of device for every dollar it costs.

STUDENT BRANCH OF A. I. E. E. ORGANIZED IN MILWAUKEE.

At a meeting of faculty and students of the School of Engineering of Milwaukee, Wis., held on Oct. 21, a branch of the American Institute of Electrical Engineers was organized with a membership of about 200. At the meeting Dean John D. Ball presided and Arthur Simon, Harrison P. Reed and Prof. F. A. Kartak spoke. The following officers were elected: J. D. Ball, chairman; Henry Lowcock, vice-chairman; John L. Gordon, secretary; W. H. McCoy, treasurer; B. A. Bovee, director at large. Meetings will be held on the third Friday of each month.

Commercial Practice

Low First Payment Policy—Relations of Central-Stations to Contractors and Dealers—Electric Pumping for Sluicing

CENTRAL STATION ADOPTS PART-PAYMENT POLICY OF $1 DOWN.

As a special inducement for the purchase of electrical appliances the Commonwealth Edison Co., Chicago, has, during the current week, been selling such devices as washing machines, ironing machines, flatirons, vacuum cleaners, electric talking machines and the like on a basis of an initial payment of $1. Subsequent payments may vary from $1 to $5, depending on the total cost of the article in question.

The offer, which held for the one week only, is the result of observation as to customers' attitude toward the amount of the initial payment in connection with the part-payment plan. According to a statement by E. A. Edkins, manager of the Commonwealth Edison Co.'s electric shops, it has been found that a low initial payment policy has been productive of increased sales in comparison to one calling for high first payment, and this in spite of the fact that no change is made in the amount of the regular monthly payments. For instance, the number of prospective customers who will pay $5 down on an appliance is considerably less than those who will pay $2.50, and a surprisingly larger number will purchase at $1 or $1.50 than at $2.50.

The explanation seems to be a matter of valuations; as a general rule, the individual does not consider $1 as beyond his or her means, while $2.50 or $5 is an outlay of money. The future will take care of the monthly payments in either case. As far as the credit risk is concerned, the purchaser is as good a risk at a $1 as at a $5 initial payment.

THE RELATION BETWEEN CENTRAL STATIONS AND CONTRACTOR-DEALERS

Some Policies and Theories of Pacific Power & Light Co. That Have Proved Effective.

In a very illuminating manner, John V. Strange, Pacific Power & Light Co., Portland, Ore., discussed before the recent convention in Seattle of the Northwest Electric Light and Power Association the important matter of relations between the central station and the local contractor-dealer from the three aspects of prices, merchandising and campaigns.

Mr. Strange approaches his subject in the light of the experience of the Pacific Power & Light Co. which company is engaged in supplying electrical energy for the most part in the smaller communities. Fifty per cent of its total residential customers live in communities of less than 5000 population and 10% of the total live along rural lines radiating out from small population centers. It is absolutely essential in a few of the towns that the company handle appliances in order that its customers may have the opportunity to secure these devices. In other communities the need is catered to by contractors and in some of the larger centers the situation would be completely met were the utility to refrain entirely from selling appliances. Regardless of local conditions, however, the company is actively engaged in pushing the sale of electrical appliances in all its territory.

Mr. Strange expressed sympathy for the man who attempts to make his livelihood through the sale of electrical appliances and electric wiring contracting, especially in the smaller communities. As a rule he is a man with limited capital and in many ways he seems to be under a handicap. As a class he certainly has improved wonderfully in the past few years but still he needs encouragement and at least some moral assistance. The Pacific Power & Light Co. feels that he is absolutely necessary because it is not disposed to go into the electrical contracting work except where it cannot be avoided. This being true, endeavor is being made to conduct appliance selling efforts on a plane where the dealer-contractor can compete and be successful.

In years past the sale of current-consuming devices has been looked upon by the central stations as a necessary side line, the central-station manager realizing that he must carry a line of appliances so that a customer might have an opportunity to purchase if he so desired. In most places there was no dealer with the inclination to pioneer in the industry, consequently the central station became the exclusive appliance dealer. This fact has had a tendency to discourage the sale of appliances. The average customer said, "You handle appliances because you want to increase my lighting bill." After years of hard educational effort on the part of the central station, the public has been awakened to the economy, convenience and service afforded through the use of the electrical appliance and the patron of the central station has awakened to the fact that electrical appliances are offered for sale because of their real serviceable value and the current consumed in the operation of such appliances is merely a nominal and incidental operating expenditure.

This, Mr. Strange felt, is a great victory for the persistent educational campaign that has been waged during all these years by the central stations, dealers and appliance manufacturers. The electrical appliance dealers and manufacturers have played an important part in this campaign and it has occurred to him that the logic of the position of these men who have expended their money in the manufacture of a household article entirely dependent upon the use of electricity for its operation and who have had no financial connection with the central station industry, has done more to remove the prejudice that existed in the minds of current-consuming customers against the free use of appliances than any other influence. A few years ago the prospective purchaser wanted to know, "How much current will this article consume?" while today the question is, "Will this article give me the best service?" It is the great educational work of recent years that has been done through the national advertising of our manufacturers and jobbers and the persistent efforts of the local dealer have brought about this change.

We all know now that we have arrived. The day of selling electrical appliances is here. The least of our troubles is to sell—everybody wants to do it electrically. The important thing today, it seems, is to try to elevate the standard of the appliance selling business so as to make it a really profitable adjunct of our central-station industry. If prices cannot be maintained and merchandising made a self-sustaining department, it should be abandoned entirely. A study of the industry shows that the list price established by the manufacturer is a fair price for the customer to pay and is not more than enough to enable the central station to pay the expenses incidental to this department with the overhead profit remaining to which it is entitled. In analyzing the business from this standpoint it will be found that the utility is confronted with the same elements of expense that the exclusive appliance dealer encounters. In bringing the margin of profit up to a point where these elements of expense are covered and are not swallowed up by the main industry, that of manufacturing and distributing electric energy, the appliance business is placed upon a plane where the dealer can successfully compete and he is thereby encouraged to extend his efforts in merchandising.

The automobile is sold today as a labor-saving and pleasure-affording vehicle of transportation. The electrical appliance is now firmly entrenched as a part of the essential equipment of the modern home and business because of equal importance. The automobile has from the start been pushed by dealers and at no time was it ever sold by gasoline manufacturers as a gas-consuming device. The electrical appliance was, in the early stages, handled almost exclusively by the central station but not until the public became convinced of its value and the idea that it was being sold solely because of its ability to consume electrical enenergy was dispelled, did it come into almost universal use.

Now that the electrical appliance has been introduced, the pioneering work is over and it is accepted universally that no home equipment is complete without an assortment of electrical labor-saving and comfort-affording devices. As central-station appliance dealers, the utilities should take stock of the opportunities. If they are to continue to sell appliances, and there seems to be no reason why they should not do so, they should elevate the standard of the business, thereby encouraging the dealer to compete. Full list price should be maintained; an additional price for time payment sales sufficient to pay the cost of carrying installments plus interest on the capital engaged is justified; stocks should be standardized so that it is possible to keep investment to the minimum and afford a creditable percentage of turnover and, as a further result, the element of obsolescence will be minimized. The utility will be in a position to take on the improved types of appliances promptly and should carefully select all appliances on which they standardize with the idea of service as the predominating factor.

All washing machines wash clothes cleanly. One may do the job a little quicker than the other and with less wear on the garments but the essential thing is, will the appliance be in operation Monday morning or will the central station have to send a service man to the house to make repairs or adjustments before the housewife can continue the operation? This is the big consideration. After selecting the appliance that gives the maximum of satisfaction and the minimum of operating trouble, standardize on it and handle it exclusively. Attempt to handle an appliance to meet every whim of the purchaser, which removes the strongest argument, which is, "We handle this appliance because we have found it to be the best."

Mr. Strange believes in campaigns. Enthusiasm is the life of any business and it takes some kind of a revival to keep up this spirit of enthusiasm. His company has found campaigns in which the several branch offices compete to see which can make the best record as productive of excellent results. Reduced price campaigns are of doubtful value although they are, at times, necessary in order to move merchandise that has accumulated through mistakes in buying and because of obsolescence.

RAISING GROUND LEVEL BY MEANS OF ELECTRIC PUMPING.

Five Hundred Horsepower Taken from Lines of Public Service Co. of Northern Illinois for Use in Construction Work.

At the new plant of the H. W. Johns-Manville Co. being built just north of Waukegan, Ill., a novel application of electric current is being made in conjunction with raising the ground level about 4 ft. by pumping sand and gravel from one portion of the property on to another portion.

A steam shovel has dug a 4-ft. ditch from Lake Michigan parallel and closely adjacent to the electric line. About 1000 ft. from the lake a pond about 40 ft. square and 14 ft. deep has been dug. In this pond a large scow has been built, on which are installed the following items of equipment: Three 200 kv-a. 2300-volt to 440-volt power transformers, 5 kv-a. lighting transformer, 400-hp., 440-volt, slip-ring motor, driving a large centrifugal pump; 75-hp. motor driving a smaller centrifugal pump; 50-hp. motor on a hoisting engine; 10-hp. motor driving a small reciprocating pump.

The pump on this scow will pick up sand and gravel from the bottom of the pond and pump it through an 18-in. pipe line about 2000 ft. long to a point where factory buildings are to be erected, the grade at this point being raised from four to seven feet. As the sand and gravel are pumped to a depth beyond which the contractor does not wish to go, the scow will move along so that when the job is done a channel 200 ft. wide by about 14 ft. deep will have been dug from Lake Michigan across the customer's property, a distance of nearly a mile. At some future date this channel will probably be used for harbor facilities for this customer. The centrifugal pump driven by the 75-hp. motor is used to loosen up sand and gravel on the bottom of the pond, pumping water out of the pond and forcing it against the bottom through a nozzle which will give a high velocity jet.

Public Service Co. current at 2300/4000 volts is carried on to the customer's property, and a line is then run a distance of about 4000 ft. to Lake Michigan.

Current is carried from the pole line along the channel to the barge by means of a No. 4 submarine cable supported on pontoons.

This plant will operate day and night until extremely cold weather sets in, as it is desired to complete the fill as early as possible.

Operating Practice

Locating Defective Pin-Type Insulators—Handling Underground Cables—Bare Wires—Oil Switch Safety Feature

TOOL FOR LOCATING DEFECTIVE PIN-TYPE INSULATORS ON WOODEN POLES.

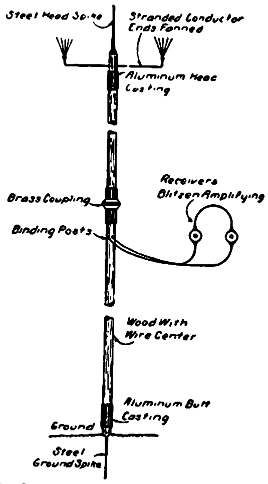
Abstract of Paper Before Southeastern Section, N.E.L.A. Valuable Experiences on Insulator Testing.

The tool shown in the accompanying illustration is designed by T. F. Johnson, Georgia Railway & Power Co., for locating defective pin-type insulators located on wooden structures. Its usefulness is almost entirely limited to those lines upon which the supporting structures are wood, such as wooden poles or built up wooden structures. The most satisfactory results are obtained on those lines on which crossarms and pins are both wood; however, it works well on those lines upon which the crossarms are steel with steel pins and not grounded, or upon which the crossarms are wood with steel pins, but no results can be obtained on lines such as steel tower lines or lines on which the cross arms and pins are steel and grounded. It will not under any condition locate a leaking or defective suspension type insulator, its usefulness being entirely limited to types of construction as explained above and pin-type insulators.

The instrument does not locate all defective pin-type insulators existing upon a line at any one time. It locates only those defective insulators which are so defective that they have started to leak. Pin-type insulators as it is well known, are defective for a considerable time before any appreciable leakage starts. However, by covering the line, as a general proposition, about four times a year with one of these instruments, all line outages due to insulator failures can be eliminated if the leaky insulators located by this instrument are removed as soon as possible after they have been located.

This instrument may be considered in a way as a small wireless antenna, and perhaps works partly on wireless principles and partly by induction. Anyhow, long experience has established that it does work, and will without fail, in the hands of an experienced patrolman, locate definitely a pole on which there is a leaky insulator. Note, in the above statement nothing is said about locating any particular leaky insulator on a pole on which there is a leaky insulator. The instrument shown in Fig. 1 is a wooden pole, joined in the middle so that it may be taken apart for transportation, with an aluminum head casting carrying a steel head spike and also a stranded conductor antenna; the ends of the conductor being turned vertically and fanned out. The head casting is connected with one binding post by means of a wire inside the stick; the lower half of the fault finder is of the same construction, the aluminum butt casting being connected to the other binding post. Across these two binding posts is connected a pair of amplifying telephone receivers. The telephone receivers are worn by the patrolman carrying the insulator fault finder.

To locate a pole on which there is a leaky insulator, the fault finder is put together as indicated in the sketch, with the receivers connected across the binding posts and the stranded conductor antenna arranged as shown. By sticking the steel ground spike in the ground as near the base of the pole as possible, and with the fault finder in a vertical position, with the antenna preferably parallel with the line conductor, the steady inductive hum of the line can be heard in the receivers; this hum is always heard when the fault finder is erected in the vicinity of a working line.



Tool for Locating Defective Pin-Type Insulators Supported Upon Nonmetallic Structures.

A leaking insulator makes itself known by a more or less intermittent scratching sound superimposed upon the inductive hum of the line. After a little experience, leaks are easily located, and a man soon learns about how long to listen at a pole for a leak before moving to the next pole. The worst leaks can be heard by simply sticking the fault finder vertically in the ground as described above, but in cases of very slight leaks it is often necessary to stick the steel head spike in the pole as far up as can conveniently be reached, holding the aluminum butt casting in one hand.

The fault finder when used in connection with the amplifying telephone receivers, is a very sensitive instrument, and it takes some experience to tell the difference between a leaking insulator and the corona which some times occur on small tie wires. Leaking insulators can be heard for a considerable distance by simply carrying the fault finder on the shoulder (rifle fashion), and holding the aluminum butt with one hand.

As pointed out, the fault finder locates the pole on which there is a leaking insulator, but does not locate the particular insulator which is leaking. To locate this particular insulator use is made of a set of amplifying receivers similar to the set used with the fault finder, by touching one end of the receiver cord to the through-bolt on the pole, and the other end of the receiver cord a short distance out on the cross arm; preferably the ends of the receiver cord should have sharp pointed instruments attached to them so that they can be buried in the wood. The end of the crossarm on which there is no defective insulator, will give no indication as the receiver cord is moved out along the bottom side of the crossarm. However, by repeating this operation on the other end of the crossarm, the defect will show up as the end of the receiver cord is moved along the crossarm on the end of which carries the defective insulator, the sound in the receivers will get louder until the point bearing the defective insulator has been passed. The sound then remains constant, or diminishes a little.

In a great many instances upon climbing a pole as described above to locate insulators, the crossarm braces will be found hot, or the insulator so noisy, or various other indications so clear that the application of the receivers will be obviously unnecessary.

METHOD OF HANDLING IMPORTANT FACTOR IN BEHAVIOR OF UNDERGROUND CABLES.

Failure of High-Voltage Lines Frequently Traceable to Careless Installation.

Every company operating high-voltage underground conductors knows that considerable damage can be done to these cables at the time they are being installed. The most frequent causes of damage are bends of small radius, too frequent bending, impact that causes cracks in the lead sheath and voids between sheath and insulation.

Speaking of the effect of careless handling upon conductor behavior of high-voltage underground conductors before the eleventh annual convention of the New England Section, N. E. L. A., held Sept. 22 to 24, inclusive, Wallace S. Clark cited a number of instances where it had been proved that bends of small radius are injurious to the conductor and lower very materially the dielectric strength.

In one investigation on a single-conductor lead-covered cable having an insulation of 5/32-in. thickness of saturated paper, a test voltage was applied, starting at 15,000 volts and increasing it at the rate of 2000 volts per minute until breakdown occurred. The lowest breakdown potential in 32 tests was 32,000 volts and the highest 48,000 volts; or expressed in volts per mil, 200 and 310 volts per mil, respectively. Duplicate samples were bent at an angle of 180° around a 11-in. mandrel, then straightened, and reversed through three cycles. Test voltage then showed that the lowest breakdown pressure was 15,000 and the highest 30,000. All samples were 10 ft. in length. This test showed that before bending the highest breakdown potential was 50% above the lowest, while after bending it was 100% above the lowest, proving that bending does materially lower the dielectric strength of underground conductors.

USE OF BARE WIRE ON LOW-VOLTAGE CIRCUITS.

Pertinent Reasons Advanced for Adhering to Use of Insulated Wires for Outdoor Transmission.

In reply to a circular sent to central stations in Canada, A. A. Dion, of Ottawa, chairman of the Canadian Electrical Association's committee on overhead lines, received the following letter from one of the companies:

"Regarding bare wire for line use under 2200 volts, it has never been the practice of this company to use bare wire for city distribution and although it is generally understood that the insulation on the wire, especially after it has been baked out, is no adequate protection for 2200 volts, insulated wire is useful in the erection of the lines because the insulation protects the wire from mechanical injury and prevents linemen coming in contact with live lines already installed.

"Our company's rules provide that all lines are normally considered alive by our men and work done accordingly. Lines are only treated as dead when known to have been killed properly and the proper clearances given. In order to show differentiation between primary and secondary lines, lines of 2000 and 4000 volts are erected on porcelain insulators, while low-voltage lines are on glass insulators.

"Use of both bare and weatherproof wire would necessitate carrying two classes of wire in stock as well as on repair and construction wagons. In city work the primary is only a small part of the distribution system and it would be still necessary to supply insulated weatherproof wire for all service work.

"In outlying districts where primary runs are long and service connections few, it would likely be considerably more feasible to use the bare wire."

Mr. Dion states as his own opinion that while ordinary weatherproof triple-braided insulation is not altogether effective, and linemen should treat all wires as alive, still the insulation is some measure of protection in dry weather and he favors its use on city streets.

SPECIAL SAFETY FEATURES FOR INDICATING OPENED CIRCUIT-BREAKERS.

Safety Indicating Lights Feature of Philadelphia Electric Co.'s Operating Procedure.

When a circuit-breaker is opened for repairs or any similar reason, the Philadelphia Electric Co. not only employs a tag or card stating why the circuit-breaker is open, by whom opened and on whose authority, and mechanical blocks for preventing accidental closing, but a special illuminating system for showing when a circuit-breaker is open is also employed. At the load dispatcher's office miniature electric lamps fed from a source of supply through "jacks" indicate upon the system dispatch board when a circuit-breaker has been reported opened anywhere on the system.

In the stations, not only is a circuit-breaker cell locked when the switch had been opened for special purpose, but inside each cell is installed an incandescent lamp which can be clearly seen through the wire glass panel at the front. These lamps are controlled by the mechanism of the circuit-breaker and are so located that they cannot fail to be seen when anyone looks at the disconnect switches between the circuit-breaker and the bus. These indicating lamps, in addition to those located on the switchboards and benchboards, are colored green and are in circuit only when the circuit-breaker is open. They serve the additional purpose of indicating when it is safe to pull the disconnect switches controlling the circuit-breaker which is shown to be open by the fact that the lamp burns.

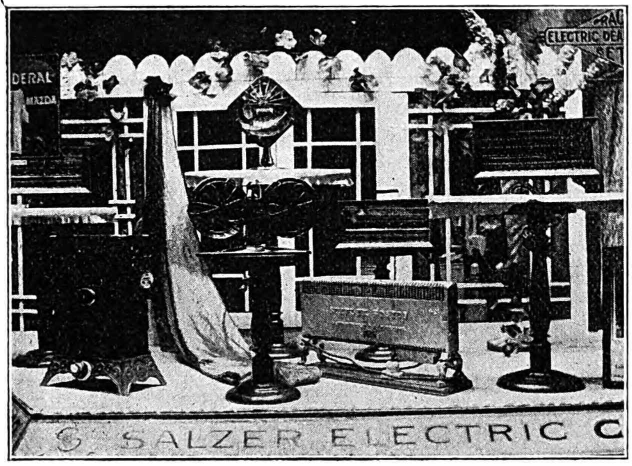
Contractor-Dealer

Week End Specials Part of Merchandising Plan—Collecting Bad Accounts—Contractors Organize Bureau of Education

PLAN OF SELLING WEEK-END SPECIALS USED BY CLEVELAND DEALER.

The Salzer Electric Co., Cleveland, Ohio, makes a practice of advertising a week-end special, an attractive price being made on a single electric appliance for Thursday, Friday and Saturday of each week.

Newspapers advertisements are linked with window displays to make its sales plans more effective.



This Window Display Was Used in Connection with Newspaper Advertisements Announcing Special Terms on Electric Radiators and Helped to Introduce Them to Many People Who Did Not Know the Convenience and Utility of This Electric Heating Device.

In connection with a recent sale of electric radiators the company inserted this announcement in the local papers:

ELECTRIC RADIATOR

Regular price, $12—Thursday, Friday and Saturday, only $9.

Just the heat for cool mornings and evenings, for bathroom or bedroom. At this price we can accept no telephone orders, C. O. D.s, charges or deliveries.

The window display space was carpeted with lavender cloth and a tall white vase in the rear was filled with branches of autumn leaves and wreathed with vines. In the center were the radiators mentioned in the newspaper advertisements, while the balance of the window space was given over to electric heaters and radiators of different types and prices.

SUCCESSFUL METHODS OF COLLECTING BAD ACCOUNTS.

Effective Collection Letters and a Series of Collection Media for Electrical Contractor-Dealers.

By Chester A. Gauss.

The most common way to collect overdue accounts is through the medium of collection letters which, if properly written, are not only cheap, but extremely effective. In writing these letters the appeal should be based upon plain human nature, for human nature is fundamentally the same the world over. Many people pay their bills just because they are honest. Others are too proud to have outstanding accounts, while still others will only pay bills through fear of action.

Most people are honest, so the first appeal to be made in a series of collection letters is one based on honesty. If a person is not honest, he generally has some pride, so the second appeal should be based on pride. There are still other people, but not a very large percentage, who deliberately try to avoid paying their bills. Such people can only be reached through fear of a lawsuit or other public method of collection. This gives us the third appeal that should be used, namely, one based on fear.

All three appeals should not be used in one letter, but only one in a letter. The first letter of a series of collection letters should be a strong appeal to the customer's honesty. Such a letter will bring returns from those who have lapsed in payment because of oversight or temporary inability to pay. This first letter should therefore be short and straightforward in the statement that the bill has evidently not been paid through oversight. The next few letters should be based upon the same appeal but more emphasis should be put on the fact that the debtor is expected to pay because he is truthworthy and honest. If three or four letters with the honesty appeal fail to bring a response. several letters based on the second appeal, that of pride, should be sent.

Failing to collect by appealing to both honesty and pride, there is only one other appeal that can be made in a letter, namely that based on fear. Whether or not this appeal should be used on any particular customer, depends upon whether or not it is worth while to let the account drag in the hope of future business. This fear appeal should not be used, as a rule, until relations have practically reached the breaking point. Before using the fear appeal it would be well to try some of the usual methods of collection mentioned later in this article.

The object in appealing first to honesty, then to pride, and finally to fear in collection letters is, of course, to eliminate outstanding accounts until only the hardest to collect remain. It must be remembered that many people who are honest but who have failed to pay, may have neglected to do so because they forgot or because they are low in funds and would welcome an extension of time. In the first letters, therefore, the dealer should give the debtor a chance to explain why the account has not been paid. Granting a short extension of credit to a man who has been ill or who has suffered a temporary business reverse will cement him to a store as a customer, but if he receives letters with a fear appeal there is great danger of eliminating him entirely as a customer.

Below are given sample letters with the honesty, pride and fear appeals. It must be remembered, however, that several letters with the same basic appeal should be sent a customer before changing the appeal. Each letter should attempt to eliminate those customers that have failed to pay for some particular reason. Always give the debtor a chance to explain his failure to pay, but don't create the impression that the debt can be dragged along, for it will decrease the effectiveness of all future letters.

Based on Debtor's Honesty.

Dear Mr. Jones:

I am hoping you enjoyed the coffee made in your new electric percolator. We know you feel that it is worth all it cost—$18—and more.

Upon referring to our books we find, however, that you have forgotten to pay your bill for it last month.

May we not be favored with payment before the end of this month?

Sincerely yours,

Based on Debtor's Pride.

Dear Mr. Jones:

Do you remember how everything that Midas of antiquity touched turned to gold? If we were Midas we would not be writing this letter and insisting upon the payment of your account of $18 with us.

Why have you treated us as you have? We certainly expected, at least, a reply to our previous four letters.

We know that you take pride in paying your bills promptly—in having a good credit standing in this town rather than to be rated as slow-pay by the local merchants.

We inclose a check on your bank made out for the correct amount—$18. Just sign your name to it and mail it in the inclosed stamped envelope. Like Midas, you will have converted your account into gold for us.

Sign it now before you forget. Thank you.

Sincerely yours,

Based on Debtor's Fear.

Dear Mr. Jones:

Your standing in this community is too valuable to you to permit it to be jeopardized over harmful publicity in a suit in court for a mere $18 which you owe us. It will mean attorney fees, loss of time at work and a lowering of the esteem by which you are held by your employers.

This is our seventh and last letter regarding this long overdue account of yours.

You owe it to yourself to permit no further delay and to avoid any unpleasant step you force us to take in this matter.

Isn't it worth sending us a check immediately to avoid action?

Sincerely yours,

It will be noticed that in the second letter reference is made to an inclosed unsigned check. This, of course, assumes that the name of the bank with which the customer does business is known. Collection letters with a personal touch like this pull best, for they serve to notify the debtor that the dealer is familiar enough with his business connections to cause trouble if his account is not promptly paid.

No collection letter can be effective if it lacks dignity and force and should not indicate a doubt about getting returns. The debtor owes the creditor money and the creditor expects it as a matter of course, not as a personal favor, because he has bills to meet, or for any other reason. In all cases the amount owed should be specifically mentioned and the request for payment should be made as definitely as possible.

Tracing the Skipping Debtor.

There is one kind of bad account which is too often given up as hopeless, but which still presents possibilities of collection—namely, that of a debtor who has removed to another section of the town or who has moved out of town, failing to leave his change in address. Letters sent through the mails will, of course, be forwarded to him but, secure in the knowledge that the postoffice is not at liberty to reveal his former address, he is likely to think that he is safe in believing that his creditors cannot learn his whereabouts.

The new address, however, can very often be secured from his employers, or if he has removed to another town, from his last employer with whom he is likely to have left a forwarding address either with the firm or with an individual in it. Then, too, the debtor's neighbors can often supply the information or refer to a friend who is likely to know the changed address. The superintendent or janitor of an apartment house also often knows of a friend or relative of the debtor's. In a small town the chief of police or a justice of the peace can often furnish the desired information themselves or secure it promptly. These individuals, however, have to be approached diplomatically so as to prevent a refusal or the creating of antagonism on the part of the debtor through his learning of any ill advised statements made to these individuals. In addition, in almost every town there is some kind of a retailers' credit association which traces debtors' movements within a town and, through the aid of other local bodies, learns a creditor's new address if he removes to another town.

Faulty Checks.

Checks are often received in payment of long due accounts which are intentionally or unintentionally left in such a way as to cause one at first sight to believe that he cannot collect them and that the check will have to be returned to the debtor with the request that it be made out properly and with the possibility of another long delay in obtaining the money. Faulty checks, drafts, etc., can, as a general rule, be collected through a bank if the dealer has evidence in writing of the remitter's intention to pay and will guarantee the bank against loss.

If the remitter sends a check on one bank and his letter states that it is on another bank, the creditor, if refused payment by the bank whose name appears on the check on the grounds that it has no such account, can guarantee its amount, make a note on the check that the remitter has no account at the bank named on the check, change the name of the bank on the check and deposit the check and letter of remittance with his banker again for collection. When a check is not signed it is easy to collect it by guaranteeing its amount and depositing it with a banker together with the letter that accompanied it. If the amount of the check is incorrectly given, or if it appears in the two places on the check as different amounts, the creditor can note on the back of the check the correct amount and guarantee it above his signature, attaching to the check the letter of remittance or a copy of his bill. If a check or a draft is made out to the debtor's order but is not endorsed by him and is remitted in payment of a bill, the creditor can supply the necessary indorsement himself as agent for his debtor, attaching the latter's letter as evidence of his authority to do so.

One of the most common tricks played by a debtor of little moral stamina is to write a letter saying that he is inclosing a check or draft, which he neglects to do, feeling that he is secure in claiming that the check must have reached the creditor and that he is not responsible for what happens after it gets into his place of business. Although such an explanation for refusing to send another check is of no value as a point of law, as the drawee could easily notify his bank to refuse payment on the first check and send a new one to his creditor, one often does not care to subject himself to further delay in collecting his bill or to subject himself to a lot of wrangling as to what became of the check. An easy way out of the matter is to draw a draft on the debtor for the amount named in his letter as being remitted and to deposit the draft with the letter of remittance attached, for collection through the bank, notifying the debtor that he failed to enclose a check and that you have made a draft out on him for the amount specified in his letter to save him from "further trouble" in regard to his account.

Unusual But Effective Means of Collecting Accounts.

Although a series of collection letters is one of the most commonly used, inexpensive and effective means of collecting bad accounts, especially for the electrical contractor-dealer, there are times when it is advisable to employ other means, many of which, although affective, are not so widely known.

One method which is as good in most cases as employing a personal collector at considerable expense is to put the matter in the hands of the American Railway Express Co. for collection. The express company will provide the merchant with an envelope in which he can insert the letter asking for the remittance or giving the choice to the customer of remitting in full or returning the goods in as good a condition as received. A charge of 25 cents is made by the express company whether or not it is successful in obtaining the money or the return of the goods.

The telephone is also another effective collection medium. Although it is not very effective in the case of those who will attempt to avoid payment at any cost, it enables the creditor to secure all the advantages of a personal call with a considerable saving in time and expense. That is, the creditor can discuss the matter as freely over the telephone as in a personal interview, employing appeals to honesty, pride and even using threats of action which he would perhaps hesitate to put in a letter while the account was in its present stage of collection for fear that the printed word is longer remembered than the spoken word. In fact, before sending a fear letter it would be well for the electrical contractor-dealer to try collecting over the telephone to avoid creating the ill effects that such a letter may create.

Another method which is effective, especially when an account is long overdue, is to send a strong letter which either directly or indirectly suggests the probability of stronger action being taken, by registered mail for which a receipt is requested. Such a letter serves to inform the debtor that his account is so long overdue that the credit is likely to take more serious steps and possibly wants the registry receipt for legal purposes. An example of such a letter, carrying a threat of action and designed to be sent by registered mail, is given below:

Dear Sir:

Not having received an answer to any of our eight letters regarding your account, we have registered this letter to make certain of delivery, so that if suit is filed against you, we have proof that you were properly notified:

Certainly you are aware of the fact that all retailers in this town are organized and that the debtor who does not pay his debts cannot obtain credit from any of them. Even doctors—the very ones you must call at critical times when every minute is precious—will blacklist anyone who is rated as poor pay. Surely you do not care to ruin your reputation for honesty and to reduce your standing in this community by refusing to pay a just debt.

If this matter is taken to court, it simply means a lot of unnecessary harmful publicity for you as well as a lot of unnecessary expense. You know when judgment is entered against a debtor, he must pay not only the debt, but all the legal costs and court costs for both sides.

We have always been willing to do the right thing by you and hesitate to cause you any trouble. If it is impossible to see us immediately, write us, inclosing a check for $25, the amount of your bill.

Act now, for in fifteen days we shall be forced to take this matter to court, thereby putting you to great expense.

Very truly yours,

A less drastic letter intended to be sent by registered mail and to create the impression that more forceful and unpleasant steps are likely to be taken if a remittance is not sent, could be worded about as follows:

Dear Sir:

This is the sixth time we have written you about your unpaid balance of $50 which has been standing against you for half a year.

To be frank, you have taxed our patience to the utmost and we do not intend to write you again in regard to this matter. We have, therefore, sent you this, our last letter, by registered mail so that we shall have proof of its receipt in case you cause us to take any unpleasant steps.

You are on the level. I know it.

You have as little use as I for the man who fails to live up to his written word. You trusted me and I proved worthy of your trust, sending your goods and not merely pocketing the small initial payment. I trusted you with much more, but you have repeatedly ignored your obligations to me. I hope you merely forgot to pay your bill. I know how easily it is to put off such things—also what a lot of trouble such a neglect may cause.

Don't force me to take other steps to collect this long standing amount. I should hate to do so as I value your patronage and good will.

Just send me a check today. It will be too late if you put it off a few days.

Thank you. Insistently yours.

BUREAU OF EDUCATION AND RESEARCH ORGANIZED.

National Association of Electrical Contractors and Dealers Completes Plans for Field Educational Work.

At the Milwaukee convention of the National Association of Electrical Contractors and Dealers representatives of that organization, the Associated Manufacturers of Electrical Supplies, the National Electric Light Association, the Electrical Supply Jobbers' Association and the electrical press made up a committee to consider the establishment of a bureau of education and research. The plan was given favor and each representative made the recommendation to his respective association to support it.

It is announced by the National Association of Electrical Contractors and Dealers that organization of the plans and work of this bureau is now well under way. A number of field men will be employed who are prepared to give dealers advice as to improvement of their stores and business methods, how to install and carry on proper cost, accounting and bookkeeping systems; in fact, give any assistance they can.

At present there are not many localities throughout the country where the co-operation between the manufacturers, central stations and retailers is all that it should be, but the bureau will in time bring these interests together to the end that it will greatly increase the retail distribution of electrical material. The field men, by means of personal work in the various localities, will also be instrumental in bringing together the three branches of the industry and by getting together the interested parties and directing their efforts towards the results desired will ultimately have all sections of the country working to accomplish the same end, namely, better electrical retail shops. The work of the field men will be supplemented by a series of lectures on such subjects as management, accounting and estimating.

New Appliances

Self-Regulated Range—Electric Rivet Heater—Utility Iron Set—Rough Service Battery Jar—Linemen's Safety Staging

New Hughes Automatic Electric Range.

Two distinctive features are combined in a new automatic electric range recently developed and placed on the market by Hughes Division of the Edison Electric Appliance Co., 5660 West Taylor street, Chicago. These features are an automatic time-controlling device and an automatic temperature regulator.

The time-controlling element is a simple device which can be set to automatically switch the current on and off at any hour or over any period of time desired. It requires no winding and is always ready for immediate use.

New Hughes Automatic Range.

The automatic temperature regulator consists of a device with a thermostat which automatically maintains the heat of the oven at any desired cooking temperature indefinitely. The proper oven temperature at which to cook the food is determined first; then the regulator is set by means of a lever as shown on the instruction card which is permanently secured to the side splasher.

As the oven is heated, an indicating pointer moves up the thermometer scale until it is opposite an adjustable pointer which designates the temperature at which the oven is to be heated. The current is then switched off by means of the thermostat; if the heat in the oven should reduce the indicating pointer will drop, and as soon as the indicating pointer drops below the adjustable pointer the current is again automatically switched on. This procedure is continued until the time set for the current to be switched off, so that an even temperature is maintained during the entire cooking operation. In other words, a curve plotted in terms of heat against time would show a sharply rising curve while the oven was being brought up to the cooking temperature, then a flat curve during the cooking period, and finally a slowly descending curve starting at the point where the current was switched off. The thermometer responds quickly to fluctuations in the heat of the oven and shows actual temperature in degrees whether the oven is being heated or cooled.

The manufacturer claims that the automatic regulator prevents extravagance in the use of energy by supplying just enough heat to keep the oven at the desired temperature. It saves food because it prevents scorching or burning, and at the same time provides the particular temperature best adapted for yielding the most nutrition and flavor for any kind of cooked food.

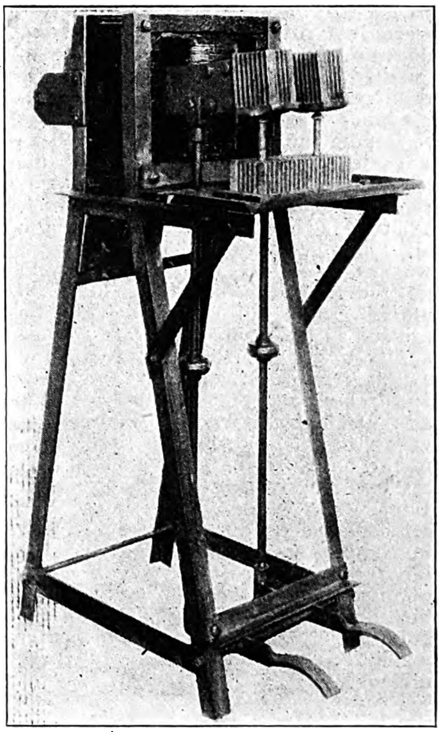
The range can be operated in three different ways: (1) The automatic time control and temperature regulator are both set, giving full automatic control. (2) The temperature regulator only is used, the current being switched on and off by hand at the oven switches. In other words, the temperature regulator is set, the switches operated by hand, and the indicating pointer moves up the scale and operates in the same manner as described above. This continues until the operator turns the current off by hand at the switches. (3) The temperature regulator is used as a safety device only, both the current and temperature being controlled by hand. That is, the temperature regulator is set at the top of the scale, so that there is no possibility of overheating.

The automatic feature for the time being will be confined to the Hughes type No. 50—right-hand oven only—and will be furnished in plain or nickel finish.

Electric Rivet Heater Possesses Many Advantages Over Old Methods.

In an effort to overcome the many difficulties involved in heating rivets previous to their being driven and riveted, the General Electric Co., Schenectady, N. Y., has designed an electric rivet heater which embodies low first cost with simplicity of operation, foolproofness of construction and maximum efficiency. This is accomplished by the following design.

A transformer rated at 15-kw. is mounted on angle-iron legs, which may be fitted with wheels. At the front of the transformer, two copper bars are fitted with heavy air-cooled electrode blocks of cast copper, and under these is another copper block which acts as a support and electrical connection for two rivets in series. When the rivets are stood up on the block and the electrodes are allowed to drop on the head of the rivet, the



Electric Rivet Heater, Which Does Its Work Reliably, Economically and Without Objectionable Features.

circuit is completed and heating begins. The two electrodes may be raised independently by two pedals, gravity being sufficient to lower the electrodes when the foot is removed. A primary tap switch mounted on the back legs of the machine gives all the variation needed for different lengths and diameters of rivets and rates of heating desired.

The advantages of this electric rivet heater are said to be the following:

(1) The higher efficiency of localizing the heat energy in the rivet resulting in less heat radiation.

(2) Better heat regulation in proportion to quantity of rivets used and

energy is used only when heating rivets, giving high economy.

(3) Production of heated rivets is 5 lbs. per kw-hr.

(4) Cleanliness—no smoke or gases are formed.

(5) No time is wasted in starting production.

(6) Quality of heat is better and minimum of scale forms. Rivet heats from inside out, giving more uniformity of heat and better upsetting conditions in shank.

(7) Wastage of rivets is reduced to a minimum.

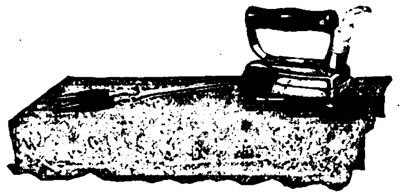
(8) Heater is portable, takes any rivet up to ⅞ by 5 ins. without adjustment, and but two power lines are required to each heater, eliminating piping for oil, air or gas.

The sizes of heaters so far developed are a 5-kw., two-jaw type for rivets up to ½ in., and a 15-kw., two-jaw type for rivets up to ⅞-in. diameter. The two-jaw heaters are intended for one-gang use; however, in actual test the 15-kw. machine heated 500 ½-in. by 1¼-in. rivets in one hour, which is ordinarily enough for two gangs of gun riveters.

During a careful survey of present methods of heating rivets, it was found that large quantities of rivets were lost after having been driven, due to uneven heating and consequently failure to upset in the hole thus causing a leaky rivet hole. Attendance was large, requiring a man to handle the forge blower as well as a passer; auxiliary equipment of the oil-burning rivet heater was expensive, requiring in many cases as high as 10 hp. per oil burner to supply the air blast necessary. The equipment was not flexible; the burners could not be moved easily from place to place. Small forges could not be utilized in many places due to the inability to get fuel to the forge as well as the trouble of handling the ashes and rebuilding the fire daily. This was particularly true in shipbuilding yards where the forge was used down in the holds of the ships to heat rivets used in riveting bulkheads, partitions, floor plates, etc. Here the atmospheric conditions were bad and in some cases it was found that the laborers have instituted severe complaints against the old methods of heating rivets. All of this led to the adoption of the electric rivet heater which has overcome many of these difficulties.

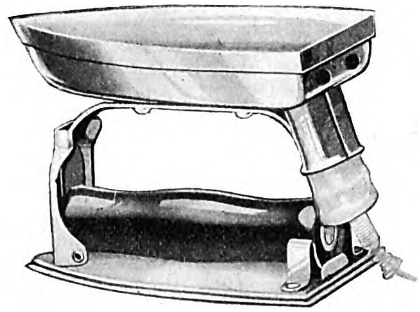
Hotpoint Utility Ironing Set.

A new electric appliance which is particularly appropriate for gift-giving purposes has been placed on the market by the Hotpoint Division of the Edison Electric Appliance Co., Chicago. It consists of a 3-lb. flat-iron, folding curling iron, and collapsible stand for inverting the iron when heating the curling iron or when used as a small cooking stove. The iron differs from the standard Hotpoint iron only in the following respects: It has no attached stand; has two holes in the rear for inserting of curling irons—thus two irons may be heated at the same time. When the stand supplied for inverting the iron is not used for that purpose it serves as an ordinary iron stand. The set fits into a very cleverly constructed folding box consisting of four wooden sides, hinged with cloth, so constructed that it will fold up in such a way as to provide closed ends. When folded in the box form it presents a very compact, neat appearance. The end of the decoratively printed cloth cover may be tied with a silk cord. The size when folded is approximately 8 by 4 ins.



Hotpoint Utility Set Consisting of Flat-Iron, Curling Iron, Ironing Board and Collapsible Stand for Using Set as Cooking Stove.

The big feature about this folding box is that when unfolded flat it provides a very handy ironing board, with a surface of 16 by 8 ins., on which any little pressing job may be accomplished by the user. Thus the inconvenience usually experienced by travelers not having suitable ironing surface will be done away with.



Collapsible Stand for Using Hotpoint Utility Set as Small Cooking Stove.

New Battery Jar for Rough Service.

In certain classes of service the storage battery is subjected to extremely rough usage in different ways. For example, mining locomotives, industrial tractors and even automobiles, are subject to jolts and vibration, while the shocks that accompany collisions and derailments of locomotives and similar incidents place heavy stress upon the storage battery jars.

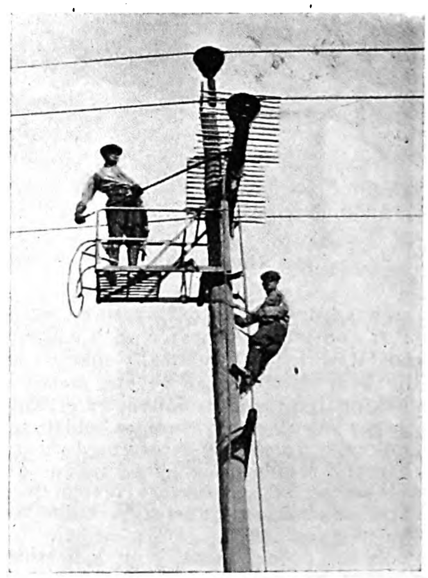
To meet this condition of rough usage, the Electric Storage Battery Co., Philadelphia, Pa., has developed a battery jar, known as the "Giant" jar. This battery jar is made of exceptionally tough material, having great strength under compression and tenacity to withstand impact. The result is that the jar is practically unbreakable; and, upon the basis of all reasonable working conditions may be claimed to be unbreakable. Exhaustive tests made by the manufacturer have proved that the "Giant" jar will stand a pressure of 2000 lbs. at its weakest cross section, while the old-style jar failed at less than 1000 lbs. The "Giant" jar has high dielectric strength, withstanding a potential test of 30,000 volts and has low unit weight. The Electric Storage Battery Co. states that the ability of this jar to withstand the severest service is causing it to be extensively used in mine-haulage service, for industrial tractors and similar work where a strong jar is needed to protect the storage battery.

Safety Staging and Guards for Linemen.

Even when using linemen's belts, working upon poles is not free from danger because of the possibility of the belt breaking or the likelihood of the lineman's spurs slipping out of the pole. In any case the fact that one's position is more or less restricted by the range of the belt and the fact that the feet are more or less rigidly fastened to the pole movement is limited and the speed at which work can be accomplished is affected. Then there are the safety aspects also.

The accompanying illustration shows a lineman's platform and guard developed by the Bush Electric Co., Cleveland, O., the purpose of which is to enable linemen to work with greater freedom and greater safety. The chief use of the Bush staging is on high-tension lines.

The staging is designed for the purpose of changing insulators, pulling up slack, grounding pins, testing insulators, etc., on high-voltage energized lines. It forms a solid platform on which the men can work and which is adjustable to any position, in or out, or around the pole. The wood from which these stagings are made is selected with utmost care and submitted to a special impregnating and drying process known as the Bush treatment. This treatment enables the wood to withstand a voltage of 5000 volts per inch so that if a workman should accidentally touch a 75,000-volt line while standing on the staging, he would not be injured. The safety guards are also made of wood similarly treated. When placed as shown in the illustration they serve as a reminder to the man to keep within certain bounds when working on the crossarm. Many otherwise impossible jobs can be done when these guards are used.



Bush Linemen's Stage and Guard in Use on High-Voltage Line.

Trade Activities

St. Paul Electric Appointed Westinghouse Agency—Matthews Light Plant Purchased by King of Siam

Citizens Electric Co., Hot Springs. Ark., will hold an electrical show in that city on Nov. 13, 14, and 15. Various manufacturers and jobbers have been invited to participate in the display of electrical devices.

James McEwan & Co., 488 Broad street, Newark, N. J., has been organized to engage in the production of electric and gas appliances and kindred specialties. Malcolm Thomas, Hackensack, and James McEwan, Montclair, head the company.

British Westinghouse Electric & Manufacturing Co. has changed its corporate name to Metropolitan Vickers Electrical Co. Through the recent amalgamation of Vickers, Ltd., with the Metropolitan Carriage, Wagon & Finance Co., the former became the controlling factor in the affairs of the British Westinghouse company.

L. V. Estes, Inc., industrial engineer, 202 South State street, Chicago, has prepared a booklet entitled "Human Relations in Industry," which in view of present conditions and the labor problem is particularly timely and of special interest. It presents a clarification of the principles and factors of industry and sets forth the underlying principles of personal relations and industrial management that are essential to industrial harmony and maximum production. It outlines in a general way the requirements of the work and the procedure necessary for putting into effect plans tending toward a betterment of human relations in industry.

Electric Furnace Sales.—Considerable activity in the sales of electric furnaces has recently been experienced by the Electric Furnace Co., Alliance, Ohio, the company having received the following orders for its product: Drew Electric & Manufacturing Co., Cleveland, Ohio, a 105-kw. furnace for melting yellow brass; Nolte Brass Co., Springfield, Ohio, a 105-kw. furnace of 1500-lb. capacity for melting yellow brass; Kennedy Valve Co., Elmira, N. Y., a 105-kw. electric furnace for red brass; American Bronze Corp., two 1500-lb. electric furnaces for melting bronze; Dominion Steel Products Co., Brantford, Ontario. Can., 50-kw. furnace of 500-lb. capacity for yellow brass; Deming Co., Salem, Ohio, a furnace of 500-lb. capacity for melting yellow and red brass; Miller Pasteurizing Machine Co., Canton, Ohio, a Baily 50-kw. furnace for yellow brass; Landers, Frary & Clark, New Britain, Conn., a 50-kw. furnace with capacity for melting 200 lb. aluminum per hour, and the installation of nine Baily electric furnaces for melting a wide range of non-ferrous metal and alloys.

The Electric Furnace Construction Co., Finance building, Philadelphia, advises orders received for "Greaves-Etchells" electric furnaces from Lacheze et Fils, Dijon, and C. Markham & Co., Ltd., Chesterfield.

The Triumph Electric Co., Cincinnati, Ohio, has appointed W. H. Thompson as works manager. Mr. Thompson was recently works manager of the Fairmont Mining Machinery Co., Fairmont, W. Va., and previously had spent 12 years with the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa.

Pelouze Manufacturing Co., 232-242 East Ohio street, Chicago, is sending out a new 25-page catalog on scales and electrical appliances. The first half of this publication is devoted to illustrated descriptions of Pelouze scales of various types and sizes. The remainder of the booklet deals with electrical devices manufactured by the company, among which are included electric irons, toasters, electric radiators, heating pads, etc.

The Roller-Smith Co., with main office and export department at 233 Broadway, New York City, manufacturer of electrical protective and measuring apparatus, announces that it is now represented in Cuba by Martinez Cartaya & Bueno, located at Muralla 40, Havana, Cuba. Martinez Cartaya & Bueno will handle the Roller-Smith products of electrical measuring instruments, watthour meters and circuit-breakers on an exclusive agency basis for the entire island of Cuba.

The Goulds Manufacturing Co., Seneca Falls, N. Y., is sending out a new bulletin entitled "Centrifugal Pump Sales Service Data." The data contained in this bulletin were first issued as a series of sales letters for the use of its selling organization, but because of the enormous demand for authentic information on the centrifugal pump, they have been reprinted by the company, placing at the disposal of its customers a vast amount of information on the theory, design, testing, practical application, etc., of these pumping units. The concluding chapters of this publication are devoted to detailed descriptions of the Gould line of pumps. The text is accompanied by numerous illustrations of typical installations and pumping units. and charts, showing head curves, efficiency curves and horsepower curves. The Goulds company is now in its seventy-first year as a successful producer of centrifugal pumps, which rank among the very best in this country in completeness, as well as in construction and design.

Western Electric Co., 195 Broadway, New York City, is making distribution of a new booklet entitled "The Eight-Hour Day in the Home," which treats in a unique way the housekeeping problem under the present servant shortage. The treatment of the subject matter marks a new epoch in electrical appliance advertising and the book carries the endorsement of a celebrated household efficiency expert, who is in hearty accord with the suggested solution of this problem, namely, the use of electrical labor-saving devices for the home. This booklet has been issued in connection with an advertisement that appeared in the Oct. 18 issue of the Saturday Evening Post. The advertisement also treats of the servant problem and how it may be mitigated, if not entirely solved, by the use of electrical appliances in the household.

The Pittsburgh Reflector & Illuminating Co., Pittsburgh, Pa., has prepared a very convenient calculator for quickly showing which of its show window reflectors should be used for the proper illumination of show windows of various dimensions. This calculator consists of a cardboard pocket holder with two slots near the top. At the left are shown different heights and depths of windows and at the right various heights of the background in feet. The window heights range from 7 to 14 ft. and the depths from 3 to 10 ft., while the window trim of background ranges up to 10 ft. A card placed in the holder has stamped on it in suitable rows the figures for height and depth of window and, at the right, the catalog numbers for the five different types of show window reflectors made by the company. By pulling out the card to any desired window dimensions, it is possible to instantly determine the type of reflector to be used for different heights of trim. On the outside of the holder are shown illustrations of the reflectors made by the company together with data relative each.

Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., has issued motor application circular No. 7179 entitled "The New Farm Help." This is an attractively illustrated booklet with a three-color art cover and pleasing two-color pages, setting forth more than seventy uses to which electric motor power can be applied as an efficiency builder and labor saver on the farm. It explains not only how electric power can be utilized for doing a large amount of work on the farm, but how it provides the best, safest and most convenient form of light and how it takes the drudgery out of many of the hardest household tasks of the farmer's wife. By citing various instances where electrical installations are in actual operation on farms, it proves that electricity is beginning to revolutionize agricultural life not only by making it more profitable, but by providing it with many of the comforts and conveniences heretofore found only in the city. It explains how central-station power may be secured where no service lines exist at present and gives instructions as to how to connect and distribute power about the farm. The booklet will be sent free on request to central station officials who are interested. The following information should be included with the request: Length of proposed line, number of possible consumers, number of original consumers and general plan of organization.

St. Paul Electric Co., jobber of electric supplies and appliances, 145-147 East Fifth street, St. Paul, Minn., has been appointed agent-distributor for the northwest territory by the Westinghouse Electric & Manufacturing Co. A complete and varied stock of Westinghouse products will be carried for which purpose an entire floor has been set aside. The company aspires to carry the largest stock of motors, meters, transformers and other power apparatus in the Northwest and to render to the trade service on apparatus such as no other distributor in this territory has heretofore been able to give. Facilities are provided for handling engineering work in connection with the proper installation of Westinghouse apparatus, and this department will be in charge of M. R. White. The Westinghouse agency will, in addition to the other manufacturers that it represents in this territory, enable the St. Paul company to handle a very extensive and varied stock of electrical apparatus either for the generation or use of electricity and supply everything from a socket bushing to a steam-driven turbogenerator.

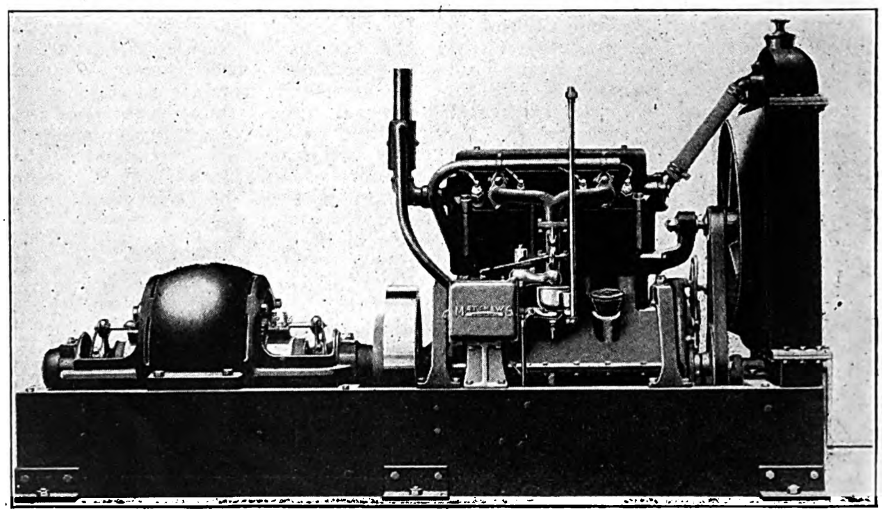
The Cutler-Hammer Manufacturing Co., Milwaukee and New York, has prepared a number of standard descriptive booklets which illustrate and describe various types of C-H apparatus. A recent addition to this list of publications is known as Booklet J and is illustrative and descriptive of C-H rectangular magnets, which are particularly adapted for efficient handling of regular shapes in steel and iron. The advantages of using a rectangular magnet over any other type of magnet for handling such material as sheets, bars, billets, ingots, pipes, etc., is maximum lifting capacity for a given weight of magnet, resulting in economy in the price of the magnet, crane equipment, and current consumption, and besides, greater speed in handling the material. The booklet makes mention of a few typical applications where C-H rectangular magnets are handling ship plates, pipe, cold-rolled steel in coil and other material. In one instance, one of the magnets had a record of unloading 50 tons of plates in 50 min. from a railroad car to stock pile. Numerous illustrations show the magnets in use in several prominent plants. Occasionally magnets are used in pairs. The booklet describes the magnet construction, gives dimensions and other engineering data and tables of lifting capacities for various classes of material.

The Esterline Co., Indianapolis, Ind., has issued a well illustrated book entitled "Typical Graphic Records." This shows 36 graphic records taken on Esterline recording instruments, these giving a very effective idea of the change in power consumption of various machines, changes in speed, variations in power-factor, fluctuation of gas production, transformer load record, etc. Through analysis of some of these power records extremely valuable results have been obtained in eliminating errors and losses in operation and production. In other cases, valuable data have been obtained for aiding in scientific rate making by power companies. The value of these records and the many possibilities of securing improvement in operation through a study thereof are pointed out in the publication. It also includes a number of views of essential elements of the Esterline graphic instruments and gives a brief description thereof. This publication should prove of great value to those somewhat familiar with the use of recording instruments but who have not fully realized the many possibilities of usefulness that they possess.

Zobell Electric Motor Corp., Garwood, N. J., has entered the field to manufacture alternating and direct current motors, ranging in size from 1 to 7½ hp. It is also intended to make a very high-grade motor with many new refinements. The design of the first line of motors has been completed in which the shafts may be removed without disturbing either the core or the commutator, and the commutator may likewise be removed without disturbing the shaft or core, a method which it is claimed has not heretofore been used on small motors. All refinements used on large motors are to be adapted to these small machines. A line of standard commercial motors is being brought out, but at present the company is principally devoting itself to building motors designed especially for machines on which they are to be employed. The equipment is designed to produce from 200 to 300 motors monthly. The company, which was recently incorporated with a capitalization of $250,000, has for its officers the following: Fred G. Bell, president; A. T. Zoebisch, treasurer, and F. E. B. Bucker, secretary.

Consolidated Utilities Corp., Chicago, factory distributor for Matthews full automatic electric light and power plants, recently sold to the King of Siam a 5-kw. electric plant to furnish light and power for the luxurious royal palace. The special representative sent by His Majesty spent considerable time investigating many factories and in studying the features of the various plants on the market, and because of its full automatic features, and its long proven reliability, as well as its wide use by the United States government, the Matthews full automatic plant was selected. On this same American trip a gold-plated typewriter was purchased. A 10-kw. Matthews electric light and power plant left the factory last week and was shipped to Rene Berndes, who is the ex-Hungarian consul for Cuba. Senor Berndes has recently gone into the sugar business and has an immense, modern plantation which requires an ample installation for both light and power, and the absolute dependability of this plant is of first importance.

The presidential train of the Republic of Mexico, renowned as perhaps the most elaborate train in the world, presented by the Pullman Co. to the Mexican government, has just been equipped throughout with electric lights and a Matthews full automatic plant was installed. This train was presented during the regime of Diaz and has been in constant service ever since. It is most lavishly decorated and finished without regard to expense, several of the interiors being trimmed in gold-leaf, with intricate and classic hand carvings, and inlaid with ivory. With its present Matthews equipment this train now possesses every possible modern convenience. These plants are the same as are used throughout America on thousands of farms, but are of larger models. The patented full automatic features of the Matthews make it a most popular plant where reliable service is expected. It gives the battery full protection at all times against over-charging or excessive discharge. It starts and stops itself automatically. These plants are built in seven sizes from ⅓ kw. to 25 kw.



Matthews Power Plant Used in Royal Palace of King of Siam.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Lewiston, Me.—Arrangements are being made by the Androscoggin Electric Co. for the construction of an extensive addition to its power at Deer Rips, on the Androscoggin river, near Lewiston, Me., for increased capacity. The project including machinery and equipment will cost about $200,000.

Ludlow, Vt.—Council has recently completed work on the extension of its power lines from the municipal electric plant to Smithville.

Springfield, Vt.—Colonial Power & Light Co. has completed arrangements with the Fellows Gear Shaper Co. for furnishing additional electric power for the operation of a new addition to its plant now nearing completion. The company has recently commenced the construction of a 3-phase line extension to the plant of B. Steinfield & Sons, for additional service.

Rutland, Vt.—Vermont Hydro-Electric Co. will build hydraulic plant and a dam to cost $450,000.

Boston, Mass.—Boston Insulated Wire & Cable Co. contemplates the erection of an addition to its plant.

Lowell, Mass.—Massachusetts Cotton Mills has awarded contract for the erection of a power house to cost $100,000.

Pittsfield, Mass.—Plans have been prepared for an addition to the plant of the General Electric Co., to cost $200,000.

Albany, N. Y.—Plans are under consideration by the board of managers of the Homeopathic Hospital, 161 North Pearl street, for the erection of a new heating plant, laundry building and solarium at the institution, estimated to cost $134,415. Considerable electrical and mechanical equipment will be required in connection with the proposed work.

Brooklyn, N. Y.—In connection with the construction of the proposed plant of the Gehnrich Indirect Heat Oven Co., 60 Franklin avenue, to be located at Buckley and Skillman streets, Long Island City, estimated to cost $100,000, considerable electrical and mechanical equipment for operation will be required. The new works will be a two-story structure, about 125x200 ft.

Brooklyn, N. Y.—Fahnestock Electric Co., Meadow street, manufacturer of electrical equipment, has completed negotiations for the purchase of property, about 50x100 ft., on East avenue, Long Island City, to be used as a site for the construction of a new machine shop.

New York, N. Y.—Announcement has been made by the Marconi Wireless Telegraph Co. of America, Woolworth building, that a contract has been entered into with the United States Shipping Board, Emergency Fleet Corp., for the maintenance of its wireless service on the 400 ships of the board. The agreement provides that the company furnish the necessary operators, and includes the maintenance and repair of the wireless apparatus.

New York, N. Y.—Considerable electrical and mechanical equipment will be required by the United Cork Co., 50 Church street, in connection with the construction of a new plant at Lyndhurst, N. J. The works will comprise a group of one-story structures, including main manufacturing building, and are estimated to cost $100,000.

Bloomingdale, N. J.—Plans are under consideration by the Borough council for increasing the electric lighting facilities in the Bloomingdale Flats district.

Dover, N. J.—Board of Water Commissioners is considering plans for the installation of new electrically driven pumping units at the municipal pumping station to replace the present gas engine equipment. Service is furnished by the New Jersey Gas & Electric Co.

Hoboken, N. J.—Fire recently damaged a large quantity of stock at the plant of the Cooper Hewitt Electric Co., 722-32 Grand street.

Hoboken, N. J.—Button Machinery Co., 1023 Clinton street, has awarded a contract to the Industrial Engineering Co., 30 Church street, New York, for the erection of a new boiler plant in connection with its proposed works to be located on 11th street, extending from Grand to Adams streets. The project is estimated to cost $170,000.

Newark, N. J.—Essex and Hudson county commissioners jointly have ordered the county engineers to prepare specifications for a new contract covering the lighting of bridges over the Hackensack and Passaic rivers in the respective counties for a period of five years. The present contract expires on Nov. 15.

Verona, N. J.—In connection with the construction of the proposed group of hospital buildings at the Mountain Sanatorium by the Essex county officials, work has been practically completed on the erection of the boiler plant at the site. It is understood that light and power service, as well as water, will be furnished from the Overbrook Hospital, Overbrook, and work has been completed on a new booster installation to be used for this purpose. A large laundry building is also included in the plans, and in this connection, considerable electrical and mechanical equipment will be required.

Washington, N. J.—In connection with the establishment of the proposed plant of the Merritt-Grieler Silk Throwing Co., on East Washington avenue, plans have been prepared for the installation of a new engine plant for general factory operation.

Allentown, Pa.—Peters & Jacoby Co., 627-29 Hamilton street, has recently completed extensive improvements at its plant, including a change in motive power to individual motor drive. It is said that the company is considering the erection of a new plant for the manufacture of ice cream, and in this connection considerable electrical equipment and refrigerating apparatus will be required.

Glen Mills, Pa.—Glen Mills Electric Co. has filed application with the Public Service Commission for permission to furnish electric energy for light, heat and power purposes to Thornbury township.

North Catasauqua, Pa.—Borough council has approved plans for the installation of the proposed electric street lighting system. It is understood that power for operation will be furnished by the Lehigh Valley Light & Power Co. for a period of about ten years.

Philadelphia, Pa.—Sears, Roebuck & Co. have awarded contracts for a large reinforced concrete building, 780x440 ft., and will represent an investment of approximately $7,500,000. George C. Nimmons & Co., Chicago, are the architects.

Philadelphia, Pa.—Announcement has been made by the Keystone Telephone Co. that plans are being arranged for the installation of automatic telephones, to replace the system now in use by the company throughout the Philadelphia district. Edward M. Cooke is vice-president and general manager.

Philadelphia, Pa.—In connection with the construction of the proposed building of the American Ice Co., to be located in Frankford district, contract for which was recently awarded to Cramp & Co., Philadelphia, considerable electrical equipment and refrigerating apparatus will be required. The structure will be of reinforced concrete construction, and will cost approximately $150,000.

Pittsburgh, Pa.—The department of public service will advertise for bids for furnishing and installing motor generator set in connection with the plant at the Department of Public Safety building. Address E. V. Babcock, mayor.

Pittsburgh, Pa. — Follansbee

Brothers Co., manufacturer of tin plate automobile and electrical black sheets, etc., has completed arrangements for a bond issue of $1,500,000, the proceeds to be used to cover the cost of the construction of a new manufacturing plant of like size as its present works at Follansbee, W. Va. The plant comprises four 35-ton open-hearth furnaces, six tin and seven sheet mills, and has an annual capacity of about 65,000 tons of finished material. William U. Follansbee is president.

Yardley, Pa.—Yardley Water Co. has recently completed the installation of a large new pumping unit at the local waterworks plant. Other improvements to facilitate service have also been made in the system.

Baltimore, Md.—Service Terminal Co. is understood to be considering plans for the erection of a large new local cold storage plant. Considerable electrical equipment, refrigerating apparatus, etc., will be required in connection with the proposed work.

Baltimore, Md.—Samuel T. Williams, 223 North Calvert street, is in the market for a motor-driven single-drum hoister, suitable for tub rig hoist, 50-hp. motor, a. c., 220 volts, 3-phase, 25-cycle; drum 30-in. diammeter, 24 ins. long with or without motor.

Welch, W. Va.—Welch Armature Co. will erect a three-story and basement building, 63x63 ft. John Doss, architect.

Wadesboro, N. C.—Extensive improvement will be made to the light system. Address mayor.

Denmark, S. C.—Edisto Public Service Co. is arranging plans for the erection of a new local plant, including the construction of a 10-mile transmission system to Stalo. The work is estimated to cost $40,000. R. A. Easterling is manager.

Gaffney, S. C.—City council is considering plans for extensive improvements and extensions in the municipal light and water system.

Orangeburg, S. C.—City is planning for a bond issue of $45,000, the proceeds to be used to cover the cost of proposed extensions in the municipal electric light system. W. A. Livingston is mayor.

Bainbridge, Ga.—Bainbridge Power Co. has organized with a capital of $100,000 to build dam and power house, to cost $75,000. The power house will be erected at Spring Creek. Bids will be asked for the machinery. J. M. Simmons, president.

Cochran, Ga.—City has approved the issuance of bonds for $15,000 to cover the cost of improvements in the municipal electric light and water systems. H. D. Sturdivant is engineer.

Spring Creek, Ga.—Bainbridge Power Co., recently organized with a capital of $100,000, is arranging plans for the construction of a local hydro-electric power plant with dam, estimated to cost $80,000. Included in the proposed work is the construction of a transmission system, which with machinery will cost about $55,000. J. M. Simmons is president; D. T. Sutherland, vice-president; and E. J. Perry, secretary-treasurer; all of Bainbridge, Ga. B. M. Hall & Sons, Peters building, Atlanta, are architects and engineers for the company.

Eau Gallie, Fla.—Eau Gallie Electric Co. will erect an ice and electric plant to cost $40,000.

Vero, Fla.—Vero Utilities Co. is arranging plans for extensions and improvements in its local power plant, to provide increased service, including the installation of new generating and engine equipment. It is also proposed to extend its lines to Vero Beach.

DATES AHEAD.

Jovian Order. Annual convention, Chicago, Nov. 5 and 6. Headquarters, Hotel Sherman. Acting Mercury, Eli C. Bennett, St. Louis, Mo.

Electrical Supply Jobbers' Association. Semi-annual meeting, Cleveland, Ohio, Nov. 18-20. Headquarters, Hotel Cleveland. Secretary, Franklin Overbaugh, 400 South Clinton street, Chicago.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

American Institute of Chemical Engineers. Annual meeting, Savannah, Ga., Dec. 3-6. Secretary, J. C. Olsen, Brooklyn, N. Y.

Electric Power Club. Meeting, Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

NORTH CENTRAL STATES.

Indianapolis, Ind.—Delaware Realty Co. will erect an 18-apartment building, to cost $100,000.

Indianapolis, Ind.—Gladstone Realty Co. has begun the erection of a 48-apartment building, to cost $200,000.

Indianapolis, Ind.—Holcomb & Hoke Manufacturing Co. will erect two new buildings, one to be a three-story brick building and the other a one-story frame structure.

Wabash, Ind.—Service Motor Truck Co. will erect a new building, 75x775 ft., to cost $150,000.

Wabash, Ind.—T. F. Vaughn, president of the Wabash Cabinet Co., announces that additions to cost $100,000 will be erected at once.

Chicago, Ill.—Edison Electric Appliance Co., Inc., has under consideration an addition to its plant. The structure is to be 342x355 ft. and will cost $270,000.

Chicago, Ill.—George W. Pyott Co., manufacturer of power transmission machinery, has purchased from the Pyott Foundry Co. a tract of land, 575x318 ft. at Lake street and Kilpatrick avenue.

Chicago, Ill.—Ed. V. Price Clothing Co. will build a 12-story building, 250x120x178x250 ft., corner South Throop street and West Jackson boulevard.

Chicago, Ill.—Stromberg Motor Devices Co. has begun work on the erection of a seven-story building on a 75-ft. tract, and will involve an expenditure of $280,000. It will be used as addition to the plant of the Stromberg company on 25th street.

Chicago, Ill.—A four-story factory building, to cost $50,000, is to be erected by Ludwig Pottasch, 32 South Wabash avenue, at 113-115 West Austin avenue.

Chicago, Ill.—C. Reynolds Bronson will erect a one-story factory building, 100x100 ft., at 4435-45 West Kinzie street. This building has been leased to the Handy Manufacturing Co., manufacturer of steel clamping devices, for a period of 10 years.

East St. Louis, Ill.—Through the construction of a second line from the Keokuk dam to the distributing station of the East St. Louis Light & Power Co., it is hoped to relieve the interruptions in light and power to which the city is now subjected. Work on a dual high-tension line is being pushed rapidly and will soon be completed. With this line in operation the company will always have one line in reserve in case of interruption to the other.

Elgin, Ill.—An ordinance is before the council providing for an issue of $200,000 in bonds for establishing a local lighting plant. Address A. E. Price, mayor.

Galena, Ill.—Interstate Light & Power Co. has received requests from two large mining companies for extension of electric transmission lines to furnish power for sinking shafts to new ore bodies.

Monmouth, Ill.—On Nov. 18 an election will be held to vote on the question of issuing municipal light bonds. Address city clerk.

Ottawa, Ill.—Peltier Art Glass factory has been destroyed by fire, with loss of $150,000. The plant will be rebuilt.

Peoria, Ill.—Cappel-Garrard Co. will erect steel addition, 60x40 ft., to cost $15,000.

Peoria, Ill.—National Warehouse Co. has awarded the contract for new buildings to W. M. Allen & Sons, for $175,000. The new building will be 140x80 ft., seven stories in height.

Waukegan, Ill.—Board of education plans the erection of a $200,000 high school building.

Kalamazoo, Mich.—Eddy Paper Co. has commenced work on its power plant at Three Rivers, Mich., 57x191 ft.

Monroe, Wis.—Monroe Electric Co. has under consideration the extension of its service to Juda. The proposed route of the transmission wires is now being surveyed and it is expected to have the work under way in a short time. The company has also installed an additional boiler at its plant, increasing its capacity by one-third.

Oshkosh, Wis.—Oshkosh Washing

Machine Co. contemplates a plant addition, one-story, 80x200 ft.

Wood, Wis.—Local business men will organize a company and will incorporate the Wood Electric Light & Power Co. for the purpose of providing the town with electricity for lighting and power. It is planned to install a plant at once and have it completed within 60 days.

Faribault, Minn.—One hundred hp. in motors has been added to the connected load of the Colburn Brick & Tile Co., served by the Northern States Power Co. This is for the operation of electrically driven hoists for stripping.

Montevideo, Minn.—Southwestern division of Northern States Power Co. will supply electric energy amounting to 75 hp. in motors for the requirements of the new $300,000 high school at Pipestone. The company is also furnishing 30 hp. for the operation of a new creamery at Montevideo. Among new buildings in prospect for Pipestone is a $50,000 hospital, foundation for which will be started this fall. Electric light and power requirements will be supplied by the Northern States Co.

Dubuque, Iowa—Cadillac Motor Co. will erect a $20,000 garage building for storage and display rooms.

West Liberty, Iowa—Bonds will be issued for the purpose of installing additional equipment in the local power plant.

Clark, Mo.—A transmission line is to be built to connect with Sturgeon's 24-hour electric service.

Doniphan, Mo.—Election to vote bonds for new equipment for the power house carried.

Greer Springs, Mo.—As a future development the Missouri Iron & Steel Corp., St. Louis, will build a hydroelectric plant at Greer Springs. Surveyors are now assembling hydraulic, topographic, and geologic information from which development will be designed.

Independence, Mo.—The city council has awarded contracts for machinery for an addition to the electric light plant to cost $60,000. The contract for an engine, generator and condenser was awarded to the Hamilton Corliss Engine Co., for $40,940. The O'Brien Boiler Co. of St. Louis, was awarded the contract for a boiler which will cost $8851.

Liberty, Mo.—Missouri Gas & Electric Service Co., which owns the Liberty electric light plant, will construct a transmission line to Missouri City to furnish electric light and power to the coal mines there. The line will also be extended to Lexington and Richmond.

Mexico, Mo.—Contract to furnish electric current for light and power to the city of Auxvasse, was closed Oct. 15 with the Mexico Light & Power Co. The line will be 11 miles in length and construction will begin immediately.

Osborn, Mo.—L. C. Lambard has purchased the electric light plant at Osborn from Ed. Bauer.

St. Louis, Mo.—Board of public service is having plans prepared for the complete electrification of the street lighting system, to cost approximately $193,000. Ralph Toensfeldt is engineer.

St. Louis, Mo.—Union Electric Light & Power Co. is said to be planning for the construction of a large new addition to its generating station for greatly increased capacity. It is planned to have a daily generating capacity of approximately 60,000 kw. It is said that the project will involve an expenditure in excess of $5,000,000.

St. Louis, Mo.—Mississippi Valley Iron Co., 6500 South Broadway, plans the erection of a one-story engine house, 29x82 ft., and a one-story plant, 36x93 ft.

Peabody, Kans. — Peabody Light, Power & Ice Co. has been granted a 24-year franchise. The plant is to be doubled or trebled in capacity at once.

St. Francis, Kans.—Election will be held Nov. 4 to vote $15,000 in bonds for the purchase of a site and constructing a power, light and heat plant. F. L. Shields, city clerk.

Lincoln, Neb.—Plans for a new $85,000 power house and equipment in connection with the proposed extension of the municipal water and lighting departments, were submitted to the city council by C. F. Lampert, representing Burns & McDonnell, Kansas City, consulting engineers.

Armour, S. D.—The towns of Ethan and Dimock have raised $25,000 for installing electric lights here.

Clark, S. D.—F. W. Boyle purchased property on which he will erect an electric light plant soon.

Ipswich, S. D.—The city has granted Ipswich Electric Light & Power Co. the right to erect, construct, install and maintain an electric light, power and heating plant. E. R. Perrin, city auditor.

Ree Heights, S. D.—The proposition of granting a franchise to E. L. Eague, for installing and operating an electric light system, was approved at a recent election. It is expected the construction of the plant will be commenced soon.

Montpelier, N. D.—Albert Sitel will erect an electric plant and feed mill.

SOUTH CENTRAL STATES.

Louisville, Ky.—Commercial department of Louisville Gas & Electric Co. during the week ended Oct. 10, secured 66 new electric light and power customers with 42 kw. of lighting and 71 hp. in motors, and accepted contracts for wiring 39 already built houses. New business connected to the company's lines shows an increase of 62 customers. Output of electric energy was 15.7% greater than during the corresponding period last year.

Mayking, Ky.—Mayking Coal Co. has completed arrangements for the installation of new electrical operating equipment at its local plant, to increase the present output. Lee Stone, Lexington, Ky., is general manager.

Maysville, Ky.—Maysville Power Co. is arranging for the installation of new power plant equipment to increase the present capacity. The installation will include a new steam turbogenerator unit with exciter and other operating equipment. J. E. Sirrine, Greenville, S. C., is architect and engineer for the company.

Birmingham, Ala. — Henry Lengfelder, head of the Orbon Stove Co., Belleville, Ill., is organizing a new stove manufacturing company in Birmingham. He has purchased a site for a future location of the plant.

Starkville, Miss.—Bonds to the amount of $55,000 have been voted by the city for an electric light, water and sewer system. Address the mayor.

Monroe, La.—City has called a special election on Nov. 18 for voting on the issuance of bonds for $450,000 to provide for the construction of a new electric light and power plant and waterworks system, to be used for municipal service. Arnold Bernstein is mayor.

Monroe, La.—R. A. Smith Co. is in the market for electrical equipment.

Texarkana, Ark.—Southwestern Gas & Electric Co. will double the capacity of its power plant at a cost of $75,000, including a 300-hp. turbine engine.

Enid, Okla.—Announcement has been made of the Oklahoma Flour Mills Co.'s intention to erect a $100,000 mill in Enid.

Hobart City, Okla.—V. V. Long & Co., engineers, 1300 Colcord building, Omaha, have prepared plans for the proposed light plant to be erected at a cost of $130,000.

Ochelta, Okla.—Election will be held Nov. 4 to vote $13,000 in bonds for a waterworks system and $7000 to extend and improve the electric light plant.

Oklahoma City, Okla.—Oklahoma Gas & Electric Co. has had plans prepared for an electric generating plant to cost $3,000,000.

Sulphur, Okla.—Sulphur Ice, Light & Power Co. contemplates the expenditure of $30,000 for new machinery.

Dallas, Tex.—The city commission has approved the requisition of the Dallas Electric Light & Power Co. for the purchase of the heat, power and distributing plant owned by Smith & Whitney. The cost will be $50,000, and it has been purchased for the improvement of service.

Devine, Tex.—Devine Electric & Ice Co., recently incorporated, is considering plans for the construction of a new local plant, estimated to cost $25,000. B. Morrison is manager.

Fort Worth, Tex.—Texas Power & Light Co. has arranged plans for improvements and extensions at its plant, including the erection of a new boiler house. The work is estimated to cost $135,000.

Fort Worth, Tex.—Ballard-Martin Electric Co. will erect a factory which will involve the expenditure of $100,000.

Port Arthur, Tex.—Eastern Texas Electric Co. is considering plans for the construction of a new unit at its

Port Arthur electric generating station. The work is estimated to cost $600,000.

WESTERN STATES.

Cheyenne, Wyo.—The lighting system will be rearranged by the Cheyenne Light, Fuel & Power Co.

Chehalis, Wash.—The city commission has passed a resolution calling for the installation of new standard street lights, about 90 concrete poles with 400-cp. lights on the business streets.

Everett, Wash.—On Nov. 15 an election will be held to decide whether or not a municipal power plant is desired and to ask for sufficient bond issue to cover the proposal.

Everett, Wash.—The Commercial Club is discussing a better lighting system for the city. It is planned to create an improvement district in the down-town section for installing a cluster light system.

Seattle, Wash.—Seattle Lighting Co., Stuart building, is to erect a fireproof gas holder at a cost of $50,000, at 2000 Northlake avenue. The Stacy Manufacturing Co., Stuart building, has the construction contract.

Seattle, Wash.—Rothert Process Steel Co., 622 Harriman street, Seattle, is installing a two-ton alloy furnace to make its own alloys. This will be operated by electricity as are its other furnaces. The company is now turning out from two to three tons per day of high-speed steel and the output is to be steadily increased. Installation of a small rolling mill is under consideration.

Seattle, Wash.—H. Bittman, structural engineer, Securities building, has been authorized to prepare plans for construction of a one-story building with concrete floors and basement for the Everready Electric Service Co., at East Pine street and Nagle place, estimated cost about $30,000.

Astoria, Ore.—McCartney Electric Co. received the contract for electric wiring of sections 1, 5 and 6 of the port warehouse at $3344.

Astoria, Ore.—Announcement has been made of proposed developments by the Crown-Willamette Paper Co. of its holdings in the Youngs river district, a few miles above Astoria. The plans include erection of a 60-ft. dam to electrically harness Youngs river falls. Power will be furnished for an electric plant which will be the center of a number of industries to be located in that vicinity. The company announces a proposal to erect a grinding and pulp mill with a capacity of 100 tons of paper pulp daily. Work of clearing the site for the dam has been completed.

Bend, Ore.—T. H. Foley, president of the Bend Commercial Club and manager of the Bend Light & Power Co., was in Salem recently to enter into a contract with the state for the appropriation of water from Tumalo creek for power purposes at this place.

Bishop, Calif.—Southern Sierras Power Co. is making rapid progress on the preliminary work in connection with the construction of its new local plant located on Bishop creek. Active work has been inaugurated on the grading for a 51-in. flow line to be about 14,000 ft. long, extending from Sabrina to the proposed power plant site, while plans have been arranged for the building of another flow line six miles in length, to extend from South Lake.

Modesto, Calif.—Plans are under consideration by the city officials for the issuance of bonds for $20,000, to cover the cost of the installation of the proposed ornamental street lighting system.

Porterville, Calif.—Plans are being arranged by the Mt. Whitney Power & Electric Co. for the rebuilding of approximately 80 miles of its transmission system. It is understood that the present 30,000-volt line will be replaced with an aluminum system of 60,000-volt capacity.

Sacramento, Calif.—It is reported that the Pacific Gas & Electric Co. will build a large hydroelectric plant in Shasta county.

San Bernardino, Calif.—City is having plans prepared for the installation of a new ornamental street lighting system on Third street. It is understood that Marbelite standards will be utilized.

San Bernardino, Calif.—Announcement has been made that plans have been arranged by the Pacific Electric Co. for the removal of the general offices of the entire eastern division to Riverside.

San Francisco, Calif.—Great Western Power Co. has completed arrangements for the construction of the proposed steel tower transmission line from Caribou, Plumas county, to extend to Oakland, a distance of about 195 miles. The new line will parallel the present system of the company from the Big Bend power site in the vicinity of Oroville to Brighton, and will be of 150,000 volts capacity. The company is planning to complete the new power plant at Caribou and the proposed power line within 12 months' time. The project is estimated to cost $2,500,000.

Santa Ana, Calif.—City council has taken bids for the construction of the proposed ornamental street lighting system to be installed on Glassel street, extending from Sycamore to Culver avenues, and on Chapman avenue, between Cambridge street and the Santa Fe railroad.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Electrical Goods (31,062).—A firm in Brazil desires to secure an agency for the sale of agricultural machinery, factory supplies, and electrical goods. Reference.

Electrical Materials (31,023).—An agency is desired by a man in Italy for the sale of electrical materials of all kinds, especially those for illuminating purposes, agricultural implements, machines, tools, rolling stock for railroads, locomotives, and electric locomotives. In all cases where possible samples and catalogs are desired. Quotations should be given c. i. f. Italian port. Payment, cash against documents. Correspondence should be in Italian. References.

PROPOSALS

Light Station.—Until 2 p. m., Dec. 17, bids will be received by the Commissioner of Lighthouses, Washington, D. C., for all materials and labor for the construction of Point Borinquen light station at Porto Rico.

Electrical Equipment for Bridge.—Bids will be received at Room 406, City Hall, Chicago, for furnishing, constructing, delivering and installing the entire electrical equipment for a double-deck bascule bridge over the Chicago river at North Wells street, according to plans and specifications on file in the office of the Department of Public Works. Charles R. Francis, commissioner of public works.

Electrical Equipment.—Until 12 o'clock, Nov. 14, the Philadelphia District Salvage Board, Committee on Sale of Buildings and Equipment, Ordnance Department, 1713 Market street, will receive bids for electrical equipment at the Eddystone rifle storage plant at Eddystone, Pa. It is understood that the equipment includes approximately 300 motors, ranging from 1 to 75 hp., as well as 50-hp. motors with starting compensators for each motor of 5 hp. and above, and other apparatus.

Electrical Equipment.—Bids will be received by J. P. Henican, vice-president of the board of administrators, Charity Hospital, New Orleans, until Nov. 10, for the following: electric wiring for the buildings, Diesel engines, direct-current generators, steam engine, switchboards and underground cables, underground ducts and manholes, direct-current X-ray apparatus, and second-hand alternating-current apparatus. A. Wyndham Lewin, consulting engineer, 804 Union street.

Electric Work.—Bids will be opened in the office of the supervising architect, Treasury Department, Washington, D. C., at 3 p. m., Nov. 20, for furnishing materials for the construction of the United States post office at Lewiston, Pa., including materials for concrete, reinforced concrete, stone, granite, brick, structural terra cotta, structural steel, miscellaneous iron and steel work, composition roofing, slate roofing, sheet metal work, skylights, plastering, interior marble, heating, electric work, etc., in accordance with drawings, specifications and bills of quantities attached thereto. Copies may be obtained from the custodian of the site at Lewiston, Pa., or at this office, in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

INCORPORATIONS

New York, N. Y.—Geyser Electric Washing Machine Co. Capital, $20,000. To manufacture electrically operated washing machines, etc. Incorporators: E. S. Hawley, F. H. Butehorn, and R. S. Baker, 37 Wall street.

New York, N. Y.—Utility Products Corp. Capital, $100,000. To manufacture electrical machinery and supplies for railway power and lighting service. Incorporators: G. Tiernan, G. H. and J. B. Purcell, 64 Wall street.

New York, N. Y.—Hadges & McLain Co., Inc. Capital, $100,000. To manufacture electrical devices, etc. Incorporators: E. Hadges, H. E. McLain, and W. Loomer, 652 Amsterdam avenue, New York.

Brooklyn, N. Y.—Agenda Novelty Manufacturing Co., Inc. Capital, $25,000. To manufacture electrical mechanical novelties, etc. Incorporators: H. J. Lauman, F. E. Bloch, and D. Goldfoile, 57 East 89th street, New York.

New York, N. Y.—Ranwood Manufacturing Co. Capital, $200,000. To engage in a general electrical and mechanical engineering capacity. Incorporators: C. A. Wolf, Brooklyn; L. B. Morehouse, and J. B. Greene, 2 Rector street, New York.

Louisville, N. Y.—Louisville Power Corp. Capital, $20,000. To operate an electric plant at Louisville. Incorporators: G. P. Matthews, V. A. Warren, and W. F. Wilson, Louisville.

Portville, N. Y.—Portville Utility Co. Capital, $50,000. To operate a plant at Portville, Cattaraugus county, for the generation and distribution of electric power. Incorporators: M. J. McCary, C. L. Vergason, and E. C. Nagel, Portville.

Atlantic City, N. J.—Pleasantville & Shore Electric Co. Capital, $100,000. To engage in the distribution of electric energy for heating, lighting and power purposes. Incorporators: G. M. Gest, Edmund Wishewski, and Howard C. Blackwill.

Plainfield, N. J.—Edoscope Manufacturing Co. Capital, $200,000. To engage in a general electrical engineering capacity. Incorporators: Charles A. Rice, Frank A. Weeks, and Walter F. Manning.

Philadelphia, Pa.—Aerex Manufacturing Co. Incorporated under Delaware laws with a capital of $100,000. To engage in an electrical engineering capacity, manufacture electrical goods, etc. Incorporators: J. Vernon Pimm, E. M. MacFarland, and F. R. Hansell, Philadelphia.

Chicago, Ill—Automotive Power Co. Incorporated under Delaware laws with a capital of $1,500,000. To manufacture engines, tractors, etc. Incorporators: J. A. Massen, L. P. Barrett, and R. W. Plummer, Chicago.

Beatrice, Neb.—Consolidated Electric Co. has been organized with capital of $10,000, to supply the towns of Virginia, Rockford and Holmesville. Adress J. S. Dell, president, Beatrice, Neb.

Goshen, Ind.—Goshen Auto & Electric Co., of Goshen, has been incorporated with a capital of $25,000, with U. D. Straw, Claude E. Cornell and Benjamin Hartzog as the incorporators.

Chilli, Wis.—Lynn-Chilli Electric Co. has been organized with an authorized capitalization of $15,000 to manufacture, purchase and sell electric current. Incorporators: W. C. Portz, William Wagner, Oscar F. Franke, August Lindow, Ernest Neinas.

Albany, Ore.—W. F. Burman, E. C. Cline and C. E. Bryant have incorporated the Electric Store of Albany with a capital stock of $10,000 to handle and deal in everything electrical.

Arkansas City, Kans. — Broror-Willys Light & Power Co. has been chartered with $25,000 capital stock by F. R. Brown, Ann Brown, Foss Farrar and J. F. Hunt, all of Arkansas City.

Warsaw, Ind.—Hurgo Manufacturing Co. has been incorporated with capital of $1,500,000 to manufacture vacuum cleaners and accessories.

East Orange, N. J.—Electric Signal Manufacturing Co., Inc. Capital, $100,000. To manufacture electric signalling apparatus, etc. Incorporators: Charles O. Geyer, Harry H. Picking, and S. L. Gedney, Jr.

Huntington, W. Va.—Electric Unit Corp. Capital, $50,000. To manufacture electrical goods. Incorporators: E. F. Kincaid, C. C. Hatzell, E. L. Smith, H. T. Lovett, and H. Blaisdell, all of Huntington.

New York, N. Y.—American Keith Co., Inc. Capital, $100,000. To manufacture power fans, blowers, and other power equipment. Incorporators: W. R. Young, S. K. Greene, and W. C. Wallace, 30 Church street.

Wurtsboro, N. Y.—Mamakating Light & Power Co., Inc. Capital, $25,000. To operate a local plant for furnishing electric service, etc. Incorporators: Fletcher Rhodes, Joseph E. Holmes, and Samuel Goldstein, Wurtsboro.

Paducah, Ky.—Paducah Electric Co. Capital, $1,200,000. To operate a local electric plant. Incorporators: Charles K. Wheeler, Alfred S. Nichols, and R. N. Kirkland.

Lee, Ill.—Lee Power & Light has incorporated with a capital stock of $10,000. Incorporators: David L. Hedberg, James Johnson and Emanuel Anderson.

NEW PUBLICATIONS

"Bibliography of Scientific Literature Relating to Helium" has been issued by the Bureau of Standards, Washington, D. C. This bibliography was first prepared at the beginning of the development of helium for balloon-gas purposes and was intended as an aid in that enterprise. It has since been brought up to date, and is believed to contain practically everything published up to Jan. 1, 1919, except reviews and other articles containing no original work which were published in inaccessible foreign journals and contained no material which was not available in English or American publications. The arrangement of material under each subhead has, in general, been such that closely related articles occur together in their chronological order. The bibliography is thus in effect a brief outline history of the subject. Copies may be obtained by addressing a request to the Bureau.

Reflecting Power of Stellite and Lacquered Silver is the title of Scientific Paper No. 342, by W. W. Coblentz and H. Kahler, published by the Bureau of Standards, Washington, D. C. This paper presents data on the reflecting power of the latest production of stellite and also of lacquered silver mirrors. It is shown that the reflectivity of stellite varies somewhat in the visible spectrum depending upon the homogeneity and no doubt upon the exact composition of the alloy. Data are given on the reflecting power of lacquered silver mirrors, before and after exposure to ultra-violet light. It is shown that owing to photochemical action in the lacquer the silver is turned brown in color, thus reducing its reflecting power. The price of this paper is 5 cts. and anyone interested may obtain a copy by addressing a request to the Bureau.

Electrolysis in Concrete.—The Bureau of Standards, Department of Commerce, Washington, D. C., is making distribution of the revised edition of technologic paper No. 18 entitled "Electrolysis in Concrete," issued March 19. It contains the results of a series of long-time tests which show that with reinforcing iron anode at very low current densities, rusting of the iron and cracking of the concrete eventually occur. In the specimens under test, damage became apparent in from four to eight years. The cathode effects noted in former tests had not progressed much beyond the point reached at the end of the first two or three years. Any one interested may obtain a copy by addressing a request to this Bureau.

Leakage Resistance of Street Railway Roadbeds and Its Relation to Electrolysis of Underground Structures is the title of technologic paper No. 127 issued by the Bureau of Standards, Department of Commerce, Washington, D. C. This bulletin was prepared by E. R. Shepard, electrical engineer of the Bureau, in collaboration with the U. S. Forest Products Laboratory. Several methods of making electrical resistance measurements on street railway roadbeds, and on experimental roadbeds are described and the results of such measurements are given in tabular and graphical form. Certain conclusions are reached regarding the best type of roadbeds and the best methods of treating ties where the reduction of stray currents is important. This paper is now ready for distribution and those interested may obtain a copy by addressing a request to the Bureau.

Personals

Leonard Morey to Study Trade Conditions in Far East— F. A. Moreland Joins Carrick Engineering—Other Changes

WALTER J. HOWELL, for some time radio inspector for the Sperry Gyroscope Co., has been appointed instructor in the Marconi Telegraph Co.'s school at 25 Elm street, New York.

WILLIAM H. FETTER, for the past five years manager of the Harrisburg, (Pa.) branch of the Bell Telephone Co., of Pennsylvania, has been appointed district manager, to succeed S. S. Eberts, recently deceased.

E. E. YENSEL, vice-president and general manager of the New Jersey Power & Light Co., Dover, N. J., has resigned to become connected with the American Auto Supplies Co. Mr. Yensel will be succeeded by E. L. White.

G. O. HOUSE, manager of the St. Paul division of Northern States Power Co., was manager of the St. Paul Association of Public and Business Affairs which has carried on a campaign for the inauguration of a "Better St. Paul." E. E. Sanford, manager of the securities department, is also taking an active part in the campaign.

J. M. BRAMLETTE, manager of the Lincoln Traction Co., Lincoln, Neb., has resigned to take a long needed rest. Mr. Bramlette has been connected with public utility companies for more than 30 years, starting as an electrician with the Union Depot Co. in St. Louis in 1889. He has been vice-president as well as manager of the Lincoln company.

F. H. VAN GORDER, who has been connected with the Western Electric Co. for the past 12 years, has been appointed manager of the Newark store. Mr. Van Gorder joined the Western Electric Co. in 1907 as salesman with the Chicago branch. In the spring of 1914 he was made sales manager of the Detroit store and in June, 1918, became power apparatus specialist at New York.

F. A. MORELAND has recently become connected with the Carrick Engineering Co., Chicago, as manager of sales. Mr. Moreland is very well known in the power plant field throughout the Middle West. For 10 years he was connected with the Vulcan Fuel Economy Co. and the Vulcan Soot Cleaner Co., in their Chicago office. He was treasurer of the Vulcan Fuel Economy Co. for a number of years, during which time he was responsible for the development of a number of the company's products, the most important work of his being perhaps the development of the Vulcan-Orsat instrument for analysis of flue gases. As manager of sales for the Carrick Engineering Co., Mr. Moreland is using his wide and thorough knowledge of power plants and methods necessary for coal conservation toward making the control of combustion an automatic process by the use of the Carrick automatic regulator.

FRANK HEDLEY, vice-president and general manager of the Interborough Rapid Transit Co., 165 Broadway, New York, has been elected president of the company, succeeding the late Theodore P. Shonts.

PROF. R. C. DISQUE of the electrical engineering department has severed his connections with the University of Wisconsin to become head of the electrical department of Drexel Institute, Philadelphia.

LEONARD MOREY, vice-president and sales manager of the Electric Products Co., Cleveland, Ohio, left that city on Oct. 1 on an extended business trip, which will include the Pacific coast and western Canada. On Nov. 11 Mr. Morey will sail from San Francisco for Sydney, Australia, to visit his old home. Although his trip is primarily for personal reasons, he will take advantage of the opportunity to study trade conditions in Australia and the Far East, which under present conditions is of utmost importance. Mr. Morey expects to return to the States by April 1, coming back either by way of Italy, France and England or by the southern route to San Francisco and from there east.

Leonard Morey.

MAJ-GEN. JOHN BIDDLE, U. S. A., recently visited the Chicago offices of H. M. Byllesby & Co., and inspected the various departments. General Biddle until recently was commander of all of the American forces in Great Britain. Colonel Byllesby served under him as purchasing agent for the A. E. F. in Great Britain during the period of greatest activity in the acquisition and handling of munitions and military supplies.

R. H. BALLARD, Los Angeles, president of the National Electric Light Association, stopped at Seattle, Oct. 19, enroute from the East and Middle West, through which he recently made a tour to confer with other leading members of the association.

FRANK GILL has been appointed chief engineer of the Western Electric Co. for Europe, adding to the staff of this company one of the best known and highly respected telephone engineers outside the United States. Mr. Gill is a telephone expert of varied experience and began his career in 1882 with the United Telephone Co. of London. In 1896 be became responsible for the management of the whole Irish system and in 1902 was selected engineer-in-chief of the National Telephone. Ten years later, with his assistant engineer, Mr. Cook, he established the firm of Gill & Cook, consulting telephone engineers, in which capacity he was jointly responsible for work in Argentine, Brazil, China, Egypt, India, Malay States, Portugal, Turkey and other localities. With the outbreak of war, he offered his services and was called upon at an early date to organize a department of the ministry of munitions which he undertook in a voluntary capacity. At the completion of this work he resumed his consulting practice. The exigencies of war called for his further service in this direction and he was asked to establish and take charge of another department which occupied his time from 1917 until he relinquished the office of controller of stores in the ministry of munitions last June to enter the services of the Western Electric Co. Mr. Gill is well known in the United States. He visited this country in 1903, 1905, and 1913 and has studied telephone practice in Canada, France, Belgium, Holland, Denmark, Sweden and Switzerland.

Obituary.

W. P. SPARKS, who for the past year has represented the Cleveland Milling Machine Co., Cleveland, at Indianapolis, passed away on Oct. 10. Mr. Sparks was held in high esteem by members of his firm and his many friends in the industry.

PAUL H. STENZ, junior partner of the Stenz Electric Co., Milwaukee, Wis., died at his home on Oct. 17, after an illness of three months. He was a native of Fond du Lac, and is survived by his widow, father, mother and seven brothers.

FRED A. LARKIN, connected with the New York office Allis-Chalmers Manufacturing Co., Milwaukee, manufacturer of motors, generators, turbines, etc., in the capacity of mechanical engineer, and formerly New York representative of the company, died on Oct. 18 at his home in Brooklyn.

Electrical Review
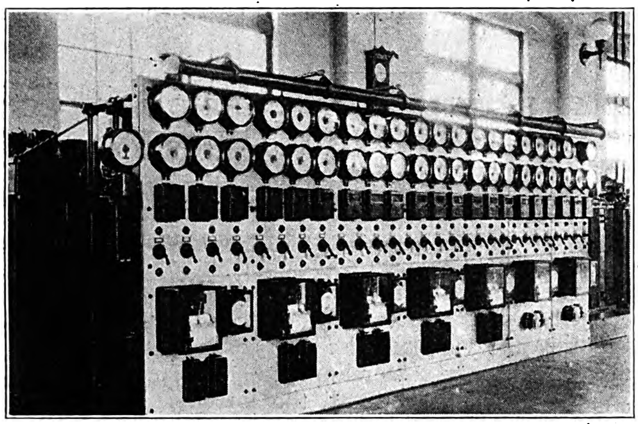
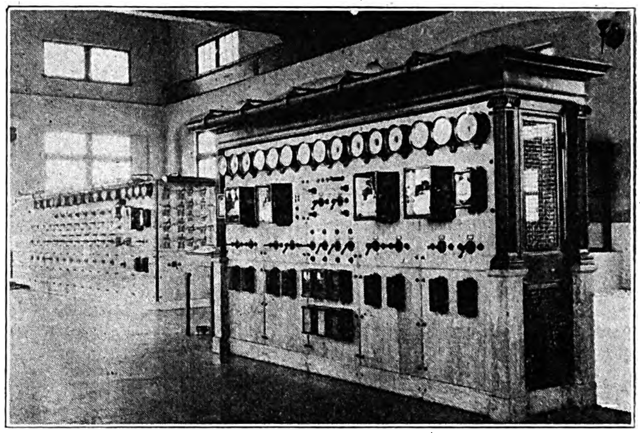
WITH WHICH IS CONSOLIDATED WESTERN ELECTRICIAN AND ELECTROCRAFT

VOL. 75—No. 19. CHICAGO, SATURDAY, NOVEMBER 8, 1919. PAGE 769.



Seven-Panel Feeder Switchboard Installed in Nisqually Substation, Tacoma, Wash.



Five-Panel Switchboard Controlling High-Tension Lines and Transformers—14-Panel Board in Background.

Some Features of the Nisqually Substation at Tacoma, Wash.

Switchboard and Control Equipment—Interesting Method of Regulating the Standby Battery for Operating Circuit-Breakers and Pilot Lamps

THE supply of electrical energy for the city of Tacoma, Wash., is well provided for by the Nisqually substation of the Department of Light and Water of that municipality. The station was designed to transform and distribute electrical energy up to a capacity of 20,000 kw. Three-phase, 60-cycle power is received at 50,000 volts over two transmission lines from the city's hydroelectric station at La Grande, 36 miles distant.

A tap is taken off the high-tension line to supply Camp Lewis and also the pumping station for the city water supply. Current is distributed at 4000-2300 volts, over a Y-connected primary distribution system throughout the city for light and power. By agreement with the city, the private central-station company operating in Tacoma does not furnish any light or any power in units under 25 hp. within the city limits.

Though the substation was originally designed for a capacity of 20,000 kw., it usually carries a load of 24,000 kw. or over. The substation is under the direction of F. S. Morrison, chief operator, who has under him one operator and an assistant for each of the three 8-hour shifts.

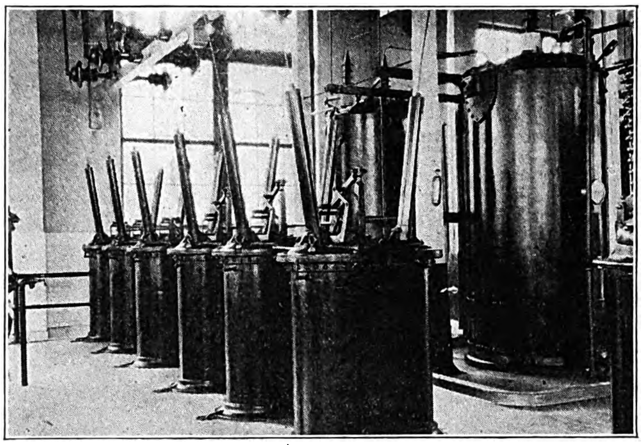
For regulating the voltage of the light and power feeders, there are installed 21 69-kv-a., 10 to 20%, single-phase automatic feeder regulators.

The switchboards for the control of the incoming lines, outgoing feeders, series arc street-lighting circuits and auxilaries in the substation are built in sections and mounted separately, as shown in the accompanying illustrations. The boards are of blue Vermont marble surmounted by cornice work and are equipped with the usual complement of switching and measuring devices, making altogether a most attractive looking installation. Each outgoing feeder circuit is equipped with a graphic recording meter. The switchboards, together with the lightning arresters and oil circuit-breakers on the high-tension lines, transformer banks and feeder circuits, and the feeder regulators were furnished by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa.

Standby current for the operation of the remote-controlled circuit-breakers and the pilot lamps is furnished by a storage battery which floats on the line continuously. It contains 65 cells and is of the E-11 type supplied by the Electric Storage Battery Co., Philadelphia, Pa.

Current for normal operation of the circuit-breakers and pilot lamps and for charging the battery is supplied by a motor-generator installed in the basement. The battery is kept floating on the line continuously, that is, it is never discharged except in an emergency and during tests, and it is charged just enough to equalize the cells once every two weeks; at other times the motor-generator carries the load and the battery floats.

The floating voltage of the battery is from 2.10 to 2.14 volts per cell, and in order to protect the graphic meters and pilot lamps it was necessary to insert a resistance. The resistance originally used was a grid with a standard rheostat head which protected the

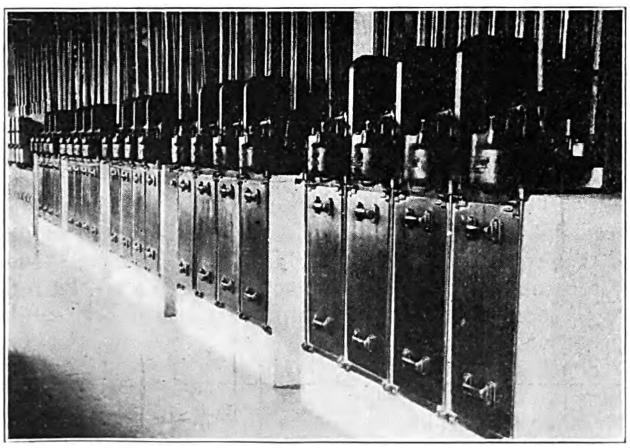


Two Three-Pole 60,000-Volt, 300-Ampere Oil Circuit-Breakers on Incoming Lines—Transformers in Background.

devices but did not allow enough current to pass to operate the oil circuit-breakers. In order to overcome this difficulty, counter cells were installed, some of which were built up out of old battery elements. These cells reduce the voltage, but at the same time permit a sufficient flow of current to operate the breakers. There are 12 counter cells divided into three groups of four each, with taps taken off so as to permit the cutting in or out of one or more groups as may be desired, and they are so connected that the current passes through them from positive to negative, thus continually charging them.

The operation of the graphic meters and pilot lamps requires a continuous flow of about seven amperes through the counter cells which causes a rapid evaporation of the water as well as the deterioration of positive plates. To overcome this, Mr. Morrison has adopted the following scheme which has worked out most successfully. A 6.6-ampere series burning incandescent lamp is connected across each group of four cells. This shunts six amperes away from the cells, reducing the current flowing therein to from one-half to three-fourths of an ampere and at the same time affords the benefit of the illumination given by the lamps which are located at certain points about the premises where it is needed. These locations are vital points and in the event of the power going off at night the illumination is of the greatest assistance to the station operator.

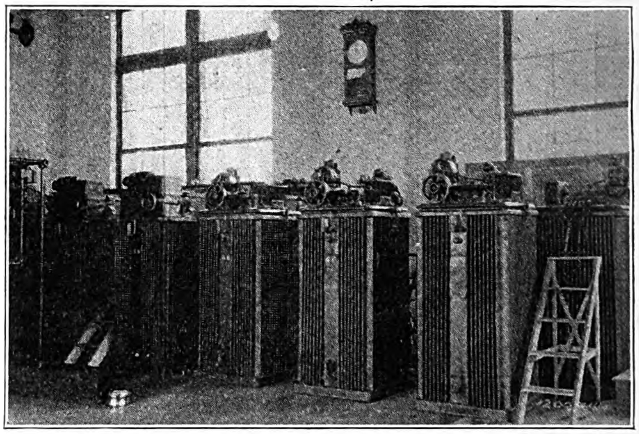
In operating one of the circuit-breakers, the current momentarily reaches a value of seven amperes, thus subjecting the lamps to an excess rush of current. In order to correct this Mr. Morrison expects to add three more cells, making a total of 15; he will divide them into three groups of five each and install a short piece of resistance wire in series with each lamp so as to hold down the current to six amperes. A snap switch is installed on each lamp so that when the battery is getting its equalizing charge the lamp can be cut out, causing the counter cells to build up to their highest voltage at the time when it is most needed.



Five 4000-Volt, 600-Ampere, Four-Pole Oil Switches on Light and Power Lines.

FERTILE FIELD FOR AMERICAN ELECTRICAL GOODS IN LATIN AMERICA.

A most promising future for American electrical goods exists in Argentina, Brazil and Uruguay, according to a report made to the Bureau of Foreign and Domestic Commerce, Department of Commerce, by Trade Commissioner Philip S. Smith. The use of electricity is widespread in all three countries. In Argentina and Uruguay the high cost of imported fuel and lack of water power limit the use of electricity to some extent, but in Brazil the immense amount of water power available makes the electrical field a peculiarly attractive one to manufacturers of electrical equipment. As this water power is found for the most part in the coastal section of the country, it will be available for industrial enterprises and for general lighting, heating and power purposes in the numerous cities of this section, which includes the greater part of the population of the country.



Part of the Bank of 21 Single-Phase, 2300-Volt Regulators on Light and Power Feeders.

American materials were not a very important factor in Argentina before the war but have become decidedly so since hostilities began, and the problem there is to maintain this advantage when the old competition returns. In Brazil, American electrical supplies have always been favored above all others, owing principally to the fact that the power plants in the large cities use American materials almost exclusively. Germany's share in the trade, however, was increasing steadily up to the time the war started, and since that time Japanese materials have appeared on the market, although not in large quantities.

The trade commissioner's report is a detailed guide published for the benefit of the American manufacturer who wants to make the most of his opportunities in Latin America. It is entitled "Electrical Goods in Argentina, Uruguay and Brazil," Special Agents Series No. 184.

Central-Station Rates in Theory and Practice

Eighteenth Article — Rates Based on Both Energy and Demand—Time Interval of Maximum Demand, How Demand Is Determined and Other Details—Power-Factor—Demand Measuring Instruments

By H. E. EISENMENGER

This is the eighteenth article of this series that began in the issue of July 12. The first part of the series consisted of seven articles on the cost of central-station service. In Part II there were six articles on the policies relative to choice of a rate system. Part III, of which this is the fifth article, deals with the different rate systems in more or less common use; next week's article will conclude this part. In Parts IV to VI will be discussed rate analysis, accuracy of rates and rate regulation by commissions. The remaining articles will appear weekly until the end of the current volume, Dec. 27.

PART III—SYSTEMS OF CHARGING—Continued.

II. The Various Types of Rates—(Continued).

D. Rates Based on Both Energy Consumption and Demand.

2b. Details of the Determination of the Measured Demand in Practice.

1. Interval of Time Over Which the Customer's Demand Is to Be Averaged.

SECTION 134. As has just been shown, it is impossible to determine by exact theory how long the interval should be over which the customer's demand is to be averaged for the determination of his rated maximum demand. Consequently this interval in practice varies within very wide limits[1] and it is impossible to say that the time interval chosen by one company is more correct than that of another company as they all remain within reasonable limits. Here again is an instance where a wide field is left to the judgment of the designer of the rate. Where we have reason to assume that the customers of a certain class all have a peak of about the same duration it may be well to choose the duration of that peak as the interval over which the maximum demand is to be averaged.

Sometimes several intervals are quoted in the schedule as alternatives, so that smaller percentages are to be taken of the short-interval demands than of the long-interval ones.[2] Or shorter intervals are chosen for such loads as are subject to violent fluctuations, such as hoists, elevators, welding machines, etc.[3]

The instantaneous demand may also be made the basis for the rated demand, but then it is generally reduced by a certain large percentage to arrive at the rated maximum demand and special provisions may be made in that case to exclude the effects of short-circuits and accidents on the rated demand.[4]

2. Period Over Which a Certain Amount of Demand, Once Determined, Remains the Basis of the Charges.

135. As the capacity of the central station is determined by the yearly peak and the monthly peaks have nothing to do with it, it seems logical to take the customer's yearly maximum demand as the basis for all his demand during the whole year and not to change it until his peak load for the following year has been determined.[5]

In most cases it is felt, however, that a single high demand would penalize a customer for the whole year and thus might work hardship and injustice. The maxima are, therefore, taken usually for shorter periods than one year; most commonly the monthly maximum is chosen. As the bills are almost universally rendered monthly, the demand-meter reading can be easily taken together with the watt-hour-meter reading every month. We are trying in this manner to get a value which is proportional to the *probable* value of the customer's maximum demand as given by the character of his load and to eliminate the accidentals of a single maximum demand. Since the maximum demand is nothing but a substitute for the peak responsibility, it seems that the average of the 12 months' maximum demands is a good substitute for, or even a better one than, the amount which the demand happens to reach only once a year. If customer *A* reaches 50 kw. in one month and 25 kw. only during each one of the remaining 11 months, and if customer *B* reaches 40 kw. of maximum demand month after month, the 50-kw. maximum of *A* may

[1] 1 minute: Duluth, General Power, see footnote 2 below.
2 minutes: Buffalo, Wholesale Lighting and Power (optional schedule).
3 minutes: Binghamton, N. Y., Wholesale Power.
5 minutes: East St. Louis, Ill., Retail Power.
10 minutes: Waterbury, Conn., General Power.
15 minutes: City Electric Co., San Francisco, Wholesale Lighting and Power.
30 minutes: Chicago, General Lighting and Power.
1 hour: Detroit, Standard Power, where lighting amounts to more than 10% of total load.
3 hours: Detroit, Standard Power, where lighting amounts to less than 10% of total load.

[2] One of the two optional General Power Schedules of the Great Northern Power Co., Duluth, rates the demand at the option of the company as the highest of the following: 40% of the instantaneous peak, or half the maximum 1-minute peak, or two-thirds of the maximum 3-minute peak, or the maximum 5-minute peak.

[3] Primary Power, Cincinnati: 5 minutes instead of 20 minutes.

[4] The Duluth schedule mentioned in footnote 2 provides that peaks due to short-circuits and accidents shall not be counted.

[5] This would mean that the highest recorded demand of the previous 12 months is to be chosen, as in the Wholesale Light and Power schedule of Washington, D. C. A little different interpretation is made in the Standard Lighting schedule of Detroit, where the demand indicator is reset June 30 each year so that the customer has to pay for the maximum demand since the preceding June 30 only. In the first case the rated demand will never be smaller than the maximum of a full 12-month period, whereas in the second case the demand to be paid for will generally steadily increase from June until December and then remain stationary until June, when a sudden decrease to the June monthly maximum takes place.

be the result of some casual contingency (neglecting in this example, for the sake of simplicity, the seasonal regular variations of load) and B is then liable to have a larger peak responsibility than A; yet under a system which takes into account the yearly maximum demand A would have to pay more for demand charges than B.

The demand charges are mostly based simply on the monthly readings, but other plans for calculating the rated maximum demand are also found.[6]

3. *Sundry Details of the Determination of the Measured Demand.*

a. Influence of the Demands of Previous Billing Periods.

136. Various rate schedules provide that the rated demand depends on the previous demands of the same customer in such a manner that during the term of contract it may not decrease substantially below the highest demand established at a previous period[7], or that it cannot decrease below a certain percentage of the highest previous demand[8], or that the previous demand retains such a restricting influence at least for a certain length of time[9] (usually one year). In the latter case we get either the equivalent of a yearly demand, or if the maximum monthly demand may not exceed a certain percentage of the highest reading of the last 12 months, we arrive at a hybrid between the monthly and the yearly establishment of the demand.

b. Influence of the Power-Factor.[10]

137. A small number of electric supply companies make provision for a modification of the rated demand in case of the power-factor being below certain limits. Thus in some cases the demand is increased over the measured demand if the power-factor is smaller than a certain minimum percentage.[11] In other cases the regular demand charge of the schedule is not based on a 100% power-factor but on a smaller one; consequently the demand charge is not only increased for smaller power-factors but also decreased if the power-factor is large.[12]

Naturally provisions for an influence of the power-factor on the charges are found only in power rates for large consumers (wholesale power rates and general power as distinguished from retail power, etc.).

c. Methods Used for Measuring the Maximum Demand.

138. There are two methods in practical use for finding the maximum which the average demand over a certain interval (for instance 30 minutes) reaches within a given period (for instance, one year).

1. Determining the Demand by the Service Watt-Hour Meter.

139. The first method is the calculation of the average maximum demand from the number of kilowatt-hours consumed during the interval. The service watt-hour meter of the installation can be very conveniently used for that purpose in combination with a stop watch. If, for instance, the readings on the watt-hour meter show that during one certain hour 500 kw-hr. have been consumed, the average hourly demand during that particular hour is evidently 500 kw. If we now obtain a number of such readings at different hours when the maximum demand may be expected to take place, the maximum of these readings will be the nearer to the maximum average hourly demand the larger the number of readings has been. If we desire to know the average demand over a shorter (or longer) interval than an hour, we have to divide the kilowatt-hour reading of that interval by the length of that interval in hours.[13]

This method can, of course, be applied for large customers only and is not suitable for general use. It is not as reliable as the other method, to be described hereafter (special demand-indicating instruments) because it is left to chance whether the watt-hour-meter readings are made actually at that interval which shows the highest average demand. The test method is, therefore, not frequently used and where it is used

---

[6] Standard Power schedule, Detroit, Mich.: The maximum demand is determined by load tests every 60 days.

Long-Hour Lighting schedule of Boston: The highest reading between Nov. 1 and Feb. 1 is taken to be in force for 12 months. That means a yearly maximum, but only that part of the yearly maximum demand is counted for which there is a possibility of its coinciding with the central station's peak.

The Retail Power schedule of the same city bases the demand charge on the average of the November-December-January-February peaks, whereas the demand charges of the Wholesale Power schedule are based on the average of the 150 highest half-hour peaks that have occurred in the 12 months previous to the bill.

The Primary Industrial Power and Railway Generating Power schedule of Baltimore requires that the demand be based on the highest readings (not less than ½ hour) between 4 and 8 p. m. any week-day during the months of November, December and January and not less than two-thirds of the actual demand at any other time.

The Wholesale Power schedule of the Sioux City Gas & Electric Co. rates the demand as the measured average over 15 consecutive minutes during the month, provided that the instantaneous demand is not more than twice the annual maximum demand. In the latter case the demand for the month shall be rated as 50% of the instantaneous demand.

The Large Lighting and Power schedule of Chicago provides that the demand be determined either monthly or yearly. When on the monthly basis, the average number of kilowatts in the highest 30-minute interval in the month is to be taken. When on the yearly basis the average number of kilowatts in the three highest 30-minute intervals in the month is selected from three different days, the first month's maximum to prevail for 12 months, unless a higher maximum takes its place, in which case a new 12-month period begins.

[7] Industrial Lighting and Power schedule of Baltimore, where the demand is not substantially to be decreased during the term of the contract. The minimum term of contract under this schedule is three years.

[8] Wholesale Power schedule of Macon, Ga., where the demand shall in no case be less than 75% of the highest previous recorded demand. Under the Primary Power schedule of Minneapolis the demand must never be under 50% of the highest previous peak occurring throughout the 10-year term.

[9] General Lighting and Power, Portland, Me.: Once determined, the demand may not be decreased during the year. Primary Lighting and Power schedule of Des Moines, Iowa: The demand shall not be less than 75% of the demand occurring in any of the preceding 12 months. Wholesale Power schedule of Pawtucket, R. I.: The demand shall never be under 50% of the highest in the preceding 12 months.

[10] The nontechnical central-station man will find an explanation of the term "power-factor" and allied terms in Insert XV.

[11] Primary Large Lighting and Power schedule, Chicago: If the power-factor is less than 70%, the maximum demand is increased for billing purposes. In other cities the limit of the power-factor is 80%, thus in Philadelphia (Wholesale Power Lighting), Harrisburg, Pa. (Primary Power), and Little Rock, Ark. (Wholesale Lighting and Power). In Pittsburgh (Off-Peak Service) the limit is 90%.

Another way of expressing the same thought is that of the Wholesale Power Schedules of Boston, which specify that either the average kilowatts, or 80% of the kilovolt-amperes, are used for the demand, whichever is higher.

The Wholesale Power schedule of the Sioux City Gas & Electric Co. specifies that the monthly demand charge will be increased by 1% for each 1% the lagging power-factor on the consumer's load is below the following:

75% at the time of the demand.
70% at 75% of demand.
65% at all other loads.

In Cambridge, Mass., the average demand during the peak-load period is determined from the kilowatt-hour consumption as indicated by a watt-hour meter in case of noninductive load and from the kilovolt-ampere-hours as determined by a voltmeter and amperemeter in case of inductive load. (See Section 139, "Determining the Demand by the Service Watt-hour Meter" and second footnote of that Section.)

[12] The General Power schedules in the following New England cities: Waterbury, Conn., New Britain, Conn., and Salem, Mass., provide that the maximum demand be adjusted accordingly if the power-factor is below 75% or above 80%.

An extra discount of 10 cents per kilowatt per month is granted on the demand charge of the Sioux City rate (referred to in the preceding footnote) if the power factor is 95% or better.

[13] For instance, if in the 2 hours between 3 and 5 o'clock 100 kw-hr. have been used, the average demand during that interval has been $100/2 = 50$ kw. Or if in some 10-minute interval 8 kw-hr. have been used, the average demand during that interval has been $8 \div 1/6 = 48$ kw. (because 10 minutes equals 1/6 hour).

it is generally either as an alternative to some other method[14] or for secondary purposes.[15]

This method may also be carried out in a more accurate way by means of the so-called "printometer," that is an attachment to the customer's watt-hour meter which prints on a strip of paper in regular intervals—for instance, 5 minutes or half hours, etc.—the number of kilowatt-hours used.

2. Demand Metering Instruments.

140. The second method of determining the maximum demand makes use of special instruments for that purpose. This method is much more frequently employed than the calculation from watt-hour-meter readings and in all cases where the actual amount of the maximum demand in kilowatts or watts must be known the use of these instruments is the rule.

A description of the principles on which these instruments act is given in Insert XVI.

In a few cases the readings of the demand meter are modified by a stipulation in the schedule that the demand must never be taken lower than a certain percentage of the connected load.[16]

In some isolated cases the demand charge is based not on the measured demand, but on a certain fixed percentage of the demand.[17] This is, of course, merely a matter of changing the form; the total demand charge in dollars is the same as if the total measured demand had been chosen with a correspondingly reduced unit charge per kilowatt. But certain conditions, for instance the historical development of the rates of a company, may make this way of expressing the charges preferable.

The demand limiters (see Section 130) and similar devices, like fuses, automatic cutouts, etc.,[18] do not strictly belong in this class of instruments as they give no lasting record of the amount of the maximum demand, but they simply disturb the customer's supply as long as he tries to draw a larger demand than he has subscribed for. They have a very small time interval, which means that they act practically on the instantaneous demand.

d. Substitutes to Approximate the Measured Maximum Demand.

1. General Remarks.

141. Measurements of the maximum demand as described in the preceding Sections require either special labor, or special instruments, or both. Moreover, as has been pointed out several times in this series of articles, the element of the customer's demand as a basis for the demand charges has been derived from the theoretically correct basis by a series of approximations and therefore is not the accurate basis anyway. For these two reasons many electric utility companies avoid in all or in a part of their schedules the complication occasioned by the measuring of the maximum demand and use substitutes for the measured maximum demand which are more easily determined, even though by the additional approximation a further element of inaccuracy is introduced.

The possibility of substituting other values for the measured maximum has already been proviously mentioned, in Section 129. It has been stated there that these substitutes, such as connected load and number of sockets, are not popular among central-station managers for the flat rates other than display lighting. It is different in case of the rates which are based on both the maximum demand and the energy consumption. Here the inaccuracy introduced by the employment of a substitute for the real maximum demand of the customer affects a portion only of the total charges, so that the inaccuracy is, so to speak, diluted. A customer who increases the wattage of his lamps or the number of his sockets will in general also increase his energy consumption and therefore he will not get for nothing the additional, and possibly fraudulently obtained, service, as he would in case of a flat rate.

Insert XV—Appendix to Sections 53 and 137.

EXPLANATION OF THE TERM POWER-FACTOR AND ALLIED TERMS.

(For the nontechnical reader.)

In case of purely heating and incandescent lighting loads the power in watts consumed by the customer is given by the product volts × amperes. The number of the kilowatts is of course only 1/1000 of this value, as the unit of kilowatt is 1000 times as great as the unit watt. The power in kilowatts with such loads is therefore $\frac{\text{volts} \times \text{amperes.}}{1000}$.[1] With certain other loads, the so-called inductive or reactive loads, notably with most motor loads, the physical conditions in alternating-current circuits are such that the power which is produced by a certain current at a given voltage is smaller than the term $\frac{\text{volts} \times \text{amperes}}{1000}$ indicates. A larger current is therefore necessary with these loads to produce a certain power in a given system (that is at a given voltage).

Now the "capacity" or "size" of generators and transformers is determined by the product of volts × amperes and since in a given electric system of the most common type the voltage is constant, a generator or transformer of a given size can supply less power with inductive load than with noninductive load.[2] Also the copper sections of transmission and distribution lines depend on the current they have to carry and a given line will therefore not be able to carry as much inductive load as noninductive load. We see from this that it is cheaper to supply noninductive load because the electrical supply equipment is smaller and therefore cheaper. Moreover, the maintenance of proper voltage is more difficult with inductive load.

The term $\frac{\text{volts} \times \text{amperes}}{1000}$ is called the "apparent kilowatts" or the "apparent power." The apparent power is equal to the real power only in case of non-inductive (nonreactive) load, otherwise it is always larger. The unit of apparent power is the "kilovolt-ampere," which is 1000 times the apparent power delivered by one ampere at one volt, with single-phase current, just as the kilowatt is 1000 times the real power delivered by one ampere at one volt on noninduc-

[14] Wholesale Power and Lighting schedule, Birmingham, Ala.: If no demand indicator is used, the demand in kilowatts is assumed to be four times the highest recorded consumption in kilowatt-hours for any 15-minute period.

Primary Power Service, Buffalo: The demand is determined by the kilowatt-hour meter for 2 minutes, or by an indicating or graphic recording wattmeter.

[15] For instance, Cambridge, Mass., has pure block meter rates, but the knowledge of the customer's demand is necessary for writing out the bill in one of the schedules, because the minimum monthly charge is based on it and another one of the schedules applies only for the customers whose load-factor exceeds a specified minimum. The demand in these cases is determined as the average of three 5-minute readings of the watt-hour meter (or, in case of low power-factor load, of a voltmeter and ammeter), the readings to be made with the use of a stop watch.

[16] General Power schedule in South Bend, Ind.: 50%; Optional Commercial Lighting schedule of the Universal Electric & Gas Co., San Francisco: 60%.

[17] General Power schedule of Fitchburg, Mass., and Haverhill, Mass.; 75% of the measured demand.

[18] Auxiliary Lighting and Power schedule, Buffalo: Demand limited by fuses or other device. Auxiliary Power, Cleveland: The customer shall install an automatic circuit-opening device which the company will set and seal for an amount slightly above the demand contracted for.

[1] This applies to direct-current and single-phase alternating-current circuits. In case of three-phase circuits this product must be multiplied by 1.732 here and in the following.

[2] This does not mean that power is lost (except in a secondary way). The generator is simply unable to deliver as much power without undue heating and it can, therefore, not receive as many horsepower from the prime mover. It is designed and built as a larger "generator" with corresponding cost but can operate only as a smaller one if the load is inductive. Transformers are affected in the same way.

tive load with single-phase current. A kilovolt-ampere furnishes one kilowatt in case of noninductive load, otherwise less.

The ratio of the real power to the apparent power is called the power-factor. In central-station practice the power-factor is expressed in per cent; "80% power-factor" means that the real power is 80% of the apparent power. The power-factor can never be larger than 100%. In case of noninductive load it is equal to 100%, while for inductive load it is smaller. The power-factor of small motors is smaller than that of larger motors, and for a given individual motor it decreases as the load on the motor decreases. This refers to asynchronous (induction) motors. In synchronous motors the power-factor can be regulated by the exciting current.

All our readers will probably be familiar with the fact that in alternating-current circuits the direction in which the current is flowing is continually reversing and at a very rapid rate too, in most of our central-station systems 120 times a second. It increases from zero to its maximum value in 1/240 second, then decreases in the next 1/240 second again to zero, reverses its direction, reaches its maximum in the opposite direction after the third 1/240 second (negative maximum), again becomes zero and thus after 4/240 or 1/60 second begins the same cycle as described. The same applies to the voltage. The speed with which the voltage varies is exactly the same as that of the variations of the current (namely 120 reversals of the direction every second), but the current does not in every case reach its maximum (or its zero value) at the same instant as the voltage. It may be, for instance, always 1/500 second ahead of the voltage, or it may be a little behind the voltage. In the former case we say the current is "leading," in the latter it is "lagging." If the current and the voltage both reach their maximum at exactly the same instant, that is, if the current is neither leading nor lagging, we say current and voltage are "in phase."

The machinery in the central station determines the number of reversals per second, the character of the load determines whether the current is leading, lagging, or in phase.

Now noninductive load means nothing else than that current and voltage are exactly in phase. Then the power-factor is 100%. If they are out of phase we have a power-factor of less than 100%. We see from the above that if the power-factor is smaller than 100% this may be due either to a leading or to a lagging current.

As may be expected, the lag of the current of one customer may be balanced partly or wholly by the lead of the current of another customer, so that the supply of the two together may combine into a current in phase or at least less out of phase. The generators, transformers, etc., will then have to supply current which is less out of phase, the power-factor will be raised and the undesirable effect of a low power-factor on the central station and lines will be reduced.

Now the ordinary asynchronous or induction motor has such characteristics that it can only draw a lagging current from the system. Conditions of the customer's load which make the current lead the voltage are practically found only in the so-called synchronous motors under certain methods of operation (overexcitation.) These synchronous motors are practicable in exceptional cases only for large sizes and under certain other conditions. This explains why in Sioux City (see footnote 11, Section 137) the increase of the demand charges in case of small power-factors is restricted to lagging currents.

Insert XVI—Appendix to Section 140.

Instruments for Measuring the Maximum Demand.

One type of demand-measuring instruments is working in connection with the ordinary service watt-hour meter of the consumer. A contact mounted on the wormwheel of the watt-hour meter makes and breaks a circuit at a rate proportional to the speed at which the meter disk revolves, that is, proportional to the power which passes through the meter. Every time the contact is made, a member in the demand-indicating instrument is pushed forward a small fixed amount by means of an electromagnet and a ratchet. This member may be either a stylus (if a graphic record is desired) or a driving dog which pushes a friction pointer forward on a dial. After a prearranged interval over which the demand is to be averaged has elapsed (5, 10 or 30 minutes, one hour, etc.) the above mentioned stylus or driving dog is disengaged by the action of a clock and drawn back to zero position by spring action. The stylus in the recording type of instrument then begins a new mark on the sheet or disk of paper which is creeping or revolving underneath the stylus. The driving dog in the other type of instrument on its withdrawal leaves the friction pointer lying in the position to which it had been pushed previously, so that the pointer always indicates the highest position which the dog has ever reached since the pointer was reset the last time by hand. From the chart of the recording instrument (called "demand indicator" by the manufacturers in contradistinction to the dial instrument, which is called "demand meter") we have then to select the highest mark as indicating how large the highest demand was and when it occurred, whereas in the dial instrument we can read directly from the position of the pointer how large the maximum demand has been since the last resetting of the instrument, but not when it occurred.

Another type of instrument for measuring the demand is the "Wright maximum-demand meter." It consists of a U-shaped glass tube partly filled with liquid and sealed at both ends. At each end (both of which in the normal position point vertically upwards) the tube is widened into a bulb. Just below one of these two bulbs the vessel communicates with the upper end of a graduated vertical overflow glass tube, which is sealed at its lower end. (The whole arrangement is therefore hermetically sealed on all sides.) The bulb on the other leg is surrounded by a coil of resistance wire connected in series with the consumer's installation. The heat generated in the coil by the current expands the air in that bulb and forces a portion of the liquid out of that leg, making the liquid overflow at the other leg into the vertical overflow pipe. The liquid will remain in the latter even after the coil cools off and thus the amount of liquid contained in the graduated tube is a measure of the maximum current, which has been passing through the coil since the last resetting of the instrument. This resetting is made by tilting the instrument so that the liquid can run back into the U-shaped tube. The whole instrument is enclosed in a cast-iron casing and hinged, so that the electric light company's inspector can easily tilt the instrument for resetting after he has made his periodic reading.

As this instrument acts on the heating capacity of the current it will at fluctuating loads register differently from the electromagnetic instruments previously described, which base their registry on the energy delivered. The Wright demand meter is rated to record as follows (from Foster, "Electrical Engineer's Pocket Book"):

If the maximum load lasts 5 minutes 80% will register.
If the maximum load lasts 10 minutes 95% will register.
If the maximum load lasts 30 minutes 100% will register.

If we have, for instance, a load of 1 kw. (1000 watts) for 5 minutes and no load for the following hour this combination of loads will register on a Wright demand meter as 800 watts, whereas an electromagnetic instrument will record the following maximum demands:[1]

If the instrument is set for 5 minutes or less: 1000 watts.

If the instrument is set for 10 minutes: $1000 \times 5/10 = 500$ watts.

If the instrument is set for 30 minutes: $1000 \times 5/30 = 167$ watts.

As the Wright instrument records 100% of the demand after 30 minutes duration of the full demand, the comparison might be made with an electromagnetic instrument set for a 30-minute interval. Supposing now the full load of 1000 watts to be turned on for a number of minutes, as shown in the first column of the following table, and no load for the rest of the time, the registries will be:

Duration of 1000-watts Load	Electromagnetic Instrument Set for 30 minutes	Wright Demand Meter
5 minutes.....	167 watts	800 watts
10 minutes.....	333 watts	950 watts
30 minutes.....	1,000 watts	1,000 watts

We see from these comparisons that the Wright demand meter is more sensitive to high demands of short duration than the electromagnetic devices. This will not surprise the engineers among our readers as they know that the heating effect increases with the square of the current.

It seems reasonable to assume that the heating effect of various percentages of load acting for various periods of time on the air in the bulb of the Wright instrument is more or less similar to the heating effects on electric machinery and equipment; the way in which the Wright instrument responds to various loads may therefore to a certain degree express the effect of an overload on the necessary size of the capacity of the power-house machinery, etc., and with that on a certain part of the capital invested and the corresponding demand charges.

We cannot, however, by any means say that the way in which the Wright demand meter responds to various dura-

[1] Provided that this 5-minute interval of 1000 watts starts at the same moment when the electromagnetic instrument starts its own interval of readjustment, that is, at the moment of the disengagement by the clockwork.

tions of overload is preferable to that of the electromagnetic instruments. (Compare also Sections 36 and 37). In the first place a certain part of the electric light company's equipment, notably the distribution lines, have no time element in the way they respond to overloads; this means a short overload on the distribution lines will at once show its full effect on the quality of the service (by an excessive voltage drop). In the second place the heating and cooling curves of the various parts are different from one another and different from that of the Wright instrument. In the third place we have moved so far away from the exact theoretical requirements by the various successive approximations made[2] that these nice distinctions lose their importance alongside these approximations.

(To be continued.)

CONDITIONS FAVORING AND FACTORS INFLUENCING ELECTRICAL UTILIZATION OF BLAST-FURNACE GASES.

British Fuel Economy Committee's Report Advocates Cleaning Gases and Efficient Use.

In the course of a report on fuel economy and consumptions in the manufacture of iron and steel, which came before the autumn meeting of the Iron and Steel Institute in London, England, recently, Prof. W. A. Bone, Sir Robert Hadfield, and Alfred Hutchinson in the course of a review of their conclusions said that the result of their investigations proved beyond all question that much remained to be done before British iron and steel works would have attained to anything like the practical ideal of fuel economy which at least three leading iron and steel makers had declared to be even now attainable. Among other directions in which economies could be effected was the utilization of waste gases from boilers, stoves, furnaces and soaking pits. Such satisfactory progress was now being made with the electrostatic cleaning of blast-furnace gases, that the day might be confidently anticipated when all gas, whether required by stoves or engines, would be so cleaned. This would undoubtedly increase the thermal efficiency of the hot-blast stoves, and make a larger surplus of gas available for the steel works. Speaking of the utilization of the surplus gas for power purposes, it seemed a barbarous practice, said the authors, to burn uncleaned blast-furnace gas in Lancashire boilers, whose efficiency probably did not exceed 55%, when (if cleaned) its potential energy could be transferred into electric power via the gas-engine and the dynamo. The day was fast approaching when, in steel works adjacent to blast furnaces, all stationary machines (including blowing engines, cranes, and rolling mills) would be electrically driven by current generated from the explosion of blast-furnace gas in internal-combustion engines. Even now, steam-driven reciprocating blowing engines should be superseded by electrically driven turboblowers. When such reforms had been carried out in connection with the blast-furnace plants they might look for the abolition of the "gas producer" in the adjacent steel works, a step much to be desired.

In the course of their reference to the problem of isolated blast-furnace plants, the authors said it would, as a rule, undoubtedly pay any firm to make coke in its own regenerative by-product ovens on a site adjacent to the blast furnaces. In the case of a Cleveland furnace making 1000 tons of pig iron per week, and using no more than 22.5 cwt. of coke per ton (which means working under the best possible conditions) it could be shown that the total gas made per hour at the furnaces would be about 1,115,000 cu. ft. at 60° F. and 30 in. barometer. If this were electrostatically cleaned and used to the best advantage on the plant, half of it should suffice to generate and heat the blast. The potential energy of the other half, if converted into electric power with an overall efficiency of 20% would be capable of developing 3350 kw. continuously at the switchboard. The available surplus coke-oven gas would amount to a further 48,000 cu. ft. per hr., or sufficient to generate about 1150 kw. continuously. Hence the total available power from the combined gases would attain about 5000 kw. continuously. This did not take any account of power derivable either from the stove waste heat or gas-engine exhaust, or yet of the heat carried away in the molten slag and iron, all of which might be turned to profitable use. The best way of disposing of such surplus gas and waste heat would be to sell them to an electric power company for conversion into electricity; but, if there was no power company near at hand to buy the energy then it might be used to generate electricity for some electrochemical process, such, for instance as (1) the manufacture of nitric acid from the air, or (2) some electrometallurgical or electrolytic operation. "What ought to be realized is that the combined by-product coke-oven and blast-furnace plant is not only an efficient producer of iron, but that it simultaneously, and of necessity, generates a most valuable power gas, of which the utmost use must be made in the interests of national economy."

The same subject was covered further in a report prepared by Cosmo Johns and Lawrence Ennis for the Iron and Steel Institute "On the Present State of Fuel Economy in the German Iron and Steel Industry of the Occupied Territory on the Left Bank of the Rhine." They stated: (1) The blast-furnace gas should be cleaned, without loss of sensible heat, if the conditions render it possible, until the dust content is at least as low as 0.1 gram per cu. in. It is only when this has been done that the gas can be used economically for any purpose in iron and steel works practice. It is only thus that any useful surplus can be obtained for use in the steel works. Gas intended for use as fuel in internal-combustion engines should, of course, be still further cooled and cleaned. (2) All power, whether compressed air for blast furnaces or converters, or electric energy, should be generated in gas-driven prime movers, with only such steam turbines as are found necessary to deal with fluctuating loads. As much steam as possible should be furnished by waste-heat boilers attached to the large gas engines. These waste-heat boilers should be of the fire-tube type, not water tubes. (3) If the linking up of the power stations of neighboring works is possible, then the whole of the steel works should be electrically driven.

CITY SAVES $15,000 THROUGH CENTRAL-STATION SERVICE.

Two years ago the city council of Grand Forks, N. D., signed a contract with the Red River Power Co. for electric energy for operation of its water pumping supply system and street-lighting system. At the Oct. 6, 1919, meeting of the city council the report of expenditures for electric power showed that in the 23 months of the contract the city had saved $14,846, compared with the cost of operating its own plant.

[2] Compare Insert V and the additional assumption that the consumer's maximum demand is proportional to his peak responsibility, and that the latter is the correct portion of the central station's capacity for which the customer should be charged; see Insert VI.

Military Searchlights and Their Scientific Testing

Review of War's Very Striking Developments in This Field of Light Projection — Power, Mobility and Utility Greatly Improved—Important Developments in Searchlight Testing

AMONG the most important engineering developments of the World War was the big stride in improvement of big searchlights. Doubtless the most complete general review of these achievements was presented in a paper by Capt. Chester Lichtenberg, U. S. Army, read before the recent Chicago convention of the Illuminating Engineering Society. Extracts from this paper are given herewith, followed by extracts from an article on searchlight testing by F. A. Benford, of the Illuminating Engineering Laboratory, General Electric Co., which article appeared in a recent issue of the General Electric Review. The rapidity and success of these searchlight developments was due in large measure to the splendid co-operation of the research scientists and engineers of progressive manufacturers with the engineers of the Army. Each step in the development of powerful and mobile searchlights was verified by painstaking tests calling for new methods and apparatus, the principal ones of which are described herewith.

SEARCHLIGHTS have been used for military purposes for over fifty years. They are essentially war materiel, although in recent years they are being used for special illumination work. Their military application has been varied according to the strategy employed and the tactics involved. Their development has been spasmodic, resulting from immediate needs in war times with practically no peace-time demands. Their testing has been difficult owing to the many independent variables and the large parameters involved.

The startling events of the past four years have caused marked changes in military affairs and required fundamental and radical alterations in many lines of equipment. Searchlights are included in that class of materiel which experienced undreamed modification. They received a design and application impetus during the past two years which has more than counterbalanced the relative inactivity of the preceding fifteen years.

Service.—Searchlights are used by military organizations for detecting and illuminating distant targets. The visible area, color contrast, shape and relative speed of the targets varies through wide limits. They may be grouped in classes as follows:

1. Buildings, intrenchments, bodies of troops, and similar large stationary or essentially stationary targets on land.
2. Automobiles, motorcycles, bicycles, horsemen, small bodies of troops, and similar agile and fast-moving targets on land.
3. Battleships, troop ships, and similar slow-moving targets on water.
4. Destroyers, motorboats, rowboats and similar small, agile or fast-moving targets on water.
5. Bombers, and similar cargo-carrying and sluggish targets in air.
6. Scouts and similar fast agile targets in air.

The service requirements determine in a large measure the desirable characteristics of the most suitable searchlight. Distant targets require beams of great penetrating power, hence a beam of minimum divergence is sought. Near targets require beams of relatively great area-covering power, hence a beam of maximum divergence is preferred. Fast-moving targets demand an agile control of great responsivity. They require a beam of relatively wide divergence for their continued illumination. Slow-moving targets may use a beam of relatively small divergence if the beam fully covers them at the nearest range to which they will be permitted to approach. So for each kind of target there is a beam which will best detect and illuminate it.

The year 1917 found the nations of the world confronted with at least one new problem. The science of aeronautics had developed with astonishing rapidity. High-speed airplanes of huge carrying capacity were sent hundreds of miles under cover of darkness distributing terrifying and death-dealing missiles throughout wide areas. The destruction of life was serious. The undermining of the morale of the civil and military population threatened defeat.

The tactics were new. No counter efforts were known. Means for detecting the raiders were demanded. Searchlights were suggested, tried and found effective. The available materiel was, however, ill adapted for aerial service. It had been designed for detecting and illuminating land and water targets. The elevation range was limited to about 30°. The designs were heavy and immobile, being intended for installation in fixed fortifications. The control was sluggish, being intended for following relatively large and slow-moving targets on the earth's surface.

A survey of the situation was ordered by Maj. Gen. Wm. M. Black, the chief of Engineers, United States Army, in the early fall of 1917. It was inaugurated by Col. R. S. A. Dougherty, Engineers. The investigation covered existing European practice and the probable trend of the art.

It was found that the targets were new. They moved above the earth's surface at altitudes up to 25,000 ft. They were remarkably fast and agile. They were colored so as to blend with the backgrounds that they used. They moved singly or in formations. They were accompanied at times by screen or decoy units. They presented relatively small visible areas making detection at a distance difficult, even by day.

Problems.—The problems disclosed were many and difficult. Searchlights to meet the situation seemed to require new characteristics. They must have a relatively wide field to rapidly search a given area of sky. They should have a beam of good and well distributed illumination effective at ranges from 5000 to 25,000 ft. Their design must be simple yet rugged since only inexperienced operating personnel would be available. They must be relatively light in weight to permit rapid movement from point to point. They must be relatively small in size to permit convenient intrenching. They must have reliable, silent and mobile power units which must not only carry the searchlights and personnel, but must furnish the power to operate the searchlights. The control must be simple, capable of operating the searchlights very fast for changing direction of search and relatively slowly for searching. It must permit searching through 240° in elevation and indefinitely in azimuth.

The requirements were new. Existing facilities were limited to a few standard barrel searchlights each week. Thousands of units were needed immediately. Increasing production of developed designs was difficult because of the acute labor shortage. It was, therefore, imperative that new design and manufacturing facilities be sought and developed.

Mobilization.—Mobilization of existing resources was started in the spring of 1918. The principal manufacturers of searchlights and searchlight equipment were approached. The problems were presented to them. They were induced to assign new groups of engineers, designers and mechanics to the task. The aid of prominent scientists was enlisted and fundamental problems presented to them for solution. Close liaison was established with the American Expeditionary Forces in France. Advantage was taken of the facilities of the National Research Council to maintain contact with established scientific organizations of the Allied nations. Every source of information or assistance was probed and advantage taken of each bit of data obtained.

Determinations.—The determination of the characteristics of existing searchlights and searchlight equipment was the next step taken. Existing methods were investigated. They were found to be antiquated and inaccurate. Expert assistance was sought. Dr. C. G. Abbott of the Smithsonian Institute, I. G. Priest, E. C. Crittenden and A. H. Taylor of the Bureau of Standards, Physicist Enoch Karrer of the Army Engineers, W. D'A. Ryan and F. A. Benford of the General Electric Co., and Preston R. Bassett of the Sperry Gyroscope Co. were consulted. In co-operation with the officer in charge, searchlight investigations, United States Army, they surveyed the field, analyzed the problems involved, and developed and applied new and novel methods of determining the characteristics of searchlights for land, water and air service.

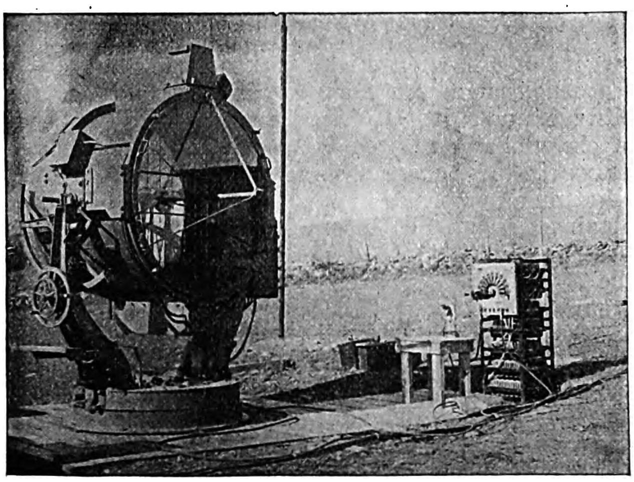


Fig. 1.—Full Automatic High-Intensity Searchlight in Coast Fortification Type Drum—On Account of Bulk and Weight This Outfit Was Not Suitable for Mobile Service.

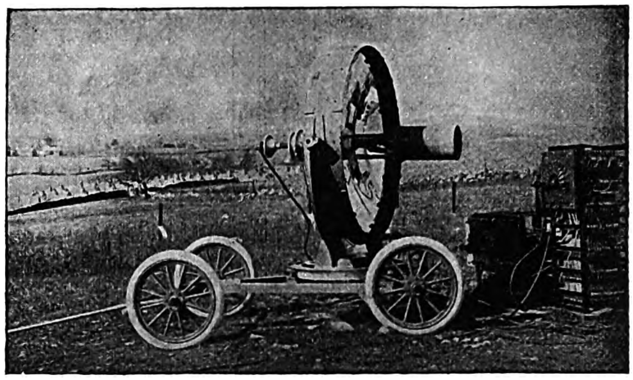

Fig. 2.—An Early Model of the 60-In. Open Type Medium-Intensity Searchlight Adopted for Army Use—This and Later Types Were Much Lighter, More Portable and More Powerful Than the Type Shown in Fig. 1.

Arc illumination is the basis for all searchlight calculations. The amount of light energy available, and its distribution are vital factors in projecting beams. Methods for determining the characteristics of arcs and other similar sources of light used in searchlights were developed by Messrs. Crittenden, Karrer and Benford.

Messrs. Crittenden and Karrer determined arc illumination by the use of mirrors and a photometer. The arc and photometer were held fixed in position. The mirrors were rotated around the arc step by step in three great circles. Photometric observations were made at each step. The observations were plotted and a characteristic curve obtained. The curves gave direct means for comparing the various arcs and other light sources used or considered for searchlights.

Mr. Benford used a hollow hemisphere with its concave side receiving and collecting the light. A reflecting surface at the focus and a photometer located outside the hemisphere complete the equipment. The observations give the total light from the arc or the beam when a mirror is placed behind the arc.

The determination of the most suitable color of searchlight beams was a problem of absorbing interest. This characteristic was found dependent principally on the temperature of the source. At relatively low temperatures, that is, with low-intensity arcs having a current density of about 0.1 ampere per square mm., the color is reddish-yellow. Ingredients in the cores of the carbons can be used to modify the color slightly. At intermediate temperatures, such as produced by medium intensity arcs having a current density of about 0.4 ampere per sq. mm., the color of the beam is greenish-yellow. Ingredients in the cores of the carbons have little modifying effect on the color. At high temperatures, such as produced by high-intensity arcs with a current density of about 1.0 ampere per sq. mm., the beam color is bluish-white and is uninfluenced by ingredients in the cores of the carbons.

The colors of searchlight beams can be accurately controlled by the use of filters. These reduce the amount of light in the beam from 20 to 50 or more per cent. Their use has been abandoned for military purposes, where the amount of light is of paramount importance.

Absorption.—The absorption of searchlight beams under various atmospheric conditions has been studied. The investigations have not been completed. They are still in progress. Initial results indicate that the amount of light returned to an observer near the searchlight varies inversely as the sixth or seventh power of the range. It has also been found that the shorter wave lengths of light energy are absorbed more rapidly by the earth's atmosphere than the longer wave lengths. Experiments with a blue-white 150-ampere high-intensity arc in a 60-in. parabolic glass mirror showed the beam to appear distinctly yellow at 20 miles. Radiometer tests show that 75% of the light energy in the yellow part of the spectrum is dissipated in 7.2 miles of clean dry air near the earth's surface.

Front Glass.—The front glass or door or lens of a searchlight was first given attention by Dr. Abbott. While observing a searchlight beam he remarked the large diffusion caused by the front glass. Later investigation revealed that the glass used was relatively poor optically and that it diffracted some of the light of the beam. It was also found that dust and dirt on the front glass further reduced the light in the beam.

Tests were made to determine the ordinary light losses caused by the front glass. Three organizations co-operated. They made an exhaustive series of measurements at ranges from 1000 to 3000 ft. It was found that the front glass cut off an average of 25% of the beam light.

Searchlights were next operated without front doors. Trials were made with 24-in. barrels containing 75-ampere high-intensity arcs, and 36-in. and 60-in. barrels with 150-ampere high-intensity arcs in all kinds of wind and weather. Their operation was found successful in all but rare combinations of wind and angular position of the searchlight barrel. In these cases it was found that the walls of the barrel caused eddies of air which disturbed the arc stream. The successful operation of barrel searchlights without front doors was a leading factor in suggesting the development of open type searchlights.

Target Finding.—Target-finding determinations proved a most interesting and valuable contribution to the art. Previous investigators had contented themselves with separate photometry or other measurement of searchlight arcs and beams. The lack of suitable standards, the intensity and unsteadiness of the source and the important effects of atmospheric absorption were neglected. The results were neither absolute nor comparative.

The limits of the older forms of testing were soon realized. It was seen that more reliable methods were necessary. The field was carefully surveyed and the problem studied. A return was made to first principles. One or more sources of light comparable with the source to be examined were arbitrarily made standards. These were chosen from sources which had been or were being used under service conditions and concerning whose performance some data were obtainable. The visibility of distant targets illuminated alternately by the standard sources and the unknown source was determined when viewed by a number of observers at service distances from the source and the targets.

Fixed-area targets were the first form used. They were 18 in number. They were rectangular in shape. Their sides were in the proportion of 5 : 1. They were painted dull black. The largest had an area of 500 sq. in. The smallest had an area of 2.5 sq. in. They were located on a sky line about 3000 ft. from the searchlight under test. The number visible when illuminated by any beam gave an indication of the finding power of that beam. The inverse relation of the least mean areas observable when illuminated by the several searchlights gave a comparison of their relative finding powers.

Variable-area sky-line targets followed. They consisted essentially of a long canvas roll mounted on a cylinder in the same fashion as a window curtain. The surface turned toward the searchlight was painted dull black or in a series of combinations of dull white and dull black. They are used in the same manner as the fixed-area targets. Their principal advantage is that the observations with them are less likely to be biased since the observers have no gauge of the least area visible.

Airplanes and ships are being used extensively as comparison targets. They are the preferred kind. Their use is relatively simple. They are caused to pass successively through the standard and unknown beams at 6 to 10 ranges on 3 or 5 or more nights. The number of times they pass through each beam is noted by observers on them. The number of times they are seen to pass through the beams is noted by observers located at service positions. A ratio of the mean number of times the targets are observed to pass through the beams and the actual number of times they pass through gives an indication of the finding power of the beams. A comparison of the ratios of standard and unknown beams gives a direct comparison of their finding powers.

Comparison target-finding tests are based on the assumption that lights of known finding power under service conditions are used as standards. These tests then form a simple, accurate and rapid method for the determination of the service utility of a new or modified searchlight. The tests were used with marked success in comparing mirror sizes, mirror colors, mirror shapes, front-glass losses, medium and high-intensity arcs, color screens and over 20 designs of searchlights.

Observer's Position.—Observer's positions have always been known to influence the finding power of a searchlight. Many observations were made from time to time, but no co-ordinated results obtained. The problem was given special attention in the spring of 1918. A series of tests was made with airplane targets at Ellington Field, Texas. A 36-in. barrel searchlight with a 150-ampere high-intensity arc, 40 observers on a 6000-ft. base line and an airplane flying at elevations from 3000 ft. to 6000 ft. and ranges of 10,000 ft. to 20,000 ft. were used. Observations were taken on a number of nights. Over 800 readings were obtained. The collated results indicate that the best observing position is in the axis of the trunnion of the searchlight and from 300 ft. to 1000 ft. distant from it.

Designs.—The design of searchlights and searchlight equipment to meet the new warfare conditions required radical changes in the fundamental ideas previously held. The service needs were collected and analyzed. The views of collaborators and liaison officers were obtained. Future operations and tendencies were considered. Problems were formulated and assigned to selected groups of engineers. Their queries were invited and answered. Their products were examined during the progress of development. The final samples were given rigid and exhaustive tests.

Five designing engineers with their assistants cooperated with the War Department. Each formed a group of keen, skilled enthusiasts whose knowledge, interest and efforts resulted in the successful development of a number of new, novel and epoch-making designs.

Barrel Searchlights.—The barrel searchlights available at the beginning of hostilities were intended for fixed installations. A portable type was needed. The problem was submitted to the Sperry Gyroscope Co. and the General Electric Co. They assigned Preston R. Bassett, John L. Hall and E. J. Murphy to consider the requirements. The first result of their study was a standard 36-in. barrel searchlight with a four-wheeled carriage instead of the remote-control base. This reduced the weight from 4000 to 1600 lbs. Next they modified the design and produced a 60-in. light barrel weighing 1800 lbs. complete with carriage. The mechanisms of these searchlights are noteworthy. They are automatic yet very simple. The number of parts in them is less than one-fifth of the number in the previous standard designs. They weigh only one-fourth as much as the standard designs, yet are more rugged and function better.

Open Searchlights.—The open type searchlight was conceived by Maj. Richard Wheatley Lewis, Engineers, in May, 1918. He was deeply impressed with the need for a lighter-weight searchlight than any available. He saw the desirability of having one which would combine lightness with ruggedness, simplicity and ease of operation. He studied the results of experiments made in the United States and sketched a design which eliminated all but the basic essentials of a searchlight.

The problems of design were submitted to a group of army engineers, the General Electric Co. and the Sperry Gyroscope Co. Capt. L. C. Josephs, Jr., and C. A. B. Halvorson and P. R. Bassett were assigned to crystallize Major Lewis's conception. They developed and within two months placed in production a 60-in. searchlight of remarkable properties. It weighed only one-fifth as much as the previous standard. It had one-twentieth of the bulk and cost only half as much. It was infinitely simpler and could be produced in less than one-fourth the time required to produce the old standard. It used the same mirrors and carbons as the old designs. It was uniquely adapted for the service conditions encountered.

Improved open type searchlights followed the successful initial designs. The carriage was made stronger and lighter. The mechanism was made simpler. A tripod mounting was made for a 30-in. size. A litter carrier was made for the 60-in. size. The finder was simplified and improved, the controls bettered. The result is a searchlight design which will accommodate the wide variety of arc light sources and mirrors to meet the many service conditions encountered.

Power Units.—Mobile power units were as essential as mobile searchlights. They were required to be dependable and quiet in their operation. Their design was submitted to Maj. Lorimer D. Miller and Capt. L. C. Josephs, Jr., Engineers, and Harry S. Baldwin of the General Electric Co. Two schemes were developed. Both used an automotive engine as prime mover. One is the so-called Mack design. It had the generator located in front of the engine and supported beyond the automobile chassis. The other is the so-called G. E. Cadillac design. It had the generator located on a quill between the automobile transmission and the differential and supported inside the automobile chassis.

The Mack design was an adaptation of French practice developed during the war period. It eliminated the belts, chains and other links of the French systems and placed the generator on an extension of the engine crankshaft. This design permitted standard truck units to be modified and used as mobile searchlight power units. It also permitted a limited operation of the searchlight and truck motive power simultaneously. The design was projected in December, 1917. One hundred and eighty units using 5½-ton Mack trucks were built. They were equipped with extra radiator and extra water supply and carried a 115-volt, 15-kw. generator, a 36-in. wheeled barrel searchlight, 500 ft. of cable, rheostats, etc. About 30 units reached the American Expeditionary Forces in France where they were successful on hard roads.

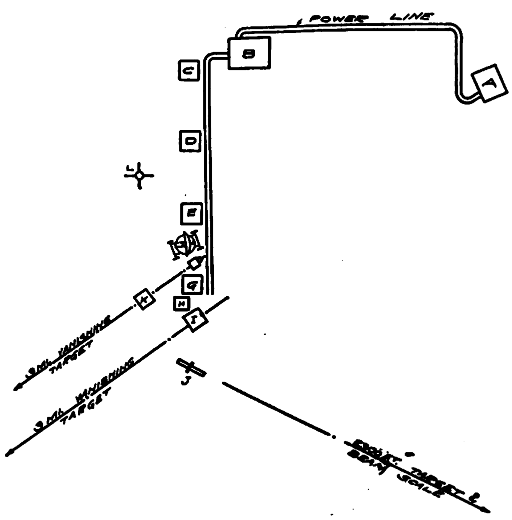

Fig. 3.—General Ground Plan of Searchlight Station.

(A) Power house; (B) general test house; (C) 60-in. high-intensity drum type projector; (D) 60-in. low-intensity drum type projector; (E) 60-in. high-intensity drum type projector; (F) 60-in. medium-intensity army open type projector; (G) incandescent projector; (H) wireless telephone station; (I) sectored disk for visibility test; (J) 6-in. telephotometer; (K) 15-in. telephotometer; (L) antenna of wireless telephone.

The G. E. Cadillac design was a distinct departure in power unit construction. Similar to the Mack, it uses a standard automobile engine and chassis. In addition, however, it uses the standard water reservoir and cooling equipment. The generator is placed concentric with the propeller shaft and connected to it through a quill. A standard Cadillac clutch and gear-shift lever enable the engine to be connected to either the generator or the automobile propellor shaft.

The Cadillac idea was suggested in June, 1918. A sample was ordered in July, 1918. Delivery was made in September. A short but thorough test was made in the United States. The sample was then shipped to France where it was received and placed with the Second American Army early in October. It carried a 105-volt, 20-kw. generator, 600 ft. of cable, and a 60-in. open type searchlight. Ninety additional units were authorized soon after the sample was started.

Extensions of the Cadillac idea have been made. A 50-kw. unit has been completed. A 7-kw. unit is being constructed. The three models form a unique line of portable power units employing automobile designs which have been standardized for the general service in the Army.

The future of military searchlights is assured. The remarkable advances in aeronautics alone provides a wide field for their employment as detectors, beacons, landing lights and signals. Their development has but just started. They will undoubtedly be wonderfully improved in the next decade.

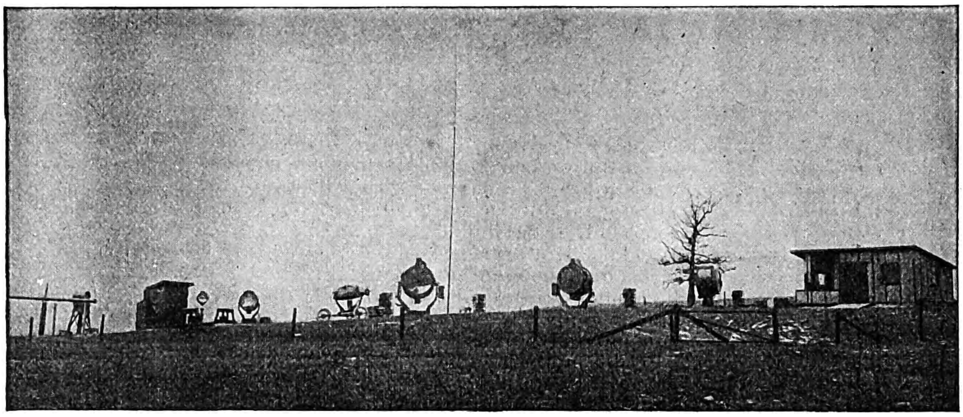

Fig. 4.—General View of Searchlight Station—Test House at Extreme Right.

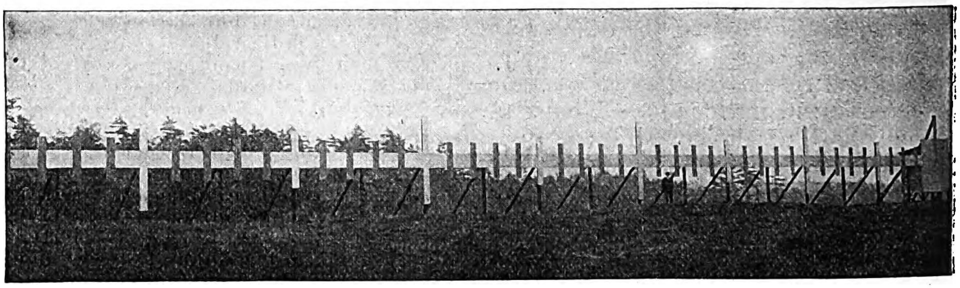
Searchlight Testing.

The characteristics required of an anti-aircraft searchlight are: Mobility, durability under rough usage, reliability under all circumstances, ability to operate at any elevation of axis or even upside down, good luminous efficiency, and quietness of operation. When to this list is added the fact that the positive electrode is often at a blazing white heat for its entire length and many parts of the lamp are red hot during a protracted run, it is seen that the design of an operating projector is not a simple matter. Several of these requirements were entirely new, and some idea of the radical changes in the new projector may be gained by a glance at the illustration of the old fortification-type searchlight, Fig. 1, and the army open-type searchlight, Fig. 2. During the tests that accompanied the development of the new type searchlight, every part of the projector had to be kept under constant observation and the interested engineers kept posted. The scheme and scope of the testing was laid out by W. D'A. Ryan, and all actual test work was done by members of the Illuminating Engineering Laboratory of the General Electric Co. Following each test, technical reports were made to the General Engineer Depot, U. S. Army, covering first, fairly complete original test data and notes on operation; second, a summary and comparison of the data; and third, a judgment on the thing tested.

Fig. 5.—Close-up View of the Beam Scale and Photometer House—Note Size as Compared with the Man Standing Near Middle.



The principal source of information was the outdoor searchlight range on the Schenectady-Duanesburg road. Here was equipment for operating and testing the numerous types of searchlight, singly or in groups. The test work fell into three classes: first, a mechanical or operation test of the searchlight or carbons; second, a test of the relative revealing power of the searchlights; and third, a photometric analysis of the beams of light. The last class of testing took up the greater part of the time, but the three classes were always more or less interwoven and proceeded simultaneously. To the uninitiated, the amount and

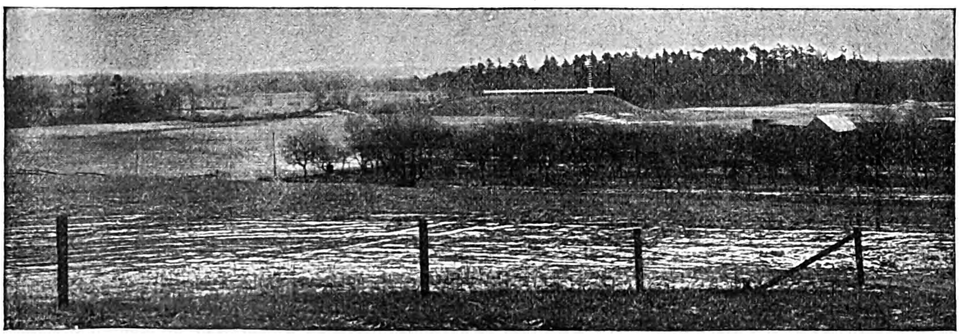


Fig. 6.—The 2300-ft. Target and Beam Scale as Viewed from Searchlight Station — Horizontal Scale Is 5° 30′ Long, and Vertical Scale Is 1° 30′ High.

scale of testing apparatus is amazing, and the labor involved in choosing between two identical appearing carbons seems beyond all reason. The explanation is simple enough for sheer difficulty—searchlight photometry stands in a class by itself. There are several factors, such as current and voltage, that are under control; several others, such as crater formation and steadiness of burning, that can be observed but only slightly controlled; and finally, there is the action of the atmosphere, which cannot be controlled, and until this station was built was probably never before measured as a regular part of the photometric testing of a searchlight.

The country around Schenectady was thoroughly examined before a suitable location was found on the Schenectady-Duanesburg road about five miles from Schenectady. This location is entirely free from smoke and river fog. The power station and searchlight are located on a hillside having a free view across a wide shallow valley. A high point of ground 2300 ft. away was selected for the station at which photometric readings were to be taken. A mile and a half away an airplane silhouette was erected, and three

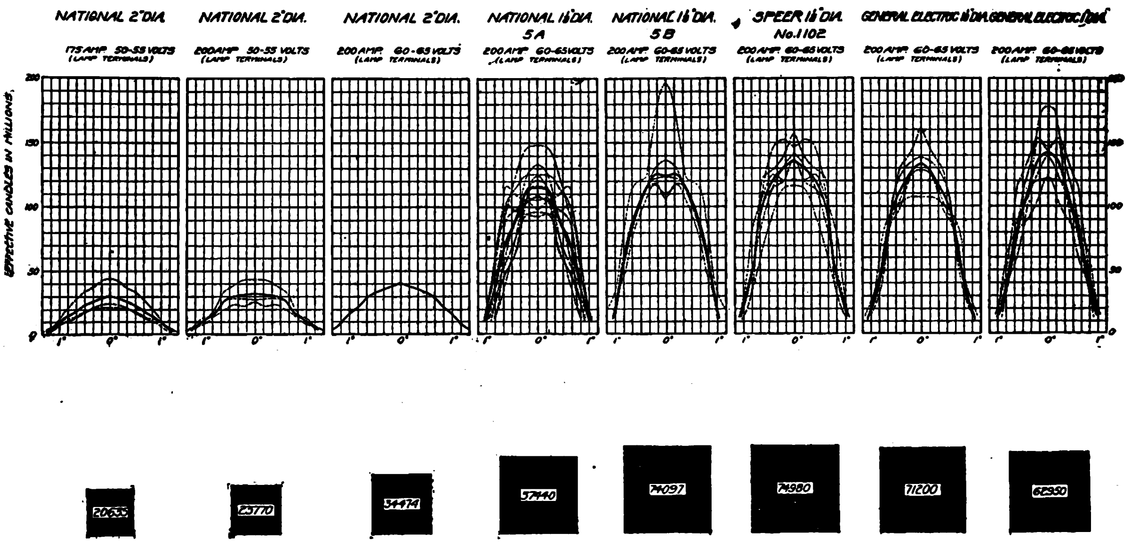

Fig. 7.—Three Curves at Left Show Pre-War Intensities from a 60-In. Searchlight—Five Curves at Right Show Preliminary Results with Five of the Most Promising Electrodes Developed During the War—Later Tests Were Restricted to the Three Best Out of These Five.

miles across the valley was located the big "vanishing" target mounted on the brow of a hill so that the sky formed the background. The searchlight station, power house, and photometric station were connected by a telephone line, while communication between the searchlights and vanishing target depended on a wireless telephone outfit similar to those used by the airplanes spotting for the artillery.

The beam of light reflected from a parabolic mirror has several peculiar features, the most important being the great distance to the point where the light in the beam has assumed an approximately final distribution. The light that strikes the center of the mirror has the greatest spread and forms the outside of the beam, and the light that strikes the rim of the mirror is most abundant in the center of the beam. Theoretically this crossing over process never ceases, but practically the light is in its final position at from 100 to 400 times the diameter of the mirror, depending upon the type of arc. These distances allow considerable atmospheric interference and also necessitate some means of constant communication between the two parts of the testing squad which is composed of five active members, as follows:

(1) Lamp operator, who also records arc voltage and current at half-minute intervals.

(2) Beam trainer, who sees that the arc is properly focused and who directs the beam on the target and, by watching the arc, helps the operator in maintaining a normal crater.

(3) Communication man at searchlight, who in addition to keeping up communications, records the degree of flicker in the beam, the kind and time of hissing arc, and the outages.

(4) Photometer reader and communication man.

(5) Data recorder for photometer only.

In addition to the above, there is the engineer of the power station and from one to six observers, depending on the type of the test.

The electrodes of the open-type searchlight are kept in the correct burning position by occasionally rotating both positive and negative. Any slight movement of the crater on the positive carbon is accompanied by a movement of the beam and there is no provision on the searchlight itself for keeping the arc as sharply in focus as is required in test work. For this reason, the beam scale shown in Figs. 5 and 6 was used as both a guide for the beam and as a means for observing and checking the beam width. The photometer was placed with its head at a hole in the center of the large white square near the right end of the scale. This zero mark on the scale was really a 6-ft. square hut with full equipment and accommodations for the photometer reader and the data man. The trainer would direct the beam so that the part in which measurements were required would come at the zero mark. The points of measurement were usually 0.2 of a degree apart, or two small divisions on the scale. The trainer watched one edge of the beam as he moved it across the target. The edges of the beam are more clearly defined than the center and as only one edge can be seen plainly at a time, the target was placed near the extreme right end of the scale. The left edge of the beam could then be moved over 4° 30′, if the beam were that wide. In general.

the testing was done across the horizontal center line of the beam, but a vertical scale was built so that occasional special tests in a vertical plane could be carried out.

The photometers were of the Weber portable type with a working range of 100,000 to 1, which is more than sufficient to cover the variations in intensity encountered. Thus, the ratio of the greatest intensity of the high-intensity arc to the lowest measured intensities of some of the smaller arcs was about 1000 to 1. The readings were in foot-candles at the face of the target, normal illumination, and the apparent intensity of the searchlight in candles was found by multiplying the illumination by the square of the distance, or 5,290,000.

It was realized from the first that the handicap of not knowing the atmospheric transmission would be fatal to much of the testing originally planned. Consequently, two instruments were designed and assembled at the laboratory for the measurement of this transmission. The smaller one, 6-in. diameter and 18-ft. focal length, was used during photometric work on the 2300-ft. target; and the larger one, 15-in. diameter and 30-ft. focal length, was used during the visibility tests on the three-mile target. These telephotometers each consisted of a simple double convex lens which formed an image of the target in the center of the Lummer-Brodhun cube of a portable photometer.

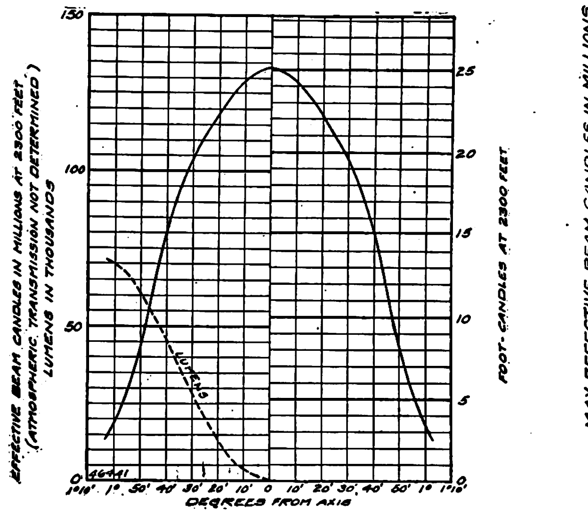

Fig. 8.—Curves Showing Beam Intensities and Flux Values Obtained With a Certain Group of Similar Electrodes.

The instruments were first set up in the laboratory and directed against a block of magnesium of such size as to give an image similar in size to that of the target on the outdoor range. The brightness of the magnesium was then measured through the telescope and compared with measurements made directly at a few feet distance. This ratio gave a figure for the relative brightness of the image in the photometer field. When used on the range, the zero section of the beam scale was illuminated by an incandescent searchlight that was carefully adjusted and maintained constant during the test. At a given signal, the man at the telephotometer would take readings and the men at the target, who had an extra photometer for the purpose, would take brightness readings on the same surface. A comparison of the two figures for brightness so obtained would give the loss of light in the atmosphere from the target back to the telephotometer, and the photometric data of the searchlight on test could be corrected accordingly.

Telephotometer readings were usually taken at the beginning of each night's work, at 11 o'clock, and at 2 a. m. just before quitting. A curve of time against transmission was drawn for each night, and the various tests were then located on this curve and given the proper correction.

The selection of electrodes for the open-type searchlight involved testing a large number of makes and mixtures before the final choice could be made. Three companies, the Speer Carbon Co., the National Carbon Co., and the General Electric Co., were actively engaged in making experimental mixtures that were tested out and reported on so that the chemists of the three companies were kept posted on both their own electrodes and those of the other two. Frequent meetings of the three chemists were held at the laboratory, where the test data and carbon stubs were inspected and these led to an extremely rapid development in the art of making better electrodes. It was this part of the work with which Mr. Ryan identified himself most closely, and it was his original specifications for sizes and currents that gave the development of carbons its flying start toward success.

Fig. 7 gives the total data of the tests on eight

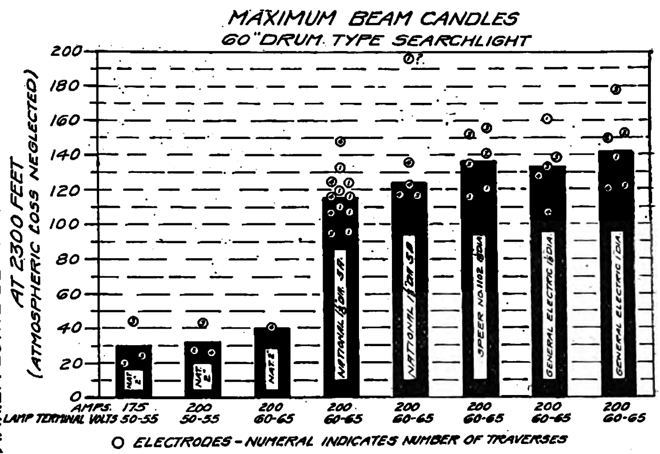

Fig. 9.—Graphical Study of Maximum Intensities Given by Different Electrodes—Scattering of the Spots Indicates the Variations Encountered Between Individual Electrodes of the Same Mix.

carbons of the same mixture, including curves of the beam characteristics as determined by 17 separate traverses of the beam.

There are three prime requirements to be met by carbons for anti-aircraft searchlights. These are: High luminous efficiency, steadiness and uniformity of burning, and quietness. The first is the easiest to meet and the last is the hardest. Luminous efficiency and quietness (that is, freedom from hissing) seem to be opposite characteristics, and to obtain one without sacrificing the other is often difficult. The electrodes now made surpass the best pre-war carbons in all three features; and the development of carbons for greatly increased currents is still under way and holds great promise for the future.

The so-called disappearing target consisted of a strip of canvas 13 ft. wide and 300 ft. long. This was wound on two spools leaving exposed a section 13 ft. long. This 13-ft. section constituted the target on which visibility tests were made. The canvas was held high in the air so that the sky formed its background, and to this extent at least it resembled an airplane, and its distance from the searchlight, three miles, represents a common "pick up" distance for airplanes. One end section of the canvas was painted with a good white diffusing paint having a reflection coefficient of 0.670. The second section was white with a number of fine black stripes, reducing the average coefficient to 0.532. The third section had wider black stripes and a coefficient of 0.423. The fourth had a coefficient of 0.335 or just one-half that of the first section. This geometric series, which reduces the coefficient by half every three steps, was continued until the last target was entirely black. The black and white markings were not visible at three miles, and to the observer the target grew dimmer and dimmer as it was moved toward the black end.

This target was used both as a disappearing and as a reappearing object. Starting with a white target, the canvas was rolled toward the black end. To the observers the target became gradually dimmer and dimmer until it finally disappeared. The disappearing point is not sharply defined, principally on account of the normal variations in the intensity of the beam. While the target was still fairly bright and distinct it would momentarily disappear during a period of low crater brilliancy. These periods of invisibility became longer as the target became a darker gray, until finally the target could be seen only during short periods of high crater brilliancy, and then came total invisibility.

The observers, who occupied various positions about the searchlight and whose watches had previously been set to agree with that of the target operator, recorded

(a) Time of first momentary disappearance,
(b) Time of disappearance half the time,
(c) Time of final disappearance.

The curtain was then wound in the opposite direction and the observers recorded

(d) Time of first appearance,
(e) Time of visibility half the time,
(f) Time of permanent visibility.

These records were then compared with the log of the target and the various sections identified. This test repeated with different searchlights gives a means of comparing their revealing power. It is worthy of notice that the revealing power, or working range under fixed conditions, increases much less rapidly than the beam intensity.

It is one of the unfortunate peculiarities of a searchlight that the beam itself often forms a most effective concealment for the target. The beam appears as a bright blue-tinted shaft of light, and this illuminated space forms a curtain in front of the objects under observation. In the vanishing-target tests the beam maintained its brightness and the target grew dimmer. At the vanishing point it may have had a fair degree of brightness, but not enough to make it visible in the body of the beam. This condition made it highly desirable to have another means of controlling the disappearing point of the target. An obvious way of doing this would be to decrease the intensity of the searchlight until the target was lost. It is not practicable to alter the intensity of a searchlight without altering its color or beam width. The same result may be obtained by cutting down the light from target and beam as it enters the observer's eye. This was done at the range by having the observer look through the blades of a rapidly rotating sectored disk. The eye slit slid along a scale that told the degree to which the light was diminished. Thus, if the target was found to be just visible at 0.20 on the transmission scale of the disk, it indicated that a projector of one-fifth the intensity would show the target under the given conditions of test.

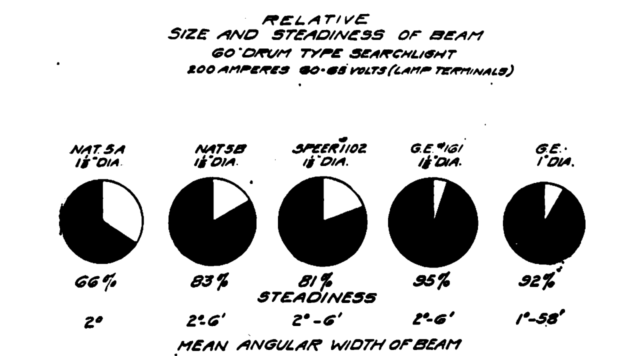

Fig. 10.—Holding a Searchlight Beam on a Swiftly Maneuvering Plane Requires Alertness and Quick Action for Which a Wide, Steady Beam Is a Great Help—The Above Shaded Areas Are a Measure of the Beam's Holding Power.

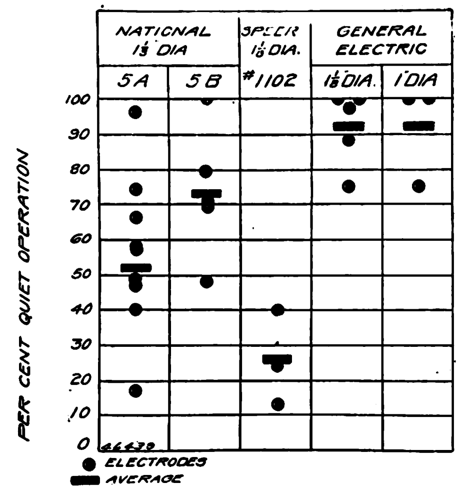

Fig. 11.—Quietness of Operation Is Essential When the Operator Has to Listen for Shouted Orders—Many Electrodes of Good Efficiency Were Discarded Because of Hissing—Such Noises Also Interfered Greatly with the Listening Devices Auxiliary to the Searchlight Equipment.

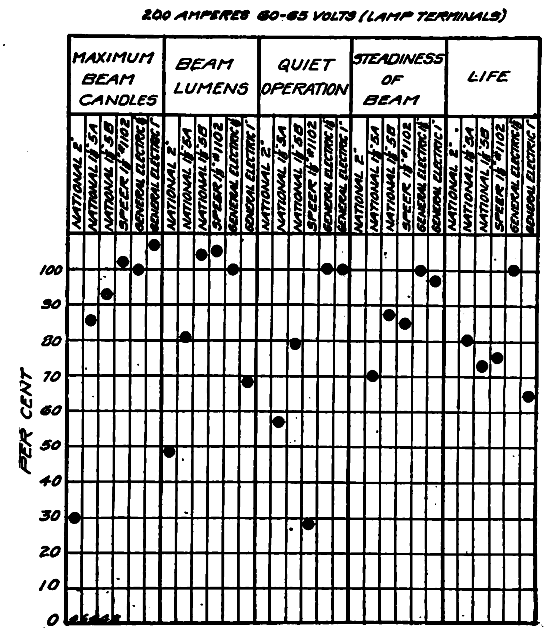

Fig. 12.—General Graphic Summary of Tests—This Form of Final Record Is a Great Help in Getting a Properly Balanced View of All Factors.

Editorial Comment

Improving the Load-Factor in Coal Mining

As a general rule the public has only a very vague notion of all the conditions prevailing in any industry, and it is not until something develops to focus attention upon some particular industry that the actual facts regarding it bcome generally known. This truth is being borne out in the intensified study now directed on the coal-mining industry as the result of the widespread strike of bituminous coal miners.

One of the main contentions of the miners is that in the summer, when conditions for work in the mines are most favorable, they actually are called on to work but two or three days a week, whereas in winter they must work seven days a week. They insist on an evening up of their work to five days a week throughout the year. The mine owners, on the other hand, reply that they would gladly bring this about if the public would spread out its coal purchases more evenly during the year. Storage of coal on a large scale at the mines is said to be out of the question. Much money has been spent in trying to educate the public to order its winter supply of coal during the spring or summer months, but little has yet been accomplished in this direction.

The electrical central-station industry was the first to recognize that a spreading out of the demand brought about important economies and electrical men have for a great many years been working for improvement of the load-factor in electrical supply. In other lines of business, while the desirability of steady orders has frequently been appreciated, little has actually been done to make a systematic study of it and adopt such measures as will improve the load-factor in the respective business. In the coal-mining industry the conditions just cited evidently call for an improvement in the load-factor. This would involve a change in the habits of the people and many are afraid that human nature is against this, because people as a rule do not want something until they actually need it and then they want it very badly. Thoughts of coal during the summer offend the ordinary perspiring individual at that time and he puts off purchase of his winter's coal until he actually must start up his heating plant.

In central-station electrical supply a great deal has been done in improving the daily and annual load-factors by introducing demand rates to keep down the peaks, by making off-peak business desirable through slightly more favorable rates, by stimulating summer loads and by attracting other loads that fill the valleys of the daily and yearly load curves. In the coal business reductions in price per ton are offered during the spring and summer months, but evidently they are not large enough to attract purchases on a large scale at those times. It is now proposed to make a strong effort to secure lower freight rates on coal during the summer months. Whether this would suffice in stimulating purchases during the summer it is not easy to say, but the matter deserves serious study and earnest co-operative effort on the part of every one concerned in improving the annual load-factor in coal mining. We believe that much good will come from this not only to the miners, to the mine operators, to coal dealers, the railroads and all others concerned with the coal business, but also to the public generally because the more stabilized condition in every branch of the coal business should reduce the necessary margins now necessary and possibly lead to reduction in price or at least prevent or restrict further increases in price.

Electricity Helps the Worker to Increase Production

For many months past writers and public speakers have been urging upon industrial workers the importance of settling down to work and ensuring, with the aid of the more efficent means now at their disposal, a larger output. The needs of the world are very large, and the need of greater financial and economic stability on the part of some great nations is even more pressing than are the requirements of peoples that cannot manufacture for themselves.

It has been stated over and over again that a special kind of propaganda movement suited to the prevailing spirit and conditions must be promoted in order to expedite the return to full industrial activity through the better understanding of the situation on the part of the people. It is said that it has always been one of the serious questions after there has been a war, how to get the people back to the ways of peace and every-day occupation without delay. After the late great war in which half the world has been compelled to change its ways, the problem is necessarily a more serious one than ever before. It is one thing to change over from war production to commercial industry in a factory; it is quite another, and a more difficult one, to change the mind and disposition or intention of millions of men and women. It is proving to be of little service for public men, however exalted, in England to urge British workmen to work harder and produce more in order that the nation may keep off the Road to Ruin. What is likely to be more successful is to show them that by the better means that have been placed at their disposal during the war, by the use of modern and efficient equipment, and by the fullest possible use of electric power, they will be able to increase their output of work and manufactures without greater strain than in the past. References to Road to Ruin do not move them in many cases, but the other line of argument makes an appeal to the imagination and will produce quicker results.

The situation has created an excellent opportunity for electrical propaganda, but unfortunately public men and those who have the ear of the people are not quite so well qualified as they might be to handle the great national and personal aspects of electrical questions. In England such subjects have never seemed to appeal to legislators as suitable themes wherewith to interest their audiences, but there is a change in progress at last. The nationalization of electric power supply, by being a plank in the platform of the government now in office, has done something to induce the change. Mr. Lloyd George has referred to the subject once or twice recently, and others are now following suit. One of the best speeches of the kind was delivered recently by Mr. C. A. McCurdy, parliamentary secretary to the food controller. We quote some extracts from this address elsewhere in this issue. It would seem opportune for our public men in America to take a similarly progressive view of the potentialities as to production increase through greater use of electric power. No time should be lost in bringing the matter to their attention.

Air Supply to the Boiler Room

IN THE production of steam in power plants, air, fuel and water are the raw materials employed. Air is the bulkiest raw material handled by the power plant, and a greater weight of air is handled than any other raw material that goes into the conversion of the latent chemical energy of coal into the thermal energy of steam.

The evaporation of water per pound of coal varies from, perhaps, 4 to somewhat above 10 lbs. in the large modern plant. The amount of air required for the combustion of coal, likewise, varies quite widely. Theoretically, about 12 lbs. of air per pound of coal are required for complete combustion. In practice, the excess air may and often does attain 300 per cent, so that in practice the air per pound of coal may vary from 18 to 48 lbs. per pound of coal. Upon this basis it can be readily seen that the weight of air handled always exceeds from 12 to 48 times the weight of coal consumed, and even at the highest evaporation of water per pound of coal exceeds the weight of water evaporated.

In the utilization of the steam, however, in contradistinction to the production of steam, a greater weight of water is handled for condensing purposes than of air for combustion. And, incidentally, this water carries away to waste about 60 per cent of the heat obtained from the coal. The amount of circulating water used depends, of course, upon the vacuum obtained, the temperature difference of the cooling water and condensate. For low vacuua and cold water, the weight of cooling water handled may be less than that of the air required for combustion. But for vacuua above 29 ins., referred to a 30-in. barometer, and temperature of cooling water above 40 deg., the weight of the condensing water will be equal to and will usually exceed the weight of air needed for combustion.

That a greater weight and volume of air than coal or water is handled in producing steam is a fact that should be borne in mind in laying out a power plant and in operating it. At this time of year especially it is well to remember the large amount of air required for combustion, for sometime and somehow this air must come from outdoors. With cold days and colder nights, windows and doors are closed for the comfort of the men, and absence of a definite entrance for the air may result in operating difficulties and lowered efficiencies.

It might seem that so long as air gets under the grate and thence through the fuel bed, it matters little how it gets there. But not so. With windows and doors closed and the free entry of air hindered, a partial vacuum may be created in the station, reducing the effective draft, which in turn affects the combustion rate and efficiency, ability to maintain steaming rates, tending to create smoke and taxing stack or blowers. And then the temperature of the ingoing air to the fuel bed is a factor in furnace temperatures. Cold air only lowers the furnace temperature while air taken into the boiler room through the roof or warmed by the boiler room or losses of turbogenerators not only adds to the comfort of the men but may be transferred from the debit to the credit side of the ledger by lowering combustion losses.

Comfort of the men in the boiler room is almost as important a factor as the air furnished the fire. Both can be best served when the air supply is given as much attention as the coal and water-handling systems. Too many power plants suffer from insufficient air; too many stacks are taxed because of closed doors and windows during the cold weather. The fires in too many boiler rooms are partly asphyxiated because no proper provision for incoming air has been made. And the reason for these things is not because it has been overlooked that air is one of the three raw materials required in steam making by fuel, but because the vast volume and heavy weight involved are not fully appreciated.

The air-supply system, like the coal and water-handling systems, needs deliberate consideration and wise provision unless the performance of the furnaces is to be influenced in the interests of the comfort of the boiler-room force when the cold weather comes. Plant layout cannot now very well be changed, obviously, but the effect upon plant performance of closing all doors and windows and other sources of influx for air can be borne in mind.

Current Events

Jovian Order to Be Revived—Power Economy Conference to Promote Fuel Conservation — Drafting of Safety Codes

N. E. L. A. COMMITTEE TO AID UTILITIES GET COAL.

National Committee on Electric Service Revived to Co-operate With Government as to Coal Needs of Central-Station Companies.

John W. Lieb and George Elliott, chairman and scretary, respectively, of a special committee representing the electric light and power companies affiliated with the National Electric Light Association, have gone to Washington to co-operate with Director-general Hines and Fuel Adminstrator Garfield regarding the maintenance of fuel supply to public utility and related companies during the strike.

M. H. Aylesworth, operating manager of the association, said the committee's functions would be similar to those which were exercised by the National Committee on Gas and Electric Service during the war, in helping to conserve coal and to allocate the supply. A number of light and power companies, Mr. Aylesworth said, had advised him that they were already facing a fuel shortage and, in some instances, higher prices were being demanded for coal.

The committee will endeavor to keep every plant in operation by obtaining for it the required amount of fuel.

JOVIAN ORDER REJUVENATED AT CHICAGO CONVENTION.

Measures Adopted That Will Revive Interest and Bring Back Old Members—A. J. Binz Elected Jupiter.

Voting unanimously to reduce annual dues to $2, to eliminate all existing commercial features and to function solely as a fraternal and social body, the Jovian Order in annual convention at the Hotel Sherman, Chicago, Nov. 5, took steps that practically assures it of renewed interest and activity. Preceding this action, Arthur J. Binz and Ell C. Bennett generously agreed to underwrite the present indebtedness of the Order, so that the money received during the current Jovian year may be used to pay operating expenses. Any surplus after all expenses are paid will be used to apply against the past indebtedness, but even if there is no surplus at the end of the year the Order will be clear of debt.

Another measure adopted unanimously that will be of considerable importance in reviving interest provides that any man heretofore affiliated with the Jovian Order can by the payment of $2 for the current year's dues be placed in good standing regardless of his past indebtedness or his having previously resigned. It was the consensus of opinion that this action would insure the return of a great many Jovians who dropped out or failed to pay dues during the war.

The convention was scheduled for two days, but the work arranged was carried out so harmoniously that it was found possible to complete the program at the end of the first day. Jupiter L. O. Ripley presided at the two sessions, assisted by Mercury Bennett. The report of Jupiter's cabinet, which held a meeting on Nov. 4, was presented and embodied the recommendations already mentioned, which were unanimously passed with the exception of a recommendation to remove the central office from St. Louis to Texas. This recommendation was not pressed because of the action of Messrs. Binz and Bennett agreeing to underwrite the indebtedness of the Order providing the central office remained in St. Louis.

The election of officers resulted in Arthur J. Binz, Dallas, Tex., being elected Jupiter; Ell C. Bennett, St. Louis, Mercury; J. H. Betz, New York, W. R. Herstein, Memphis, and William Hand, Kansas City, members of Jupiter's cabinet. Upon motion of Mr. Bennett it was voted that Mercury serve without compensation.

In connection with the reduction of dues to $2, it was provided that such dues be payable directly to the central office. It was also voted to retain the insurance feature, which permits Jovians to obtain insurance at reduced rates.

NEW YORK ELECTRICAL SOCIETY AND AUTOMOTIVE ENGINEERS MEET.

Army Officers Describe the Remarkable Work of the Motor Transport Corps with the American Expeditionary Forces in France.

A joint meeting of the New York Electrical Society and the Metropolitan Section of the Society of Automotive Engineers was held in New York City on Oct. 30. The program consisted of a lecture by Lieut.-Col. Kingsley G. Martin, chief transport officer of Base Section 1, A. E. F., and a discussion by Lieut.-Col. Arthur J. Slade, of the Motor Transport Corps, on the motorization of the world's traffic. Colonel Martin revealed the experiences of the Transport Corps during the war, the accomplishments of the motor truck in the war emergency, and, finally, the impressions created by the American car in the minds of foreigners. He alluded to the relation between electrical development and the development of the motor car and showed that the successful operation of a motor car like that of so many other mechanical devices, depends upon the successful functioning of electrical apparatus.

Nearly all motor vehicles used by the expeditionary forces were shipped abroad in a knocked-down condition and were assembled at bases established in various parts of France. The amount of assembly work required per vehicle increased as the duration of the war increased, because of the tendency to ship abroad the separate parts of the cars collected in crates. Even the bodies were shipped knocked down, the metal covering being merely stamped in shape, the wood parts fashioned, and the upholstering material in bolts. Some disorganization was caused at one time because a shipment of parts failed to contain tacks for the upholsterers.

The Motor Transport Corps was sent to France without equipment and instructed to assemble and repair the army's cars and trucks. The officers negotiated for land at the bases and began work when the right to use the land was acquired. Plans of assembly buildings were drawn so that the work could be prosecuted exactly as it is prosecuted in the most successful automobile plants in the United States. A chassis started down an inclined track at one end of a building and arrived a complete car at the other end.

Buildings for barracks and other purposes could not be erected until shipments arrived on account of the fact that the men had no building material. The crates in which the cars arrived, however, solved the building material program. From these crates the men constructed the only buildings in the bases. They built their own hoists, derricks, and shops, and made many of their own tools. They set up their own electric light plants and installed their own lighting equipment. They improvised prime movers by driving their dynamos by means of engines salvaged from disabled cars.

The wholesale production of cars was the marvel of the French people. Before 1917, European cars generally were made to order to suit the fancy of the purchaser, who was willing to wait several months for delivery. One of the principal influences that this country exerted on the actions of the Europeans was to change their method of producing manufactured goods. The hand-made system in French industry was replaced in many places by the system of quantity production which was introduced by the Motor Transport Corps. The largest French cities never had traffic control before the American army trucks arrived. The size of the army trains can be judged by the fact that, to fuel a single train, two five-gallon gasoline pumps operated continuously during a 43-hour interval.

WESTERN SOCIETY OF ENGINEERS TO BROADEN ITS ACTIVITIES.

Plans for More Intensive and Numerous Meetings, More Frequent Inspection Trips, New Sections, More Committees and Greater Service to Members.

As the result of the recent fiftieth anniversary membership campaign of the Western Society of Engineers, during which an effort was made to increase the membership to about 2000, a total of 2096 applications were received, thus increasing the membership to almost three times what it was before the campaign. The success of this campaign led to a general meeting of the society, held in its rooms in Chicago on Nov. 3, at which plans for the future of the society were freely discussed.

Amendments to the present constitution were submitted, changing the fiscal year to begin hereafter on June 1, instead of corresponding with the calendar year. The idea of this was to bring the change of administration during the summer dull season and cause less interference with the year's business program thereby. These changes were approved by the meeting and will be submitted to letter ballot of the members.

E. T. Howson, chairman of the Development Committee, presented a general report of the work done by this committee so far in discussing plans for expanding the work of the society and increasing its value to the membership. Much study has been given to this matter, especially in view of the very large increase in membership as the result of the campaign referred to. The committee submitted various suggestions for discussion and wished to get the sentiment of the meeting thereon.

As regards the time of holding the meetings, it was urged that the meetings convene earlier in the evening so as to permit members living in the suburbs and cities near Chicago to reach home in good time; the general sentiment was that the meetings should begin promptly at 7 p. m., and terminate not later than 9:30.

It was proposed to have, aside from the regular weekly or semi-weekly evening meetings, occasional luncheon meetings, these to be devoted largely to civic and nontechnical subjects, but which engineers should keep closely posted on. This suggestion was indorsed by many speakers who thought that one such a meeting a month would be very valuable, not only in broadening the knowledge of engineers, but in enabling them to meet socially more frequently.

Secretary E. S. Nethercut spoke about the library service of the society, which it is hoped to extend. Classification and indexing of the books has been carried on and this cataloging should be completed in the near future. There is considerable call on the librarian for furnishing special bibliographies on a considerable range of technical subjects and the librarian is co-operating with other libraries in Chicago on this matter. It was suggested that if enough members would desire it the rooms of the society would be kept open in the evenings. On motion of C. W. PenDell, this will be tried out for some 90 days and each notice of a meeting will carry mention of the fact that the reading rooms and library are open in the evenings.

Conducting more frequent inspection trips and excursions was suggested and this met with hearty approval. It was pointed out by a number of speakers that such inspections, given about once a month, should include not only the most important engineering works in and near Chicago, but also interesting industrial plants, public buildings, etc.

The society now has five sections devoted to electrical engineering, mechanical engineering, bridge and structural engineering, sanitary, hydraulic and municipal engineering and gas engineering. Three new sections have been authorized as follows: Electrical communication, industrial engineering and railroad engineering. Several speakers advocated the formation of still other sections, devoted to chemical engineering, power-plant engineering and public affairs.

An extension of the committee work was also discussed and among the suggestions made was that a committee be organized to gather data from construction projects involving deep foundations to secure definite information as to the depth of rock in different sections of the city. Another committee suggested was one to keep posted on proposed city ordinances involving engineering matters; another one that may be organized should investigate accidents in engineering structures; still another may draft standard contract forms for construction work.

The Committee on Program and Publications reported that programs for the remainder of the year have been practically completed and the prospects are very satisfactory for having a very interesting series of meetings throughout the coming season.

Fuel Conservation Comes Nearer as Permanent Bureau Is Formed

International Power Economy Conference Establishes Bureau to Collect and Circulate Information of Plant Performance at Chicago Convention

WITH the bituminous miners' coal strike looming as a certainty, the second International Power Economy Conference assembled in Chicago at the rooms of the Western Society of Engineers, October 30 and 31. The purpose of this meeting was to discuss the fuel situation present and prospective, to review progress made since the previous meeting and to formulate plans for promoting a permanent organization after listening to the reports of the Executive Committee and other committees.

Vice-chairman A. A. Gray in calling the meeting to order reviewed the past work of the conference, the need for carrying on and perpetuating the accomplishments of the Fuel Administration, and dwelt upon the threatened coal strike that would start before the conference terminated. Mr. Gray then stated what the Conference had done in connection with the Bureau of Mines toward assisting in perpetuating the work of the Fuel Administration, telling of interviews at Washington with Dr. Van H. Manning, director of that Bureau. Dr. Manning strongly endorses an organization that aims to co-operate with the Bureau of Mines and improve fuel economy and transportation facilities by inspection and supervision of coal at the mines. The prominent part taken by David Moffat Myers toward fuel conservation, by his work in the Fuel Administration and as a consulting engineer was dwelt upon by Mr. Gray, who then told of Mr. Myers' suggested program for carrying on and enlarging upon the work of the Fuel Administration. Unfortunately this program, while very thorough and desirable, was so comprehensive that there seemed little hope of having it acted upon by Congress at this session, due to its chaotic conditions and frenzied attempt to economize and cut expenditures.

C. A. Tupper, chairman, who then assumed charge of the meeting, said he was convinced that the present time offered a real opportunity for the manufacturers of power-plant apparatus to render a patriotic service. The looming coal strike and the possibility of similar conditions to those existing during the war strongly emphasized the need for such a body as was gathered together in the cause of making fuel economy permanent. Everyone should stand solidly behind the Government, regardless of politics and affiliations, during whatever complications lay ahead. The conference must decide for itself whether it should be a permanent organization or not, and this can be done only when everyone does his bit instead of "letting George do it." Mr. Tupper then explained the vast opportunity to serve the public and conserve fuel by education and development of public opinion.

The report of F. A. Moreland, chairman, Committee to Co-operate with the Fuel Administration, was thereupon presented.

Mr. Moreland told of the manner in which the Bureau of Mines had taken over the work of the Fuel Administration and gave in more detail the suggested program drawn up by David Moffat Myers, advisory engineer, Fuel Administration, and of the proposed inspection of coal at the mine by the Bureau of Mines, including the method by which coal would be sold upon a heat-unit basis and coal operators required to rate their coal accordingly to a definite set of standards under supervision at coal-sampling stations maintained by the Bureau throughout the country in proximity to the coal mines. As Mr. Myers' program would require not less than $1,000,000 appropriation, the first year, there would be little immediate chance to obtain any such amount from Congress. Meanwhile the Fuel Administration has been inactive, while the Bureau of Mines is not able to carry on the work for lack of authority to do so and from the fact that the Fuel Administration is still in existence. The big fuel saving brought about by the Fuel Administration in a short time and before it got working steadily augurs well for some similar body to encourage and carry on the work.

Urgency of Coal Conservation.

Joseph Harrington, former administrative engineer for Illinois, Fuel Administration, then said the fuel situation was really critical. The demand for fuel and labor-saving equipment today was greater than ever before. Practically every manufacturer of such equipment has never been busier and never was the opportunity and possibilities of co-operation for the interests of fuel saving more promising than now. With a coal strike virtually under way, whatever the result, higher coal costs seem inevitable, so that coal already deserves to be classed as an expensive commodity. Coal saving is not a matter of choice, but one of necessity today, and the public, as the ultimate consumer, is realizing that fact. The sum total is that more efficient use of coal is compulsory and wasteful methods will not be tolerated indefinitely.

The public is awakening to the situation through force of circumstances. It is being educated, and now is the time for such a body as represented at the conference to serve the country as a whole, and themselves also, by spreading the gospel of fuel saving. So long as a manufacturer produces equipment that serves a good purpose—and saving coal is prima facie an excellent object—it is to the interests of the public and nation as a whole that such equipment be used, and the fact that the manufacturer profits by its use is merely incidental. If all the manufacturers of power-plant equipment get together and boost the game by educating the public through publicity as to the need for saving coal and how best to save it by consuming it economically, all will be the gainers.

Mr. Myers' Program for Continued Fuel Conservation.

David Moffat Myers then outlined the program he had submitted for the continuation and extended scope of the work formerly carried on by the

Fuel Administration, if taken up by the Bureau of Mines. He said while it may be a crime to waste coal, Congress will only take cognizance of the matter in times of peace when public opinion is roused. The men represented by the present conference can accomplish most by educating the public, so that through it Congress can be reached and influenced in the cause of fuel saving. The high cost of fuel has given the movement of fuel saving great incentive. It is quite possible to save as much as 100,000,000 tons of coal per year without curtailing manufactured products. Over 25,000,000 tons were actually saved by the Fuel Administration in the short time it was active, and this is only a beginning. Valued at $6 per ton, $600,000,000 saving in coal bills annually is a factor neither the public nor the Government can afford to ignore. It is a factor vitally affecting the cost of living. While shortage of apparatus and inability to obtain it made it necessary for the Fuel Administration to devote its energies to saving coal by improving operating knowledge and education, conditions are now such that apparatus can be obtained. The efficiency of any process is the product of machinery and men. Today fuel saving may be brought about to an even greater extent than during the war, since both men and machinery are obtainable. From this reasoning it is apparent that machinery or equipment must be considered by the Government in any national program for coal saving.

Mr. Myers told of mistakes in the use of equipment and the installation of the wrong equipment in the wrong place, pointing out that these things must be stopped if coal saving is to obtain upon a national scale. He looks forward to the time when state engineers or district engineers will be appointed by some body successor to the Fuel Administration for checking up plant designs and seeing that they conform to thermodynamic principles. He said that the time must come when ability to operate power plants will not merely involve a state or city license to indicate sufficient knowledge to keep wheels turning and prevent a boiler from blowing up, but will mean that the engineer possesses some knowledge of combustion and ability to save coal and money for his employer. An organization of manufacturers of power-plant equipment has a magnificent opportunity for serving the country, and if this service is rendered unselfishly such an organization should have immense success.

Mr. Tupper then enlarged upon certain phases of Mr. Myers' remarks, pointing out that the scientific knowledge of the manufacturers and engineers could be utilized to educate the public in the proper way, and he hoped the movement now started would increase in momentum and accomplish its good purpose. The movement had also to have moral support of the central-station industry and many other industries. The problem before the assembly was how best to carry out the work of educating plant operators in the ways of saving fuel.

A. L. Rice, managing editor, *Power Plant Engineering,* opened the discussion by telling of the need and possibilities of coal saving, as based upon his close contact with the power plant field. The quality and cost of coal is becoming an increasingly serious problem. The power-plant-equipment manufacturers can accomplish a noble work by acting in an advisory capacity, and by being more altruistic in teaching the public. Where the coal consumption of a large consumer is reduced as little as one per cent, tremendous good accrues to the public. Such savings to a small number of large consumers are equivalent to the coal used to warm many a town. The task undertaken should be to do altruistic work in educating the public, and not merely trying to build up business.

A. W. Patterson, of The Engineer Co., said the man who manufactures coal-saving equipment is doing a good thing, and that such men are best able to tell the general public how to save coal by the coordination of apparatus. In this he was joined by Mr. Moreland, who pointed out that the public as a whole goes to the manufacturers for practical and technical information and uses them much as consulting engineers. An organization of power-plant-equipment manufacturers can thus be of immense value to the coal-consuming public by the correlation of data and the dissemination of knowledge.

R. J. Stewart, of H. W. Johns-Manville Co., spoke of educating the chief engineers and consulting engineers, telling of his experiences of equipment and materials misapplied and the readiness usually shown for correction and information. Just such a purpose would be served by the organization of manufacturers of power-plant equipment who would educate and co-operate. Other speakers presented similar views.

Coal Zoning and Washing.

Opening the afternoon session, Mr. Tupper introduced Hans J. Meyer, former advisory engineer for Minnesota for the Fuel Administration, and a consulting engineer, who spoke on "Solid Fuels." He said waste occurs in mining, in transportation, in distribution and in utilization. Wastes of transportation offer a big field for the organization to work upon, and the zone system of coal distribution and utilization is one of the most important things accomplished by the Fuel Administration. There is no need for importing eastern coals in the West, for the vast deposits of Illinois and Iowa coals and western lignites can be used when the public is educated in their use. Use of lignites in Minnesota and contiguous territory alone would save more than 500,000 tons of coal a year and release 50,000 freight cars and thousands of locomotives. The movement of coal is an enormous tax upon the transportation system of the country, and only the zoning of coal will solve it. The supervision of fuels mined and used was advocated.

B. J. Roberts, chairman, Committee on Washing and Pulverizing Coal, then presented a report on the "Purification of Coal" in which it was shown that by washing much foreign matter could be eliminated. If done at the mine this would reduce freight and coal bills, conserve freight cars and in any case would eliminate many operating troubles due to clinker, fluxing of refractories, etc. By washing, many coals now considered worthless could be used, and the culm banks now seen around mines could be put to good use. The various methods of washing coals were covered, and the financial gain of so doing brought out. This paper was discussed by David Moffat Myers, Mr. Harrington, and Mr. Meyer, who all agreed that the large amount of foreign matter in coal worked hardship upon the consumer and taxed the railroads needlessly. It was emphasized that cleaning coals by washing and pulverizing offer solutions to the use of low-grade fuels, and thus extend the use of fuels within easy reach.

M. F. Newman, chairman of Committee on Water Purification, then presented his very able and concise report. This covered the choice and operation of the various appurtenances, and the influence of scale upon absorption efficiency of boilers and condensers, the transformation of energy in the turbine, etc. He told of the effect of scale formation in pipe lines, economizers and boilers and the various causes and forms of incrustation, etc. The inertia of the average plant operator was deprecated and the importance of water purification emphasized as a factor in fuel economy. In his remarks Mr. Newman was supported by C. Kennicott who dwelt upon various phases of water purification.

Albert Goetz, chairman, Committee on Boiler Settings, then presented his report, in the discussion of which A. W. Knight elucidated upon the various losses through the brickwork and segregated them. He pointed out that, while comparatively small, the loss through the setting, about 4 to 6% of the total heat loss, can be reduced from 1 to 2% by simple methods.

The report of W. G. Williams, chairman, Committee on Oil Fuels, was then presented. This report covered the consumption of fuel oil and the situation as regards its increasing use and decreasing sources of supply. Statistics were presented that visualized the situation as it exists today. The various methods of producing gasoline and distillation and refining of oils were discussed briefly and a plea made for conservation by reducing needless wastes in producing and drilling and by more efficient methods of utilization. Two lines of action were suggested, the one the more rapid development and utilization of cracking distillation for which the automotive industry must be looked to for assistance; and to the central stations for the use of the fuel oil more efficiently. The report of the Committee on Lubricants was then presented by A. A. Gray.

General Discussion on Organization.

As time was late, discussion of these reports was passed over. Mr. Tupper asked for a general discussion upon the scope of the proposed organization and the best methods of going about their program for the guidance of the Committee on Organization. Mr. Harrington said the matter on hand was to decide what was to be done, what needed to be done and how it should be done. There was the matter of co-operation with the Fuel Administration and Bureau of Mines, there was the matter of educating the public, of the zoning of coal mined and used, and of supervising engineers, etc. J. M. Spitzglass said it was partly a matter of educating engineers of what to do to save coal and what is available in the way of machines and equipment for saving coal, but it was also a matter of telling the public about coal saving and how to accomplish. He promised his unqualified support of such a good movement and offered to do all in his power to further the work of the organization.

E. G. Bailey spoke out for a broad-gauged viewpoint and a concentrated effort as both necessary for success. He advocated that the Fuel Administration be revived rather than that its work be continued by a different body. He said four principal aspects of the situation must be considered. These concern the procedure, the consumer, the general public and posterity. The subject may be divided into two parts, the coal producer and the coal consumer, and between these two groups the Government and the engineering professions must step in if coal is to be saved to posterity. Once the public understanding is obtained, and its opinion aroused, it will back up such an organization as proposed. A. A. Gray and H. J. Gebhardt both spoke of the weight carried by the manufacturers of power-plant equipment and that this weight must be added to that of public opinion for co-operative effort. The engineers are the go-between and it is they to whom the public must look to tell them how to save coal. Mr. Gray said 85% of those present were manufacturers and they represented the opinion of the industry. J. D. Cunningham pointed out the strength in numbers, advocating that the Association of Commerce and the various enginering societies be asked to help the cause.

Mr. Myers spoke at length on the responsibility of the engineering profession to the public and also to themselves. The four national engineering societies can be of assistance as they extend their influence into industry as a whole. The proposed organization should co-operate and seek the assistance of these national engineering societies.

Others prominent in the proceedings were Joseph W. Hays, Joseph W. Hays Corp.; G. B. Burke, Sarco Co., Inc.; E. E. Lee, Vulcan Soot Cleaner Co.; F. R Wheeler, C. H. Wheeler Mfg. Co.; A. H. C. Dalley, consulting engineer, Locomotive Superheater, vice-president, Pulverized Fuel Equipment Corp.; A. W. Knight, Celite Products Co.; G. P. Dravo, Dravo Co.; G. W. Heald, Diamond Power Specialty Co.; W. A. Darrah, consulting engineer; O. R. McBride, Northern Equipment and Coppus Engineering Cos.; J. J. McNulta, Vacuum Ash & Soot Conveyor Co.; M. B. Skinner, M. B. Skinner Co.; C. C. Phelps, Uehling Instrument Co.; W. D. Dreiske; L. L. Shailer, Ehret Magnesia Mfg. Co.; W. D. Hess, Builders' Iron Foundry; C. E. Brainard, Brainard-Fairchild Engineering Co.; C. V. Frailey, Barber-Greene Co.; M. O. Haeger, Abell-Howe Co.

During the first day's meeting Mr. Tupper appointed the following as members of the Resolutions Committee to draw up a preamble as to the aims and organization of a permanent body: Joseph Harrington, James A. Brady Foundry Co., chairman; Hans J. Meyer, Chas. L. Pillsbury Co., consulting engineer; A. L. Rice, managing editor, *Power Plant Engineering;* A. W. Patterson, vice-president, The Engineer Co.; T. Wilson, western editor *Power;* M. F. Newman, manager, water purifying department, W. B. Scaife & Sons Co.; R. J. Stewart, H. W. Johns-Manville Co.; A. A. Gray, of A. A. Gray & Co.; Howard Ehrlich, managing editor, Electrical Review.

Friday Morning Session.

The Friday morning session was opened by C. A. Tupper in the chair. The first speaker was Francis W. Carrett, chairman, Committee on Recording Instruments, who in presenting his report stated that accurate recording instruments are proving immensely valuable in every industry by showing conditions and thereby enabling them to be improved and corrected and results to be sustained. He discussed in particular the instruments of the boiler room, pointing out that without them the combustion of coal must be a hit and miss process, since it is not possible to know what is being done or how it is being done. He spoke of co-operation between the instrument manufacturer and other manufacturers and also between them and the plant operators. Instruments can only tell what is going on and they must be interpreted and their interpretation properly applied if the highest return upon the investment is to accrue. Instruments are of vital importance in the boiler room, and are one of the most powerful factors in power-plant efficiency. By preaching the value of instruments, by applying them correctly and educating the users in their workings and meanings much can be done to save coal and make instruments more useful and more widely used than they are at present.

Following this report, R. J. Stewart, chairman, then presented the report of the Committee on Insulation and Pipe Coverings, in which he dealt with insulating materials and their application, emphasizing the need for a better understanding of the requisites and economies of pipe coverings on the part of the operating and consulting engineers. He advocated closer understanding with plant operators and consulting engineers. The magnitude of the losses was then dwelt upon and instances given where costly pipe coverings had more than paid for themselves in 9½ months. The possibilities of an organization as proposed for educational purposes and as a clearing house of information and data appeared almost limitless. Both the reports by Mr. Carret and Mr. Stewart received considerable discussion.

L. A. Griffin, chairman, presented the report of the Committee on Ash Handling. In this report he took up the evolution of ash-conveying systems going on to point out that the labor situation existing makes mechanical handling practically compulsory. Various methods of handling non-combustible were given and the economies of the ash conveyor pointed out. One specific example of economy was given where a steam ash conveyor functioning for three 15-minute periods during the twenty-four hours was doing the work previously done by eight to twelve men. The future will necessitate mechanical ash-handling methods even more than is the case today. Mr. Griffin spoke forcibly in favor of a permanent organization to further the cause of fuel conservation, offering everything in his power toward making the organization an accomplished fact.

G. S. Carrick, Carrick Engineering Co., chairman, Committee on Combustion, spoke of combustion and the importance of educating firemen. Combustion requires not only men skilled in methods of combustion, but also apparatus and instruments for performing it and telling how it is being accomplished. The labor situation has created the need for automatic apparatus for maintaining high sustained and uniform performance, but these must be supplemented by man power of the right sort, and it is to help produce the right kind of man power by edcuation that the organization proposed can accomplish much. Both these papers received considerable discussion, mostly of a practical nature in the form of personal experiences in the boiler room.

After the presentation of the report of the Committee on Cooling and Condensing Systems, a general discussion ensued. Mr. Patterson emphasized the importance of co-ordinating the various apparatus and the relation existing between them. A better knowledge of individual pieces of equipment would enable a better and less expensive plant to be designed frequently. Each individual manufacturer should be called upon to furnish data and information on his speciality, and then the Educational Committee could analyze this and put it into proper form and sequence for general digestion and utilization. He went on further to give instances of saving due to the use of feed-water regulators, control equipment, instruments, etc. By instilling common sense into the boiler-room crews, between 50 and 75% of the operating troubles occurring today could be obviated. Many men spoke in the same strain, all agreeing upon the need for education and circulation of information.

Hans J. Meyer then presented the report of the Committee on Organization which had prepared the following statement:

Resolutions Adopted.

"The object of this conference is disinterested public service in the subject of conservation of fuel resources.

"We are initiating this movement because of our direct understanding of conditions and desire to convert to the public good our specialized knowledge of this subject.

"We having had direct and intimate acquaintance with the work and results of the Fuel Administration during the war, believe that the results accomplished were substantial and in the interest of the public at large and we, the International Power Economy Conference, advocate the continuance of the work of the administration through the Bureau of Mines, or suitable government agency.

"We are convinced that the losses are so widespread and ingrained that only governmental action will result in securing effective improvement.

"Serious waste occurs in mining, preparation, transportation and utilization of fuel, much of which is preventable. If prevented, a saving to the public will be made of $600,000,000 annually.

"We therefore unite for the purpose of bringing about the results stated in the preamble by means of the dissemination of information of this subject, which should lead to an awakening of public interest and create a demand by the public for governmental action. In furtherance of this object, we solicit the co-operation of the public as well as all civic and engineering bodies—and pledge ourselves to collect and distribute data on this subject as to the best means of accomplishing the economies sought.

"Resolved, That this Conference shall become an incorporated association with the usual officers and directors as soon as 100 representative firms shall become contributing members.

"There shall be appointed by the chairman an executive committee of ten which shall conduct the campaign for membership and draw up a constitution and by-laws for presentation to the next conference.

"Upon the election of the permanent officers, the executive committee shall be dissolved.

"The permanent officers and directors shall thereafter direct the affairs of the association as is usual in accordance with the constitution and by-laws adopted by the Conference."

Hans Meyer made a motion that the report of the Organization Committee be adopted and that the chairman appoint a new executive committee to undertake the work suggested. The resolution was passed unanimously. A. A. Gray offered a vote of thanks for those manufacturers who had devoted so much time to the cause of the movement and those that had come many hundreds of miles for the same purpose. Mr. Stewart offered a rising vote of thanks to Mr. Tupper and his associates for the time and effort they had expended to bring the formation of an organization to such a promising stage. Both of these motions were unanimously adopted and the second annual session of the International Power Economy Conference adjourned.

REPORT OF BALLOTING ON INDUSTRIAL SAFETY CODES.

Bureau of Standards Issues Statement Showing That Interested Organizations Favor Preparation of Safety Codes Under Auspices of American Engineering Standards Committee.

A conference on Industrial Safety Codes was held at the Bureau of Standards on January 15, 1919, at which the best method of procedure in formulating such codes was considered and plans made for the co-operation of all organizations concerned therewith. A committee appointed at this conference and consisting of C. A. Adams, H. W. Forster and E. B. Rosa made a report on April 15, which was printed and distributed to all those attending the conference. This report gave a summary of the proceedings of the conference and submitted two plans, designated as Plan A and Plan B, for future procedure in the formulation of the industrial safety codes.

Plan A provided for the preparation of safety codes under the leadership of the Bureau of Standards with the co-operative effort of all interested organizations and under the general supervision of a large and representative conference committee.

Plan B provided for the preparation of the safety codes and other standards by appropriate sponsor bodies, but under the auspices and procedure of the American Engineering Standards Committee as enlarged under a revised constitution. Since then, the American Engineering Standards Committee has approved a revised constitution, and has submitted it to the five parent engineering societies and the three government department members for ratification as provided in the old constitution. Although the American Engineering Standards Committee will continue to be called a committee, and not an association as was first proposed, the revised constitution provides for the enlargement of its membership and sets forth the procedure by which other national organizations may join it. It is understood that a number of such associations will apply for membership at an early date. Further information concerning the conditions under which national associations may join and the annual dues which are paid by member bodies may be obtained by addressing the acting secretary, C. B. LePage, 29 West Thirty-Ninth street, New York City. It is confidently expected that favorable action will be taken by all members within a short time.

In conformity with the report of the committee above referred to, ballots were sent out for voting on Plan A or Plan B. Such ballots were sent to a designated list of federal bureaus, state commissions, municipal departments, technical associations, manufacturers' associations, utility associations, associations of government representatives, associations of insurance interests, safety and labor organizations.

The result of this ballot is as follows, the voting being by organizations rather than by individual delegates: For Plan A, 25 votes were cast. For Plan B, 60 votes. Of those voting for Plan A, less than one-half indicated a likelihood of joining the Standards Committee in case its reorganization is completed. Of those voting for Plan B, three-fourths looked forward to joining the committee. In other words, approximately 70% of the ballots cast favor Plan B and about 66% of the organizations voting would expect to join the enlarged and reorganized Standards Committee.

The distribution of the votes is shown in the following table:

BALLOTING ON INDUSTRIAL SAFETY CODES.

	For Plan A	For A and probably join	For Plan B	For B and probably join
Federal Bureaus	4	2	5	2
State Industrial Commissions	3	3	5	4
State Utility Commissions	6	2	6	4
State Inspection and Rating Boards	0	0	4	3
Municipal Departments	0	0	2	2
Technical Associations	3	2	10	7
Manufacturers' Associations	3	0	12	10
Utility Associations	1	1	4	2
Associations of Government Representatives	2	1	2	1
Associations of Insurance Interests	0	0	6	6
Labor and Similar Organizations	3	0	0	0
Safety Organizations	0	0	4	4
Total	25	11	60	45
Total Vote	85			
Join A. E. S. C.	56			

It will be noted that the governmental bodies give a slight majority in favor of Plan B; that the engineering, utility and manufacturers' associations give a large majority on the same side, and that the insurance organizations are unanimously in favor of this plan. The two labor organizations voting favored Plan A. Most of the safety organizations favored Plan B. It is consequently evident that Plan B will secure the most general support and should be followed if the necessary conditions are fulfilled.

To further consider this matter and in order to make progress in the co-operative work necessary to formulate industrial safety codes, the Bureau of Standards is calling another conference to be held in Washington, D. C., probably on Dec. 5, 1919. It is intended at that time to consider the procedure which should be followed in further work on safety codes and the co-operation that can be secured among the engineering societies, government departments and other agencies that are actively concerned with safety work.

Formal invitations to attend this conference will be sent out in the near future together with a program of the subjects to be considered.

MILWAUKEE STREET-CAR CASE SETTLED BY COMMISSION.

Fares Raised, More Cars Ordered, Service to Be Improved and Accounting Revised As Result of Important Decision of Commission.

The Railroad Commission rendered a decision on Oct. 30 in the long drawn-out Milwaukee street-railway case. It grants the Milwaukee Electric Railway & Light Co. an increased fare, orders extensions of double transfer privileges, orders it to put into effect the wages, hours of service and working conditions as embodied in the decision of the State Board of Conciliation, orders the puting into service of 100 additional cars, establishes a single fare between certain suburban districts and orders sweeping changes in the company's methods in order to more properly reflect the actual operating costs. In the single-fare zone the cash fare will be 7 cents, 6 tickets for 35 cents or

18 tickets for $1. Children's fares are not changed. The Commission reserves jurisdiction in the matter of tickets in the hope that the revenue produced under this scheme will be such that within a short time it will be able to order an increase in the number of tickets sold for $1. In the suburban area a cash fare of 3 cents for each zone within a minimum of 6 cents is established. Suburban ticket rates are not changed. The company is ordered to submit within 15 days a scheme for the issuance of commutation tickets between South Milwaukee and the single-fare areas.

This decision involves four cases—the report of the Board of Conciliation establishing fair wages to employes which was rendered Sept. 17, 1919, the application by the company for revision of rates which was filed in July, 1919, investigation by the Railroad Commission of the necessity for double transfers which was started in January, 1919, and the original application of the company for increased fares which was started in 1915, and in which case several temporary decisions have already been rendered.

Auditing the company's monthly operating reports and estimating the amount of revenue required for operating expenses for the coming year, the Commission finds that the amounts charged by the company for certain operating expenses exceeds the reasonable allowance for these expenses by several hundred thousand dollars, and it finds that the company had not separated its expenditures and charged the proper amount to reserves and capital accounts. But even with this adjustment after making allowance for this deduction and adding the estimated cost of the increased wages ordered into effect, the Commission finds that additional revenue of between $850,000 and $900,000 would be needed for the coming year. The estimated increase in wages for the single fare and suburban area amounts to about $710,000.

In estimating the return on the investment the value of the Milwaukee company's system, exclusive of power-plant property, was found to be $16,145,534 on July 31, 1919. The Commission finds that there have been no excess earnings during the period beginning Aug. 23, 1912, under the rates of fare established by the Railroad Commission. The excess amounts which it is claimed should be applied to make up the operating deficits at the present time the Commission finds were earnings prior to Aug. 23, 1912, under rates provided by franchises which were lawful rates at that time; that these excessive earnings, if any, were legal earnings and are the property of the company to do with as it sees fit and that it can not be deprived of them without violation of the constitution of the United States; furthermore, to deprive the company of this surplus would be establishing a principle against public policy and against the interests of the riding public of the city of Milwaukee. It could only result in crippling the company financially, making it impossible to carry out the provisions of this order, including additional equipment for giving adequate service, and would interfere with other improvements which might be found necessary for serving the public in the future.

The Commission finds that the working men living in the Bay View district and employed in the manufacturing plants at Cudahy have been discriminated against by the zone system when the fares in this district are compared with those applicable to West Allis and some other suburban territories, and believes that this situation can be remedied by establishing a special rate to and from Cudahy depot from and into that territory south of Mitchell street known as the Bay View district which shall be applicable on special cars and trains during rush hours and has therefore ordered into effect for this special service the same rate of fare as applies to the single-fare area.

The company is also directed to make a study of economies that can be brought about through short routing and a development of traffic during the non-rush period with the idea of improving service conditions in the city. The Commission has repeatedly called attention to the necessity for more equipment on the city railway system. It felt it was not justified during the war period in ordering the company to enter into any activities which might interfere with war activities. However, under the present changed situation, new equipment to meet the present needs should be secured at the earliest possible time. The Commission's investigation shows a considerable shortage of cars on practically all lines in the city. The company is therefore ordered to provide at least 100 additional cars with a total seating capacity of 5000 to be placed in service from time to time, the complete equipment to be in service before Nov. 1, 1920.

In a memorandum attached to the decision the Commission discusses the advisability of establishing an automatic cost basis of fares within the single-fare and suburban areas of Milwaukee, by the operation of which fares would automatically decrease as operating expenses decreased. The Commission is of the opinion that in this way many of the problems connected with street-railway operation would be solved more easily and the regulation of fares put on an automatic basis.

IMPORTANCE OF ACOUSTICAL ENGINEERING IN INDUSTRIAL PLANTS.

Time and money saving are the two all important considerations upon which acoustical engineering will establish itself as one of the important sciences of industrial construction in future, Prof. Vladimir Karapetoff, head of the electrical engineering department of Cornell University, told members of the Cleveland Engineering Society and the Electrical League of Cleveland, in their joint meeting at Hotel Statler, Cleveland, Ohio, on Oct. 30.

Declaring that American industry must speed up production to the highest possible degree if we are to compete successfully with Europe for the world trade, Professor Karapetoff emphasized the necessity of making provisions in every factory for instant communication between responsible departmental heads. This is peculiarly the day of the expert; when infallible knowledge is imperative, quick decisions necessary, and every source of counsel must be ready to respond instantly. Delays in decision were never so costly. And with the possibility of a shortening of working hours in many lines the problem becomes all the more acute.

For the last year the professor has been engaged in research work in many different kinds of industrial plants with widely varying conditions. He has experimented with half a dozen systems of factory code calls, audible and visible. The possibilities of such a system were interestingly demonstrated as a feature of his talk, through the use of the klaxocator, an electrical code calling mechanism of the audible type. The appliance is entirely automatic, and when set for a certain code sounds the call simultaneously in every part of the plant, however large, and summoning the person wanted to the nearest telephone.

Commercial Practice

Increasing Production—Comparison of the Cost of Electric Service With Other Commodities—House-Wiring Activities

MAN, MACHINERY AND POWER TO INCREASE PRODUCTION.

British Parliamentary Official Urges Much More Extensive Use of Electricity to Stimulate Production.

Electric power engineers and specialists are recognizing that they have at hand a means for helping to satisfy one of the most urgent demands of the time—increased production. Through the more general use of electric power the limited outputs per workman due to sticking to manual methods can be greatly increased, efficiencies of plants and of departments can be improved, and present production capacities of existing plant facilities can be increased without expensive extensions or new construction. While these truths are being applied by all progressive American power companies, interesting corroboration of them comes to us from across the water through the following condensed report of an important address, for which we are indebted to our British correspondent.

C. A. McCurdy, parliamentary secretary to the British food controller, recently delivered an excellent appeal to British workmen to settle down to industry and produce more wealth as a means of securing the maintenance of the higher wages brought by the war.

"There are three things used in making wealth: men, machinery and motive power," said Mr. McCurdy. "If you want more wealth you have got to speed up either the men or the machinery, or supply more motive power. There is no other way. Don't expect impossibilities from the men. How about the machinery and the motive power? There you touch the heart of the problem. Machinery and motive power are the tools you give the worker for his business. Before the war the American worker was far better equipped in this respect than the British working man. He had in his factories on the average newer and better machinery, and he had 50% more motive power (steam power or electrical power) to help him in his task. We might double the efficiency and the output of British workmen by giving British industry cheap and abundant motive power.

"Every year we use in England 80,000,000 tons of coal as motive power to drive machinery to help the workers to produce the things we want. Man for man we use in industry half as much coal again as they do in America, but we do it so badly, so wastefully, that one ton of coal used to assist the worker in the United States gives him 50% more help, 50% more motive power, than 1½ tons used to assist the British worker. That ought to be put right. The Coal Conservation Committee during the war reported that our present consumption of coal for industrial purposes might be made to give at least three times the amount of power. That is one way of increasing production. Treble your motive power. More power means more output, and more output means higher wages.

"The motive power of the future will be electricity. What are we doing about that? We have 600 separate authorities at present generating electricity for public purposes, apart from all the private companies and firms that supply themselves. It is a wasteful, petty, parochial method of supply. Experts advise us that this country is losing $500,000,000 a year through failure to take advantage of electrical progress. . . . We know exactly what we want—centralized supply, abundant and cheap distribution of electricity in the interests of British trade. . . . We want cheap power brought to every town and village.

"Cheap power and efficient transport would revolutionize our agricultural industry. Science has achieved many marvels. It has opened for us in the depths of ocean and in the trackless mazes of the air new highways for the commerce of mankind. If the same genius and effort were applied to the soil of England there is an inexhaustible mine of wealth for our people. It cannot be worked out like coal. The more it is worked the better it becomes. In France, Italy, Germany and Sweden, electricity is being harnessed to the service of agriculture. From extensive power stations light overhead lines carry electricity to the farm. A trailing cable carries electricity to the plow. By electricity the chaff is cut, the corn is kibbled, the apples pressed for cider, the sheep are shorn, and the cows milked. The application of science to agriculture is only in its infancy, but to increase greatly our production of food it is only necessary to apply the knowledge we have already got."

MAP SHOWS ADVANTAGES OF TIEING CALIFORNIA SYSTEMS TOGETHER.

The Mt. Whitney Power & Electric Co., Visalia, Calif., has prepared a large relief map of central and southern California showing in distinctive colors the principal lines of the Mt. Whitney Power & Electric Co. and the Southern California Edison Co. as well as the location and capacities of all generating stations and the location of the principal substations of both companies.

This map is to be used in a demonstration of one of the many advantages accruing to each, but more especially to the Mt. Whitney Power & Electric Co., through the unified management of both companies, this advantage coming from the interconnection of the generating systems of the two companies and which permits of the Edison company using the surplus power of the Mt. Whitney company which in former years has gone to waste. It will be shown that, in the absence of any appreciable storage above the hydroelectric generating stations of the Mt. Whitney system, and the existence of Huntington Lake reservoir, with a capacity of 88,834 acre-feet above Big Creek power houses No. 1 and No. 2 of the Southern California Edison Co., all surplus power generated in the Mt. Whitney plants can be and is sold to the Southern California Edison Co., thus enabling the latter company to reduce the quantity of water withdrawn from Huntington lake during such period. It will also be pointed out that with the lines of the two companies tied together and the generating stations of both companies operated as a single system, a continuous and ample supply of electric power to meet the growing demands in the Mt. Whitney territory is made possible.

DEMAND FOR HOUSE WIRING SHOWS IMPROVEMENT.

For the period from Jan. 1 to Sept. 30, this year, the total number of houses wired by the Public Service Co. of Northern Illinois and by contractors in its territory was 2247, a number much in excess of the figures for the same months of 1918 and 25% greater than the total reached during the corresponding period of 1917.

During the war the company found a marked disposition on the part of property owners to restrain all expenditures, but this year there has been a hearty desire to modernize their houses by the installation of electric service. It is noteworthy that in nearly half of the houses wired by the company this year the improvement was paid for in cash.

DECREASING COST OF ELECTRIC SERVICE SHOWN IN STRIKING MANNER.

Curves Circulated by Commonwealth Edison Co. Emphasize Low Relative Cost of Its Service.

That the cost of central-station service has shown a steady decrease year by year until the conditions created by the war brought the decrease to a standstill is quite generally appreciated by the electrical industry and a large number of the people. Likewise, everyone knows that practically all other costs of living have increased, they not even having stood still—as

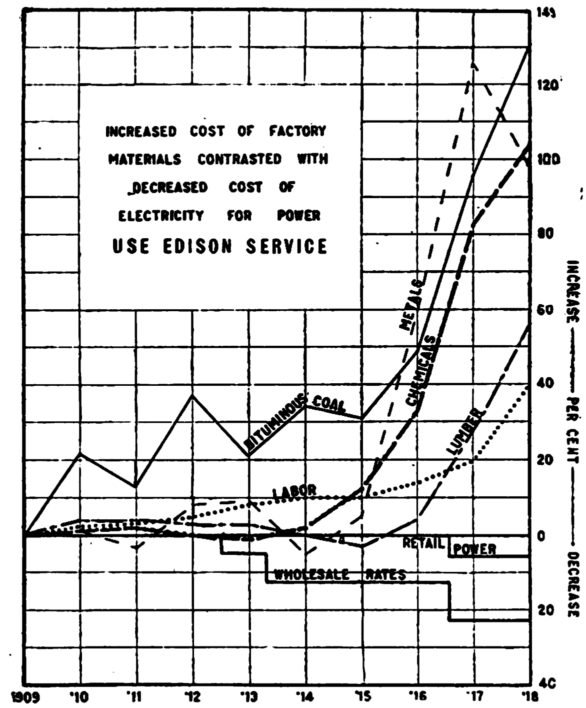

Fig. 2.

the cost of central-station service has done with many of the larger utilities.

During the electrical show in Chicago, the Commonwealth Edison Co. adopted a novel and striking method of bringing home to the local public and all those others who patronized the show the extent to which many of the items in the cost of living have increased in cost while the cost of "Edison" service has gone down steadily until the middle of the year 1916, since which time it has remained constant at the low level reached. The curves distributed among the visitors to the Chicago Electrical Show, typified central-station service to the hundreds visiting the exhibition, and to this extent benefited other utilities.

The accompanying curves, developed by the Commonwealth Edison Co., bring out in a striking manner the relative cost increases—decreases in the cost of central-station service only—that have come about since 1909.

In Fig. 1 are shown curves illustrating the increases in cost of clothing, food, coal and taxes during the last twenty-three years, and the decreases in the cost of electricity during the same period. In Fig. 2, the curves show respectively, the increases in cost of factory materials—coal, metals, lumber, chemicals and labor—during the last ten years and the decreased cost of electricity from Edison service for the corresponding period.

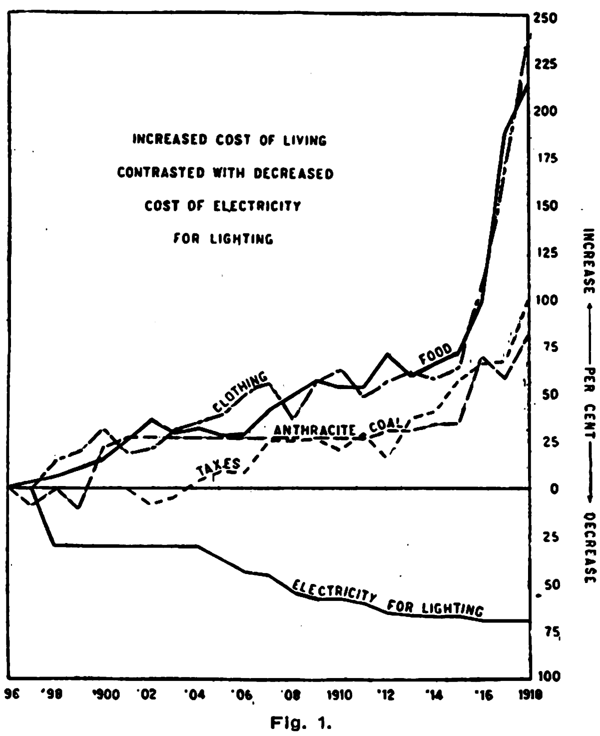

Fig. 1.

NEW HOUSE-WIRING RECORD ESTABLISHED IN MINNEAPOLIS.

Indicating the current prosperity of the people in Minneapolis comes an item from the Northern States Power Co. to the effect that during the month of September one already-built house was wired for electricity every 45 minutes during working hours. The average number of old houses wired per day during September was 23, the total for the month being 597, an increase of 9% over the largest house-wiring month in the experience of the company. As compared with 1918, nearly double the number of houses are being wired this fall.

Operating Practice

Maintaining Boiler-Room Instruments—Advantages of Air and Oil-Break Switches—Special Transformer Mountings

MAINTENANCE OF BOILER-ROOM INSTRUMENTS AND PLANT PERFORMANCE.

Experience of One Power Plant Proves Value of Instrument Maintenance and of Routine Coal Analysis in Improved Operation and Fuel Economy.

Many power plants install boiler-room instruments as a means of reducing their fuel bills by enabling higher operating economies to be obtained, and then, after the novelty of these appliances has worn off, ignore them. The result is that the expected economies do not accrue, and the savings that should occur do not materialize.

Speaking before the International Power Economy Conference held in Chicago October 30 and 31. A. W. Patterson, the Engineer Co., stated he was frequently discovering almost unbelievable things going on in power plants, sometimes through ignorance and sometimes through inaccuracy of instruments.

In one instance especially, of a plant consuming several hundred thousand dollars worth of coal annually, Mr. Patterson said a very simple remedy for inaccurate instruments had been adopted. And this policy had been found to be one of the best dividend producers of all. The plant in question had a full installation of steam-flow meters, stack thermometers, feed-water meters, CO_2 recorders and instruments for indicating feed-water temperature, steam temperature, draft gages and everything else that should enable the boiler-room attendants to maintain plant efficiency. Unfortunately, and of necessity, these instruments did not remain accurate indefinitely, as no instrument can. Stack thermometers became sooted up, dirt and dust, friction and leaks caused inaccuracies to occur, wrong indications resulted and the instruments came into disrepute and disuse.

The superintendent of this plant then had a work shop, consisting of a small room and work bench fitted up, and one or two men assigned to it, according to the demand, to calibrate all instruments and maintain them in proper working condition. This entailed not sporadic work but continuous work since cleaning, calibrating and checking in a station of its size offered steady work for one man all the time and two for a large part of the time.

The result of this workroom and bench, to which has been since added a coal-testing division, has been to place all instruments back on the job and to enable them to function accurately at all times. The aim is to keep instruments in service rather than to repair and re-calibrate them after they are out of service. Coal analysis enables the grade of coal furnished to be checked and too great a variation from the contract grades to be prevented or paid for according to variation. Predetermination of results, uniform results and efficient methods now obtain, followed, of course, by higher evaporation per pound of coal and improved over-all economy generally.

The simple expedient of installing a work shop for the maintenance of boiler-room instruments, and thereby obtaining to the full the return upon the investment, has been found one of the best investments of all.

AIR AND OIL-BREAK SWITCHES FOR OUTDOOR SERVICE.

Review of Situation Shows When Either Piece of Equipment Is Indicated as More Desirable for Installation.

The two major advantages of the air-break switch as compared with the oil-break switch are first cost of the switch itself and the lower installation cost resulting from the facts that the air-break switch occupies less space and may be mounted in the air while the oil-break switch must usually be mounted near the ground. Oil-break switches are more expensive than air-break switches, of course. But the one way in which the low cost of the air-break high-voltage switch can be obtained with but little loss in flexibility existing with the high-voltage oil-break switch, is to install fused air-break switches on the high-voltage side and an oil-break switch on the low-voltage side. The amperage of the fuse on the high-voltage should be such that the low-voltage automatic switch should open in all except the most severe cases of short circuit.

Under short-circuiting conditions, a fuse will open a short circuit much more rapidly than an automatic circuit-breaker. High-tension fuses of good design will clear short circuits in approximately 0.013 sec., which is from ten to twelve times as rapidly as an automatic circuit-breaker. The exceptionally rapid action of fuses will therefore permit over-fusing the transformers theoretically twelve times the normal current and still secure protection equal to that of an automatic oil switch. In actual practice over-fusing from three to ten times normal should be used, depending upon local conditions. For power circuits subject to wide fluctuations, the high-tension circuit opening devices should be so rated that they will not operate except in case of actual trouble, such as transformer failure, and such cases are rare with modern transformer designs.

Such overload protection as is desired can be secured easily and cheaply by means of a low-tension automatic oil switch installed on the secondary side of the transformer bank. In substation practice this combination of heavy high-tension fuses on the primary side which will open only in case of transformer failure and properly adjusted oil circuit breaker on the secondary side of the transformer bank is an excellent protective system often taken advantage of.

The high-tension automatic oil switch has the advantage that it can be used for switching in addition to the overload feature. When fuses are used it is necessary to install an air-break switch to disconnect the transformers from the line. In actual practice, however, it is often advisable and is considered good engineering practice to install disconnecting switches between the oil switch and the line. The reason for this is that the oil-switch contacts are necessarily concealed in the tanks and to be absolutely sure that a line is clear the disconnecting switches should be opened, thus giving the operator ocular evidence of disconnection.

Should the oil switch open frequently or under severe load conditions, it is advisable to inspect the contacts, oil levels and condition of the mechanism. To enable inspection adjustments or repairs, it is often advisable to install auxiliary disconnecting switches so connected that the oil switches can be shunted and entirely disconnected from the circuit, power being temporarily delivered through the auxiliary switches.

Another point in favor of the oil switch is that after interruption it can, if in good condition, be immediately closed, thus reducing the time of service interruption. It will naturally require more time to open an air-break switch and replace fuses than it will to close the oil switch. The saving of a moment's time may in some instances warrant the additional expense of the oil switch. However, the average high tension substation attendant, especially if not "hardened" by long experience, will after an interruption be inclined to go slow in closing the switch until he can actually view every possible part of the switch mechanism, assuring himself that it is in condition to resume service.

The fuse and air-break switch combination has, therefore, a certain advantage in that every part of the units, including contacts and the condition of fuses are in plain view of the attendant.

The above are excerpts from a paper by H. W. Young entitled "Modern High-Tension Outdoor Substations" presented before the Illinois State Electric Association's convention in Chicago October 23 and 24.

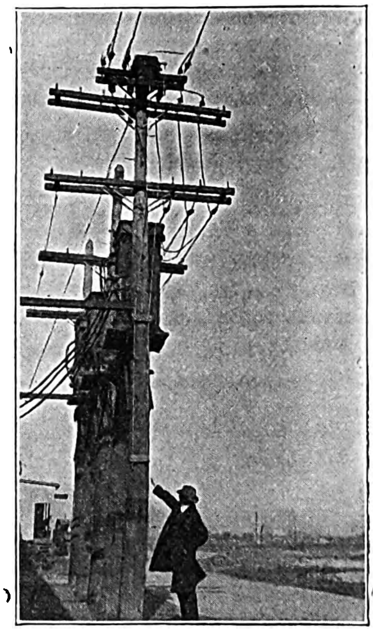
FORM OF OUTDOOR SUBSTATION FOR HEAVY LOADS IN CITY LIMITS.

Salient Features of Structure Used for Some of Cleveland's Heavy Industrial Loads.

Every transformer mounted upon a pole is, in a sense, an outdoor substation. And yet when speaking of outdoor substations something different is implied and understood. When serving heavy loads, as some large industrial plant, within city limits, apparatus must often be mounted upon poles out of ready reach of pedestrians, and yet the nearer the transformers are located to the service connection, the less the voltage drop and line loss on the secondary, likewise, the less work required to hoist the transformers up the pole.

In the accompanying illustrations is shown a type of transformer mounting used by the Cleveland Electric Illuminating Co. for serving some of its heavy loads from overhead lines. These transformer banks are located directly at the load and often on the customer's right-of-way, and vary from 100 up to several hundred kilovolt-amperes in transformer capacity.

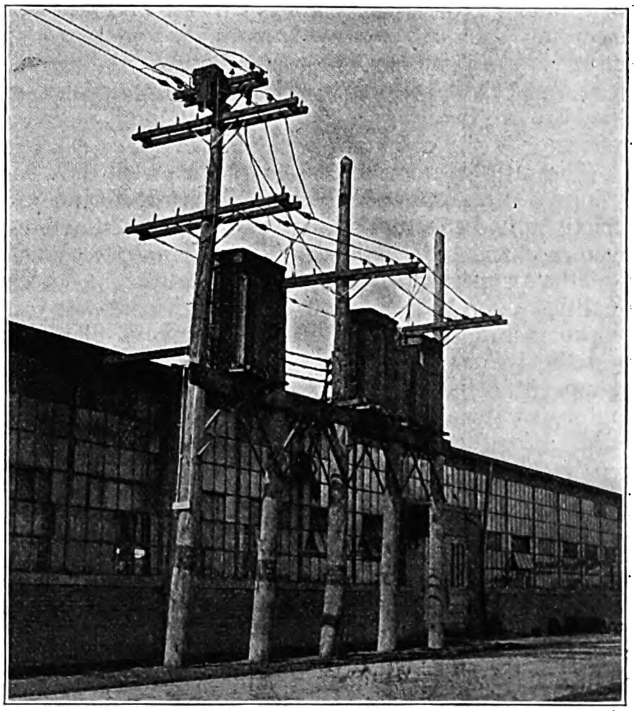
The installation shown consists of three 200-kv-a. single-phase transformers stepping down from 4160 to 460 volts. Space exists upon the transformer platform for a fourth unit. The supporting structure consists of three 35-ft. and two 25-ft. cedar poles. The transformers are mounted 14 ft. from the ground. The secondary leads are of No. 4/0 copper, there being



End View Showing Oil-Switch Control Ropes, Lightning Arresters and Conductor Arrangement.

three leads per phase, an arrangement that not only simplifies handling, but lowers resistance and also inductive drop. It may be noticed that the secondaries are fairly short, a further factor contributing to good voltage regulation.

The transformer bank is controlled by a 4500-volt automatic oil-switch mounted upon the top arm. This switch may be operated from the ground by means of ropes that pass down the side of the pole. Between the oil-switch and the transformer bank are installed compression type lightning arresters, one per phase.



Three 200-kv-a. Transformers Mounted Upon Platform with Automatic Oil Switch and Control Ropes.

Contracting-Construction

St. Louis Contractor Comments on Repair Business—Dallas Jovians Co-operate With Architects—Mine Feeder Wires

POINTS ON CONDUCTING AN ELECTRICAL REPAIR BUSINESS.

Suggestions Brought Out in a Paper Read Before the Missouri State Association of Electrical Contractors and Dealers by C. J. Briner, St. Louis.

Because electrical equipment will deteriorate and wear out, even with the best care and attention. and because abuse, neglect, misuse, defective materials and causes beyond human control must be taken to task, the electrical repair shop has a perfectly legitimate standing in the electrical industry. It may safely be said that 20% of all material such as insulation and copper products is used for replacements.

For one to be successful in the repair business the first requisite is 75% knowledge, gained by experience and study, and 25% in surrounding yourself with capable help and equipment. These figures refer to motor and generator repairs, omitting such repairs as those of household appliances, vacuum cleaners, fan motors, heating devices, telephones, etc.

Knowledge of Electrical Equipment.

Any one engaged in the repairs of electrical apparatus should certainly have knowledge of the various types of motors and generators, both old and modern, their principles and functions, the various types of windings, the temperature guarantees, and, above all, an idea of costs. There are no miracles or guesswork in the repair business; what the engineers in laboratories and factories have laid down must be repeated, excepting such as improved methods and materials only; very seldom can a motor or generator which has been a so-called hot one be made to operate cooler, or, likewise, can heat be put into a cool-running motor or generator if the original principles are adhered to.

The ratio of turns and sizes of wire with the revolutions per minute have been predetermined and it is strictly up to the repair man to reproduce the same; even in changes of the revolutions per minute or voltage the proper ratio must be maintained. Running qualities may be improved by better insulation and workmanship, but the original fundamental principles must be followed. Changing the turns or number or groups of coils affects the speed and horsepower of motors or generators, and changing the sizes of the wires affects carrying capacities. When a motor is repaired properly its test should verify the nameplate unless the latter has been tampered with. With the limited spaces for wires in the slots of armatures or stators or rotors, it is almost impossible to make a mistake unless wantonly so.

Motors and generators built today have the same fundamental principles they had 25 years ago, excepting that they have been mechanically refined and higher values obtained with relation to copper, iron and temperature.

The repair shop does not only attempt to restore to a sound or good state worn and defective apparatus, but should afford prompt and efficient service when catering to the public. Therefore, about the first requirement to consider in a large or a small shop is a good system. When apparatus is received for repairs there should be attached a tag on which full information, such as the owner of the apparatus, date received, maker, horsepower, kilowatts, voltage, amperage, revolutions, type, direct or alternating current, phase, whether with base, pulley, starter or rheostat, etc. This identification tag can be used for any form of apparatus and also for further identification in carrying the repairs through the shop.

Good Shop Systems.

In many instances it becomes necessary to determine the extent of repairs necessary and to confer with the owner as to cost before proceeding with repairs, or an exchange may be affected, all of which means that considerable detail work must be done before final disposition is made.

Motors or generators entered for repair should carry a shop working order and a data card, the latter giving a full description as to repairs, type of winding, number of coils, sizes of wire, etc. A complete time and material record must be kept along with the data for the purpose of rendering a proper bill as well as for comparing costs with the estimated price so the self-preservation of the bank account may be maintained.

It is quite a problem to secure competent help, but having a good simple system will help matters wonderfully. The employe should feel that full knowledge and instructions, especially useful prints and bulletins, can be had and that he can consult superiors without hesitancy or timidity. Most repair men have limited experience. Armature winders can be easily trained because most armatures and stators are coil wound and in many cases hand-wound armatures can be changed to form-wound. Field and coil winding is entirely given over to apprentices. In making repairs outside of the shop it is safest to send good, capable men with instructions to reserve their opinions and communicate with superiors when in doubt. It should be remembered that the customer is usually somewhat excited or exceedingly anxious to resume operations and the repairman must be 100% efficient or the customer will find fault.

Repairs Outside the Shop.

It is a safe policy to have outside workmen get their time as well as the acceptance of job O. K.'d by the customer and so avoid any disputes as well as assuring everyone connected with the transaction that it was performed satisfactorily.

When doing emergency or temporary repairs the client should be advised accordingly, for he may recall a bill of several months' standing when another breakdown occurs and ask for an allowance or refuse to pay, being under the impression that repairs last forever.

In my long experience I have found it does not pay to attempt any patch work. It will only be a short time until permanent repairs become necessary and, although inconveniencing your customer for the time being, a good job takes a little longer and saves time, aggravation and money in the end.

When complete, apparatus should be given a good free running test and a voltage at least three times normal voltage for ground and short-circuit should be applied. All terminals for armature, shunt or compound fields or phase connections should be plainly marked whether for motors, generators, compensators or starters, and the direction of rotation should be indicated by arrows.

Referring to materials and insulating varnish, the best motto is, "Let quality be uppermost; buy the best." Insulation is the cheapest part of electrical apparatus but the most expensive if not handled properly; therefore, for the small difference in price, quality should not be sacrificed. Copper products cost in direct proportion to the market base price. Anticipate stockroom needs, for nothing is worse than to be without materials, especially for emergency repairs. Ninety per cent of the motor and generator users have not learned to carry spare parts and depend upon stock. They will insure their factories against fire and water damage, but neglect operating insurance by buying extra armatures, etc.

When rendering an invoice it should read as plain as possible, giving the identification numbers and the specified character of repairs. When crating or shipping apparatus is used, it must be properly and securely constructed in order to lessen freight damage claims, secure prompt deliveries, relieve the worry of retracing shipments and avoid missing parts.

DALLAS JOVIAN LEAGUE TO EDUCATE ARCHITECTS AND CONTRACTORS.

The Dallas Jovian League, which includes in its active membership over two hundred of the men in every branch of the electrical business in Dallas, Texas, has recently by amendment of its constitution opened its membership to architects and also to building contractors. This action was taken with the idea, as expressed in its constitution, of "inducing the architects and contractors to provide full modern facilities for the use of all forms of all electrical apparatus and devices and also to induce such to specify and use approved, modern materials, appliances and apparatus and to have these installed in a safe and convenient manner."

In order to give full expression to this matter the league invited to its regular luncheon on Oct. 20, the architects and contractors of the city. The idea of the meeting was opened to them in an address by a member of the league which was replied to by addresses from prominent architects and contractors and committees were formed to carry forward this plan of co-operation into actual practice.

The idea of the league is to make itself, through its secretary and committees, a free bureau of information to the architects and contractors not only with reference to the proper wiring of all buildings but also to advise them as to the best apparatus and appliances to be used in each particular case and the proper and most convenient method of installation. In fact, it is hoped to make of the league a free bureau of advice and assistance to every one directly or indirectly connected with the electrical business in Dallas.

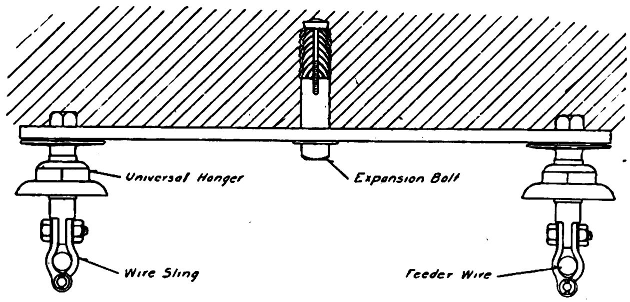
It is further the intention of the Dallas Jovian League, if this idea proves a success in Dallas, to endeavor to extend the idea to other large and medium-sized cities of the state and in this way standardize the electrical business throughout Texas.

This plan does not include any idea of merchandising electrical supplies or apparatus, as it is believed that this latter can best be accomplished through the medium of the National Association of Electrical Contractors and Dealers, the organization of local branches of which is to be undertaken in Texas.

SUPPORTING FEEDER WIRES IN MINES.

A method of supporting machine and feeder cables which is a considerable improvement over the common method of supporting such wires on porcelain spool insulators, has been worked out by John Oniones, Indiana Creek Coal Co., Bicknell, Ind.

The arrangement is shown in the accompanying illustration in which a single expansion bolt supports



Feeder Support for Mines.

both wires. The cross member is a structural steel bar upon each end of which is mounted a universal mine hanger. A cable-sling supports a feeder wire from each of these hangers.

The cable is held more securely by the sling than it could be by a tie wire on the usual type of porcelain spool.

STANDARDIZATION IN CONSTRUCTION.

The National Association of Construction Industries, with offices in the Drexel Building, Philadelphia, has taken up the matter of the need for further standardization in construction activities, and is sending to associations, business firms and individuals a questionnaire asking for the following information:

1. Is there need for further standardization in your branch of construction activity?
2. If there is, what are the needs and what are your suggestions for meeting them?
3. Are you or your association in a position to co-operate in a program of standardization designed to embrace every field of activity concerned?
4. What suggestions have you or your association to make in connection with such a program?

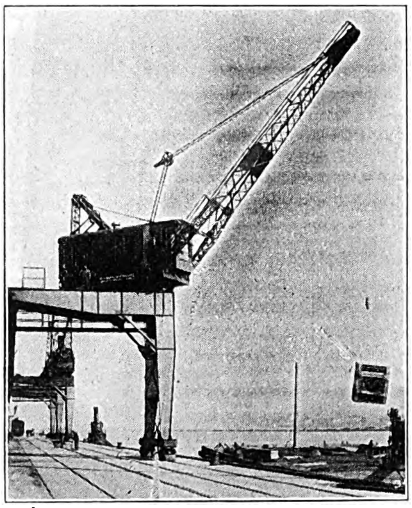
The cost of labor has advanced to a point where the welfare of the construction interests and the general public will be conserved by adopting methods through standardization which will reduce the percentage of labor cost in construction. It is apparent that through the associated effort of all construction interests valuable results can be accomplished which would not be obtained by any single branch of the industry working alone, and it is for this reason that the association has taken up the matter.

New Appliances

Interesting Installation of Dock Cranes at Boston Army Supply Base — Electric Furnace Equipment for Norway

Government Acceptance Test of Dock Cranes at Boston Army Supply Base.

The Wellman-Seaver-Morgan Co., Cleveland, Ohio, recently installed four semi-portal bridge-type hoist cranes at the U. S. Army Supply Base, Boston, to handle freight to and from ships. The Boston terminal includes a long eight-story warehouse separated by a wide street from the marginal two-story wharf house alongside the wharf where the ships dock. Between the wharf house and the water is a space 35 ft. wide with two standard-gauge tracks on which freight cars are run in from main-line tracks to deliver or receive freight from the boats. The W-S-M cranes span these tracks, as will be seen in the illustration herewith. These cranes were described in our issue of Sept. 13, 1919.



View of Dock Cranes From Wharf Deck.

The Government acceptance test of the cranes was made Sept. 17, at which time all four cranes were operated under full load. The speed of the different motions and cycle of operation exceeded in every instance those called for in the specification. The test load consisted of a steel bucket filled with cement sacks, the total weight being 5,000 lbs.

In unloading wool from barges on the same day, one of the cranes made 73 trips an hour, taking on each trip three bales weighing from 500 to 800 lbs. each. It was required to unload the barges evenly, making it necessary to take a load alternately from each end and the middle and landing the loads all in the same place. This method of handling meant a considerable time spent in bringing or traveling along the dock.

The operation included picking up of the wool from a lighter at the wharf side about on the level of the wharf, making a vertical lift on the hoist line of about 40 ft., rotating the boom through an angle of about 120°, traveling of the bridge about 30 ft. along the wharf, and delivering the load on the upper deck platform along the wharf shed. The crane made the complete cycle in about 45 seconds, which would mean 80 trips per hour, but due to unavoidable delays in the hour the number of trips made was 73. The number of men employed in connection with operating the crane was as follows: 1 superintendent, 1 crane man, 1 foreman on the shed platform, 1 foreman on the lighter, 1 tally man, 3 gangs of 5 men each on the lighter, 3 men to receive the load on the upper bench level and to assist in loading the material on the trucks, 11 truckers, and 4 men storing the material, making a total of 38 men. Naturally the number of truckers and those required for storing the material is determined by the method of storing and the distance the truckers must travel to deliver the material inside the shed.

The alinement of the hoisting units and the reduction of friction by the use of Hyatt bearings is well illustrated by the following performance: The weight of 375 lbs., consisting of the lifting hook, 2 ft. of crane chain, the fall weight and 10 ft. of hoisting line, is sufficient to allow the hook to lower at a fair rate of speed and pull the hoisting rope over two sheaves while unwinding the rope from the hoisting drum, rotating the drum, drum gear and drum gear pinion. This takes effect when the jaw clutch is in its neutral position, freeing the drum from the motor and the hold brake on the drum is released.

Notable Export Shipment of Electric Furnace Equipments with Unique Voltage Control.

Electrical equipment for twenty electric furnaces which, when placed in operation, will comprise the largest electric furnace installation ever made, is now being shipped from the United States to the Glomfjord Smeltverk Co. of Glomfjord, Norway.

The apparatus was made by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., and is divided into units, each unit comprising the equipment for one furnace. Each of the twenty units includes a 1300-kv-a. single-phase main power transformer, a 26.2-kv-a. series transformer, a 26.2-kv-a. induction regulator, an automatic selector switch, a transformer switch and a two-panel separately mounted switchboard for the control of the electrical apparatus. A total of 16,200 gallons of oil for insulating and cooling the transformers and regulators is part of the shipment.

The general scheme of connection is such that the voltage variation necessary to the heat regulation of the furnace is accomplished by changing taps on the high-voltage winding of the main power transformer. A portion of the winding, which is proportional to the amount of voltage control desired, is provided with taps in a number of equal steps. Switches and induction regulator operate together to automatically change connections on the high-tension winding and to provide voltage control on each step. In this scheme, the capacity of the regulator need be sufficient to control only the voltage of one step on the tap winding, thus maintaining a high power-factor.

Trade Activities

Block & Company Engage New Quarters—Exhibit of Electric Service Construction—Valuable Literature Distributed

Page & Hill Co., Minneapolis, is building a new yard office and laboratory at its Minnesota transfer plant. It is to be modern in every respect. It will contain in addition to the main work room, private offices for the superintendent and private offices and laboratory for the inspection engineer and chemist. Lavatory and shower baths are provided.

McGill Manufacturing Co., Valparaiso, Ind., is sending out a new folder, illustrating and describing various types of Loxon lamp guards. It is a double-duty device eliminating the needless waste of saving incandescent lamps, preventing loss by theft and reducing fire danger from hot or broken lamps. One of the lamp guards listed is of vaporproof construction and is designed to meet the requirements of the garage or wherever gases or inflammable materials may be used.

Lynton T. Block & Co., operators of the Utilities Indemnity and Fire Exchanges and Employers' Indemnity Corp., announce their removal to permanent quarters, consisting of the entire second floor of the new Chamber of Commerce building, Broadway and Locust street, St. Louis. The business of the Utilities Indemnity and Fire Exchanges and the Employers' Indemnity Corp. has grown so rapidly that the acquisition of these new and spacious quarters has been necessitated. After Nov. 8 all correspondence should be addressed to the Chamber of Commerce building, Broadway and Locust street.

Beardslee Chandelier Manufacturing Co., 216 South Jefferson street, Chicago, is sending out a new folder to department stores all over the United States, showing how effectively the Denzar unit may be used in department store illumination. It is one of the most efficient, durable and economical units for store lighting, properly diffusing and distributing the light rays and eliminating the objectionable glare. A detailed description of the Denzar is given and a cross-sectional view included, showing the various parts of this lighting unit. It is made in many different types and sizes to fit every lighting requirement.

Belden Manufacturing Co., Chicago, has issued its Bulletin 1208, descriptive of "Beldenmold" synthetic molded insulation. It is a 20-page booklet which includes descriptions of the properties of "Beldenmold" and the uses and manufacture of molded pieces. Terms and conditions governing quotations, orders and production of "Beldenmold" parts are given in detail, affording the prospective buyer much information as to the advantages and the pitfalls to be avoided in purchasing molded parts. The booklet is profusely illustrated, showing the large variety of purposes for which molded products can be used.

George Cutter Co., South Bend, Ind., has issued bulletin No. 3386, which is a 48-page catalog of its extended line of streethoods, brackets, mast-arms, pulleys, insulators, and other pole-line and street lighting equipment. In the introductory pages is set forth a review of the modern street lighting system and the applicability of Cutter streethoods and Regent film sockets thereto. Construction of these streethoods is described and illustrated and their distribution curves shown. In the strictly catalog pages are shown several hundred views and detail diagrams of the various types of streethood fixtures, brackets, center suspensions, sockets, mast-arms, pole fixtures, pulleys, crossarms, insulators and pole-line hardware. Three pages of indexes complete this book which will be found valuable by all engineers and contractors of street lighting systems of this type.

Cutler-Hammer Manufacturing Co., Milwaukee, Wis., has issued a new four-page, two-color pamphlet No. 479 entitled "Miscellaneous Applications of Electrical Heat," illustrating and describing C-H space heaters. It emphasizes numerous applications of electrical heat by means of flat standardized heaters, two ft. long, 3/16 ins. thick and 1½ ins. wide. The entire heater is built to withstand hard service and vibration. All parts are enclosed and cannot jar loose. There is no porcelain, cement, asbestos or molded insulation material used, the resistance being encased in sheet mica which in turn is encased in a steel jacket. After sealing, the heater is placed in a hydraulic press and 25 tons pressure applied. Ten of them, constituting a standard package, are packed in a box which affords a handy means of storing and identifying them. C-H space heaters have been used in scores of applications, notable among them being crane and hoist cabs, meter houses, valve houses, sprinkler riser houses, low temperature ovens including the new electrically heated bread ovens and many others. A partial list of the many applications is given in the new pamphlet. Methods of mounting, methods of connecting dimensions, wattage weights, code numbers and prices are also included in the pamphlet. Space is provided for dealers' imprint as a large number of jobbers and supply houses now carry the space heaters in stock. They are a product of the industrial heating department of the Cutler-Hammer Manufacturing Co., Milwaukee.

Electric Service Construction Co., electrical contractor, 322 Sherman street, Chicago, Ill., had an interesting exhibit, especially to wiremen and builders, at the recent Chicago Electrical Show. The repair work done by the company was featured, parts of motors, field coils, commutators, ets., showing samples of the work done by the company. The electrical construction side of the business was played up by over 50 letters displayed in appropriate glass frames. The letters consisted of orders and recommendations received by the company from customers who had expressed their satisfaction with the work done for them by the company. Another part of the exhibit was a display of antique switches, fuse blocks, fuses, lamp sockets and telephone desk sets. Some of these curios were of the vintage of the '80s and attracted much attention. P. C. Moore, president of the company, said numerous inquiries were received at the show for construction and repair work. In connection with the exhibit the Electric Service Engineering Co., an affiliated company, which is the distributor for the Pierce Fuse Corp. in the Chicago district, made an exhibit of Pierce fuses. According to R. S. Blake of the company, several hundred live prospects for Pierce fuses were obtained at the show.

I. P. Morris Co., owned and operated by the William Cramp & Sons Ship & Engine Building Co., has distributed Bulletin No. 4, of the hydraulic department, on hydraulic turbines. The catalog, which is illustrated, contains 90 pages of pictures of important installations and of printed matter. The printed matter consists of a technical discussion of the water power situation in the United States, and the part that the I. P. Morris Co. has taken in the development of hydraulic energy since the organization of the Morris Iron Works in 1828. During the 30 years preceding 1911, the company supplied turbines for the development of 855,835 hp., whereas, in the interval, 1911-1914, it supplied turbines to develop 827,885 hp. The matter in the catalog includes a discussion of factors affecting the success of a hydroelectric plant, a short history of the evolution of the hydraulic turbines, and a discussion of speed regulations. The photographs include views of entire plants in which Morris turbines have been installed, views of the interior of power houses, and of turbines and parts erected in the shops. The views show the details of the operating parts, the methods and apparatus employed to regulate the gates, and the floating lever type of **hydraulic governor. Copies of this bulletin may be obtained upon request.**

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES

Cambridge, Mass.—Cambridge Electric Light Co. has completed arrangements for the construction of the proposed one-story addition to its local substation to provide for increased operations. Walsh Brothers, Cambridge, are the contractors.

Holyoke, Mass. — Walsh Steam Boiler Works, Appleton street, has completed arrangements for the erection of a two-story brick and concrete addition to its plant, about 81x140 feet.

Lynn, Mass.—Contract has been awarded by the city council to Bertram & Fox, 45 State street, for the construction of a new municipal engine plant on Chestnut street.

New Bedford, Mass.—National Spun Silk Co. has broken ground for the construction of the proposed power plant at its works to be located at Bullard street. The structure will be one-story, brick and concrete, about 84x123 ft., and is estimated to cost $175,000, including equipment installation.

Springfield, Mass.—In connection with the construction of the proposed additions to the plant of the Fisk Rubber Co., Chicopee, Mass., contract for which was recently awarded to the Fred T. Ley Co., Springfield, plans have been arranged for the erection of a new one-story and basement brick power plant, about 23x40 ft., to be used for general factory operation.

Warren, Mass. — Warren Steam Pump Co. has recently broken ground for the construction of a new one-story boiler plant at its works, about 40x60 ft., in connection with the erection of other additions to the plant to provide for increased capacity.

Middletown, Conn.—Russell Manufacturing Co. has awarded a contract to Dennis O'Brien & Sons, Crescent street, for alterations and improvements in its factory and power plant. The work is estimated to cost $50,000.

Norwalk, Conn. — Fire recently damaged the plant of the Hi-Po Battery Co., manufacturer of electric batteries, etc., to the extent of approximately $10,000. It is understood that the company is planning to rebuild at once.

Norwalk, Conn.—In connection with the construction of the proposed four-story plant of H. Jacob & Sons, about 50x200 ft., to be devoted to the manufacture of shoes, plans are being arranged for the erection of a new brick and concrete power plant to be used for general works operation. J. C. Schaeffler & Co., 38 West 32nd street, New York, are architects.

Pawtucket, R. I.—Collyer Insulated Wire Co., 249 North Main street, has awarded a contract to the Fred T. Ley Co., Springfield, Mass., for the construction of a new two-story concrete addition to its plant to provide for increased output. The structure will be located on Blackstone avenue, about 60x120 ft., and is estimated to cost $100,000.

Westerly, R. I.—New England Silk Co. will erect a new power plant, 30x40 ft., in connection with an addition to its works to cost about $150,000.

Bath, N. Y.—Town council, municipal lighting and power system, James Foster, chairman, is having plans prepared for the construction of a one-story addition to the municipal power plant to provide for increased operations. The structure will be about 42x65 ft. and is estimated to cost $25,000.

Binghamton, N. Y.—In connection with the proposed construction of the plant of the Vulcan Last Co., Portsmouth, Ohio, on property recently acquired at Johnson City, arrangements have been made whereby the Binghamton Light, Heat & Power Co. will furnish electric energy for operation. It is proposed to commence construction at once to enable the company to inaugurate operations early in 1920. The new works will cost about $200,000.

Brooklyn, N. Y.—Riggi Brothers, 1216 Lexington avenue, have had plans prepared for the construction of a new one-story reinforced concrete boiler plant addition to their works to provide increased operations. The structure will be about 25x60 ft. P. Tillion & Sons, 103 Park avenue, New York, are architects.

Brooklyn, N. Y.—Brooklyn Edison Co., Pearl and Willoughby streets, has awarded a contract to the Maxis Engineering & Construction Co., 26 Court street, for the erection of a new one-story extension at its local plant.

Buffalo, N. Y.—Wright-Hibbard Industrial Electric Truck Co., manufacturer of electrically operated trucks, etc., has filed notice with the Secretary of State of an increase in its capitalization from $300,000 to $550,000, to provide for proposed business expansion.

Cato, N. Y.—Northern Cayuga Light & Power Corp. has made application to the Public Service Commission at Albany for permission to begin construction and exercise rights and privileges under its franchise and for authority to issue $25,000 in capital stock.

Glens Falls, N. Y.—Adirondack Electric Power Corp. is having plans prepared for the construction of a one-story extension to its plant on Monican street. The structure will be of brick, concrete and steel, about 21x104 ft.

New York, N. Y.—United Electric Light & Power Co., 130 East 15th street, has been awarded the contract for furnishing electric service in connection with the operation of the new Capitol Theater, 1645 Broadway.

New York, N. Y.—Standard Electric & Repair Co., 50 University place, has completed negotiations for the leasing of property at 64 University place, for a new establishment.

New York, N. Y.—Gryphon Rubber & Tire Corp., Bailey avenue and 192nd street, has had plans prepared for the construction of a new one-story brick boiler plant at its works The structure will be about 40x42 ft., and is estimated to cost $10,000. Frank Sutton, 80 Broadway, is architect for the company.

Rochester, N. Y.— Considerable new electrical equipment will be required by the Rochester Motors Co., Inc., in connection with the proposed construction of a new one-story machine shop addition to its plant, about 100x390 ft.

Harrison, N. J.—Driver-Harris Co., manufacturer of electrical wires, cables, etc., has broken ground for the construction of two additional units at its plant, to provide for increased operations. The structure will comprise a three-story building, about 50x100 ft., brick and concrete, to be used as an addition to the wire department, estimated to cost approximately $60,000; and the other structure will be about 26x60 ft., costing about $5000, and will be utilized as an extension to the hammer department. Edward M. Waldron, Inc., 665 Broad street, Newark, is the building contractor.

Jersey City, N. J.—Leeds Phonograph Record Co., Record and Review streets, Long Island City, N. Y., has awarded a contract to Walter Kidde & Co., 140 Cedar street, New York, for the construction of a new one-story boiler plant, between Harrison and Warren streets, Jersey City, about 28x49 ft.

Keyport, N. J.—Monmouth Lighting Co. has been awarded a contract by the Borough Council for furnishing electric service for the operation of the municipal street lighting system for a period of one year.

Lakewood, N. J.—Gas & Water Co. has awarded a contract to the Pennsylvania Engineering Co., 1119 North Howard street, Philadelphia, Pa., for the construction of a new station at its plant. The structure is estimated to cost $20,000.

Newark, N. J.—Plans have been completed for the immediate construction of the proposed radio station at Heller Field, the main eastern air mail station of the Post Office Department.

Newark, N. J.—Clifton Electric Co. has filed notice of organization to operate in a general electrical contracting capacity at 107 Belmont avenue. Herman and Albert Friedenreich, 156 Spruce street, head the company.

Newark, N. J.—Rubber & Celluloid Products Co., 56 Ferry street, is having plans prepared for the construction of a one-story brick boiler plant at its works, to provide for general factory operation. The structure will be about 20x52 ft. Clark, MacMullen & Riley, 101 Park avenue, New York, are engineers for the company.

Pompton Lakes, N. J.—Tri-County Electric Co. has completed the construction of its power lines in Wanaque Borough as far as the Haskell School site, as well as in a large part of the Riverdale section of Pequannock township.

Easton, Pa.—Pennsylvania Utilities Co. is making rapid progress on the installation of three new boiler units at its Dock street plant. Two of these units will be of 600-hp. rating, and the other of 1000-hp. capacity, and it is expected that the work will be completed during November. Effective Oct. 1, the company has resumed its steam heating service following the yearly summer suspension, during which period alterations and improvements were made in the system to facilitate operations.

Nanticoke, Pa.—Duplan Silk Co., 50 Union Square, New York, has awarded a contract to the United Fireproofing Co., 8 West 40th street, New York, for the construction of the proposed two-story boiler plant at its local works. The structure will be about 90x100 ft.

Nanticoke, Pa.—Delaware, Lackawanna & Western Railroad Co., Scranton, has broken ground for the construction of a one-story boiler plant, about 48x154 ft. at its Truesdale Colliery, near Nanticoke. The structure, with equipment, is estimated to cost $75,000.

Philadelphia, Pa.—Stroudsburg Electric Light & Power Co. and the Industrial Power Co. have reorganized as the Lehigh Industrial Power Co. First mortgages held against the property of the Industrial Power Co. and effective likewise against any extension made in the name of the reorganization of the company's subsidiary concerns into a new corporation which could issue bonds on new improvements.

Philadelphia, Pa.—American Manganese Bronze Co., Rhawn and Hegerman streets, has completed arrangements for the installation of new boiler equipment at its plant, to facilitate operations.

Philadelphia, Pa. — The United States Government has taken bids for the construction of the proposed power plant at the Frankford Arsenal.

Philadelphia, Pa.—American Preserve Co., 946 Beach street, has awarded a contract to Cramp & Company, Philadelphia, for the erection of a new four-story and basement concrete plant, about 80x250 ft., to be supplemented by a power plant for works operation, at Third and Lehigh avenues. The project, including machinery and installation, is estimated to cost $400,000.

Philadelphia, Pa.— Continental Mills, Lena and Armat streets, have completed arrangements for the installation of new boiler equipment at their plant.

Pittsburgh, Pa.—Consolidated Ice Co. has filed plans for the construction of a new one-story brick and steel engine plant on 42nd street, near the Allegheny Valley Railroad. The structure is estimated to cost $15,800.

Pittsburgh, Pa.—Duquesne Light Co., Chamber of Commerce building, is making rapid progress on the construction of its new two-story brick substation, about 50x66 ft., to be located in the Fair Oaks section of Ambridge, Pa. The structure will be supplemented by a wing 17x30 ft., and is estimated to cost $50,000. The Walker & Curley Co., Farmers Bank building, Pittsburgh, is the building contractor.

Reading, Pa.—Philadelphia & Reading Railway Co. has recently inaugurated the new system, work on the installation of which has been completed, for the operation of its trains on the Reading-Harrisburg division by telephone. The lines will be used exclusively for the dispatching of trains.

Baltimore, Md.—Universal Centrifugal Dryer Co. has awarded a contract for the construction of a new two-story brick plant, about 40x131 ft., to be located at Carroll and Weaver streets. The structure is estimated to cost $15,000.

Baltimore, Md.—American Can Co. is planning for the installation of new boiler equipment at its property at Boston and Hudson streets.

Cumberland, Md.—Western Union Telegraph Co. and the Baltimore & Ohio Railroad Co. has inaugurated work on the cabling of the new conduit system, recently installed at a cost of about $50,000, extending from the Queen City building to the Viaduct tower. The conduit will carry telephone, telegraph and electric signal wires, and was completed early in August.

Glen Lynn, Va.—Appalachian Power Co., Bluefield, W. Va., is arranging plans for the immediate construction of a new addition, about 60x75 ft., to its local steam-operated electric generating station. Complete equipment will be installed, including a 20,000-kw. G. E. turbine and other operating apparatus, and contract has been awarded to Viele, Blackwell & Buck, engineers, 49 Wall street, New York, for the proposed work. The project will cost in excess of $600,000.

Cameron, W. Va.—Spang & Co., manufacturers of oil well machinery, equipment, etc., have had plans prepared for the construction of a large new power plant to be used for the operation of the proposed local works of the company, to include machine shop, forge shop and auxiliary structures. The new plant is estimated to cost $150,000. V. Monroe, Butler, Pa., is general manager.

Charleston, W. Va.—Chesapeake & Potomac Telephone Co. has recently filed application with the Public Service Commission for permission to increase its rates for service by approximately 30%.

Pemberton, W. Va.—Three pumping units in the mine of the Pemberton Fuel Co. were destroyed by fire on Oct. 27, caused by an explosion. It is understood that the company is planning for the immediate replacement.

Plains, Ga.—City is understood to be considering plans for the installation of a new municipal lighting plant. Bonds to cover the cost of the proposed improvement will be issued. H. R. McGee is mayor.

Miami, Fla.—City has approved a bond issue for $15,000 to cover the cost of the installation of the proposed police signal system.

Winter Garden, Fla.—City has arranged plans for the installation of a new municipal electric plant, to be used for furnishing electric energy for lighting purposes, as well as the operation of the municipal water works system. It is proposed to install complete equipment, including triple and rotary pumping units, internal combustion engines, generators, and auxiliary apparatus. The work is estimated to cost $70,000. Wilbur A. Ginn, Sanford, Fla., is engineer.

NORTH CENTRAL STATES

Indianapolis, Ind.—Link-Belt Co. will build a one-story addition to its foundry. The new addition will be one-story brick and steel, 70x460 ft., to cost $65,000.

Indianapolis, Ind.—Gale Construc-

DATES AHEAD.

Electrical Supply Jobbers' Association. Semi-annual meeting, Cleveland, Ohio, Nov. 18-20. Headquarters, Hotel Cleveland. Secretary, Franklin Overbaugh, 400 South Clinton street, Chicago.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

American Institute of Chemical Engineers. Annual meeting, Savannah, Ga., Dec. 3-6. Secretary, J. C. Olsen, Brooklyn, N. Y.

Electric Power Club. Meeting, Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

American Electrochemical Society. Annual convention, Boston, Mass., April 7-10, 1920. Friday, April 9, joint session with American Institute of Electrical Engineers on "Electrically Produced Alloys." Secretary, Joseph W. Richards, Bethlehem, Pa.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

tion Co. has taken the contract for the installation of a new power plant at the Marion County Tuberculosis Hospital at Oakwood, an Indianapolis suburb. The company's bid was $27,-103.

Belvidere, Ill.—The council has under consideration placing of boulevard lights on Logan avenue. Address Alderman Robinson of the electric light commission.

Berwyn, Ill.—Architects, Holabird & Roche, 104 South Michigan avenue, Chicago, have prepared plans for a $20,000 building to be erected by the Chicago Telephone Co., 208 West Washington street. Building to be of brick construction. Specifications include hot water, plumbing and electric lighting.

Chicago, Ill.—John R. Bowes will erect three-story factory building, 268x125 ft., to cost $330,000.

Chicago, Ill.—Charles R. Francis, commissioner of public works, has approved the plans to install complete electrical equipment of the Chicago avenue pumping station.

Dixon, Ill.—Grand Detour Plow Co. works of the J. I. Case Threshing Machine Co. will enlarge its power house. The latest electrical machinery will be installed and the plant will be of sufficient size to provide complete power for the enlarged capacity which the Case company has in view for the Dixon works.

Peoria, Ill.—E. L. Hulsebus, Jefferson boulevard, has prepared plans for a $20,000 building to be erected by the Clinton Telephone & Telegraph Co., Clinton, Ill. Building to be of brick construction. Specifications include passenger elevator, hot water heating, plumbing and electric lighting.

St. Charles, Ill.—Twenty thousand dollars in bonds has been voted to improve the municipal lighting plant. Address the village clerk.

Woodstock, Ill.—Woodstock Typewriter Co. will build an addition to its plant which will increase its production from 55 to 100 machines daily. Address J. P. Swahlstedt, Woodstock, Ill.

Hancock, Mich.—The committee is in favor of installing a meter 700 ft. from the pump and operating the pumping station by electricity. Address the city clerk.

Henderson, Mich.—Henderson Light & Power Co. has organized with a capital of $3000. It will build a plant 30x50 ft. in dimensions and furnish light and power for residences and stores in the town. Harry Coy, president.

Ypsilanti, Mich.—A commitee has been appointed to investigate the cost of boulevard lights on East Michigan avenue. Address the city clerk.

Amery, Wis.—A new electric company has been formed, co-operating with Apple River Milling Co. Lines will be constructed within a radius of four miles. Jake Smith, president; S. Philip, secretary.

Bruce, Wis.—Election will be held Nov. 15 to vote $9000 bond issue for line franchise electric power proposition. Estimate of construction from Ladysmith to Bruce, $12,000. Current will be purchased from Big Falls Power Co., 24-hour service, 3-phase lines.

Darlington, Wis. — City contemplates installing a municipal electric system. Daniel McConnell, city clerk.

Milwaukee, Wis.—Mueller & Sons Box Co., 361 Canal street, will install a generator and electrical equipment. Cahill & Douglas, engineers.

Grand Rapids, Minn.—Prairie River Power Co. will hold public hearing concerning $300,000 electric power plant on Prairie river. Dam will be concrete and stone, two-turbine electric plant of 100 hp. capacity.

St. Paul, Minn.—Lindeke Roller Mills will use 150 hp. of electric energy supplied by the Northern States Power Co., beginning Nov. 1. The West Publishing Co. has installed 44 electrically heated pots in their printing plant. A new $100,000 foundry will be built in the Midway district.

Sioux City, Iowa.—City council will install 3-phase light system to replace 1-phase system; also extend lines to Winnebago, Homer, Walthill, and other towns nearby. J. S. Phillips, mayor; Paul J. Wells, clerk.

Superior, Iowa.—Election carried for electric lighting system, service to be furnished by Northern Iowa Gas & Electric Co., Spirit Lake. E. L. Briggs, clerk.

Joplin, Mo.—In connection with the construction of the proposed local plant of the Junge Baking Co., contract for which was recently awarded, plans have been prepared for the erection of a one-story power plant, about 20x32 ft., to be used for general works operation. The C. A. Dieter Construction Co., Joplin, is the building contractor.

Hugoton, Kans.—An election to vote $70,000 in bonds for waterworks and electric lights will be held Nov. 10.

Hutchinson, Kans.—Contract has been signed by J. H. Springfield, manager of the United Water, Gas & Electric Co., by which this company will furnish electric power for the transmission system of the Pawnee Power & Water Co. of Larned. The contract calls for the furnishing of at least 1500 kw., with the agreement that it furnish as much as 3000 kw. if necessary.

Diller, Neb.—A franchise has been granted to J. H. Krug of Marysville for the construction of an electric line into Diller.

Greenwood, Neb.—Election to vote $15,000 for the construction of a transmission line to furnish Greenwood with current carried.

Wood, S. D.—Wood Electric Light & Power Co. will install a system for light and power here.

Cooperstown, N. D.—City will enlarge its electric plant to furnish light and power in Griggs county and all parts of Nelson and Steele counties.

SOUTH CENTRAL STATES

Lexington, Ky.—Fire originating in the pumping plant of the Stoll Oil Co. recently destroyed the works with loss estimated at $40,000. The company is understood to be considering plans for rebuilding.

Starkville, Miss.—The sum of $55,-000 in bonds has been voted to improve the light and water plant. Address the mayor.

Ashdown, Ark. — Commonwealth Public Service Co. is making extensive improvements in the electric light plant here. The company is putting in new and larger poles, and in the near future will install a 110-hp. oil engine.

Oklahoma City, Okla.—Oklahoma Gas & Electric Co. will expend $3,-000,000 for an electric generating station on Arkansas river.

El Paso, Texas.—El Paso Electric Railway Co. has had plans prepared for the erection of new additions to its power plant for increased capacity. It is proposed to furnish electric energy to the city for the operation of the municipal sewage plant. The extensions are estimated to cost $35,000. The work will include the installation of new motors, the construction of a transformer station and power line. J. L. Alexander is superintendent.

Madsonville, Texas.—The capacity of the Madsonville Light & Power Co. has recently been doubled by the purchase of additional machinery costing $8000 and plants are under wav to supply current to some of the smaller towns in the section.

Marshall, Texas.—A white way to cost $14,000 is soon to be installed.

WESTERN STATES

Craig, Colo.—C. A. Van Dorn, president of the First National Bank; C. H. Wise and R. S. Hamilton have filed application for a certificate of public necessity and convenience for the establishment of a power and light plant at Craig.

New Raymer, Colo.—Fire recently destroyed the electric light plant here, involving a loss of about $2,000. The electric light plant is operated by a kerosene engine. It will be rebuilt, and it is probable that the town will take over the operation. George L. McQuewn, owner.

Powell, Wyo. — Harry Chapple, Greybull, and E. P. Bacon of Natrona Power Co. of Casper contemplate an electric light and power plant here.

Petersburg, Alaska.—The council has been authorized to issue $75,000 light and power bonds. Address the town clerk.

Centralia, Wash.—Washington-Idaho Light & Power Co., which was recently voted a franchise in Chehalis, is considering the erection of a power plant in Centralia. The plant will furnish power to the Eastern mill, using the mill's slab wood as fuel. The erection of the plant is dependent on the securing of a contract to furnish power to the city.

Spokane, Wash.—Crowley Brothers

will build a sash and door factory to be operated by electricity.

Klamath Falls, Ore.—Pelican Bay Lumber Co.'s plant, recently destroyed by fire, will be rebuilt and operated by electricity.

San Francisco, Calif.—Approval of plans for a hydroelectric generating plant on the north fork of Kern river, which, with transmission lines, will cost $9,231,350, was sought from the State Railroad Commission by the Southern California Edison Co.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Electrical Goods, Engines, Etc. (31,083).—Electricians in Australia desire to secure agencies for the sale of accumulators, power engines from ¾ hp. to 3 hp. and generators and motors up to 4 hp.; also any electrical goods. Reference.

Pumping Plants (31,094).—A member of a traders' association in Egypt desires to purchase and represent in that country manufacturers of tractors, motor plows, reapers, binders, threshing machines, drills, cultivators, pumping plants, all sizes, etc. References.

Pumps, Turbine, Etc. (31,129).—A commercial agency firm in France desires to secure the representation of manufacturers for the sale of machine tools, any machinery necessary to industry, oil motors, compressors, pumps, turbines, material for mines, forge material, lathes with horizontal plates, drilling machines (radial type), and planing machines. References.

Electrical Supplies (31,133).—A firm in Italy desires to secure an agency for the sale of telephonic and telegraphic apparatus and electrical supplies. A full list and description of what is required may be had on application to the bureau and its district offices. Correspondence may be in English. References.

Electrical Materials (31,146).—An electrical goods merchant in Spain desires to purchase and secure an agency for the sale of raw insulated materials for electrical construction and repair shops, high-tension apparatus, telephones, porcelain insulators, copper wires, and copper in bars and sheets. Quotations should be given c. i. f. Spanish port. Payment, cash against documents. Correspondence may be in English. References.

Electrical Supplies (31,166).—A company in England desires to purchase electrical fittings and appliances, steel- enameled conduits for electrical wires, and teak blocks for mounting switches. Quotations should be given c. i. f. English port. Reference.

PROPOSALS

Electric Light Plant.—The town council of Homestead, Fla., will receive bids until Nov. 17 for the installation of a new electric light plant to be used for municipal service. J. Burton is president; I. R. Matthews, clerk.

Electric Light Plant.—Bids will be received Nov. 19 for labor and apparatus to install a municipal electric light plant at Maquoketa, Iowa. The specifications include 250-b.hp. oil engine, generator, exciter, belt and switchboard, transformers, meters, etc. Address D. T. Bauman, city clerk.

NEW PUBLICATIONS

Price of Ferroalloys, Nonferrous and Rare Metals is the title of a publication by H. R. Aldrich and Jacob Schmuckler, issued by the War Industries Board. This bulletin, presenting a study of the wholesale prices of metals other than iron and steel in the period 1913-1918, inclusive, is one of a series of 50 class bulletins dealing with prices during the war. In classifying the list of commodities whose prices were to be studied, these metals were grouped together and three subdivisions made on familiar bases, namely, ferroalloys, nonferrous metals, and rare metals, and are collected in convenient form in this bulletin. Aside from presenting a record of price fluctuations for certain metals and their fabricated products, the bulletin gives briefly the causes of these fluctuations and discusses in some detail the industrial significance of each metal, its production, imports, and exports, and other data.

INCORPORATIONS

New York, N. Y.—Universal Superheater Corp. Capital, $100,000. To manufacture superheaters. Incorporators: J. S. Milne, R. McGregor and J. T. Crane, 2 Rector street.

New York, N. Y.—W. E. Nichols Corp. Capital, $50,000. To engage in a general electrical engineering capacity. Incorporators: O. A. Schramm, R. S. King and K. M. Nichols, 882 Eighth avenue.

New York, N. Y.—Traders' Electrical Supply Co. Active capital, $500,000. To manufacture and deal in electrical goods. Incorporators: G. W. Dunn and W. A. and J. Daly, 261 Broadway.

New York, N. Y.—Tiphany Motor Co. Capital, $400,000. To manufacture motors, etc. Incorporators: W. C. Dodge, F. U. Horowitz and L. M. Crumbacher, 1451 Broadway.

New York, N. Y.—Acorn Electric Contracting Co. Capital, $10,000. To engage in a general electrical contracting capacity. Incorporators: S. Wolf, M. Levin and I. Broff, 1155 Longfellow avenue.

New York, N. Y.—Roeser Studios. Capital, $10,000. To manufacture lighting fixtures, etc. Incorporators: R. Y. Barrows, C. V. G. and C. Roeser, 58 West 37th street.

Charleston, W. Va.—Kallmenten-Warner Electric Co. Capital, $10,000. To manufacture electrical goods. Incorporators: I. W. Belcher, O. W. Kallmenten, J. E. Hanley, D. C. and G. E. Warner, Charleston.

Wilmington, Del.—Little Giant Washing Machine Co. Capital, $2,500,000. To manufacture electric operated washing machines, etc. Incorporators: M. C. Kelly, M. L. Horty and S. L. Mackey, Wilmington.

Wilmington, Del.—Ivers-Lee Co. Capital, $2,500,000. To engage in a general electrical and mechanical engineering capacity. Incorporators: P. B. Drew, T. L. Croteau and H. E. Knox.

Tildenville, Fla.—Tildenville Power Co. Capital, $10,000. To operate a local electric light and power plant. C. H. Tilden is president.

Raleigh, N. C.—Carolina Electric Equipment Appliance Co. Capital, $25,000. To manufacture electrical appliances. T. A. Norris is the principal incorporator.

Miami, Fla.—Monad Electric Co. Capital, $10,000. To manufacture electrical supplies. W. B. Scott is president.

Indianapolis, Ind.—R. C. Dunn Manufacturing Co. has been incorporated with capital of $40,000 by R. C. Dunn, J. I. Dunn and S. W. Dunn.

Peoria, Ill.—Continental Electric Sign Co. has been incorporated with capital of $25,000, by W. G. Ronny. R. H. Morey and J. B. Wolfenbarger of Peoria, Ill., and H. H. Marriott, of Kansas City, Mo. The company will manufacture and sell electrical advertisement signs and displays.

Vincennes, Ind.—Indiana Power Co. has been incorporated with capital of $5,000,000 to supply light, heat and power for the city of Vincennes. Address C. E. Gregg, Vincennes, Ind.

Kindred, N. D.—Kindred Light & Power Co. has incorporated with a capital of $15,000. Address John Ottis.

Milbank, S. D.—Milbank Power Co. has incorporated with a capital of $50,000. Arthur M. Savage, Everett P. Winter, Philip G. Saunders.

Boston, Mass.—Massachusetts Electric Dredge Co. has been incorporated with capital of $50,000. Incorporators: Charles E. Fay, Fred C. Fernald and Forrest H. Abbott. Quincy, Mass.

Louisville, Ky.—Peerless Storage Battery Co. Capital, $50,000. Incorporated under Delaware laws. To manufacture storage batteries. Incorporators: D. Warren, A. E. Wolke, and F. A. Kronuer, all of Louisville.

Personal

H. F. Thurber Elected President of New York Telephone—O. T. McLean Resigns from Northwest Utilities—Changes

LEONARD H. KINNARD, Philadelphia, Pa., was elected president of the Bell Telephone Co. of Pennsylvania at a special meeting of the board of directors. Mr. Kinnard succeeds Frank H. Bethell, of New York, recently resigned.

L. L. HILL, Page & Hill Co., Minneapolis and J. D. Burns, inspection engineer for the company, attended a meeting of the committee on "non-pressure treatment for wood preservation" at the Forest Products Laboratory, Madison, Wis., last week. Mr. Hill is chairman of this committee.

MURRAY C. BEEBE, professor of electrical engineering, University of Wisconsin, has accepted a position in the research department of the Western Electric Co., New York City. He will have charge of investigating the financial possibilities of inventions and labor-saving devices that are submitted to the company.

WALTER MCCRUM, assistant manager of the Clark Electric Manufacturing Co., Middletown, Conn., has resigned to accept a position with the Haytian American Corp., which controls the electrical output of the island of Hayti, West Indies. Mr. McCrum has left the country to take up his new duties.

H. E. TOWLE, vice-president and secretary of the American Water Works & Electric Co., 50 Broad street, New York, has resigned, effective Nov. 1, to become a member of the banking firm of W. G. Souders & Co. C. S. ASHDOWN, treasurer of the company has been elected vice-president to succeed Mr. Towle, and W. K. DUNBAR has been appointed secretary.

DR. LEONARD F. FULLER, who recently became assistant manager of the insulator factory of the Ohio Brass Co. at Barberton, Ohio, has been honored with the degree of Ph.D. in electrical engineering by Stanford University in recognition of his work in wireless. Dr. Fuller is said to be the greatest single contributor to the development of long-distance transmission in radiotelegraphy, and his work with the Federal Telegraph Co., Palo Alto, Cal., with which he was formerly connected, has won for him the highest academic honors as well as nation-wide recognition.

SAMUEL B. TUELL, formerly with the Stone & Webster Engineering Corp., Boston, Mass., is now manager of the Houghton County Electric Light Co., Houghton, Mich. He is a graduate of the electrical engineering course of the Massachusetts Institute of Technology and has gained an extensive experience in engineering work in his connection with the Stone & Webster organization, having been employed at Key West, Porto Rico and other places. He was for some time at Pawtucket, R. I., and was later placed in charge of the utility work at Hog Island, later entering the office of the vice-president.

H. F. THURBER, vice-president of the New York Telephone Co., was elected president of the company at a meeting of the board of directors held on Oct. 29. The new president has been vice-president in charge of the companies constituting the eastern group of Bell System Telephone companies, which includes the New York Telephone Co., the Bell Telephone Co. of Pennsylvania, and the Chesapeake & Potomac Telephone Co. Mr. Thurber is one of the best known men in the telephone business. He entered it in 1890 immediately following his graduation from Cornell University as a mechanical engineer. The telephone business was then very young and Mr. Thurber's interest in it was aroused by an address given at Cornell University by Dr. Alexander Graham Bell, inventor of the telephone. His first position was with the Metropolitan Telephone & Telegraph Co. of New York, the predecessor of the New York Telephone Co., and he has risen through the ranks to the position he now holds.

H. F. Thurber.

GUY E. TRIPP, chairman of the board of directors of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, has been elected a director of the American International Corp., succeeding J. Ogden Armour. Mr. Tripp was one of the original directors of the American International Corp., but resigned upon entering the Ordnance Department of the army. He has been chairman of the board of directors of the Westinghouse company for more than seven years.

M. L. MURRAY has resigned his position as branch office manager of the Waterbury Co., 15 Murray street, New York, and has been elected vice-president and general sales manager of the Alloy Metal Wire Co., 146 West 99th street, New York City.

O. T. MCLEAN, who has been connected with the Northwest Utilities Co., has resigned to devote his entire attention to the Electric Service Co., Mankato, Minn., of which he is secretary and treasurer. Mr. McLean entered the employ of the Minneapolis General Electric Co. in 1910, and when the company was sold to H. M. Byllesby & Co. in 1912 he was retained and promoted to the position of accountant. A year later he was sent to Mankato as auditor of the Mankato division of the Northern States Power Co. and later acted as assistant to R. E. Brown, manager. He resigned in 1917 to become acting manager of the Northwest Utilities Co., formerly the Southern Minnesota Power Co. of Spring Valley. On the completion of the transmission line, connecting this division to the line extending from Winona to Chatfield, the plants in the Spring Valley division were closed and he returned to Mankato to assume the duties of general auditor of the company. Mr. McLean's previous public service and merchandising experience in the industry should prove of considerable value to the Electric Service Co.

Obituary.

JAMES HARDIE, head of the financial department of John Robertson & Co., Brooklyn, N. Y., manufacturers of hydraulic pumping equipment, died on Oct. 23, at his home, 154 Eighth avenue, Brooklyn. Mr. Hardie was 79 years of age.

WILLIAM D. WEAVER, formerly editor of *Electrical World*, died suddenly on Nov. 3, at his home at Charlottesville, Va. Mr. Weaver was born at Greensburg, Pa., Aug. 30, 1857. He was educated at Kentucky University and the U. S. Naval Academy, graduating in 1880 as a cadet-engineer. He also engaged in special laboratory work at the Sorbonne, Paris, France. He accompanied the first Greeley relief expedition in 1883. He resigned from the navy in 1892 to become editor of *Electrical World*, which he served continuously until his retirement to his country estate several years ago. Mr. Weaver served in the Spanish-American war as chief engineer of the *U.S.S. Glacier*. He was a member of the American Institute of Electrical Engineers and many other technical, scientific and civic societies and clubs.

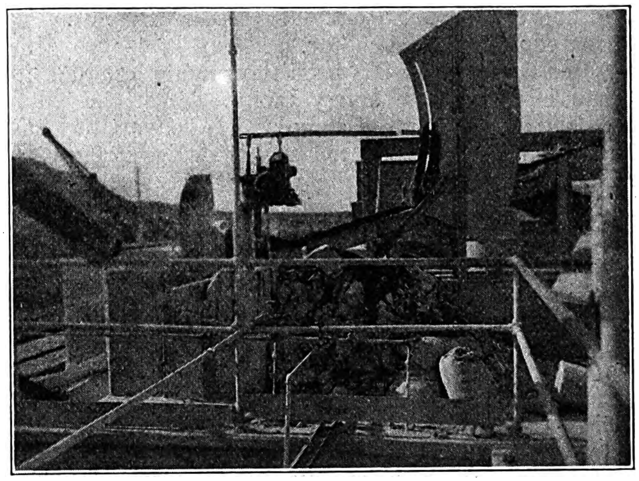

Fig. 2.—¼-hp., Single-phase Motor Driving Kiln-Slurry-Feed Control Dipper.

Electrical Equipment of Western Portland Cement Plant

California Cement Plant Driven Completely Through Motors Supplied from Power System—Features of the Equipment — Practically Dustless Operation Secured

APPLICATION of electric drive in the operation of a cement mill and the advantages to be derived therefrom are unusually well exemplified in the plant of the Southwestern Portland Cement Co. at Victorville, Cal. The town of Victorville is in the southern part of California about one hundred miles from the city of Los Angeles on the Santa Fe Railroad, the tracks of which pass by the plant, affording a convenient outlet for the finished product.

The mill has an output per year of approximately 300,000 bbls. of Portland cement, and employs an average of about eighty men. All of the buildings are of substantial reinforced concrete construction built to withstand the severe conditions imposed by the heavy cement mill machinery installed.

The system of manufacture used is known as the "wet process," and the water required for use throughout the mill is raised to a reservoir on a hill back of the plant by a 15-hp. motor-driven triplex pump.

Electric current is purchased from the Southern Sierras Power Co., thus relieving the cement company of the expense and trouble incident to the operation of a power plant. Current is received at 33,000 volts and stepped down to 440 volts for application to the various motors installed throughout the mill.

All the transformers and the switching outfits are of the outdoor type, located immediately adjacent to the mill. The current is taken from here to a seven-panel marble switchboard, from which it is distributed to the various power and lighting circuits in the mill.

Rock and shale are brought to the mill from the quarry, which is located seven miles distant, by steam locomotive hauling trains of cars which have two compartments or hoppers, one of which is dumped at a time into the crusher hopper.

The lime rock is delivered from the hopper cars direct to the crusher, but a reserve pile of crushed stone, amounting to between 3000 and 5000 tons is maintained sufficient to keep the mill operating for a period of approximately 30 days. This reserve is maintained in the event of an accident, such as a washout, crippling the railroad service from the quarry to the mill.

The crusher and Williams mill are driven by a 250-hp. Westinghouse type CW wound-rotor motor, shown in Fig. 1. Here the rock is broken into pieces about the size of a walnut or a little larger. From here the rock is elevated to a storage bin by a bucket elevator, driven by a 30-hp. motor, and thence by belt conveyor to the pulverizing house. Up to this time no water has been put with the rock except what is thrown on at the time it goes into the crusher, which is done with a hose to eliminate whatever dust rises at that time.

During the process of pulverization, water is added for further eliminating the dust. After being thoroughly pulverized the mixture is taken to the slurry tanks, where it is kept in motion by air agitation until ready for admission to the kiln.

There are six slurry tanks served in pairs by elevators, operating at a speed of approximately 88 ft. per min., for elevating the mixture from the pulverizing house tanks. Each elevator is driven by a 7½-hp. constant-speed motor.

After the mixture has been thoroughly agitated, it is transferred to the slurry tanks nearest the kiln. From here it flows into a sump and is delivered to the kiln by a motor-operated measuring device illustrated in Fig. 2, which shows the rear of the scale. The dipper is made in the shape of the letter "S," the outlet being in the center. By raising and lowering the dipper in the sump the amount of slurry entering the kiln can be controlled. The dipper is driven by an extended shaft, provided with two universal joints, from one of the elevators and is raised and lowered by a ¼-hp., 1725-r.p.m. motor by means of remote control from the klinker end of the kiln. The large scale is visible to the operator at the klinker end and he can feed the proper amount of mixture to the kiln and watch his fire at the same time.

The rotary kiln is approximately 200 ft. long and 20 ft. in diameter, lined with firebrick and heated by an oil burner to a temperature of about 2500° F., which is measured by a radiation pyrometer. It is driven at a speed of one revolution per minute by a 50-hp., type CW, 700-r.p.m. motor through Foote reduction gears, as shown in Fig. 3. The kiln is elevated at the raw end, so that as it rotates the mixture will travel toward the klinker end. Upon coming from the kiln the klinker falls about 20 ft. into a pit to allow it to cool somewhat. It is then elevated by the klinker elevator, which is driven by the 7½-hp., 680-r.p.m. motor shown in Fig. 4 to an automatic scale and dumped into the storage bin.

From the klinker storage it is transferred by means of a locomotive crane with a clam-shell bucket to a bin from which it is fed into the finishing mill. The locomotive crane is also used for mixing the klinker as it will vary somewhat in quality. After being ground and analyzed by the chemical department, it is ready for the packing house, to which it is carried on a belt conveyor over a weighing machine, which automatically records the number of barrels that pass.

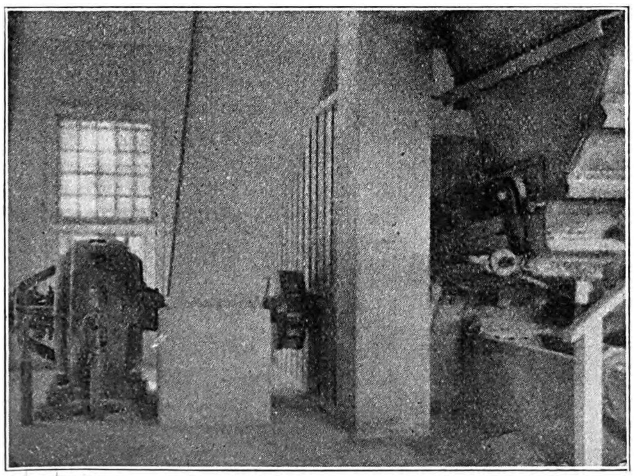

Fig. 3.—50-hp., Three-phase Motor Driving Rotary Kiln Through Foote 14 to 1 Reducer at 1 r.p.m.

From the storage bins, the cement is taken to the sacking machines, driven by a 15-hp. motor. A sack cleaner is driven by a 7.5-hp., 680-r.p.m. motor through a Foote reduction gear. A 15-hp. motor-driven blower for collecting dust from the sacking and sack-cleaning machines is also used.

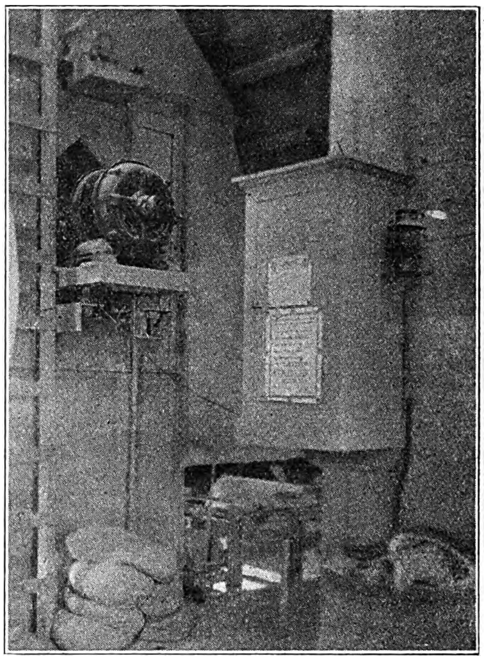

Fig. 4.—7½-hp. Motor Driving Klinker Elevator.

All the motors are of the alternating-current, 440-volt, 60-cycle, three-phase type and were furnished by the Westinghouse Electric & Manufacturing Co.

This plant was designed and built by L. D. Gilbert and has been in operation over three years, during which time no shutdowns have been experienced due to any trouble with the electrical equipment described.

NEON VAPOR LAMPS FOR HIGH VOLTAGE AND LOW CANDLEPOWER.

Previous endeavors to manufacture metal-filament lamps which could give 10 cp. or even less, and operating on the 220-volt lines generally used in many European countries, have been a failure in that the strength of the filaments has been found to be very low. A satisfactory solution of this problem is claimed to have been arrived at by two scientists working in the Pintsch laboratories in Berlin.

The lamp designed by them can be manufactured for a current consumption of only 1 to 5 watts and can be connected to any 220-volt network. It is provided with an ordinary lamp bulb and a standard base, and contains in a clear glass bulb a mixture of neon and helium gas at 8 to 10 mm. pressure. In this bulb is a large surface cathode, and, opposite it, an anode, placed at such a distance that at 190 volts pressure a dim discharge is set up which forms the luminous yield of the lamp. The remainder of the voltage is absorbed by a series resistance, the size of which is arranged to suit the current absorbed by the lamp. This resistance is concealed in the lamp socket. In order to change the color of the light given from orange red to pinkish-white, a little mercury vapor can be added to the gas charge.

Central-Station Rates in Theory and Practice

Nineteenth Article—Combined Energy and Demand Rates—Substitutes for Measured Demand—Encouraging Use of Appliances—Hopkinson, Doherty and Wright Rate Systems — Combination Rates

By H. E. EISENMENGER

This is the nineteenth article of this series which began in the issue of July 12. Part I of the series included seven articles dealing with the cost of central-station service. Part II comprised six articles on the policies governing the choice of a rate system. The present article is the sixth and last of Part III discussing the various systems of rates in use. The remaining six articles will constitute Parts IV to VI and will treat of rate analysis, the accuracy of rates and the current practice in rate regulation by commissions, the last article appearing in the issue of Dec. 27.

PART III—SYSTEMS OF CHARGING—Continued.

II. The Various Types of Rates—(Continued).

D. Rates Based on Both Energy Consumption and Demand—(Continued).

2d. Substitutes to Approximate the Measured Demand.

2. The Various Substitutes for the Measured Demand.

a. Size of Transformer Required.

SECTION 142. To begin with a rather isolated type of substitutes for the measured demand, the size of the transformer actually required for the customer's service may be used as the measure of his maximum demand.[1]

b. The Connected Load.

143. A very frequent substitute for the measured maximum demand is the connected load of the customer in some form or other.

Sometimes the measured demand and connected load are used together in such a manner that the measured demand is limited by the connected load so that the demand is never counted as less than a certain specified percentage of the connected load.[2]

1. The Full Connected Load.—The full connected load as the determining factor of the demand charge is used mostly in power rates,[3] although lighting rates on the same basis can also be found.[4]

The unit of the connected load in these instances is, in case of power rates, frequently the horsepower connected, for instance, the rating of the motor or motors.[5] Otherwise it may be the load in watts or kilowatts as determined by inspection of the installation.[6] The use of the number of 50-watt units installed,[7] or the rather obsolete method of using the 16-cp. lamp or equivalent,[8] as unit for the connected load are varieties of this rating.

2. Percentages of the Full Connected Load.—Instead of the full connected load a certain percentage of the load is very frequently made the basis of the charges and that percentage may be either a fixed one[9] or it may vary—within the same schedule[10] or from one schedule to the other[11]—with the character of the business served.

144. The percentage of the connected load which is to constitute the rated demand is frequently also varied with the *size of the connected load.* This is justified by the following considerations.

With a very small load, consisting, for instance, of one lamp or a very few lamps, the maximum demand will be equal to the connected load. If we have a larger installation the chances are in many installations that not all lamps will burn at the same time. The various lamps will have a diversity among themselves which in the average will be the greater, the larger the installation's capacity is in kilowatts. The same applies to power loads, especially where we have more than one motor installed. The chance that these motors will never be all running at the same time at full load is the greater the larger the number of motors is. Where we have one motor only, even if it be driving a number of power-consuming devices which have a diversity amongst one another, we must assume that this diversity had been anticipated when the selection was made of the size of the motor. At

---

[1]The Electric Welder Service schedule of the Standard Electric Light Co. of Kansas City: Transformer capacity connected for each service.
All schedules of Lansing, Mich., where the demand enters into the rates: Transformers actually required.
Wholesale Power schedule, Erie, Pa.: 75% of the transformer capacity, where installation is greater than 15 kw. (otherwise demand is measured).

[2]Wholesale Lighting and Power schedule, Norfolk, Va.: The demand is never to be counted as less than one-half the connected load.

[3]For instance, in the Wholesale Power rate of Denver, Colo., a three-charge rate system where the monthly demand charge is $2 per horsepower connected.
The Wholesale Power schedule of Omaha (which applies also to lighting where this is not more than 20% of the total load) determines the demand as the motor rating of the connected load, not counting the portion formed by the lighting load.

[4]For instance, in the Retail Lighting Schedule of Washington, D. C., or in the Residence Lighting schedule of Pueblo, Colo., (Wright demand rates).

[5]See footnote 3 above.

[6]See footnote 4 above.

[7]One of the two optional Commercial Lighting rates in Rockford, Ill., is a three-charge rate with a monthly demand charge of 16.6 cents per 50 watts connected.

[8]Denver, Colo.: Combination Lighting schedule, which is a three-charge rate system with a monthly charge of 15 cents per 16-cp. lamp.

[9]General Power, Haverhill, Mass.: For smaller installations 75% of the connected load or by test, but never under 60% of the connected load.

[10]The General Lighting Schedule in Brooklyn rates the demand as 50% of the connected load in residences and 70% elsewhere, with exception of sign lighting where the full connected load is used.

[11]Buffalo: The Residence Lighting schedule and the Commercial Lighting schedules are identical except that the demand in the former schedule is determined as 25% of the total installation and in the latter schedule as 50%. The minimum rated demand for residences of 250 watts is accordingly raised for commercial lighting to 500 watts.

"demand" (number of rooms or number of square feet of floor area, respectively), or in some other more complicated form.[7] This latter form of rates will be discussed and analyzed later (Sections 161 and 167) and here will be mentioned only, anticipating this analysis, that it embodies the equivalent of a customer charge for certain customers.

A variety of the Wright system is based not on the block system of gradation, but on the step system;[8] such systems are exceptions, however.

What has been said before (Sections 119-121) about step meter rates applies also to step Wright rates, for instance that the steps can be formed by discounts, except that in this case the discounts are not quantity discounts but load-factor discounts.[9]

The Wright rate principle can also be applied to block or step meter rates.[10]

d. Combination Rates.

156. In this and similar ways a large number of combinations between the various systems of rates and various principles of rate-making[11] can be put into effect and a great variety of "combination rates" of this kind are found in practice. It is almost impossible and is of little purpose to enumerate or classify all these combination rate systems. Just to show the fertility of this field a few examples from practice will be quoted here at random:

1. The Retail Power schedule of Spokane is a combination of a Hopkinson and a Wright demand rate as follows:

Demand charge: $1.50 per kv-a. connected
plus an energy charge of
Nothing for first 20 hours' use of connected load
3 cents per kw-hr. for next 30 hours' use of connected load
1.5 cents per kw-hr. for next 50 hours' use of connected load
1 cent per kw-hr. for next 300 hours' use of connected load
0.5 cent per kw-hr. for excess.

We see, moreover, that in this particular Wright rate the unit energy charge is not steadily decreasing with increasing load-factors but that it first increases from zero to 3 cents per kw-hr. and then decreases by blocks. We might also look at it in this way that the Wright rate begins only at the load-factor or of 20 hours' use instead at the load-factor zero, as in all other Wright rates.

2. The General Power rate of the Great Western Power Co., of Sacramento, Cal., is a straight meter rate stepped according to the size of the demand (in connected load) as follows:

3.75 cents per kw-hr. under 10 hp. connected.
3 cents per kw-hr. from 10 to 50 hp.
2.5 cents per kw-hr. over 50 hp.

3. The Commercial Lighting schedule of Atlanta, Ga., is a combination of a step, block and Wright demand system as follows:

A. Demand 25 kw. or less:
Primary kw-hr. charge 7.77 cents per kw-hr.
Secondary kw-hr. charge, 6 cents per kw-hr.
Primary charge applies according to the following table:

Demand in 50-watt equivalents.	Primary charge applies to the following number of kw-hr.
1 to 50	150
51 to 60	175
61 to 70	200
71 to 75	225
76 to 85	250
........etc........	

B. Demand 25 kw. to 50 kw.:
Primary kw-hr. charge, 7.77 cents per kw-hr.
Secondary kw-hr. charge, 6 cents per kw-hr.
Tertiary kw-hr. charge 4 cents per kw-hr.
The primary and the secondary charges apply according to the following table:

Demand in 50-watt equivalents.	Primary charge.	Secondary charge.
501-600	First 925 kw-hr.	Next 925 kw-hr.
601-700	First 945 kw-hr.	Next 945 kw-hr.
701-800	First 965 kw-hr.	Next 965 kw-hr.
801-900	First 985 kw-hr.	Next 985 kw-hr.
901-1000	First 1000 kw-hr.	Next 1000 kw-hr.

C. Demand above 50 kw.:
Primary kw-hr. charge 7.77 cents per kw-hr.
Secondary kw-hr. charge, 5 cents per kw-hr.
Tertiary kw-hr. charge 3 cents per kw-hr.
The primary charge applies for the first 20 hours' use of the connected load, the secondary for the next 20 hours' use and the tertiary, of course, for the excess. We see, therefore, that beginning from demands of 50 kw. we have a pure Wright demand rate, but not for demands below that amount.

Some of these rates require more or less study in order to arrive at a thorough understanding of their meaning. This study is very much simplified and the understanding of the various rate systems in general is made much easier by the systems of analysis explained in the following (Part IV), especially by the graphic system.

(To be continued.)

LYNN SECTION A. I. E. E. LEARNS ABOUT ATOMIC STRUCTURE.

In General Electric Hall, West Lynn, Mass., Dr. Saul Dushman, on Nov. 5, gave a lecture on "Structure of the Atom." Dr. Dushman, who is connected with the Research Laboratory of the General Electric Co. at Schenectady, N. Y., illustrated his address with lantern slides and a model.

SIGNALING SYSTEMS TO BE DISCUSSED.

A meeting of the Signaling Systems Committee, National Fire Protection Association, is scheduled for Nov. 18-20 at 141 Milk street, Boston, according to Chairman Ralph Sweetland. Proposed amendments to present regulations and other matters concerning signaling systems and fire hazards will be discussed.

6 Optional Residence Lighting schedule, Oklahoma City, Okla.:
10 cents per kw-hr. for the first 5 kw-hr. per active room,
7 cents per kw-hr. for the next 5 kw-hr. per active room,
3 cents per kw-hr. for the excess.
Residence Lighting schedule of Tacoma, Wash.:
5 cents per kw-hr. for the first 40-watt-hours per sq. ft. active floor area,
1 cent per kw-hr. for the excess.

7 Residence schedule of St. Louis, Mo.:
8 cents per kw-hr. for the first 4 kw-hr. for each of the first 4 active rooms, plus 2½ kw-hr. for each excess room,
6 cents per kw-hr. for excess up to 7 kw-hr. per room for all active rooms,
3 cents per kw-hr. for the excess.
This latter kind of Wright rate is not easy to understand for the beginner; the analysis of Sections 161 and 167 will explain it fully.

8 Retail Power, Akron, O.:
5 cents per kw-hr. for 30 hours' use of the demand
4.4 cents per kw-hr. for 60 hours' use of the demand
3.9 cents per kw-hr. for 90 hours' use of the demand } 21 steps
.... etc. ....
1.5 cents per kw-hr. for 630 hours' use or over

9 Wholesale Combined Light and Power rate of Dallas, Tex., (see next footnote).

10 As, for instance, in the example of Dallas, Tex., where the rate is a step meter rate with a load-factor discount. This discount is given only, however, if the energy consumption is in excess of 50,000 kw-hr., which brings a further element into the rate.
Or, General Lighting rate, Northern Electric Co., Portland, Ore.: Primary rate covering the first 100 hours' use of the demand:
8 cents per kw-hr. for the first 10 kw-hr.
7 cents per kw-hr. for the next 70 kw-hr.
6 cents per kw-hr. for the next 100 kw-hr.
5 cents per kw-hr. for the next 720 kw-hr.
4 cents per kw-hr. for the next 1100 kw-hr.
3 cents per kw-hr. for the next 1500 kw-hr.
2.5 cents per kw-hr. for the excess.
Secondary rate covering the excess over 100 hours' use of the demand:
Demand 5 kw. or less. 3 cents per kw-hr. for next 1000 kw-hr.
2 cents per kw-hr. for excess.
Demand 5 to 30 kw... 2 cents per kw-hr. for next 1500 kw-hr.
1.5 cents per kw-hr. for excess.
.... etc. .... etc. ....

11 Such as, for instance, changes of the unit prices by blocks or by steps, guarantees for a minimum bill or minimum demand or minimum consumption, discounts of various descriptions, such as quantity discounts, discounts for guaranteed bill, for guaranteed consumption, for guaranteed demand, for guaranteed term of contract (for instance, Lowell, Mass.), seasonal discounts, etc.

Pulverized Coal Under Boilers

Relative Theoretical Performance of Stoker-Fired and Pulverized Coal—Comparative Costs—Abstract of A. S. M. E. Paper

By FREDERICK A. SCHEFFLER and H. G. BARNHURST

SINCE the purpose is to present the facts which indicate the coming general adoption of pulverized coal as a fuel for boilers, the discussion is presented in the form of a comparison with stoker firing, the latter being the most efficient method in general use for burning solid fuel under boilers.

The ultimate adoption of a new method depends entirely on its overall commercial efficiency. In the generation of power, overall efficiency may be considered as composed of the following factors: reliability, cost and adaptability. A method may acquire a wide field if it shows improvement in any one or two of these points. Improvement in all three points leads to the general superseding of other methods.

Comparison of Stoker with Pulverized-Fuel Plants.

Reliability.—Let us compare the reliability of a pulverized-coal installation with that of stokers. This factor depends on two items: Apparatus for preparing and presenting the fuel for combustion, and continuity of operation of the furnace itself. In a stoker installation the first of these includes the stoker itself. Neglecting the inherent defects of any system that presents a metal mechanism to the action of high temperatures, it may be admitted readily that the stoker system is satisfactorily reliable, with respect to its apparatus, for preparing and presenting the coal for combustion.

The corresponding mechanisms for pulverized fuel are equally reliable. This fact is proved by their widespread use for years in the cement industry and more recently in an ever-increasing variety of industries. It should be recognized that these mechanisms are not innovations, but are the result of years of development under operating conditions. Proper design of equipment by engineers of standing who are specialists in this line has made negligible the danger of dust explosions.

The second condition for reliability is the continuity of operation of the furnace. Here again we find an apparent balance between stoker and pulverized-fuel installations during operation. The advantage lies with pulverized fuel, however, for several reasons. The mechanism is altogether outside the furnace, hence cleaning and adjustment and the making of the few repairs required need not interrupt the operation of the boiler. In case of sudden necessity the fire may be ignited and quickly brought to full intensity, or it may be extinguished almost instantly. Greater uniformity of flame and temperature is conducive to longer life of the furnace lining in a properly designed furnace, and to the minimum variation in furnace efficiency. Finally, the pulverized-fuel installation relieves the power plant from dependence upon the availability of a certain grade of coal. Stokers will not handle all grades of coal.

Cost.—This second factor refers to the cost per B.t.u. delivered to the boiler. The various items entering into this cost by the stoker system comprise power, repairs and maintenance, labor, interest on investment, depreciation, insurance and taxes.

With pulverized-coal equipment the cost of fuel for the drier should be added to the preceding items. A moment's consideration will show that this item must be taken care of in the furnace of a stoker-fired boiler and that it is clearly cheaper to remove the excess moisture content from the coal in a drier, from which the gases leave at very low temperature, than in the furnace itself, where the evaporation of the moisture damps the fire, increases the content of inert gas and at the same time carries off a very perceptible amount of heat.

Returning to the balanced cost items, it appears that these show a saving in favor of pulverized fuel

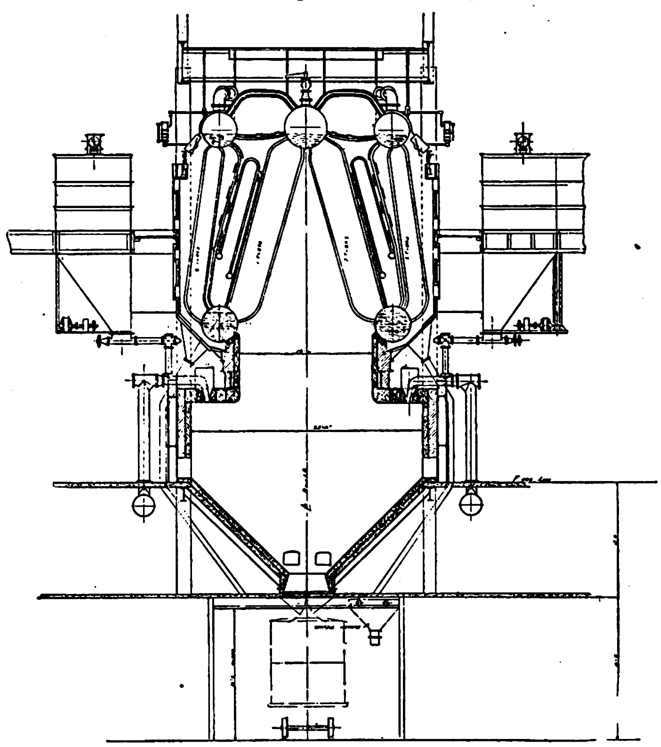

Fig. 1.—2400-Hp. Detroit Edison Type Boiler Arranged to Burn Pulverized Coal at 200% Rating.

in a large power plant and for the stoker in a small power plant. The figures in question are discussed further on in detail. It should be noted that when central pulverizing plants are built, they will relieve small power plants of the necessity for maintaining pulverizing equipment and make pulverized fuel considerably cheaper than stoker-fed fuel regardless of the size of installation. This feature is already being carried out successfully.

The final factor of the cost, furnace efficiency, which governs all the others, results in all respects to the advantage of pulverized fuel for the following reasons:

First: The fuel enters the combustion chamber in a finely divided state, being introduced with air at low pressure, and ingly pays for electric light. Moreover, the use of these appliances improves the central station's load-factor and thereby it cheapens the service eventually to all customers, because a central-station equipment which is being used 24 hours a day is able to produce the unit kilowatt-hour of energy as well as kilowatt of demand more cheaply than one used during a short period of the day only and then resting idly.

The demand and energy consumption of these appliances is as a rule quite considerable and is a large multiple of that of an ordinary household lamp. The capacity of almost any of these household appliances runs into the hundreds of watts and sometimes (ranges, etc.) into the thousands. The capacity of one or two of these devices may exceed that of the whole lighting installation. Therefore the leveling effect of these appliances on the total residential load curve can be a very considerable one.

For these reasons it is generally recognized by central-station managers that the use of domestic appliances should be encouraged in the mutual interest of the central station and of the customers.

150. The ordinary step and block meter methods, either as applied to the energy (step and block meter rate) or as applied to the rating of the demand are a step in this direction. However, with these two methods the lowering of the charges does not clearly apply to the use of appliances, but to the larger user in general.

The reduction of the charges to the user of the appliances, regardless of the amount he is using is more outspoken in the following method used by a number of central stations which base their rated demand on the connected load (either full load or a certain percentage) or on the number of sockets or outlets. The demand of the above mentioned appliances is then exempted from the rated demand [23] or it is counted at a smaller percentage than the lighting load.[24] Where the demand is rated by sockets or outlets the first receptacle in each room may be exempted.[25]

The same object of automatically allowing the residential customers a lower rate for "appliances" than for lights is at the bottom of the most modern system of residential rates, the "number-of-rooms" and the "floor-area" rates. The idea of these rates is that the actual lighting demand of a residence depends on the number of rooms or on the floor area and that the deviations from the average in individual cases are generally not large.

To illustrate this by a simple case, a demand charge might be made of a certain amount for every room or for every 100 sq. ft. of floor area, and an energy charge of, let us say, 5 cents would then be added for every kilowatt-hour consumed.

[23]Residence Lighting schedule of Pueblo, Colo.: The rated demand is the full connected load of lamps only.

Retail Lighting schedule of Washington, D. C. (includes all residence service): The rated demand is the full load, not counting small fans, heating and cooking appliances.

Residence Lighting schedule of Cincinnati: The demand is determined by inspection as 70% of the connected load. Small motors, heating devices and appliances for domestic use consuming less than 1 kw. are not figured in the demand.

Residence Lighting schedule of Cleveland: 17 watts for each outlet. Fans, heating and cooking appliances, charging sets and motors for domestic purposes not counted.

[24]General Lighting schedule of Saginaw, Mich.: Residence customers 80% of first 500 watts connected plus 60% excess. Appliances, such as electric ranges, ovens, etc., will be included at two-thirds of their maximum capacity, while other miscellaneous appliances are not included in determining the active load.

General Lighting schedule, Flint, Mich.: Residence customers full connected load. Electric ranges, ovens, etc., will be included at 75% of their maximum capacity. Other miscellaneous appliances not included.

[25]Cleveland, Ohio. See "Rate Research," Vol. VIII, page 179.

This rate, like every other one with a demand charge apparently penalizes those customers who are using their installation for a shorter time than the average customers of that class, that is, the customers with a small load-factor, inasmuch as the average price paid by them *per kilowatt-hour* is higher. Conversely, it apparently favors the customers with a large load-factor by reducing their average charge per kilowatt-hour. A special feature of the rates under discussion is the fact that the customer who has not installed lamps of sufficient size and number to give adequate illumination in the whole house is also penalized by being charged a relatively higher price, because he has to pay the same amount for the demand—though not for the energy—as if he had installed lamps of sufficient or ample total wattage. On the other hand, he gets additional service for "appliances" against payment of not more than the energy charges for the additional service.

151. The question is hard to decide whether the number of rooms or the floor area is a better basis theoretically. It depends to a certain degree on the size of the rooms, as we can see from the following. If we imagine a very large hall, an auditorium, a skating rink, or the like, the wattage required for a given illumination (with a given type of lamp, etc.) depends obviously only on the floor area. If we subdivide the hall by partitions into several smaller rooms, these partitions will cast shadows and shut off the light of certain lamps from certain parts of the floor, thereby reducing the illumination. Every room will get light only from the lamps immediately above it and the rest of the light will be lost (neglecting the fraction which is reflected from the partition walls). To maintain the illumination the wattage per floor area must therefore be increased as the number of rooms in the same total floor area increases, that is as the size of the rooms decreases.

In practice the great majority of central-station managers who have chosen this system of rates have decided for the number-of-rooms in preference to the floor-area[26] basis, probably because the number of rooms is easier to determine than the floor area and the method of determination is easier understood by the average customer.

It is possible to combine the number-of-rooms principle to a certain degree with the floor-area principle by stipulating in a number-of-rooms rate that rooms with an area over a certain size count as two rooms[27] or that they count as many times as they exceed that maximum area.[28]

In at least one instance the floor-area principle is combined with the connected-load principle for determining the demand, in such a manner that the demand is rated as the connected load with the restriction that lighting equipment in excess of one watt per square foot of floor area is not considered.[29]

152. It has been shown above (Section 148) that, where the number of sockets is the basis of the rated demand the sockets in certain localities are not counted. In the same manner and for the same reason certain rooms—or their floor area, respectively—are exempted in the number-of-rooms and floor-area rates. We thus get "active" and "nonactive" rooms.

[26]For statistical figures see the end of Section 152.

[27]El Paso, Texas, 300 sq. ft.

[28]Superior Water, Light & Power Co., Superior, Wis., 300 sq. ft.

[29]Portland Railway, Light & Power Co., Portland, Ore.: Nor are heating, cooking and power appliances considered in this residence rate.

The definition of an active and a nonactive room is as a rule made by simply enumerating the different kinds of rooms which fall under one or the other or both classes. The rates of different companies differ from each other to a slight degree in that respect. Nonactive rooms are in all or almost all schedules: halls, bathrooms, basements, attics, closets, and porches. In several of the schedules we find further specified as inactive: The first three bedrooms, laundry, pantry, alcoves, garage, unfinished rooms, coal shed, storage rooms, etc. The real estate rating[30] or the architect's rating simply is made the criterion to distinguish the active from the nonactive rooms in isolated cases. The rooms of the first floor are rated differently in one case.[31]

The rates on the number-of-rooms principle and the floor-area principle have not yet found as wide an application in this country as they would deserve. An investigation (which does not claim completeness) showed 16 companies in the United States employing the number-of-rooms principle in 17 cities, and two companies only using the floor-area principle in three cities.

The number-of-rooms rates and the floor-area rates are almost exclusively designed on the principle of the so-called Wright demand rate or its modifications. Further discussion will therefore be put off until that principle has been explained (see Section 155 *et seq.*).

3. Description of the Various Rate Systems Based on Both Energy and Demand.

a. The Hopkinson Rate.

153. The simplest system of rates which embodies both an energy charge and a demand charge is the rate system which was devised by Dr. John Hopkinson in 1892. The customer's bill under the Hopkinson system consists of two separate portions, a demand charge and an energy charge. The demand charge is figured as the product of a certain fixed unit demand charge times the number of kilowatts (or horsepower or whatever unit has been chosen for the demand), and likewise the energy charge is the product of the unit charge times the number of kilowatt-hours consumed.[1] (It goes without saying that the energy charge is lower than it would be under a straight meter rate for the same service.)

The unit demand charge as well as the unit energy charge can be varied with increasing demand or energy, respectively, according to the block system ("demand block," "energy block" and "double block" systems), or according to the step system as shown for the pure meter rates in Sections 122 and 119.[2] "Demand block" and "demand step" systems with unchanged energy charges do not occur in practice as far as the author's knowledge goes.

b. The Doherty Rate.

154. This rate is an amplification of the Hopkinson rate by the addition of a customer charge.[3] It is named after Henry L. Doherty, the well-known New York engineer and financier who, to the author's best knowledge, introduced this system for the first time in Denver in the first decade of this century.

The Doherty rate can also be found in practice with a graduation of the energy charges.[4] Graduations of the demand charges by blocks or any graduations by steps are not found in practice with Doherty rates, as far as the author's knowledge goes.

c. The Wright Demand Rate (Multiple Rate).

155. This rate, which is one of the most generally used systems, has been designed by Arthur Wright, of Brighton, England, after whom it is generally called. Sometimes, especially if it embodies more than two steps, it is also called the "multiple rate."

This rate mentions only kilowatt-hour charges and yet, as will be demonstrated later (Sections 160, 161, 166 and 167) it embodies the equivalent of a demand charge and sometimes of a customer charge as well. A certain charge per kilowatt-hour ("primary charge") is made for the first block of kilowatt-hours of every customer; another one ("secondary charge") is made in the next block of kilowatt-hours, and so on, just like in the block meter rate, with this difference that the blocks are not determined by a certain fixed absolute number of kilowatt-hours but by some relation of the customer's kilowatt-hours to the customer's demand, in most cases as a certain fixed number per every kilowatt (or other unit) of demand. In other words, the blocks are not energy blocks, but generally load-factor blocks.[5]

Practically all the rates on the number-of-rooms or floor-area basis are Wright demand rates, either in the simple form just discussed that the number of kilowatt-hours in each block is proportional[6] to the

---

[30] Minneapolis. (See "Rate Research," Vol. XI, page 164.)

[31] Pittsburgh. (In apartment houses bedrooms and bathrooms are counted as second-floor rooms, all other rooms and halls as first-floor rooms).

[1] Refrigerating rates of the Universal Electric & Gas Co., San Francisco: Demand charge $2 per hp. connected, plus an energy charge of 1 cent per kw-hr. Auxiliary service of the same company: Demand charge of $2.25 per kilowatt connected plus an energy charge of 2 cents per kw-hr.

[2] Energy Block System (demand charge unchanged):
Wholesale Lighting and Power, South Bend, Ind.:
Demand charge $1 per hp. connected, plus an energy charge of—
6 cents per kw-hr. for the first 50 kw-hr.
4 cents per kw-hr. for the next 50 kw-hr.
3 cents per kw-hr. for the next 100 kw-hr.
2.3 cents per kw-hr. for the next 300 kw-hr.
2 cents per kw-hr. for the next 500 kw-hr., etc.
Double Block System:
Wholesale Lighting and Power, High Tension, Boston:
Demand charge—
$60 per year per kw. for the first 15 kw. of demand.
$36 per year per kw. for the next 40 kw. of demand.
$30 per year per kw. for the next 100 kw. of demand.
Energy charge:
5 cents per kw-hr. for the first 1500 kw-hr.
3 cents per kw-hr. for the next 4000 kw-hr.
1.5 cents per kw-hr. for the next 50,000 kw-hr.
1.25 cents per kw-hr. for the next 50,000 kw-hr., etc.
Step System of Demand Charges and of Energy Charges:
Primary Power, Atlanta, Ga.:

Kw. demand	Demand charge.	Plus energy charge of
10 to 20	$1.70 net	0.9 cents per kw-hr. net
21 to 50	1.70 net	0.7 cents per kw-hr. net
51 to 100	1.60 net	0.6 cents per kw-hr. net
101 to 200	1.40 net	0.5 cents per kw-hr. net

Etc.

[3] Optional Lighting rate, Denver, Colo.:
Customer charge $9 per year, payable monthly
plus a demand charge of $1.80 per year per 16-cp. lamp of demand payable monthly (one-third of connected load)
plus an energy charge of 5 cents per kw-hr.
Wholesale Power, St. Joseph, Mo.:
Customer charge $100 per month.
plus a demand charge of 25 cents per hp. connected
plus an energy charge of 1 cent per kw-hr.
In this latter case the object of the customer charge is obviously to restrict the use of these cheap unit charges for demand and energy to the wholesale customer.

[4] Optional Commercial Lighting schedule of the Universal Electric & Gas Co., San Francisco:
Customer charge $10 per month
plus a demand charge of $1 per kw. maximum demand.
plus an energy charge of 1.5 cents per kw-hr. for the first 4000 kw-hr. and 1 cent per kw-hr. for the excess.

[5] General Lighting rates of Sioux City Service Co.:
12 cents per kw-hr. for the first 40 hours' use of the connected load
6 cents per kw-hr. for the excess.
General Lighting schedule, Portland Railway, Light & Power Co.:
9 cents per kw-hr. for the first 6% of the "monthly maximum consumption"
7 cents per kw-hr. for the next 6%
4 cents per kw-hr. for the excess.
"Monthly maximum consumption" means the number of kilowatt-hours which would result from continuous use of the demand.

the same time the choice of a smaller percentage for the rated demand in larger installations expresses the principle of granting lower unit prices to the larger consumer.

The percentage which determines the rated capacity is therefore reduced as the *connected load* increases or as the *number of motors* in the installation increases, or both.

145. Where the connected load is the determining factor of the percentage—which is quite frequent practice—we can use methods entirely analogous either to the "step" or the "block" method, explained in the description of the step meter rate and the block meter rate, respectively (Sections 119 and 122). The same laws which govern the decrease of the energy charge per kilowatt-hour with increasing energy consumption in the step and block meter rates apply here to the decrease of the percentage with increase of the connected load.[12]

As regards those rather infrequent cases where the number of motors installed is used to determine what percentage of the connected load is to make up the rated demand, the simplest conceivable method, and the only one used in practice, is to state how large the percentage of the connected load is which corresponds to every number of motors. Usually only two or three different percentages are used in this manner; for instance: one for one motor, another one, say, for two to five motors, and the third one for more than five motors.

The use of the number of motors alone, without any reference to the size of the connected load, does not occur. It is either combined with the step or block method of the connected load as just described in such a manner that the percentages for the various numbers of motors are different for the different steps or blocks of the connected load[13] or the use of the number of motors applies to a certain range of the connected load only and outside of that range the percentage is entirely independent of the number of motors.[14]

Another measure to take into account the effect of the diversity of the motor loads can be made by assigning a lower percentage of the connected load to the rated demand if the motors are driving a group of power-consuming machines than if we have individual drive of the power-consuming devices. In both cases we will have the same diversity between the power demands of the various machinery,[15] but in case of the group drive—if the size of the motors has been chosen intelligently—the diversity of the loads on an individual motor has been anticipated and the capacity of the motor, that is the "connected load," is selected correspondingly smaller than in case of the group drive, although the character of the mechanical load on the motors is exactly the same in both cases. Consequently the actual maximum demand is a larger percentage of the motor capacity in case of group drive than in case of individual drives[16].

In a few cases the size of the largest motor installed is chosen to determine the percentage of the connected load which is to form the rated load. In these cases the block method is used: The rated demand is a certain percentage of the capacity of the largest motor plus another percentage of the rest of the connected load.[17]

146. Instead of reducing the percentage of the connected load which is to be used as the basis for the determination of the rated demand, we can get the same numerical results by rating the demand as the full connected load and reducing the demand charge accordingly. Whichever law—step or block—we use for the reduction of the percentage of the connected capacity, the same law will apply to the equivalent reduction of the unit demand charge and the latter will be reduced in the same proportion as the per-

[12] Step method: Power rates, Cincinnati:

Connected Load.	Rated demand in % of connected load.
Under 5 hp.	90%
5 to 10 hp.	75%
10 to 20 hp.	70%
20 to 50 hp.	65%
50 to 100 hp.	60%
100 hp. and over	55%

Block method: Optional Commercial Lighting schedule, Bay City, Mich.:

Connected Load.	Rated demand in % of connected load.
First kw.	95%
Next kw.	90%
Next 2 kw.	85%
Next 6 kw.	80%
Over 10 kw.	Varies with the class of business.

[13] A. Combined with steps of connected load:
1. Optional Commercial Lighting and Power schedule, Cleveland:

Connected load.	One motor.	Two or more motors.
Up to 5 kw.	80%	75%
5 to 10 kw.	75%	70%
Over 10 kw.	70%	65%

2. Wholesale Power, Newark:

Connected load.	One motor.	Two or more motors.
Up to and incl. 50 hp.	70%	60%
Over 50hp.	70%	50%

B. Combined with blocks of connected load:
General Power schedule of the Portland Railway, Light & Power Co., Portland, Ore.:

Connected load.	One motor.	2 to 5 motors.	Over 5 motors.
First 5 kw.	95%	90%	85%
Next 5 kw.	75%	70%	65%
Excess	65%	60%	55%
Minimum	75%	70%	65%

[14] Retail Power schedule, Philadelphia:
Rated demand:

One motor connected—85% of connected load	If less than 10 hp. are connected.
Two or more motors connected—75% of connected load	

Optional Power schedule, Lancaster, Pa.:
Rated demand:

One motor connected—85% of connected load	If 25 to 50 kw. are connected.
Two or more motors connected—80% of connected load	

When the connected load is different from that specified (under 10 hp. or between 25 and 50 kw., respectively) another method of determining the rated demand applies.

[15] This means that their joint maximum demand will be smaller than the sum of their individual maximum demands because their maxima do not occur at the same time.

[16] This discrimination of the demand charges between group drive and individual drive is very rare; only one example could be found, that is the Retail Power schedule of Wilmington, Del.:

Connected load. Kw.	One motor.	Two motors. Group.	Two motors. Indv.	3 to 5 motors. Group.	3 to 5 motors. Indv.	6 to 10 motors. Group.	6 to 10 motors. Indv.	11 to 19 motors. Group.	11 to 19 motors. Indv.	Over 19 motors. Group.	Over 19 motors. Indv.
Under 3		98%	95%								
3 to 4.9	99%	97%	93%	90%	82%						
5 to 9.9	97%	95%	90%	88%	80%	85%	78%				
10 to 19.9	95%	92%	86%	85%	77%	82%	73%	75%	68%		
20 to 49.9	93%	90%	83%	82%	75%	78%	70%	73%	65%	70%	62%
50 to 99.9	92%	85%	78%	80%	72%	75%	68%	70%	62%	68%	60%

[17] Wholesale Lighting and Power schedule of San Francisco: For installations under 50 hp. the demand may be estimated at the option of the company as 100% of the rated capacity of the largest motor installed, plus 60% of the rated capacity of the additional motors or other devices.

Retail Power, Louisville:

Up to 10 hp. connected—30% of largest motor	+40% of the total connected load.
10 to 50 hp. connected—25% of largest motor	
Over 50 hp. connected—20% of largest motor	

This might also be written to conform with the form of expression chosen above, as:

Up to 10 hp. connected—70% of largest motor	+40% of the capacity of the additional motors.
10 to 50 hp. connected—65% of largest motor	
Over 50 hp. connected—60% of largest motor	

centages of the connected load have been reduced.[18] Both principles of reduction—step and block—are sometimes found combined with each other as block-block, step-block or step-step systems. For instance, the percentage of the connected load decreases with increasing connected load according to the block law and the unit demand charge also decreases with the increasing connected load according to the block law. This "block-block" or "double-block" system can be reduced to one single-block system[19] either based on full connected load instead of percentages of the same and employing a varying demand charge or, if preferred, with a constant demand charge and varying percentages of connected load. (This does not mean that either of these single-block systems is always preferable to the double-block system or vice versa; the fact is mentioned here only as an instance of the interchangeability of various forms of rates with the same numerical effect, to introduce the reader to the methods of analyzing the meanings of the various rate schedules). Similarly a "double-step" system is equivalent to a "single-step" system with the number of steps generally equal to the sum of the numbers of steps in the two systems. Finally a "step-block" system is conceivable which would be resolved into a combined step and block system, again either based on full connected load, or with a constant demand charge.

147. The block and the step method and their combinations are the simplest methods of varying the demand charges with the connected load. There are other methods which are very frequently used. In these the demand charges depend on the energy consumption as well. The demand charge is then generally altered not when the *demand* but when the *load-factor* exceeds a certain limit. These less simple methods will be discussed later (Wright system, etc.).

c. The Number of Sockets or Outlets.

148. Just as the connected load is an approximation of the maximum demand so the number of sockets or outlets is an approximation of the connected load, and just as the introduction of the connected load in lieu of the maximum demand brings about certain advantages and disadvantages, namely an increase in simplicity and a decrease in accuracy, so this same advantage and disadvantage is correspondingly further enhanced by the introduction of the number of sockets as basis for the demand charge.

The use of the number of sockets is an exception in case of rates which are based on both demand and energy consumption. The basis for the demand may be in these cases either the full number of sockets connected[20] or a certain percentage of that number,[21] in accordance with the parallel proceedings with the connected load (Section 143).

Sockets for lights which are liable to burn a few minutes only at a time (so-called convenience lights) and for lights which are liable to burn only occasionally or not at peak-load time are sometimes exempted from the rating for the demand,[22] so as to avoid a restricting influence on the installation of the customer and to let him get the benefit of the convenience of electric lighting without unduly high charges.

d. Encouragement of the Use of Domestic Appliances. Number-of-Rooms and Floor-Area Basis.

149. Whereas in the earliest times of central-station history electricity was used in residences purely as a lighting agent, it is now being employed more and more for heating and power purposes around the house, in radiators, stoves, toasters, percolators, milk-warmers, flatirons, ranges, washing machines, vacuum cleaners, fans, battery chargers for automobiles and in similar domestic appliances.

These appliances are used as a rule at a different time of the day than the electric lights and their use increases the peak of the central station in a far smaller measure, if at all, than the use of the same capacity in lamps would. Therefore, their operation costs the central station much less than their capacity implies. Their use should be cheapened also from the point of view of the value-of-service principle, since nobody would, for instance, care to use an electric range if he had to pay the same price for current as he will-

[18]To quote a simple example, the demand charge of the (optional) Commercial Lighting rate of Bay City, Mich., is $2 (net) per kilowatt of active load and the active load is—
95% for the first kw. connected.
90% for the next kw. connected.
85% for the next 2 kw. connected.
80% for the next 6 kw. connected, etc.
This plainly amounts to the same numerical effect as if we would change the demand charge to
95% of $2 = $1.90 for the first kw. connected.
90% of $2 = $1.80 for the next kw. connected.
85% of $2 = $1.70 for the next 2 kw. connected.
80% of $2 = $1.60 for the next 6 kw. connected.

[19]The following example will illustrate this:
The Lighting and Power rate of Grand Rapids, Mich., charges a yearly demand charge of—
$24 per kw. of the first 50 kw. of active load (rated demand).
$18 per kw. of the next 50 kw. of active load.
$15 per kw. of the excess.
Plus an energy charge which is of no interest in this connection.
The active load or rated demand is determined in the following way from the connected load:
100% of the first 20 kw. connected.
90% of the next 20 kw. connected.
80% of the next 20 kw. connected.
60% of the next 20 kw. connected.
50% of the next 20 kw. connected.
30% of the excess.
To reduce this rate to one based on the full connected load we proceed as follows:
The first 20 kw. connected are evidently charged at $24 per kilowatt connected.
The demand charge for the next 20 kw. connected is obviously $0.90 \times \$24 = \$21.60$.
The demand charge is changed from $24 per kilowatt of active load to $18 as soon as the active load reaches 50 kw. We have first to determine what the corresponding connected load is.
40 k.w connected corresponds to $20 + (0.90 \times 20) = 38$ kw. rated load.
60 kw. connected corresponds to $20 + (0.90 \times 20) + (0.80 \times 20) = 54$ kw. rated load.
Consequently 50 kw. of rated load lies in the third block of the original load system, that is, between 40 kw. and 60 kw. connected load. The first two blocks of connected load together comprise 38 kw. rated load; this leaves 12 kw. rated load reaching into the third block or, as 80% is the prevailing percentage in that block, $12/.80 = 15$ kw. connected load. The total connected load corresponding to 50 kw. rated load is therefore $40 + 15 = 55$ kw.
After 50 kw. of active load (55 kw. connected) has been reached, the demand charge changes from $24 per rated kw. to $18 per kw., that is, from $0.8 \times \$24 = \$19.20$ per connected kw. to $0.8 \times \$18 = \$14.40$ per connected kw.
In this manner we arrive by successive steps at the following table:

First 20 kw. connected	$24 per kw. connected
Next 20 kw. connected	21.60 per kw. connected
Next 15 kw. connected	19.20 per kw. connected
Next 5 kw. connected	14.40 per kw. connected
Next 20 kw. connected	10.80 per kw. connected
Next 20 kw. connected	9.00 per kw. connected
Next 80 kw. connected	5.40 per kw. connected
Excess over 180 kw. connected	4.50 per kw. connected

In the same manner we might also express this rate as a rate with one single kilowatt charge applying to different percentages of the connected load.
The reader who is familiar with elementary mathematics will find preferable the algebraic methods as described in Part IV.

[20]Residence Lighting schedule, Indianapolis, Ind.: All lighting sockets; sealed sockets, baseboard and floor receptacles for small power appliances not counted.

[21]Residence Lighting schedule, Youngstown, Ohio: Of the sockets in the principal rooms as specified in the schedule (that is, omitting closets, bath room, attic, etc.) seven-tenths are considered as 50 watts each and three-tenths as 25 watts each. Four-tenths of the wattage so obtained is then counted as the customer's demand. An easy calculation reveals that this simply means 17 watts are counted for every one of the sockets in the respective rooms. The demand charge per kilowatt may thus be reduced to a demand charge per socket.

[22]Residence Lighting schedule, Youngstown, Ohio: Lamps in the following rooms are not counted: Vestibule, porch, closets, bath room, lavatories, dressing rooms, attic, basement, pantries, summer kitchen, servant's room, back halls, back stairways, billiard room, barn and yard.

is approximately perfectly mixed with the air for theoretically perfect combustion. Therefore no excess air is required for complete combustion. The units of heat taken up by heating excess air reduce the combined boiler and furnace efficiency. It is impossible to get a uniform fuel bed on a stoker or a grate and, therefore, impossible to approach complete combustion without introducing excess air. Should it be desired for other reasons to introduce excess air with pulverized fuel, it can be done in exact amounts, evenly distributed, without affecting the uniform nature of the flame and flue gases. This uniformity, which cannot be obtained in either grate or stoker installations, means maximum efficiency in all parts of the furnace and a maximum rate of heat transference to the boiler throughout its exposed area. It also means that flue-gas analysis gives an accurate determination of conditions in the furnace and that control of coal delivered and air supply can be adjusted with great accuracy.

Second: In pulverized form all of the combustible is burned, a consummation certainly impossible in lump-coal firing by either hand or stoker. It is not unusual to find 20 to 30% of carbon in ash refuse from grate or stoker-fired boilers.

Third: With pulverized fuel there are no standby losses with change of load or when shutting down, such as banked fires, etc.

Fourth: With properly designed pulverized-fuel apparatus nothing of a mechanical nature takes place in the furnace. In stoker and grate firing not only is the mixing with the air done in the furnace, but the presentation of fresh surfaces of combustible to the air supply must take place by the removal of the ash and its discharge through the grate bars, or the pressure must be great enough to force the air supply through the ash bed.

Adaptability.—Pulverized fuel is here pre-eminent. The primary feature is the possibility of burning all

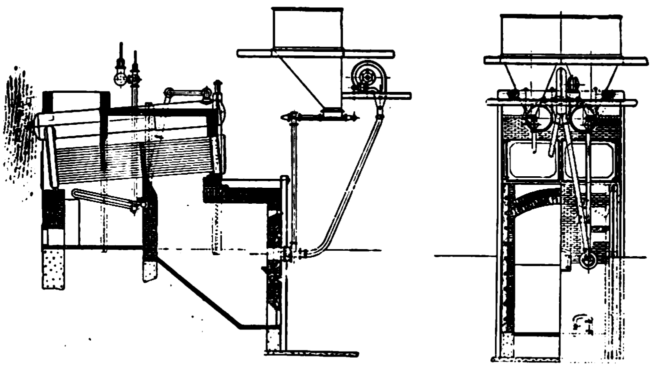

Fig. 2.—425-Hp. Heine Boiler Arranged for Pulverized-Coal Firing.

grades of fuel without affecting the efficiency of the furnace. To burn anthracite and very low grades of fuel requires a furnace allowing a return flow of the flame past the incoming flame, to heat up the incoming fuel, and in furnace of this type fuel containing over 50% ash has been burned with high efficiency. The stoker is very much restricted in comparison.

The flexibility in the use of pulverized fuel is perfect, and the fire may be instantly adjusted to suit any condition of overload or lower load, including the cutting in and out of the boilers. The paramount importance of this feature and the utter impossibility of approaching it with stoker or grate firing is readily evident. Furthermore, the operation and the determination of conditions for complete combustion may be made automatic, the result being a smokeless and sootless boiler plant, which is essential in modern cities.

Furnace Design.—A few words on the design of furnaces for pulverized fuel may be of interest. The primary requisite for good results is to maintain low velocities in the furnace. The combustion is no less perfect with high velocities, but this will result in damage to the linings and in their erosion. A furnace cubical in shape usually gives the most satisfactory results.

The burners should inject the coal under low pressure and should permit of varying the density of the mixture in the burner itself. Their location and number will depend upon the size of the boiler and rating required, and also may be varied to suit the grade of fuel. High boiler ratings such as are used in modern boiler practice can be obtained when desired, and such overratings should be predetermined and the furnace volume designed accordingly.

It will be noted that pulverized coal behaves more nearly like liquid and gas fuels than it does like lump coal and that it is in the ideal state for burning with the highest possible efficiency. It has been shown that it is superior to lump coal as regards all three factors of overall efficiency and these statements are susceptible to proof upon investigation. The novelty of the pulverized-fuel plant is rapidly beginning to disappear, and on account of the fact that all obtainable coals are apparently becoming more inferior in quality, the interest in the use of pulverized fuel is very general throughout the United States and other countries.

In Table 1 will be found an itemized statement of the costs of pulverizing coal, and elsewhere some statements as to the cost of stoker operation for comparison purposes. Table 2 gives a list of boiler in-

TABLE 1—COST OF DELIVERING PULVERIZED FUEL TO BOILERS.

	100-ton plant, dollars per net ton.	1000-ton plant, dollars per net ton.
Power at ¾ ct. per kw-hr. and 17 kw-hrs. per net ton	$0.1275	$0.1275
Labor at 40 cts. per hr.	0.14	0.04
Drier coal at $5 per net ton delivered	0.06	0.06
Repairs	0.07	0.07
Total actual cost of pulverizing per net ton	$0.3975	$0.2975
Interest at 6%	0.105	0.039
Depreciation	0.12	0.04
Taxes and insurance	0.035	0.013
Total cost per net ton	$0.6575	$0.3895

stallations using pulverized coal and Table 3 reports of preliminary tests made on some of the pulverized-fuel installations now in operation. While these do not show the maximum efficiency to be expected with the further development of the art, they nevertheless indicate that the inherent difficulties have been solved and that at the present moment pulverized fuel is in a position to compete advantageously with any other method of burning solid fuel under boilers.

Comparison on an Efficiency Basis.

One of the most prominent engineers in this country, a member of the society, has stated that the combined boiler and furnace efficiency by the month, day in and day out, of a modern stoker-fired power plant with the best average plant operation is not better than from 63 to 65%, although a carefully conducted test on one boiler and furnace might show during several hours' run 75% efficiency. This statement has been confirmed by other engineers.

The results with pulverized fuel would be totally different. This is no apparent reason why a combined furnace and boiler efficiency of 75%, and even higher, could not be maintained throughout the year, as the operation of the plant would be practically equivalent to that of a fuel-oil installation, in which stand-by losses, banked fires, etc., are almost entirely eliminated. Unquestionably there should be a saving, under these circumstances, of 12 to 15% of the total coal consumption in favor of pulverized coal, and this reduction, on a basis of even a 2000-boiler-hp. plant, will show a very fair return on the investment, neglecting the fact that a lower-grade and cheaper coal could be used.

Cost of Pulverizing Coal.

The cost of pulverizing the coal is of prime importance as low costs are essential for success and are achieved when the quantity used per day of 24 hours exceeds 100 tons. The cost of pulverizing is made up of a number of items as follows:

Power.—The power required is from 12 to 13 kw-hrs. per net ton of coal crushed, dried and pulverized. The additional power required for transferring the coal to the point of use and feeding it to the boilers will vary considerably, depending upon the distance transported, the size and number of the boilers, and the conditions under which they operate. The power required for this latter purpose varies between 4 and 6 kw-hrs. per net ton, so that the total power is 17 or 18 kw-hrs. per net ton. In the following paragraphs the cost of power has been assumed at ¾ ct. per kw-hr.

Repairs.—The item of repairs, including material, labor and general upkeep of the plant or maintenance, for the entire pulverizing plant and burning equipment will vary from 7 to 10 cts. per net ton of coal handled. The figures depend upon local conditions, and the size and general arrangement of the entire installation.

Drier Fuel.—The item of coal for drying depends directly upon the percentage of moisture and upon the price of coal. Ordinarily only from 1 to 1¼% of the total amount of coal used is required for drying. Assuming coal to have an average of 7% moisture as received and the cost to be $2.50 per net ton, the cost per net ton of drying the coal will be 3 cts. At $5 per net ton the cost of the drier coal will be 6 cts.

Labor.—This item is the greatest variable in connection with the pulverizing of coal, due to the increased output that can be obtained in larger plants per man employed. It is also subject to local rates of wages. For example, assuming labor at 40 cts. per hour, a plant of 100 tons daily capacity, properly designed and equipped, will require approximately 34 labor-hours to prepare the fuel and deliver it to the conveyors, whereas in a plant having a daily capacity of 1000 tons, approximately 115 labor-hours are required. Therefore the labor cost would be 14 cts. per net ton in a 100-ton plant, only 4 cts. per net ton in a 1000-ton plant, and as low as 2½ cts. per net ton in a plant of 5000 tons daily capacity.

Interest.—The interest item is based on 6% of the entire investment, and the cost of the pulverized-coal plant and burning equipment will of course vary considerably with the conditions under which the plant is installed. Roughly speaking, however, the actual investment will vary from $12.80 per kw. output in a 5000-kw. plant down to $4.80 per kw. in a 50,000-kw. plant and $4.12 in a 100,000-kw. plant (assuming a turbogenerator water rate of 16 lbs. and continuous boiler and furnace efficiency of 75%).

All these figures in relation to cost are based on the present high prices. The investment required for a 5000-kw. plant using 100 tons of pulverized coal daily is approximately $64,000 and for a 50,000-kw. plant using 1000 tons of pulverized coal daily, approximately $240,000, so that on a basis of 6%, and allowing for 365 days' continuous operation, the interest item will vary from 10½ cts. per net ton in a 100-ton plant down to 3.9 cts. per ton in a 1000-ton plant.

Depreciation.—Depreciation in a coal-pulverizing plant is usually calculated as follows: The life of the building is considered as 40 years, of the coal driers as 15 years and of the balance of the equipment as

TABLE 2—BOILER INSTALLATIONS USING PULVERIZING COAL

Date of installation.	Name of Company.	Location.	No. of boilers.	Horsepower rating and make of boilers.	Furnace design, per cent of rating.	Coal used.

[1]Also use some waste heat from pulverized-coal-fired furnaces.

to the high voltage *per se,* and can remember no case where a person has received a dangerous shock on the motor side of the distributing switchboard. Certainly the record of 2300-volt motor equipment is as good if not better than that of low-voltage equipments as regards fire and personal accidents.

In view of favorable experience with such equipment from the safety standpoint, it is now proposed to omit the requirement calling for the lead sheathing where no moisture is liable to be present, it being claimed that the lead sheathing does not contribute to safety in dry places. Assuming that the cable will not be subjected to moisture, there have heretofore been five possible advantages attributed to the lead sheathing.

First and most important, the sheathing may serve as a protection to life in that being a conductor it will bridge across any poor joint in the conduit system and insure that the portion of the conduit beyond the faulty joint will be effectually grounded. In other words, it is expected that the sheathing will serve as a bond between the various lengths of conduit, junction boxes, etc. If we could be sure that there were no poor joints between conduit, boxes, etc., there would be no need of the sheathing as a bonding medium. While all joints may be well made when the equipment is installed, there may be some question as to whether they will remain so indefinitely, especially when in buildings where there is a considerable amount of vibration.

Second, it has been claimed that the lead sheathing tends to protect the insulation over the conductors from mechanical injury while the cable is being drawn into the conduit. Injury to the insulation is more liable to give trouble than would be the case if the voltage was lower.

Third, owing to the metallic sheathing intimately surrounding the insulation on the conductors, it is nearer the conductors than the conduit wall except at one point, and therefore if a breakdown to ground occurs followed by arcing a short-circuit between phases is liable to occur quickly and cause the circuit-breaker protecting the faulty cable to open the circuit more promptly than if the sheathing was not present.

Fourth, another claim made for the sheathing is that it tends to prevent flattening out of the larger rubber-insulated cables, which results in the insulating wall between conductors and conduit decreasing in thickness.

Fifth, it has been claimed that the sheathing tends to preserve the insulation, especially when varnish cambric is used.

The weight to be put on the advantages claimed for the sheathing is problematical and the question is whether they are of sufficient importance to require the sheathing with the attendant increased cost of the installation. During the period when 2300-volt installations were being tried out, there is but little doubt that the increased cost was warranted. In view of the satisfactory results obtained, however, from the equipment, the question now is whether the increased cost due to the sheathing is justifiable. The second, third, fourth and fifth advantages claimed are of minor importance and should not be considered except in connection with the first. From the standpoint of fire hazard it is possible that the sheathing could be left off in dry places without unduly increasing the hazard, but from a personal hazard standpoint there may be objection.

The Code at present requires rubber insulation on 2300-volt conductors, but there have been many installations put in where varnished cambric was used. This kind of insulation has been used to a large extent in power houses, etc., where high voltages were involved. The experience has been uniformly good even in places where the requirements are most exacting. While there may have been some failures, these have not been more than would have been expected if the insulation were of rubber. There is now a demand that the Code recognize and permit the use of this insulation and there seems to be justice in this.

Discussion on Change in Code Limit for High-Potential Systems.

Another matter now under consideration involving a possible change in the Code is whether 4150-volt Y-connected systems have a sufficiently greater hazard than 2400-volt delta-connected systems to require them to fall under different classes of the Code. Many systems have started out 2400-volt delta-connected and then to meet the needs of increased load have been changed to 4150-volt Y-connected. The change has put them in the extra-high-potential class, and therefore the Code requires that they be kept off from buildings and that certain other precautions be taken. The limitation of 3500 volts for the high-potential class has been used for many years. When this was first decided upon, electrical apparatus and insulation were undoubtedly inferior to that of today, so that it is possible that this limitation may be moved higher without unduly increasing the hazard. If the voltage limitation under discussion is increased, it may be wise to limit the voltage which may be used at motors scattered throughout buildings and accessible to anyone, to that at present permissible, namely 3500, but practically 2300 volts.

Possibly another change which might be made to advantage in the Code would be to make provision for allowing cables carrying voltages up to the limit now permissible to enter noncombustible transformer buildings or vaults located in the midst of a group of buildings, provided the cables were run underground the entire distance between property line and transformer building. Again why not, under favorable conditions, permit motors of voltage up to, say, 13,000, to be installed in separate noncombustible rooms accessible only to the electrician, provided the high-voltage cables are in underground conduit just as mentioned in the case of the lines to transformers?

It seems that the demand for high-potential equipment in and about buildings is sure to increase under certain conditions, and the Code should be in such shape that they will not be discouraged when the conditions are favorable. It is hardly necessary for the Code to go into detail regarding such equipments. Broad fundamental rules, together with good judgment on the part of the inspectors, are all that are needed.

NEED OF ELECTRICAL GOODS IN RUSSIA.

At the weekly meeting of the Electric Club of Chicago, held Nov. 11, Marcus Stowe Hill, who has been in Russia for two years on export work, addressed the members, telling them of industrial conditions in that country. He said Russia was five years in arrears on imports and he showed by inquiries the large demand for electrical material of all kinds. Valuable suggestions for methods of making quotations and handling shipments were also given.

POWER PRODUCTION OF COUNTRY DURING FEBRUARY TO APRIL.

Division of Power Resources, United States Geological Survey, Issues Report on Power Production by Fuels and Water Power.

Continuing a practice inaugurated a few months ago, the United States Geological Survey, through its Division on Power Resources, has compiled the accompanying data on the production of electric power and the consumption of fuel by public utility power plants in the United States for the month of April, 1919. The figures as given are tabulated alongside the corresponding data for February and March for ready comparison. Table I gives the power production in thousands of kilowatt-hours segregated as to production by water power and by fuels. Table II gives the details of the latter classified as to the three principal kinds of fuel and amounts thereof.

The reports of electric power output and fuel consumption for February, March, and April are based on returns received from about 3100 electric power plants engaged in public service, including central stations, electric railways, and certain other plants, the output of which contributes to the public supply. Returns were received from plants whose aggregate capacity is about 90% of the generating capacity of all public utility plants. Estimates of the output of plants which did not make returns were made from available information. The total "estimated" power is only about 7% of each monthly total. The average daily output in kilowatt-hours for the different months is as follows: February, 106,540,000; March,

Discussion of Code Rules on High-Potential Systems

Comments on Relation of Present Rules to Developments in Field Practice, with Suggestions for Proposed Changes in Rules Given in Paper Presented to National Association of Electrical Inspectors

By G. S. LAWLER

Electrical Engineer, Associated Factory Mutual Fire Insurance Companies.

WHILE some manufacturing plants and large properties have been served with energy at high voltage for a number of years, the potential has been over 6600 volts in but few cases until comparatively recently. Within the last few years, however, the number of plants obtaining electrical energy from central stations has increased, this being due to the increased production of the factories having limited generating capacity and to coal shortage.

The amount of power purchased in the individual cases has generally become larger and the transmission voltages higher. Some manufacturing plants also generate and transmit large amounts of electric power at high voltages for their own use. The power involved in the supply required by a single manufacturing plant may be as great as many thousand kilowatts and the voltage as high as 150,000 volts. The greater the amount of power consumed the greater the tendency for high voltages.

Questions Involved on High-Potential Systems.

There are only a few rules in the National Electrical Code applying solely to high-voltage installations, and except for those covering constant-current systems and those pertaining to high-potential pole lines, the rules for voltages above 3500 are limited to the following: "Primary wires must not be brought into or over buildings except power stations and substations." There are also a few restrictions on the parts of an equipment supplied at low voltage through transformers connected to extra-high-potential lines.

Even though both the life and fire hazards increase with the voltage, there has never been any demand that the Code cover such equipment in detail. This has probably been due to the fact that the design, construction and installation of such equipment has been in the hands of those who usually understood all the factors entering into the varying problems. Engineers have been called upon to handle the installations and in order that the installations may be reliable from the standpoint of continuity of service they must also be reasonably safe from a fire standpoint. If the installation of high-voltage equipments was not generally in the hands of experts, it is probable that no amount of detailed Code rules would make them safe.

Owing to expediency, the need of keeping costs down and the desire to improve operating conditions, those responsible for the so-called extra-high-voltage installations may be inclined to slight certain features bearing on the fire hazard. To meet such situations the inspector should have sufficient engineering knowledge to say what should be done to correct the weakness under the particular conditions. In many ways it is better to have each case dealt with on its own merits with a few sound fundamental rules as a guide than to have rules which go into such detail that unwarranted inconvenience and hardship will result. The high-voltage installations must be safe, but no unnecessary obstacles should be put in their way, for they generally mean progress and are a real necessity under present conditions.

Except for 2300-volt motor installations and some occasional installations necessary in connection with the particular processes carried on, high-voltage equipments will be found in connection with power houses, substations, transmission lines, constant-current series lighting systems and transformer installations.

Fire Hazard in Power Stations.

Power houses and substations handling high voltages are usually operated by skilled men. This is especially true when they belong to public service companies and generally applies when they are under private control. The expert knowledge of the operators, combined with their natural desire to keep all apparatus in good condition and to have the property in their charge clean and neat, goes a long way to prevent serious fires occurring even when other conditions are adverse.

In modern noncombustible power houses and substations the danger from fire due to arcing between conductors removed from oil is reduced to a minimum, but in those of older design, where considerable woodwork is present, this must be considered, especially if the electrical equipment is of early design. It is not always feasible to change the arrangement in the older stations to remove this hazard, even though the management may fully recognize the desirability of improvement.

Another hazard of considerable importance is grouped combustible insulation on conductors. This may be corrected by putting the conductors in iron conduit, by ample spacing, or when this is impossible, by providing a noncombustible outer covering over the insulation of the separate cables or wires.

High voltages always mean the presence of apparatus containing oil. The higher the voltage and the greater the capacity of the apparatus the greater the amount of oil used. Some switches and circuit-breakers require several barrels of oil per tank, while large transformers may contain as much as 10,000 or 12,000 gals. of oil, the flash point of which may be as low as 300 deg. F. Under certain conditions the oil may be violently thrown from the apparatus and ignited. It is important that this apparatus be well chosen as to its capacity and suitably for the conditions to be met. It is also important that it be so installed that fire at one piece of apparatus will damage as small an amount of other property as possible.

That the oil type circuit-breaker should have ample rupturing capacity is especially important. It frequently happens that the breakers may be all right in this regard when installed, but that increase of generating or transforming capacity has rendered them inadequate. It is not always possible to provide this capacity with the smaller breakers, but in such cases protection may be afforded by larger breakers between them and the source of power, and the time-limit attachments can be set with discretion. The use of suitable reactances may also be advisable.

Another piece of apparatus which may be a fire hazard is the aluminum type lightning arrester. So far as its functions are concerned it is effective, but due to one of several causes it may fail and it should therefore be separated from other apparatus so that if ignited oil is thrown from it the damage will be confined to the particular arrester where the trouble originated. These arresters should be installed outdoors, but if indoors they should be in separate noncombustible rooms or inclosures by themselves. If the arresters are large it may be advisable to drain the floors of the rooms. The new oxide-film arrester contains no oil and therefore is without oil hazard.

The hazard due to the oil-insulated transformers is sometimes disregarded by those responsible for their installation. Transformers installed indoors should be segregated and placed in proper noncombustible drained rooms or vaults cut off from adjoining rooms. A design of transformer has recently appeared on the market having entirely inclosed terminals and large overflow drain pipes. This type seems to possess considerable merit for installation where the primary voltages are high and the transformers must be located close to buildings.

Present substation practice tends toward installations of the outdoor type when sufficient space can be obtained. With these substations care should be taken that they are so located and arranged that danger to other property will be avoided. The ground should not grade in such a way that burning oil will tend to flow towards nearby buildings.

Fire Hazards Incident to High-Voltage Lines.

The principal fire hazards incident to high-voltage lines are, first, that they may fall on lower voltage lines entering buildings and start fires; second, the lines may break and fall on buildings if any are beneath; and third, if they pass near a building on fire, the fire may be poorly fought owing to the natural hesitation of firemen to use hose streams in the vicinity of the lines due to fear of receiving dangerous shocks. There is another hazard incident to long transmission lines, namely, the increased liability of trouble in the power houses due to lightning.

The first hazard is at present inadequately cared for in the Code, but is receiving attention. The Bureau of Standards has put a great deal of thought on it and has prepared comprehensive rules to guard against it.

The remedy for the second and third hazards is obviously to keep the lines away from important buildings. The Code requires that they keep off of buildings, but is somewhat remiss as to keeping them a sufficient distance from buildings. The minimum safe distance between lines and buildings depends upon the voltage, the height of the buildings, the value of the buildings, etc. Even though a certain distance may be safe, it may not be enough to allow firemen to work without fear; therefore the distance should be liberal.

Experiments made by Prof. F. C. Caldwell indicate there is no danger of shocks from a hose stream when the distance between nozzle and transmission line is more than 25 ft., irrespective of the voltage. At this distance from the nozzle the stream has apparently broken up into drops and the electric path has been interrupted. However, most of us would feel decidedly uneasy handling a hose line if the water could reach a high-voltage conductor even though we were sure the stream had become well broken up into drops.

While emergency switches may be installed on poles outside a property under consideration, they do not entirely eliminate the hazard, for when out of sight of the switches especially at night, fire fighters cannot be certain that the switches have been opened or remain open. There have been instances where a second person has closed an emergency switch, believing he was opening it, when the switch had already been opened. Again, there is the possibility that the presence of the switch may be entirely overlooked. The only safe way is to keep the lines away from property where serious fire is liable to occur so that all consideration of them may be eliminated.

The installation of high-voltage transmission lines with the necessary transformers also causes the well recognized hazard that, through leakage or breakdown of transformer insulation, high voltages may be impressed on low-voltage circuits. When the potential of the secondary circuit is below 150 or possibly 250 volts, the hazard may be guarded against by grounding the low-voltage side of the transformers. When the voltage is higher, grounding the circuits may cause more of a hazard than it prevents.

One way of partially guarding such circuits is to provide a substantial spark gap on the secondary side of the transformers, the gap being such that it will break down if the voltage increases much over the normal voltage of the circuit. Arcing across the gap may create such a disturbance that attention will be drawn to the conditions and cause the affected circuits to be opened. In the meantime the voltage on the secondaries will probably be prevented from increasing unduly. This arrangement may be somewhat crude, but it has its advantages.

The most common high-voltage installation in buildings other than power houses and substations is the 2300-volt motor equipment. Special needs in some instances may require high voltages and special apparatus, but these are relatively few and are special cases which may be dealt with on their merits.

Code Rules on High-Voltage Motors.

The sections in the Code applying especially to high-voltage motors and their wiring are few, but apparently they have met the needs of the situation in the past. In brief they require that there be no exposed high-voltage conductors or parts; all wires must be inclosed in iron conduit; junction boxes, cases, etc., and non-current-carrying metal inclosures must be thoroughly grounded; wires must be lead sheathed with suitable means of preventing entrance of moisture at the ends of the sheathing.

These requirements call for a high-grade installation. It is probably due to this and to capable maintenance that 2300-volt motor equipment has been so successfully used inside buildings where many nonelectrical persons are about. I have yet to learn of any fire caused by such equipment which can be attributed

20 years. With a 100-ton pulverized-coal plant and burning equipment the depreciation item will be approximately 12 cts. per net ton, and in a plant of 1000 tons daily capacity it will be approximately 4 cts. per net ton.

Taxes and Insurance.—Taxes and insurance are based on 2% of the entire investment and for a 100-ton plant this item is approximately 3½ cts. per ton and for a 1000-ton plant, 1.3 cts. per ton. Summarizing, the foregoing results show that the total cost of pulverizing and delivering pulverized coal to boilers is approximately as given in Table 1. The cost of the pulverizing equipment complete compares favorably with the stoker equipment when everything, such as coal and ash-conveying machinery, etc., is taken into consideration, and in large plants it is considerably less.

The equipment required for a first-class stoker installation must necessarily be taken into consideration when making a comparison of the costs of the different installations. The cost of pulverizing is an item of expense which must be included with the cost of the fuel, and since it includes the complete handling of the coal, the expense of crushing, handling, power, repairs, maintenance, interest, taxes and insurance covering the stoker equipment must also be considered when making comparisons.

Stoker installations and operation are expensive and the investment is as great, if not greater, than that required for a pulverizing equipment in plants of 10,000 kw. and upward. For example, in a plant using 1000 tons in 24 hours the cost of operation will be approximately as follows:

Power for stoker, 2% of the total boiler hp. developed	$180.00
Power for fans, 2% of the boiler hp. developed	180.00
Coal handling, 100 kws. at ¾ ct. per kw-hr.	18.00
Labor for coal handling, 2 men per shift and 3 shifts at 40 cts. per hour	19.20
Repairs for stokers at 30 cts. per boiler hp. per annum	17.50
Repairs for coal-handling equipment	10.00
	$424.70
Total cost per net ton	$0.425

To this must also be added the cost of fuel used to heat the moisture in the coal, interest, depreciation,

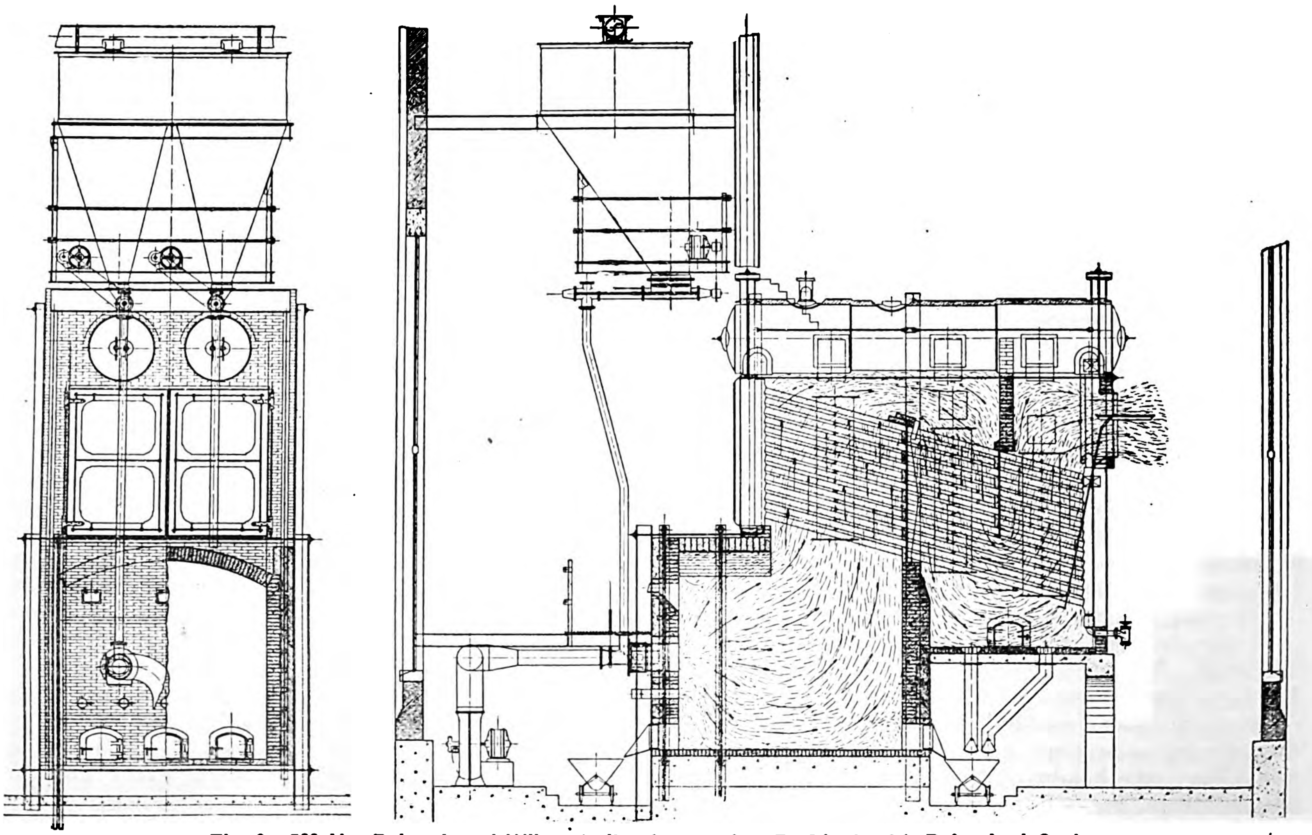

Fig. 3.—500-Hp. Babcock and Wilcox Boiler Arranged to Be Fired with Pulverized Coal.

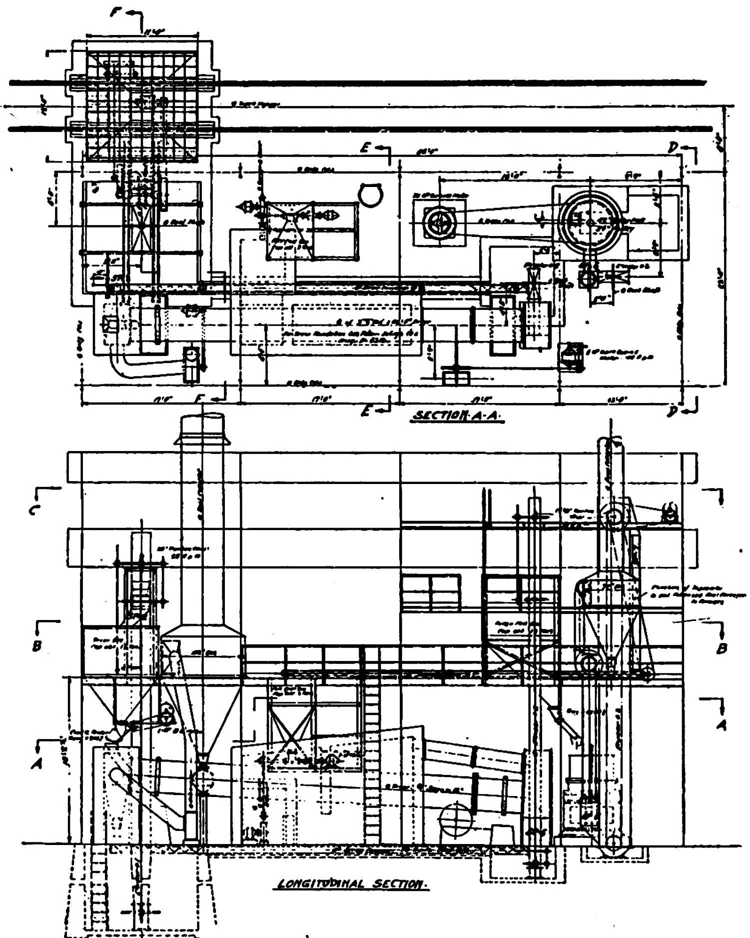

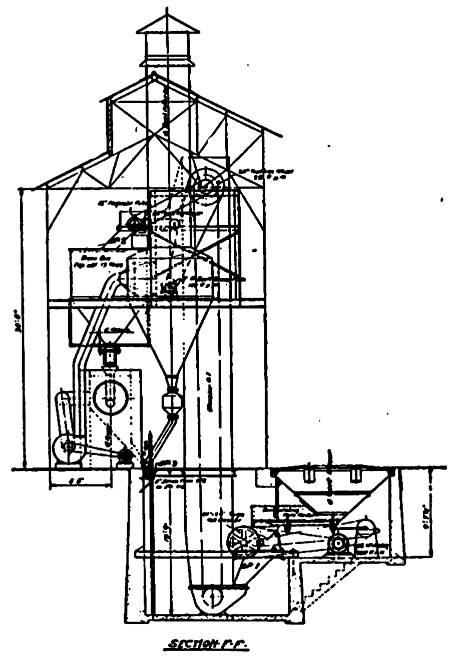

Fig. 4.—Standard Pulverized-Coal Plant With 42-In. Mill and 3½ by 42-ft. Drier.

insurance and taxes, showing that even on a basis of equal efficiency the cost of operating a pulverized-coal equipment is considerably less than the cost of operating an equivalent stoker installation. It should be stated that the figures just given are based on present average results in both cases.

NEW ELECTRIC IRON-ORE REDUCTION WORKS IN ITALY.

Hydroelectric Works Smelt Iron Ore Direct—Competitive Practicability Not Yet Assured.

The Ansaldo Co. has just started up its new 20-ton electric furnaces for smelting iron ore at Cogne, Val d'Aosta, in the northwestern corner of Italy, adjacent to the French and Swiss frontiers. The country is rugged in the extreme, with Mont Blanc towering in the near background. Considerable deposits of iron ore have been found, which in quality ranks with the best Swedish ore. Falling water capable to developing 80,000 hp. of electrical energy is near at hand. Conjunction of this latent electrical energy with native iron was hailed a few years ago as an epoch-making find for Italy. The Ansaldo Co., which undertook to develop the Italian ore deposits, after three years of preparation and the expenditure of an enormous sum, has actually begun to smelt iron ores in electric furnaces.

It is a question, says Commercial Attaché A. P. Dennis, of Rome, whether the venture will be successful. Can Italy turn out iron and steel in electric furnaces as cheaply as it can buy the material from Germany and the United States? An expert estimates that the cost of hydroelectric energy in the form of continuous current working 24 hours per day and 365 days in the year must be held down to $9 per horsepower-year to assure commercial success to electric smelting. Before the war the cheapest hydroelectric plant in the world was at Trondhjem, Norway, with an annual horsepower cost of $6. In Italy hydroelectric undertakings rarely run under $100 per horsepower for installation, which gives an interest charge of $6 to start with; adding to this $2 for amortization and $3 for overhead, we get $11 as the cost per horsepower-year.

It is stated on good authority that German pig iron is now being offered for Italian delivery at 40% lower cost than it can be produced in the new works.

It is suggested that the new electrical energy developed by the Ansaldo Co. at Cogne might be profitably conducted to the plains of Lombardy for the actuation of industrial plants and the electrification of steam railways. Undoubtedly the iron ore deposits in the Cogne region form no inconsiderable addition to the known wealth of Italy. These ores some day, when the prices of coal are lower than at present, may be transported on an easy down-grade haul to the port of Savona on the Gulf of Genoa for treatment with coal imported by sea.

PROPOSE POWERFUL WIRELESS STATION NEAR VANCOUVER.

Construction of a high-powered wireless station, which when completed will be the most powerful radio station in the British Empire, is proposed for the vicinity of Vancouver, B. C., by the Canadian Marconi Wireless Co.

The station, which will cost, it is estimated, in the neighborhood of $2,000,000, is designed to handle commercial business between Canada and the Orient, and a station of like power and cost will be built in Japan.

101,620,000; April, 100,880,000. Amount produced by water power: February, 39%; March, 42%; and April, 43%.

In view of the temporary curtailment in the coal supply resulting from the strike of bituminous coal miners, it may be of interest to note the amount of coal required for operating public utilities in the United States. The average monthly consumption of coal by electric power plants engaged in public service for the three months covered by this report was 2,815,000 tons, or about 95,000 tons per day. This is equivalent each day to about 2100 carloads of 45 tons. The amount needed for electric public utility plants in New England, New York, Pennsylvania, and New Jersey is 36,900 tons per day, or about 820 carloads.

BRITISH ELECTRICAL INSPECTOR REPORTS ON FACTORIES AND ACCIDENTS.

Mr. Ram Reviews War-time Work and Practice in Central Stations and Factories.

G. S. Ram, the British Government electrical inspector of factories, has issued his report on the use of electricity in factories during the last four years of the war. His prewar reports will be recalled by our readers as forming instructive reviews of the technical and other defects, accidents, etc., that occurred in connection with factory and public electrical installations. The one now issued, though it has not reached former proportions, is a commendable attempt to resume normal publication and it contains a great deal of useful information. As we have already put before our readers particulars of the vast extension made during the war in the use of electricity in factories for munitions production, we need not deal with the sections relating to this matter excepting to note that in connection with the building and equipment of some of the new stations and supply extensions some very remarkable feats were accomplished under most trying conditions.

Mr. Ram briefly reviews the work performed by women as substitutes for men in central stations or electricity works and the efforts made to train and employ disabled soldiers and sailors. While the new generating station work is described as good, attention is directed to an important matter which was overlooked. In stations intended to maintain a continuous supply, night and day and Sundays, medium-pressure three-phase boards were so arranged as to make it impossible to carry out any work, e. g., overhaul of an oil switch, in safety. No isolating switches had been provided between the busbars and the oil switches and no divisions between the panels. This arrangement was found on the main switchboards where the supply had been at medium pressure and in high-pressure stations in regard to the medium-pressure auxiliary switchboards. These switchboards controlling all the auxiliary plant in the station are just as important as regards maintenance of the supply as the main switchboards.

The electrical work for explosives works and filling factories necessitated special precautions on account of explosive risks or liability of damage to wiring and apparatus from acid fumes. "Danger" buildings had wherever possible been lighted entirely from outside, and motors and all switchgear, fuses, etc., being either in separate buildings or in rooms completely shut off. In some the lighting was necessarily inside, special well-glass or bulkhead type of fittings being used. Motors, where inside, were pipe-ventilated or provided with forced draft ventilation with spray-washed air. In no case was any explosion or fire attributable, so far as could be ascertained, to any electrical installation or defect therein.

Several new steel rolling-mill installations had been put in, but the most striking development, says the inspector, has been that made in the application of the electric furnace in steel manufacture. In this connection the large currents required necessitate the provision of a transformer room as close as possible to the furnace. The main supply is in many cases at 11,000 volts. Unfortunately the equipment of the transformer house was in many instances carried out in a dangerous manner. The apparatus was often badly arranged and the protection of the high-tension conductors was totally inadequate, these being treated as of no more consequence than if at 100 volts.

In discussing the great increase in the use of electricity for welding during the war, Mr. Ram says that for resistance or contact welding there is of course no danger from handling the metal being welded at very low pressure, but there is danger in case of a breakdown of the insulation of the transformer causing the welding jaws and the metal being welded to become charged at the pressure of the supply circuit, generally 200 or 400 volts, and fatal accidents from electric shock have occurred in this way. The danger can be overcome by grounding one point of the secondary circuit. Mr. Ram found a number of welding machines in different works, notably for the welding of chains, where serious dangers existed through exposure of conductors, terminals, switches, etc., of the primary circuits. In regard to the use of screens to protect the eyes of operators in welding with metallic electrodes, he finds that masks or helmets are not liked by workmen, who prefer to use the hand screen wherever possible.

In the case of alternating-current welding it is very necessary that the electrode holder should be so constructed that it is impossible for the worker to touch any live part with his hand while holding the handle. Many electrode holders were found in use which did not comply with this elementary requirement. Another important point is that one pole of the circuit, that which is connected to the article to be welded, shall be efficiently grounded. Where this is done the only danger point, assuming that the flexible conductor is properly insulated and protected and the resistances, etc., are properly guarded, is the electrode holder and the electrode. There should, of course, be no switch or fuse in the grounded conductor. Except when the arc is actually maintained, the electrode is at the full pressure of the circuit. When the welding is done in a workshop, the welder is usually close to the switch controlling the circuit and can readily cut off the pressure when he has finished or when he requires to renew the electrode. In other cases he may be at a considerable distance from the switch and it may be inconvenient to get to it and he may put the electrode and holder down or hang it up and it will remain live and be a source of danger, or he may be tempted to renew the electrode while it is alive, a dangerous proceeding unless he is insulated from earth or wears insulating gloves. To get over this difficulty, says Mr. Ram, it has been suggested that there should be an auxiliary low-voltage circuit in the flexible cable, with a push-button thumb-switch in the handle of the electrode holder, arranged to operate a contactor switch at the fixed end of the circuit. The electrode and holder would then normally be dead and would only be made alive when actually put to use.

Mr. Ram, in reviewing progress of the last few years in the science of illumination and the design of efficient fittings for factory lighting, said that in some of the new works he found some excellent examples of modern scientific lighting, but he also found in other cases instances of very bad lighting with gas-filled lamps which were unscreened and placed where they caused glare and harm to the eyesight of workers.

Except as regards districts in the United Kingdom which have been supplied for many years with direct current, the inspector says the development in the use of electrical power is mostly by alternating current, three phase or two phase, and from the point of view of electric shock risk at low voltage this is very much more dangerous if proper care is not taken. Mr. Ram found some good installations spoiled by not being properly finished off. The most prevalent fault in this connection was that even though the conductors were well protected in screwed steel conduits throughout almost their entire length, the conduit was not taken right up to switch boxes or motor terminal boxes, so that loops of unprotected cable were left, often in positions where liable to damage, e. g., on the floor at the motors. This was partly due to the slight extra cost of providing switch and fuse boxes and motor-terminal boxes having properly made sockets for the attachment of the conduit. Several large manufacturers supply their motors without any terminal boxes, cable tail ends being brought through the casing for connecting up to the circuit.

Owing to the great expansion in the use of electrical energy during the period under review it might have been expected that the number of electrical accidents would have increased. Mr. Ram says, however, that this was not the case. "The reduction in the number reported is so great that after making a liberal allowance for cases unreported owing to the stress of war conditions, it would appear to be a fact that the real number is considerably less than in the preceding period, and if the increase in the use of electrical energy is taken into consideration the proportion is very much reduced. New installation work has generally been found to comply with the regulations and the freedom from accidents is chiefly attributable to this cause. On the other hand, the number of fatal accidents has somewhat increased, 99 having been reported in the four years, 1915-18, as against 70 in the period 1911-1914. Of these 99 fatalities, 14 occurred in electrical stations of public supply or traction undertakings, the remainder on ordinary factory premises. In addition there were four fatalities indirectly due to electricity; one caused through explosion of gas from a secondary battery, by electric spark; one through failure of the current of a crane magnet allowing the load to fall on a man; one from burns where a girl got her dress set on fire by knocking the lead out of a terminal of a motor; and one from burns where a man short-circuited conductors with a benzine blowlamp; 95 out of the 99 fatalities occurred with alternating current, 19 being on systems of less than 250 volts, while 47 occurred on three-phase systems from 346 to 440 volts, but where the pressure to earth would not exceed about 250 volts, most of the systems having the neutral point grounded. Many of them occurred on lighting circuits taken from one phase and the neutral. In three or four cases only is it likely that the shock was received from contact with two of the phase conductors, the accidents being nearly all due to contact with one conductor only, the current passing through the victim to earth. Three direct-current cases were on medium-pressure traction systems having one pole grounded.

The inspector concludes his report with a reference to the importance of artificial respiration being applied in cases of electric shock. In three of the nonfatal accidents the victims were saved by this means.

TURBOELECTRIC SHIP PROPULSION AND ELECTRICALLY WELDED SHIPS.

Report by Lloyd's Register on Progress in These Lines in Great Britain.

"Lloyd's Register of Shipping" in its recent report upon its operations during the year 1918-1919 mentions that four vessels classed by the society were fitted with turboelectric propelling plant. The largest of these vessels, the *Wulsty Castle* of 3566 tons, was built in the United Kingdom and has a total shaft horsepower of 1500. The *Turbinia*, of 2259 tons, was built in Sweden and her engines have a shaft horsepower of 1020. Both these vessels were fitted with Ljungstrom turbines. Two smaller vessels were completed in America, the *Panoil* and the *Mexoil*, each of 1370 tons, the engines in each case having a total shaft horsepower of 820. These two vessels were fitted with Rateau turbines,

In referring to the use of electric welding for shipbuilding the report makes mention of the fact that in 1917 the committee arranged for an exhaustive series of tests to be carried out under the direction of the society's chief ship surveyor, to determine, as far as possible, the general trustworthiness of structural connections effected by electric welding and their capacity to withstand the strains to which they would be subjected. As a result provisional rules were adopted, as a tentative measure, for the classification in Lloyd's Register Book of vessels electrically welded, subject to the notations "experimental" and "electrically welded." The committee also formulated its requirements regarding the test to be complied with by all systems of electric welding for which approval was desired, and a notice was issued stating that the committee was prepared to consider applications from any electric welding companies, for their processes to be recognized by the society for use in ship construction and for their names to be inserted in the approved list.

Plans for the first vessel in which the butts, seams and other connections are to be electrically welded have been submitted and approved. This vessel, which is about 150 ft. in length, and in which the use of rivets will be entirely dispensed with, is now nearly ready for launching and the behavior of the vessel after completion will be carefully followed by all who are interested in the new system of construction. Applications have also been received by the committee for approval of a scheme of construction in which both riveting and welding processes shall be employed, but in such a manner that the vessel might be classed without the notation "experimental." After careful consideration the committee approved in the case of a vessel framed on the longitudinal system, a design in which electric welding will be employed in the construction of the bulkheads and for the attachment of the longitudinal frames to the structural plating, this approval being contingent upon a special notation being inserted against the vessel's name in the register book.

WILLIAM DIXON WEAVER.

Born August 30, 1857—Died November 2, 1919.

An Appreciation by William E. Keily.

"Engineer—journalist—scholar." These are the words descriptive of William D. Weaver on the memorial tablet placed in his honor in the rooms of the American Institute of Electrical Engineers. They are truthful characterizations, but it might be added that Dr. Weaver was not only an engineer but a man of the true scientific spirit; not only a journalist, but also a man of letters; and he was a scholar who possessed a warm human interest in the welfare of his fellowmen. Withal he was truly kind, sympathetic and companionable—one who "bore without abuse the grand old name of gentleman." He did much for electrical advancement, and all electrical men should hold his memory in honor.

For several years Dr. Weaver had been troubled by a weak heart, and he died suddenly at his home in Charlottesville, Va., early on the morning of Nov. 2. Dr. Carl Hering of Philadelphia, an old friend, was visiting at the hospitable Weaver homestead at the time. The man of the house seemed quite well on retiring. He died in his sleep. The funeral took place on the afternoon of Nov. 3.

Mr. Weaver was born on Aug. 30, 1857, at Greensburg, Pa., a city also noted in electrical history as the scene of the first or second commercial alternating-current system in the United States, established in 1886. After a year spent in preliminary study at the University of Kentucky he entered the United States Naval Academy at Annapolis, from which he graduated as cadet engineer in 1880. It may be remarked that only a few months ago Dr. Weaver received the honorary degree of LL.D. from the University of Kentucky. After graduation the young officer served in the Navy for twelve years except for one year's leave of absence in 1884, during which he studied electricity and conducted some investigations in the electrical laboratory of the Sorbonne, Paris, and the School of Electrical Engineering, London. In 1883 he accompanied, on the *U. S. S. Yantic,* the first expedition sent to the relief of Lieutenant Greely, the Arctic explorer. He was assistant engineer of the Navy on the *U. S. S. Omaha* which made a cruise of the world and spent two years in the waters around China, Japan and Korea. When he resigned from the Navy in 1892 he held the relative rank of ensign. While stationed at the New York Navy Yard he designed an electrical recorder which was largely used in speed trials and at launching of naval vessels. He also made other inventions, being resourceful in expedient. If he wanted to rebind his own books, he could do it, and one of the achievements of his later years was the preservation of the life of a prematurely born baby by means of an electric heating-pad incubator of his own devising.

After resigning from the Navy the young man had a year's experience with E. G. Bernard, of Troy, N. Y., in the manufacture of electrical appliances. Mr. Bernard died in 1915, and his former associate showed that he had not lost his business aptitude by winding up his deceased friend's affairs at that time. But it was as a technical editor, as a writer on engineering subjects, as a journalistic exponent of the science, art and industry of electricity, that Mr. Weaver found his life work.

He became editor of the *Electrical World* in 1893. In 1896 he enlisted the aid of James H. McGraw and established the *American Electrician* as a successor to *Electrical Industries,* a monthly originally established in Chicago in 1889. This new monthly magazine, with Mr. Weaver as editor, became notably successful. In 1899 the *Electrical World* and *Electrical Engineer,* weekly journals, were consolidated, and Mr. Weaver and T. C. Martin, the latter an able and experienced electrical journalist, became joint editors of the combined paper, which absorbed the *American Electrician* in 1906. In 1909 Mr. Martin became secretary of the National Electric Light Association, and thereafter Mr. Weaver was the sole editor of the *Electrical World* until May, 1912, when he retired, removing to Charlottesville, Va. The *Electrical World* has had many able men on its staff at various times, but it is perhaps fair to say that the editor who gave it the most distinctive impress of his individuality and to whom it was mostly indebted for its international standing as an electrical journal was W. D. Weaver.

Thus for nearly twenty years Mr. Weaver was prominent as an electrical editor. But he did many other things; he had much to do with the electrical advancement of his time, often remaining in the background, co-operating with others whose names appeared in connection with the work.

Always keenly interested in science, in engineering, in education and in literature, Mr. Weaver was a worker in the American Institute of Electrical Engineers for over thirty years. He became an associate as far back as 1887, when the society was only three years old. Later he became a member and still later a fellow. He served as manager for six years in two different periods. He was a member and afterward chairman of the committee which made the constitutional revision of 1900-1901. He always was opposed to the policy of allowing the society to be dominated by a small coterie of New Yorkers. On several occasions he was urged to become a candidate for the presidency, but such was his retiring disposition that he always refused, although he could probably have been nominated and elected.

In 1918 a group of friends and admirers, including Thomas A. Edison and Dr. C. P. Steinmetz, memorialized the president and directors of the American Institute of Electrical Engineers, requesting that a bronze tablet be placed in the headquarters of the Institute as a recognition of Mr. Weaver's services. This offer was accepted, and the tablet was unveiled on May 16, 1919. It bears a bas-relief portrait of Mr. Weaver and an inscription "To record his influence in the development and promotion of the art and science of electrical engineering." On that occasion Dr. A. E. Kennelly spoke briefly in appreciation of Mr. Weaver's efforts. He said the tablet was largely the result of the work of B. A. Behrend, and concluded by stating that the bronze portrait represented "the lineaments of a man who always thought of others and served others because he understood them." This memorial pleased Mr. Weaver greatly, but it is characteristic of his modesty that he should write, when the proposal was accepted by the directors, "I am still rather nervous over the affair, as it assigns to me a character to which I could not live up were I to have the longevity of a Methuselah." Alas, that was written less than a year and a half before the death of the recipient of this honor at the untimely age of sixty-two!

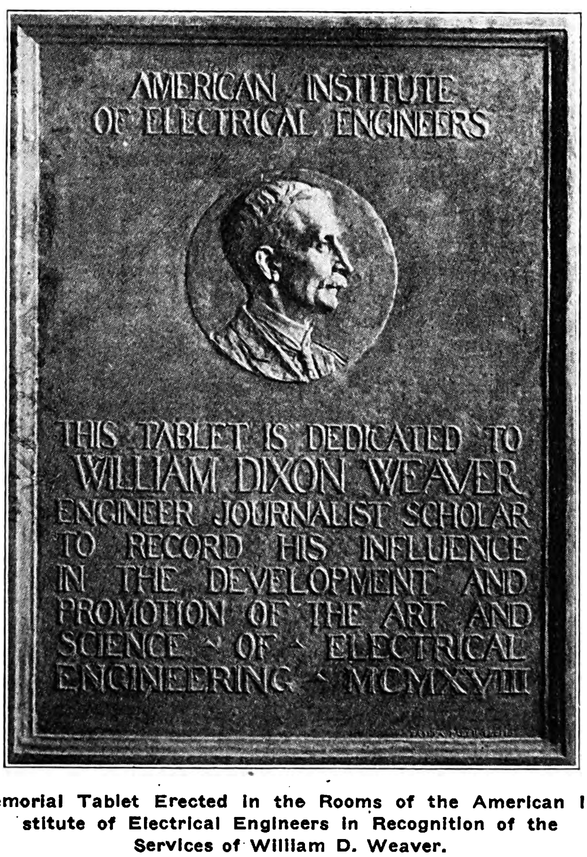
A great admirer of the clarity of the French intellect, of the beauty and precision of French literature and of French achievements in science, Mr. Weaver was nevertheless a thorough, ingrained American.

During the Spanish-American war of 1898 he served as volunteer chief engineer on the *U. S. S. Glacier*. In 1915, after his retirement, he was asked to become a member of the Naval Advisory Board but declined on account of his health. However, he was keenly interested in war work, and among other things he stimulated, by his vigorous articles in the daily press, and by other means, naval recruiting in Charlottesville and vicinity.

In 1900 he was appointed by the United States Government as an official delegate to the International Electrical Congress at Paris, but, upon his suggestion, the appointment was transferred to Dr. Kennelly. He had much to do with the St. Louis (1904) International Electrical Congress, of which he was treasurer and business manager. With Dr. Kennelly, who was general secretary, he supervised the publication of the Transactions of that Congress in three large volumes published in 1905. It is characteristic that this work bears the inscription: "Not copyrighted; publicity invited."

The engineering fraternity of New York City and vicinity is to a considerable extent indebted to Mr. Weaver for the Engineering Societies Building and the adjoining Engineers' Club. These fine structures were due to the generosity of the late Andrew Carnegie. A plan for a home for the engineering societies was submitted to Mr. Carnegie by Mr. Weaver as far back as 1895. Others made similar suggestions later, and it was in 1903 that Mr. Carnegie offered to give $1,000,000 for a suitable union building for all of the national engineering societies. A year later this gift was increased to $1,500,000, of which about one-third was for the Engineers' Club, the societies providing the land for the buildings.

Mr. Weaver was an excellent and discerning judge of engineering literature. He labored in season and out of season to build up the library of the American



Memorial Tablet Erected in the Rooms of the American Institute of Electrical Engineers in Recognition of the Services of William D. Weaver.

Institute of Electrical Engineers, which became a part of the engineering library in the Engineering Societies Building in New York. For several years he was chairman of the Library Committee of the Institute. He consulted with Andrew Carnegie and Dr. S. S. Wheeler in relation to the purchase of the large collection of electrical books and pamphlets made by Latimer Clark of London. In 1901 Dr. Wheeler purchased this library and presented it to the American Institute of Electrical Engineers. Mr. Carnegie donated the money to house, catalog and complete the collection. Thereafter, as a labor of love, Mr. Weaver, collaborating with the late Brother Potamian and others, prepared the elaborate "Catalogue of the Wheeler Gift" that, published in two volumes in 1909, stands as one of the monuments to his memory. By Dr. Wheeler's deed of gift it was provided that a copy of this catalog raissonné should be placed in the hands of every member of the Institute. These books are not only intrinsically valuable but are good examples of book making, for Mr. Weaver was a litterateur and bibliophile as well as a lover of science.

In 1916 Mr. Weaver became interested in the possibility of securing the electrical library of the late Dr. S. P. Thompson of England for an American or Canadian college or library. However, the negotiations to this end fell through, although through no fault of Mr. Weaver. At one time there was a possibility that the John Crerar Library of Chicago would buy this collection, but finally, as the result of the efforts of British engineers, the library was retained in England.

The activities of this indefatigable man were not confined to one society. He had much to do with the organization of the Illuminating Engineering Society. Of this society as well as the American Electrochemical Society he was one of the founders. He served for three years as manager of the Illuminating Engineering Society and three years as manager of the American Electrochemical Society. He had also a great deal to do with the successful formation of the Commission on Resuscitation from Electric Shock, composed of representatives of several societies. He was a member of the Societé Internationale des Electriciens and had been honored by the French Government as an officer de l'Instruction Publique. Further, he was a member of the Naval and Military Order of the Spanish-American War, a member of the Sons of the American Revolution and an honorary member of the Philosophical Society of the University of Virginia. He was a member of the Engineers' Club of New York, the Army and Navy and Cosmos Clubs of Washington, the Country Club of Charlottesville and the Colonnade Club of the University of Virginia.

Always a scholar and an investigator, Mr. Weaver was familiar with college life in America and always a friend of technical schools and technical education. After his removal to Charlottesville in 1912 he became closely associated with members of the faculty of the University of Virginia, established at Charlottesville by Thomas Jefferson. It is reported that he was offered a place on the faculty of this university a few years ago. Some time before his death Mr. Weaver gave nearly his entire collection of technical books, including a number of complete sets of the transactions of societies, to the University of Virginia. Mr. Weaver was also a liberal donor of technical books to electrical societies.

A man of high ideals, Mr. Weaver felt strongly that cultural studies should not be neglected in tech-

Commission Regulation Again Upheld — Illinois Utilities Begin Extensive Building—Tribute to William D. Weaver

STATE COMMISSION'S RIGHT TO RAISE FARES UPHELD.

Federal Supreme Court Says Utility Commissions Have Ample Right to Revise Franchise Rates.

The United States Supreme Court has dismissed the appeal of Kansas City municipal officials from the decree of the Missouri Supreme Court upholding orders of the Missouri Public Service Commission in increasing carfares in that city to six cents. In 1918 the Public Service Commission established the six-cent fare, although the franchise of the Kansas City Railways Co. provides for a five-cent fare without reservation or modifying clauses. The Missouri Supreme Court held that when the Legislature created the Public Service Commission, it restored to the State the power formerly vested in cities by charter to fix rates and public utility charges within the State. In its appeal to the Federal Supreme Court, the city argued that a contract franchise was sacred under all conditions and the State had no power to abrogate it.

PRESIDENT BALLARD OF N. E. L. A. BANQUETED ON RETURN HOME.

California Electrical Co-operative League Gives Dinner to Mr. Ballard for Bringing Big Convention to Southern California.

On Oct. 29 soon after his return home from an eastern trip of nearly two months in the interests of the National Electric Light Association, President R. H. Ballard of the association was given a banquet at the Hotel Alexandria in Los Angeles, Cal., by the electrical men of that city and surrounding cities. The dinner was given by the Electrical Co-operative League and was attended by a large number of the active electrical men from southern California, who wished to show their appreciation of Mr. Ballard's successful efforts to secure the next annual convention of the association for Pasadena on May 18 to 21.

A. Emory Wishon acted as toastmaster. Dr. John Willis Baer, of Pasadena, made a hearty address of welcome in which he spoke of the pleasure it will be to that particular city to have so great a gathering honor it next spring. He promised that nothing would be undone in the way of entertainment to make the stay of the guests from all over the country pleasant and memorable.

John B. Miller, chairman of the Southern California Edison Co., spoke of the change in attitude of eastern financiers and investors toward utility investments and other opportunities in California. William A. Brackenridge, president of the Southern California Edison Co., dwelt on the rapid progress in power transmission in California and how the achievements in this line are now being recognized throughout the country.

When Mr. Ballard responded he spoke especially of the opportunities that the convention will give to the utility men of the West in showing central-station men from all over the country the high state of development that has been attained. He said: "Two hundred and fifty million dollars can be used to advantage in electrical developments in California in the next ten years, half of which would be spent in the state for wages, raw materials and manufactured products. Large manufacturing industries would be attracted, thousands of acres of land irrigated, hundreds of thousands of homes electrically equipped from cellar to garret, making labor more productive and helping to solve the servant problem."

Others who spoke were Charles H. Pierson, E. O. Edgerton, chairman of the California Railroad Commission, John S. McGroarty, K. E. Kuran, committeeman of the California Co-operative Campaign, Glenn Arbogast, William H. Onken, Ben M. Maddox, E. B. Criddle and William Baurhyte.

BIG UTILITY BUILDING PROGRAM IS STARTED IN ILLINOIS.

Favorable Public Attitude Attracting Investors to State; Half Billion Dollar Expenditure Under Way.

High construction costs which now are 80 to 100% above the average of five years ago, are not to prove a bugaboo to public utility companies of Illinois. Believing that prices will not drop materially for some time, that the trend of general conditions is toward settlement and they have the substantial public sentiment of the state behind them, the companies are starting their after-the-war building program which in the aggregate calls for the expenditure of millions of dollars in developing the public service facilities.

According to the Illinois Committee on Public Utility Information, within the last month more new building projects have been reported as under way than in the full 18 months previous. This is directly attributed to the favorable public sentiment, which has not only given the industry confidence and the initiative to proceed, but is again giving investors the courage to invest their money within the state. The utility industry, as a whole, has plans laid for half a billion dollars of new work in the state in the coming five years. This is made possible by the growing confidence of investors who already have more than a billion dollars of their savings invested in the electric, gas, telephone and traction companies of the state.

"The greater understanding on the part of the public of the problems of the utility industry and the present generally favorable attitude is at the bottom of the determination of the managers of the properties to go ahead with construction," a prominent utility manager said. "Possessors of savings are free agents in the disposition of those savings, and they will invest them only in those enterprises where a fair interest return is in prospect and where the safety of investment is assured. If Illinois did not provide sufficient inducement for the investment of the money here, it would simply be taken elsewhere and the state would lag in development.

"The move of the utility companies is bound to find reflection in all lines of business. The realization upon the part of the general public of the indispensable character of the utilities and their relationship to general prosperity and the fair treatment which all concede must be accorded them is going far towards encouraging investment. This investment must be heavy in order to overcome the halt in new building necessitated by the war."

TACOMA'S HYDROELECTRIC PROJECT AT LAKE CUSHMAN.

City Expects to Develop 75,000 Hp. by Damming Lake, Securing Large Reservoir and 580-Ft. Head.

The city of Tacoma, Wash., in its negotiations to acquire the Lake Cushman power site, will be ready to make plans for hydroelectric development there as soon as the former owners are in position to give a clear title thereto. Lake Cushman is an expansion of the Skokomish river, and the future plans contemplate the construction of a dam on the stream below the lake and thereby raising the water level of the lake about 60 ft. higher than the present level, and greatly increasing the capacity of the storage basin. Then, the plan is to convey water from a point above the dam through an open canal to a forebay from which it will be conducted through pipe lines and penstocks to the proposed power plant on Hood canal. This will give a head of about 580 ft. at the plant. Under this scheme it is expected to make possible the development of about 75,000 hp.

REPORT ON ELECTRIC POWER SUPPLY OF TWIN CITY UTILITIES.

Geological Survey's Report on Power Facilities of Minneapolis and St. Paul and How These May Be Improved.

During the war the United States Geological Survey co-operated with the United States Fuel Administration in studies and investigations undertaken for the conservation of coal. The possibilities of saving coal in different parts of the United States by interconnecting electric power systems, by substituting hydroelectric power for steam-generated power, and by closing down competing power plants in places where one power plant could better handle the total load were investigated at the request of the United States Fuel Administration by the engineers of the United States Geological Survey, Department of the Interior.

The public utilities in the cities of St. Paul and Minneapolis were investigated and a detailed report of their conditions was submitted Sept. 30, 1918, by the Survey to the United States Fuel Administration. This report was prepared by W. G. Hoyt, district engineer, United States Geological Survey, and F. W. Huels, engineer of the Wisconsin Railroad Commission.

The report describes the facilities for power production in the vicinity of St. Paul and Minneapolis, gives curves showing the power production of the operating companies and maps of power systems, states existing and prospective load conditions and gives load curves, shows existing interconnections and opportunities for additional interconnections, efficiency of power stations in utilization of fuel, utilization of water power, coal saving possible by further development and utilization of water power, possible increase of water power by developing water storage, coal consumption and cost, extent of power shortage, and use of exhaust steam for heating.

The report, which consists of about 120 typewritten pages and diagrams, will probably not be printed and thus is not available for general distribution, but it may be consulted at the office of the United States Geological Survey, Interior Department building, Washington, D. C., or at its district office, care of the Railroad Commission of Wisconsin, Madison, Wis.

NATIONAL SAFETY COUNCIL ESTABLISHES ENGINEERING SECTION.

Will Help Meet the Technical Demands of the Industrial Sections of the Council.

The formation of an engineering section of the National Safety Council has been authorized by the Executive Committee of the Council and the new section will be organized immediately by a special committee appointed for the purpose. In announcing this action, Sidney J. Williams, secretary and chief engineer of the National Safety Council, said the decision to form a distinct engineering section was prompted by three things:

First, the growing recognition of the imporance of the engineering factor in safety work;

Second, the growing interest in safety work on the part of civil, mechanical, electrical, mining and chemical engineers;

Third, the growing volume of experience and investigation in the engineering problems involved in safety work.

"The formation of an engineering section," Mr. Williams said, "will provide a vehicle for concentration of the engineering brains of the several thousand member companies of the Council on the solution of engineering problems affecting safety work in large groups of industries, in specific industries and in industry generally.

"The development of the Council has been largely along the lines of industrial sections. The Council now has 19 sections each with its own officers and program and each interested largely in the safety problem of its own particular field. These sections are as follows:

"Automotive, Cement, Chemical, Construction, Education, Electric Railway, Health Service, Marine and Navigation, Metals, Mining, Packers, Paper and Pulp, Public Safety, Public Utilities, Rubber, Steam Railroad, Textile, Women in Industry and Woodworking.

"The greatest contribution of the new engineering section will be with respect to problems that cut across the interests of several sections and affect whole groups of industries as, for instance, the hazards of poisonous dust or gas. The new engineering section will also facilitate contact and co-operation between the various national engineering societies, the engineering departments of the Government and the National Safety Council."

Editorial Comment

Shorter Working Day Means More Electrics

BRITISH electrical men who have been working hard for many years to boost the electric vehicles for public service in the big centers feel highly gratified at the large measure of success that has lately followed their efforts. Many towns and cities have placed orders for two to six electrics and in the aggregate the total is considerable, at any rate for England. It was expected that the end of the war would be followed by a big move forward as soon as vehicles became procurable, but the shortening of the working day has accelerated the rate of progress in one case already—that of Sheffield.

Here, consequent upon the introduction of the 47-hour week, reorganization of the entire city refuse removal service has had to be considered. Experience with 12 electrics during several years' working has been so satisfactory that 51 more are to be ordered and a new garage is to be built and equipped for their accommodation. The total outlay will be about $500,000, a figure far in excess of any other scheme yet carried out in England. It may reasonably be supposed that this will be a signal for a regular forward movement in other big towns which have already experimented with electrics for similar service.

Though new factories have been laid out for production of such vehicles during the war, and others are being erected, it is more than probable that British factories alone will not be able to cope with the requirements if the business grows rapidly, as it may do. American electric vehicle producers may well note this opportunity.

Charging for Estimating Expense

CONTRACTORS, as a general rule, conduct their businesses on a profitable basis, and their customers pay for the expense of preparing estimates, since a profit is made on the aggregate contracts. But this expense is not shared by all customers in proportion to amount of work done for each one, for which reason general opinion favors some plan to equitably apportion this expense.

A number of plans have been presented from time to time, but none of them have been considered thoroughly workable, so that little has been accomplished toward putting into practice a method of securing payment for estimating. Most of these plans have failed to make provision for paying the contractor for submitting estimates on work that does not go ahead. It often occurs that bids are asked just for the purpose of ascertaining what prices will be quoted. Then again, an entire set of estimates may be thrown out because the one calling for the bids may have set too low an amount as the maximum figure for the work to be done. Some plan should be devised whereby the contractor will receive compensation for all estimates prepared, so that the necessity for burdening contracts received with the cost of preparing estimates on work for which no contracts were received will be obviated.

A new plan which has come to our attention has several interesting features. It provides that an owner must stipulate that the work involved in the estimate shall not cost over a stated amount, and of this maximum cost a certain percentage would be set aside for division among the three or four lowest bidders. The size of the contract would determine the number of bidders who would be paid for estimating. Any bidder who could not get close enough to the lowest bid to be counted in would receive no pay, the inference being that his estimate was mostly guesswork.

While the plan is not complete these features seem worthy enough to be incorporated into a plan that would help solve this question of unfair practice.

Instruments in the Boiler Room

INSTRUMENTS are not installed in the boiler room to "show up" the boiler-room force. They are installed to assist the boiler-room crew in their work and thereby enable fuel and equipment to be used more economically and advantageously. Boiler-room instruments are a boon alike to their owner and to the user, saving money for the one and saving effort for the other.

The instruments of the boiler room, using the term instruments in its broadest sense to mean anything instrumental in obtaining efficient operation, may be divided into four classes, namely, those indicating totals, conditions, rates and relations. It is only when firemen know what they are doing and how they are doing it that they can work sensibly, obtain results economically and meet conditions as they arise by co-ordinating air and fuel with the demand for steam.

It is important to know how many pounds of water are being evaporated per pound of coal, per shift or per hour. But it is of more immediate concern to know the rate of steaming, told by the steam-flow meter, the rate of combustion as told by the tachometer on the stoker drive or the coal-weighing machine, and the rate of air supply as told by the draft gages. To work efficiently and successfully, one must know what is required to be done, whether it is being done and how it is being done. When these conditions obtain, consuming fuel for raising steam no longer remains a hit or miss process but becomes an engineering function.

Knowing how something is being done without knowing what is actually being done is of little use. Only when the results are known and the manner of accomplishing them are also known can operating conditions be met and fulfilled efficiently. In other words, the boiler room needs instruments that record results and instruments that show conditions, and only when these are used can fuel be saved with certainty.

For showing quantity there are the ash and coal-weighing instruments; for measuring steam and water, steam-flow and water meters. For determining quality there are the coal calorimeter and moisture scales, feed-water thermometers and steam pressure gages and thermometers. For controlling and indicating conditions there are the familiar flow indicators, draft gages, thermometers and flue-gas analyzers. Each of these has its place and each is a good investment when properly used and intelligently applied. This means properly training the boiler-room force and offering sufficient incentives for them to do their best.

Coal is money today. Much of the waste that goes on would not be tolerated an instant longer if the quantity of coal consumed were converted to dollars and cents. Looked at from the aspect of money spent, coal-saving becomes something tangible, a financial matter of vital concern to the purchaser of coal. Considered in this light and remembering that the term "instrument" is used in its broadest sense to mean anything enabling a knowledge of operating and efficiency conditions to be known, that oft-asked question would not be "what are the fewest instruments I can do with?" but "which instruments can I afford to do without?"

Drawing Up Specifications

PURCHASE of materials or structures by specification safeguards the purchaser insofar as he knows with a certain degree of assurance that the material or structure purchased meets with those properties stipulated by him. Specifications safeguard the manufacturer in that if he meets the specifications he completes his part of the bargain, the onus for the wisdom and correctness of the specifications resting with him who specifies.

There is much to be said in favor of standardized specifications, although in this case as in all other cases, standardization has its drawbacks—drawbacks that are greatly lessened when standardization is sufficiently flexible to keep pace with progress. Standard specifications enable the producer to shape and make his product to the standard specifications, thus enabling specialization in comparatively few forms or types of product in contrast to many and varied types, as when every purchaser draws up his own specifications according to his own whim and ideas regardless of what others may be doing or have done. By so doing, the producer is handicapped, which reacts to increase the average cost of his products by limiting bulk production and all that goes with it. So, too, the purchaser is handicapped since his order may be classed as special, increasing the cost, adding to the delay in deliveries, and creating still further delay when the time comes for hurry-up repeat orders.

A specification is very largely a matter of viewpoint. It may, perhaps, be said that the specification having the greatest simplicity, the utmost brevity and sufficient completeness is the specification that meets the situation and fulfills best the need of the purchaser and the producer. In other words, a specification should stipulate what is necessary, what is fundamental, but should not deal needlessly with secondary factors not strictly germain to the condition to be met or the manner of meeting it.

A fact often overlooked is that purchase by specification may tend to add to the cost of the product, as when every purchaser draws up his own stipulations and specifications. On the other hand, standardized specifications tend to lower the purchase price because the one specification meets the need of many purchasers, hence calls for a standardized product instead of a special one. It may be pointed out, further, that the standardized specification tends to be the better all-round specification on the theory that two heads are better than one, and so several interested parties are ordinarily able together to create a broader and better specification than one party alone.

It used to be the fashion to specify voltage taps on all transformers regardless of whether there was any reasonable likelihood of using them. Better voltage regulation, appreciation that such taps cost money, cause complications and troubles, and the understanding of the fact that the cost of taps is investment wasted if the taps cannot be used, have done much to eliminate the stipulations for many needless and objectionable voltage taps on transformers. So, too, with insulation, specifications often call for the inclusion in the insulation of ingredients whose characteristics cannot be readily determined nor their presence proved. The only effect of such stipulations is to add to the cost of the product if bid upon by the conscientious bidder and offer opportunity for fraud on the part of the unscrupulous manufacturer. Specifications are of little use if no means is taken to determine whether the specifications are adhered to.

A specification should endeavor to stipulate such requirements as will enable a product to be obtained that will be able to meet its definitely prescribed function, and assure that quantities of the product will vary in uniformity only between clearly defined limits.

The specification that meets the situation best is the specification that is brief and to the point, yet is sufficiently complete without omitting any salient requirement. The thing is to say as little as feasible, not as much as possible.

nical education. "It seems to me," he wrote, "that technical engineers (as distinguished, say, from civil engineers) will some day have seriously to face the question whether they are members of a learned profession or merely followers of a technical vocation. In electrical engineering, for example, I have been shocked at the prevailing lack of pride in ancestry and interest in posterity—the only object of graduates being apparently to make a living or acquire riches from knowledge acquired with no recognition of those who in the past contributed to that knowledge, nor thought of making enduring offerings to the future in return for those received gratis from the past." He deplored a purely materialistic attitude in technical schools and thought that perhaps the reason that engineers are not accorded greater recognition in important public work is due to the opinion "that their vision is too narrow and their lack of touch with the human element in life has been too restricted to fit them to pass upon matters that must also be adapted to public policy and presented in such a form as most to assure favorable action from the public at large or from those who represent the public with full knowledge of how to placate its prejudices."

As may be judged from the above, Mr. Weaver always insisted on preserving his independence of mind. He himself said: "My name is probably more generally associated with the thought that I view things critically—though not necessarily in a hostile spirit—than with that of docility in acceptance of opinion backed by influential forces." Ordinarily the mildest and gentlest of men, he nevertheless was very tenacious in adhering to his opinions. On occasion he could express himself energetically, and he was a master of sarcasm if he desired to employ it.

He was a lover of books, both of the inside and outside of books. He was particularly interested in the French Revolution, and his collection of material relating to that period was probably excelled by few collections in the United States. He was a French scholar, reading that language with ease and speaking it well. He was, or at least was until recently, a member of three French societies for the rehabilitation of Robespierre, and in 1913 he was invited by a "maire" of one of the arrondissements of Paris to become an honorary member of a committee to forward a movement to erect a statute to Robespierre. The character of Robespierre was to him a fascinating study, and he returned to it again and again.

At one time he wrote about Paris: "I feel more at home in that city than in any other in the world, on account probably of my first impressions of the real world having been received there." He was a great admirer of Prof. André E. Blondel of Paris, who, he thought, possesses one of the finest intellects of the age. In recent years Mr. Weaver had given much study to the life and works of Thomas Jefferson. He was also an admirer of much in Russian literature.

An original thinker, a many-sided man, witty, not without his prejudices, and also, perhaps, not without a spice of malice occasionally, William Dixon Weaver was a brilliant, lovable man. He was steadfast to his friends and his kindness to them was unbounded. For young men and newcomers in the electrical field he always had a helping hand. He was an admirer of method, although those who worked in the office with him declared that he was not always methodical in doing his own editorial work. But nevertheless his was a charming personality. His home life was ideal. In 1900 he married Miss Mildred Niebuhr, and the union was blessed with six charming children. Mr. and Mrs. Weaver were most hospitable, and their home was characterized not only by books and objects of beauty and taste but also by a delightful spirit of comradeship, sprightliness and family affection. Retiring in disposition, with an acute distaste for public appearances, Mr. Weaver found his greatest joy at his own hearthside. In his later years he was able to obtain relief from the merciless daily grind of the editor's duties, applying himself thereafter to those intellectual diversions which were such a pleasure to him. From his library this brave, subtle, kindly spirit looked out on the world with the serenity of a philosopher and now, "Home is the sailor, home from sea."

NEW YORK STREET CAR COMPANIES DISINTEGRATING.

Federal Judge Julius Mayer signed an order recently directing the Brooklyn Rapid Transit Co., New York, that leases and operates several small traction lines as a single system, to return the property of the Brooklyn City Railroad Co. to its owners for independent operation. The reason for the order was the inability of the Brooklyn Rapid Transit Co. to pay $200,000 rental to the Brooklyn City Railroad Co. due on Oct. 1. The separation, which took effect at midnight, Oct. 18, results in considerable hardship to people who use the released line since, by eliminating transfers at 450 transfer points, users are required to pay two fares.

The failure of the Brooklyn Rapid Transit Co. to pay the rentals on its leased lines is caused by the general inability to operate on the 5-cent fare. Public Service Commissioner Lewis Nixon, after public hearings granted for the purpose of ascertaining the reasonableness of present rates and the increased rates petitioned for by the street railway companies, has permitted certain lines in Manhattan to institute a 2-cent charge for transfers and has authorized certain other lines to increase fares. The authorization has been suspended by a writ issued by the Supreme Court of New York prohibiting the Public Service Commissioner from acting on the application for an increase in fares because the franchise of the railway company specifically provided for a 5-cent fare.

The disintegration in the street railway systems is due to the general inadequacy of the fares being charged. Increases in fares have been prevented by the Hylan administration which contends that the railway companies should be compelled to perform their contract obligation to supply transportation for the nickel fare. Already several small lines have suspended operation. Relief for residents along these lines has been afforded by jitney buses. The relief is only partial, however, since they make no provision for transfers.

TRACTION EXPENSES STILL INCREASE.

In spite of the numerous fare increases granted during the last year, the latest figures show operating expenses of the electric railways increasing at a greater rate than revenues. Net income after payment of taxes and fixed charges was 1.54 cts., as compared with 2.23 cts. per car-mile in 1918, a falling off of 30.94%. The operating ratio in July, 1919, was 75.30, compared with 70.85% in July, 1918, an increase of 6.28%.

Commercial Practice

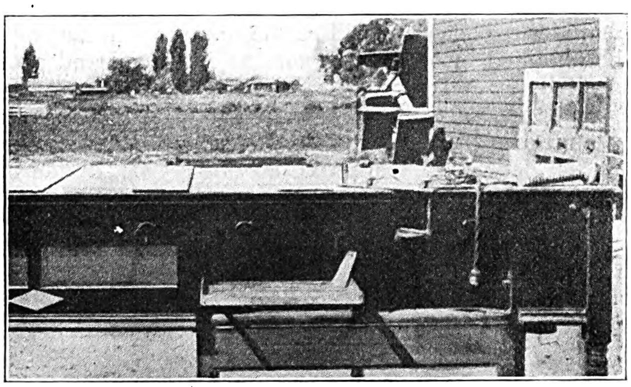
Successful Application of Electricity to Incubators—Electric Trucks in England—Surcharge for Power Service Approved

THE APPLICATION OF ELECTRIC HEAT TO INCUBATORS AND BROODERS.

Automatic Electric Incubator Proves Superior to Other Types Because of Economy and Safety Features—Description of California Installation.

Many methods of heating have been used in the past to hatch eggs, among them being the kerosene lamp, gas heater, solar heater and steam, but the only successful automatic incubator is that operated by electricity, with the possible exception of nature's method—the hen.

In the vicinity of Artesia, Calif., is located the largest electric hatchery in the world. This plant now has a capacity of approximately 100,000 eggs and a weekly output capacity of about 30,000 chicks. During seven months of the year this plant is working at full capacity most of the time and the annual output will average close to 750,000 chicks. It is here that the first successful electro-incubation was achieved, says P. J. Denninger in *Edison Current Topics,* the publication of the Southern California Edison Co.



Close-up View of Electric Incubator.

Construction of the incubator itself need not be described because electric heat and control may be applied to any type of incubator. The electric heating unit consists of a cylindrical, grooved porcelain core, and in the groove is wound a resistance coil made of nichrome wire. The resistance coil being laid in a groove, makes the heater self-insulating and there is no danger of the coils coming in contact with the metal flue or any other cover with which it may be surrounded. The current-consuming capacity of each element is 600 watts. One element is used to an incubator and the brooders contain one or more elements depending upon the size and capacity of the brooder house.

The controlling device is unique in construction yet simple in operation and easily adjusted. It is a thermostat and known as the tandem wafer type. The wafer is composed of two brass disks soldered together and the air space between is filled with ether. To the center of the top wafer is attached a perpendicular control rod. This rod extends up through the framework and operates a horizontal control lever which is weighted at the opposite end from the control rod to give a positive and steady action. The lever is attached by means of a coil spring to a rocker-arm pivoted at the center of its length. It is this rocker-arm that makes the contact and opens or closes the circuit as the wafers expand or contract. The connection between the lever and the contact arm is made in such a manner that the arm will not move until there is a considerable tension on the spring and when it does move the action is positive and the opening or closing of the circuit instantaneous. In this way burning or fusing of the contact points is practically eliminated. The entire mechanism is operated by the contraction or expansion of the tandem wafer, the ether confined in the disks being so volatile that a slight variation in temperature will cause immediate contraction or expansion sufficient to move the control up or down, thus opening or closing the circuit.

An automatically heated brooder house has also been devised using the same heater and control to which has been added an alarm bell system which warns of any undue change of temperature.

Very attractive rate schedules have been established for this business although small installations can be operated profitably on the lighting schedule. Where consumers have the combination schedule for lighting and cooking, incubators can be added to the circuits without increasing the minimum, thus obtaining advantage of the cooking rate of 3.5 cents per kw-hr. The consumer who is operating a pumping plant may apply his pumping plant rate to the incubator and brooder load by increasing the minimum charge $1 per month or horsepower equivalent added in incubator or brooders. There has also been provided a schedule for the monthly minimum of $10 per month and the rate of 3 cents per kw-hr. which may be applied exclusively to electric incubation. The cost of operation depends a great deal on local conditions, but it is generally estimated at 1 cent per chick.

The advantages of electric incubation are many and such as to make this method far superior to any other. There is no danger of fire, no loss of chicks from chilling or overheating, no lamps to clean, fill and adjust, no gas burner to go out and asphyxiate the chicks with escaping gas. It is only necessary to push the button or turn the switch and then one can devote his time to other pursuits, as the automatic control needs little attention. All these advantages spell increased profits, not only from economy of operation, but by virtue of the uniform heat control more and better chicks are assured. With the perfection of electric hatching and brooding the hen is left free to devote her entire time to egg production and even here electricity is rendering aid by illuminating the coops and chicken yards, thus getting the hens on the job earlier in the day.

Contractor-Dealer

Society for Electrical Development Prepares Holiday Helps for Dealers—Figuring Retail Prices—Merchandising Ideas

HOLIDAY HELPS PREPARED FOR THE ELECTRICAL DEALER.

Society for Electrical Development to Provide Extensive Co-operation for Entire Industry to Assist Holiday Selling.

There is a point in holiday selling that the retailer frequently overlooks. It is the fact that, in spite of natural increase in buying by the public at Christmas time, selling pressure should be kept up at that time and the retailer should add to his force and his stocks, if need be, to capitalize the holidays to the utmost. While the public is liberal in opening its purse for buying at Yuletide, it ties up the purse strings immediately after Christmas and there is usually a "valley" following the peak of holiday purchasing.

Window Trim Furnished as Dealer Help in "Electrical Christmas" Campaign.

The Society for Electrical Development has developed an extensive Christmas campaign for making the coming holidays most profitable for the retailer, and to help him provide against the post-holiday drop in buying by building up a good reserve.

The underlying motive of this campaign is to make this "an electrical Christmas," which idea is brought out forcibly in a beautiful poster design, lithographed in seven colors. This can be hung in windows, on doors and in the store. The same idea is dominant in the window-cards, poster-stamps and price-cards, all of which show the poster. Constant reiteration of this "theme" will have a favorable effect on the shoppers if the retailer uses the sales helps consistently.

Another notable fact about this campaign is that the society does not limit all the co-operative help to members exclusively but distributes certain things to non-members as well without charge. This material may be had by writing to the Society for Electrical Development, 29 West 39th street, New York City.

A CONVENIENT METHOD OF FIGURING RETAIL PRICES.

Simple Formula for Adding Profit and Overhead to Cost in Order to Obtain the Correct Price to Be Charged for Appliances.

In speaking before a recent convention of the Missouri State Association of Electrical Contractors and Dealers, M. S. Seelman, chairman of the committee on relations with contractors, dealers and jobbers, Commercial Section, National Electrical Light Association, made the following suggestions:

A simple method of arriving quickly at a fair price for which merchandise should be sold or work done to cover the cost, overhead and profit is to add the percentage of profit decided upon to the percentage of overhead, deduct the sum from 100, and divide the cost of merchandise or labor and material by the remainder. The result will be the selling price that must be obtained in order to cover the overhead and profit desired.

For instance, if the cost of some article of merchandise is $5, overhead is 25% and profit desired is 20%; deduct 45 from 100, leaving 55%; divide the cost, $5, by 0.55. The result, $9.09, is the price that must be obtained to cover the stated percentages of overhead and profit.

Poster Design to Be Used in "Electrical Christmas" Campaign.

Profit may be considered as the net return after all expenses are added to cost. Therefore, if goods are to be carried for a certain length of time the percentage added is necessarily larger because of increased costs resulting from storage and fixed charges. On the other hand, if goods are sold soon after being purchased the profit percentage may be less. Seasonal articles carried in stock depreciate and must be sold promptly to insure a rapid turnover of capital.

Merchandising Suggestions for the Electrical Dealer

Fire Protection a Sales Point for Christmas-Tree Outfits—Dealer Service for Farmers — How Arcade Shop Sells Electric Cleaners

NOW is the time for the sale of lighting outfits for Christmas trees. The general public has come to learn and appreciate the convenience and beauty of electric lighting in comparison to the old-fashioned candles, and on the appeal of these advantages the electrical dealer is able to make a rapid turnover of such equipment.

But there is still another advantage the dealer can use. It is the fact that electric tree-lighting outfits are safer from fire hazard.

What better selling argument can one use than to tell a father or mother that electric lamps afford their little ones and their homes protection against the disastrous fires that are caused by Christmas-tree candles and the matches necessary to light them?

There isn't any question about the fact that there are many fires caused by candles, for the National Fire Protection Association recently issued a bulletin giving a warning against their use, and recommending that electric illumination is safer. Almost every one of us know of a case where a candle-lighted tree caused a serious fire. It is a point that strikes close to home and dealers ought to make use of it.

Convenience and beauty are excellent selling points, but when you add fire protection to them you have a trinity of arguments that simply must make room for sales.

Service for Farm Lighting Plants.

Introduction of farm electric plants in recent years has brought up an important question of service, says a prominent electrical dealer.

Service, according to his interpretation, means the expert attention to his electric plant which the owner may never need, but which he can have on short notice if he requires it.

The average farmer looks on an electric light and power plant as more than a piece of machinery. To him it is a means toward the end of furnishing complete and dependable isolated electric service.

The farmer is not an electrician and doesn't want to be one. He knows machinery and knows how to take care of it, but he also knows that the best machinery in the world sometimes needs expert attention. He wants to know that there's an experienced mechanic within reach to give his electric plant attention when necessary.

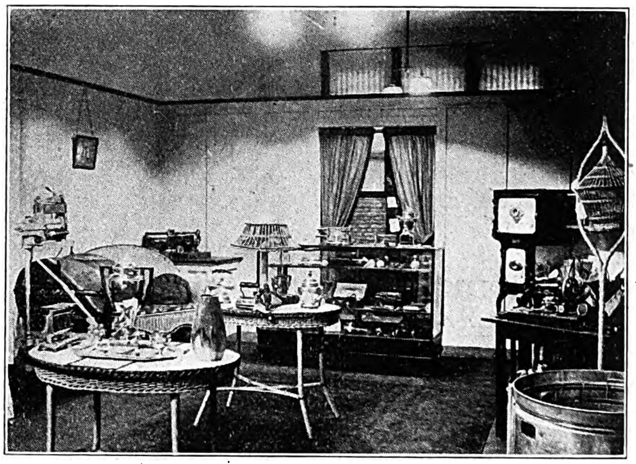
Two main things are to be considered in the purchase of a farm electric plant; first, other users' experiences. With the great increase in the use of electricity on the farm in the last few years there is scarcely a community where electric plants are not in use. It is easy for the prospective buyer to inquire among his neighbors as to the satisfaction they are receiving from their plants.

The second and equally important factor to consider is the local representation of the particular plant he plans to buy. An established representative of the plant in the community assures service when needed.

The average farmer is a careful buyer, and will doubtless take these things into consideration. If he does he is more likely to be assured of continuous and dependable electric service in his home.

Arcade Shop Features Vacuum Cleaners.

Cleveland—noted for its arcades as well as for being the "sixth city"—has quite a number of arcade electric shops. One of the advantages of an arcade is that it affords window space. Shops are not so deep as those with street frontage, and for a corresponding amount of floor space considerably more window space is secured. This permits of a larger exhibition of goods, so passersby may do more "window shopping" of things electrical.



View of Part of Electric Shop in Cleveland Arcade.

One of these arcade electric shops—the Electrical Necessities Co.—recently had a display in which was arranged tables devoted to a single household necessity—electric irons, percolators, vibrators, toasters, grills—while one table was set for breakfast, holding all the electric implements for preparing same. At one side of the room were the kitchen and laundry conveniences, and at the other an array of electric lamps with silk, parchment and art glass shades.

The firm makes a specialty of vacuum cleaners, and, according to Mr. Burgess, the manager, business the past season has been exceptionally good. Patrons are circularized regularly, and whenever a special display is made announcements are sent to customers and advertisements as well as making statements in the daily papers. A recent vacuum cleaner display attracted the attention of all who passed through the arcade. In the center was a small, ancient looking vacuum cleaner, with a card which informed the public was "Grandpa Hoover—the first suction sweeper made —sold for $125 cash." Nearby was one of the 1919 models, selling for $57.50. A card beside it observed: "Over 40,000 Hoover grandchildren have been sold in Cleveland."

nual charges for material and maintenance for the automatic substation would be $620 and the total actual cost $355.80. Of this latter amount, 82% would be for labor.

The automatic substation, consisting of one 500-kw., 60-cycle, 660-volt, six-phase, G. E., synchronous converter has now been in service for almost one and one-half years. During the first year the substation failed only on four occasions. On two of these occasions the auxiliary relay, the purpose of which is to keep the station from starting up when the alternating-current supply is below a definite voltage, failed to open, a condition since remedied by the adoption of a different type of relay. The second form of trouble responsible for another shutdown was that the thermostat protecting the machine from dangerous temperatures of the bearings functioning. The thermostat had been set at a needlessly low temperature and changing the setting has done away with this trouble. The third cause of shutdown was lightning, which entered the station before the lightning arresters had been installed, blowing a fuse and burning off a wire connecting up a lightning circuit with a 660-volt feeder.

Obviously, the above troubles are not serious and are merely incidental as contrasted with fundamental or inherent ones. In fact the automatic substation has proved so reliable that another station of similar type is expected to be installed at an early date. When this second unit is installed copper will be enabled to be recovered to the extent of $9000 and this proposed station would be available should either of the other two stations fail.

INTERESTING METHOD OF MOVING LARGE NUMBER OF POLES.

Use of Jacks Enables Pole Line to Be Moved Ten Feet to the Side Without Opening Circuits.

In building the King's Highway between Dover and Smyrna, Del., it was necessary for the telephone company to move 430 poles sideways a distance of 10 ft. Three methods of moving the pole line without interrupting the circuits in any way were tried.

The first method used consisted of digging a trench 10 ft. long and approximately 6 ft. deep. When several of these trenches were completed the poles were skidded to the new location, after which trenches were refilled and tamped. This method was not considered satisfactory, though, due to the high cost, which averaged about eighteen hours per pole, and introduction of a storm hazard due to disturbing the earth at the side of the poles, although with this method practically no circuit trouble was experienced.

Method No. 2 consisted of digging ten holes in the new location and removing poles 1, 3, 5, 7 and 9 and setting them in their new location. To do this it was necessary to remove the crossarms, after which they were placed on the poles in their new location, and then the wires were transferred. Next the crossarms were removed from poles 2, 4, 6, 8 and 10. Poles were taken down and set in their new locations, then crossarms were replaced and wires tied in. With the second method the hours of labor per pole were reduced from eighteen to twelve, as compared with the first. However, the trouble caused on the circuits with this method was excessive and, due to the importance of the circuits, it became obvious that some other plan of doing the work must be followed, as it was essential to keep the circuits in working order at all times.

The third and most successful method consisted of digging a number of holes in the new location and moving the poles by the use of simplex jacks. The following method was used in doing the job:

First operation—pole 1 guyed in direction away from which pole was to be moved.

Second operation—poles 1, 2, 3, 4 and 5 raised 1 ft. on simplex jacks.

Third operation—poles 1, 2, 3 and 4 raised 2 ft. on simplex jacks.

Fourth operation—poles 1, 2 and 3 raised 3 ft. on simplex jacks.

Fifth operation—poles 1 and 2 raised 4 ft. on simplex jacks.

Sixth operation—pole 1 raised to a sufficient height to allow a 2 by 12-in. by 10-ft. oak plank to be placed under butt of pole, after which pole was skidded on plank to new hole and lowered.

Seventh operation—the jack used at pole 1 transferred to pole 6. Pole 6 raised one foot.

Eighth operation—poles 2, 3, 4 and 5 raised 2 ft. on simplex jacks.

Ninth operation—poles 2, 3 and 4 raised 3 ft. on simplex jacks.

Tenth operation—poles 2 and 3 raised 4 ft. on simplex jacks.

Eleventh operation—pole 2 raised to a sufficient height to allow a 2 by 12-in. by 10-ft. oak plank to be placed under butt of pole, after which pole was skidded on plank and lowered.

The work of moving all poles continued in the order above and men followed with shovels and tampers, lining up the poles in their new locations.

With Method No. 3 it was found that the work could be done in approximately seven hours per pole and without causing any trouble on the circuits or damage to the wires, which was the objection to the second system.

By the improved process it was found perfectly feasible to raise the pole with the simplex jack completely out of the ground and then skid it to the hole at the new location. This dispenses with the intermittent or step-by-step process of raising the poles and resulted in a further reduction in the cost of moving the line.

The pole is first pulled out of the ground by means of the simplex jack, operated by two men while a third man holds the pole against the lean of the line with a rope guy on the road side. The pole is then launched on a plank or metal strip and skidded over to the new hole, using the simplex jack as a lever. This latter operation is usually in two stages, because the jack is not sufficiently long to permit the pole to be pushed ten feet in one operation. While the pole is being skidded to its new hole the man with the rope guy changes his position to the field side of the line so as to assist in pulling the pole over and lowering it into the hole.

The pole is lowered into the hole with no interruption of service and without any damaging effect to the open wire construction. The outfit of six men is divided into three-man gangs, each of which works at one pole; in this way two poles can be jacked over simultaneously. The gradual lean of the reset poles toward the pole that is being raised out of its old location takes care of all the slack required to permit the removal without untying the wires.

After about fifteen poles have been set in their new location the gang goes back to line up the poles and fills in the holes. The last poles of this newly lined up section are then supported with pikes or rope guys to prevent them from pulling out of line by the lean of the succeeding poles in process of being moved.

QUESTIONS AND ANSWERS

All readers are invited to submit questions and answers to this department. Anonymous communications will not be considered. Questions should relate to electrical matters of any kind. Answers contributed by readers should be submitted preferably within eight days of the date of publication of the question and should be limited, if possible, to 300 words. Payment will be made for all answers published.

Questions.

No. 467.—Operating Cost of Electric Household Refrigerators.—I would like to know from some reliable source what is the operating cost of the electrically operated refrigerators that are being recommended for household use. What is the experience as to their dependability?—R. H. T., New York, N. Y.

No. 475.—Pricing Motor Repair Work.—Can some of the readers through the questions and answers columns give me the best methods of pricing repair work on electric motors, armature winding, etc., and the best methods of setting the selling price of insulating materials and of magnet wire?—D. D., Indianapolis, Ind.

No. 476.—Colored Lighting Effects in Theater.—In producing the various changeable colored lighting effects in a theater that are now becoming so popular what is the smallest number of primary colors that will serve? Is it possible to get more pleasing gradations of color through using more sets of differently colored lamps than of primary colors alone? What is the most practical way to secure such color effects?—H. M. P., Seattle, Wash.

Answers.

No. 471.—Ringlemann Charts for Determining Smoke Density.—The use of Ringlemann charts is frequently mentioned in connection with the determination of the density of smoke emitted from smokestacks. I would much appreciate an explanation of what the Ringlemann chart actually is and how the density of smoke may be determined from its use.—M. A. P., Spokane, Wash.

(*Answer A* appeared in Oct. 11 issue.)

Answer B.—In order to make its enforcement easier and more certain a smoke ordinance must state definitely what density shall not be emitted. Some practical standard of comparison by which the density of the smoke may be determined should be specified. The Ringlemann smoke chart is one of these standards and consists of four cards having black lines forming squares upon them, the squares thus formed being of varying widths. Desirable widths and spacings as suggested by Professor Ringlemann are:

Card 1.—Black lines 1mm. thick 10mm. apart, leaving spaces 9mm. square.

Card 2.—Lines 2.3mm. thick, spaces 7.7mm. square.

Card 3.—Lines 3.7mm. thick, spaces 6.3mm. square.

Card 4.—Lines 5.5mm. thick, spaces 4.5mm. square,

Card 5.—All black—not always used.

Card 0.—All white—not always used.

In making observations of smoke proceeding from a chimney the four cards, printed in a horizontal row on one chart are hung at a point about 50 ft. from the observer and as nearly as convenient in line with the chimney. At this distance the individual lines become invisible, the cards ranging in tint from very light gray to black. The observer glances from the smoke coming from the chimney to the cards, determines which card most nearly corresponds with the color of the smoke, and makes a record accordingly, noting the card number and time of observation. The observations are repeated at one-fourth or one-half minute intervals. From these records the smoke density may be determined for each hour or fraction thereof for each day.—H. E. W., Chicago, Ill.

No. 473.—Changing Motor Frequency.—I would like information regarding changing of a 1/8-hp. Holtzer-Cabot single-phase motor of 1130 r. p. m. and 12 poles now operating on 133 cycles to make it possible to operate on 60 cycles at a speed of 1200 to 1300 r. p. m.—M. B., Dekalb, Ill.

To convert a 1/8-hp. motor designed for 133 cycles to use on 60 cycles at approximately 1200 r. p. m. it is necessary to rewind the motor, using a six-pole winding. To determine the proper winding, size wire and number of conductors per slot it is necessary to have detailed dimensions of the core and slots. It is also desirable to know the size of wire and number of conductors per slot used in the original winding.—H. S. R., Wahpeton, N. D.

No. 474.—Inferior Wire for Fixtures.—In my experience I have often run across fixtures wired with old Code wire and with No. 20 and even No. 22 low-voltage wire. I understand that considerable quantities of these wires are being used. What can be done by a contractor who wants to live up to rule 30*c* of the National Electrical Code to meet the competition of those who ignore this rule?—B. T. F., Morgan Park, Ill.

Any contractor that knows of a violation of the rules of the National Electrical Code, or of any city electrical code, should expose such violation publicly. This may be done in various ways. First he should assure himself that the parties perpetrating the violation are doing so intentionally and are not unaware of breaking the rules. With this fact established there is practically no limit as to how the exposure may be made. If there is municipal inspection, the inspection department should be informed. If insurance inspection alone prevails, the underwriters should be notified. If there is an organization of electrical contractors in the city, action should be brought through it to stop unfair competition. In the absence of any of these agencies the contractor who wants to see good construction carried out should expose the unscrupulous contractor to architects and builders directly and, if necessary, through newspaper advertisements or other means. This may stir up spirited disputes, but the honest contractor has all the merits of the dispute on his side. If he is well informed on the rules of good practice and can back them up with the reasons for their existence, he will readily get the public's support in his effort to safeguard the community against fire and accident hazards. If more contractors had the courage to take this stand poor construction would quickly become very rare.

The particular rule in question is one of the best rules of the National Electrical Code, although there are many electrical men who would like to see it made stiffer by making No. 16 B. & S. wire the smallest permissible size for fixtures instead of No. 18. I believe that where wire inferior to No. 18 approved wire is used it is by fixture men and contractors who, in the effort to save a few cents thereby, purchase the wire under various subterfuges. If the manufacturer could insist on knowing for what purpose the wire was to be used, he might refuse to sell low-voltage wire for fixtures. But some of these purchasers may ask for wire for automobile use and then wire fixtures with it. This makes the matter almost exclusively one for inspectors and competing contractors to work out.—S. D. C., Detroit, Mich.

SHEFFIELD, ENGLAND, TO PLACE BIG ORDER FOR ELECTRICS.

$500,000 for 51 Electric Trucks for Refuse Removal, and for Electric Garage.

By far the most important move that has taken place in England in the adoption of electric vehicles for refuse removal is reported from Sheffield, where 51 vehicles of the kind are to be added to the 12 already in use and 3 on order, making a total of 66 for the whole city.

It is interesting to note that the establishment of the 47-hour working week led Cleansing Superintendent J. A. Priestley to report to the City Health Committee on the question of the future policy of the department in relation to the equipment needed for the collection and disposal of the house refuse.

The reorganization plans have had to take into account the fact that the alteration in hours will mean 8% reduction in the working time of the men and a corresponding decrease in the work accomplished is anticipated. This involves the necessity of adding to the equipment to the same extent in order to obtain equal results. During the war equipment could not be added to and the system at present does not give sufficient elasticity to deal with pressure or rush periods. The department must possess equipment to meet any emergency.

Mr. Priestley in his report, upon which the city has decided to take action, says:

"The experience of the past four years with electric motors has been eminently satisfactory and has demonstrated that the work can be done by their agency more expeditiously and economically than by horse labor. I am satisfied that for house-to-house collection work the electric vehicle cannot be approached by petrol (gasoline) motors. Steam wagons approach more nearly to electrics in suitability and economy for this work, but the latter possess advantages in noiselessness and ease of maneuvering that are not shared by steam wagons and require the services of one man only to drive them, and that not necessarily a skilled man. Since electric vehicles were introduced in Sheffield we have added to the fleet from time to time such a number of vehicles as would compensate for the wearing out of the horses engaged on refuse collection but no surplus vehicles have been obtained. With the conclusion of the war and the greater facility for obtaining delivery of motor vehicles, I think it is desirable that the policy of the department should now proceed on settled lines and that horses should be replaced as rapidly as possible by electric vehicles.

"The total weight of refuse collected in the city during the year ended March 25, 1919, was 110,855 tons which gives an average weekly collection of 2131 tons, but as the amount varies as between summer and winter the maximum amount to be collected during the heaviest period of the year may be taken at about 2600 tons weekly. To collect this quantity of refuse by electric vehicle will require about 60 electrics, or allowing a 10% margin to cover breakdowns, 66 vehicles would be necessary. We have at present 12 vehicles in use and 3 on order and the full program would therefore require the provision of 51 additional machines."

Garage accommodation is available for the existing vehicles and by conversion of stables not now fully occupied provision can be made for a small number of additional machines, but the garaging of 60 or 70 vehicles will necessitate the erection of a properly designed and equipped building for this purpose. For charging the batteries of this number of vehicles three 100-kw. motor-generators would be required in addition to the present charging facilities and as a standby machine is imperative four generator sets of this capacity must be provided. Charging panels, switchboards, measuring instruments, etc., will also be required in proportion to the vehicles and Mr. Priestley estimates that the total cost of the equipment as described would be about $500,000. The process of substitution is to proceed regularly and systematically and it will be spread over a number of years which, having regard to the age and condition of the major part of the stud of horses, should not be longer than six years.

COURT UPHOLDS RIGHT TO FIX POWER SERVICE RATES.

New Jersey Supreme Court Approves Surcharge for Power Service—Private Contracts Must Give Way to Public Welfare.

The State Supreme Court of New Jersey handed down a decision on Nov. 3 upholding the right of the Board of Public Utility Commissioners to allow an increase in the power rates of the Public Service Electric Co. The case in question was brought by the Edison Storage Battery Co., West Orange; Snead & Co., iron works, Jersey City; Crucible Steel Co., Harrison; Independent Lamp & Wire Co., Weehawken, and the Bound Brook Oilless Bearing Co., Bound Brook, these plaintiffs contesting the authority of the Commission to allow a 25% surcharge for power service to industrial consumers.

This order of the Board was made on July 16, 1918, and the rates allowed were to apply to electric energy supplied after Feb. 1, 1918, at which date the company had submitted a revised schedule of charges to the Board as a war measure. The industrial plants contended that they had contracts with the utility company covering a period later than the time noted (Feb. 1, 1918) which fixed the rates at a lower sum than that allowed by the board, and this, it was held, impaired the obligation of their contracts in violation of constitutional rights. In its decision the court said:

"Private contracts as to rates to be charged for furnishing electric power must yield to public welfare, and the state may fix a just and reasonable rate without regard to that reserved in the contract. Whether the Utility Commissioners are required to determine private rights, arising on contracts, in fixing rates for the public good, and to discriminate between those of the public who have contracts and those who have not, and otherwise make a discrimination according to agreements between citizens, or whether their orders should be general as to all who are within the class affected, we are not required to pass upon this case, although inclined to the opinion that such orders should be general, leaving the contracting parties to settle their rights in an action raising that question in which they are parties and not by certiorari. The record sustains the findings of the Board that the rates fixed are just and reasonable and we being of opinion that the order properly relates to the initial proceedings changing the rates, and that private contracts must give way to public welfare when they conflict, if that question can be raised in these proceedings, the writs in all the cases will be dismissed with costs."

Operating Practice

Window for Forced-Draft Chain-Grate Stokers—Automatic Substation Performance and Cost—Moving Long Pole Line

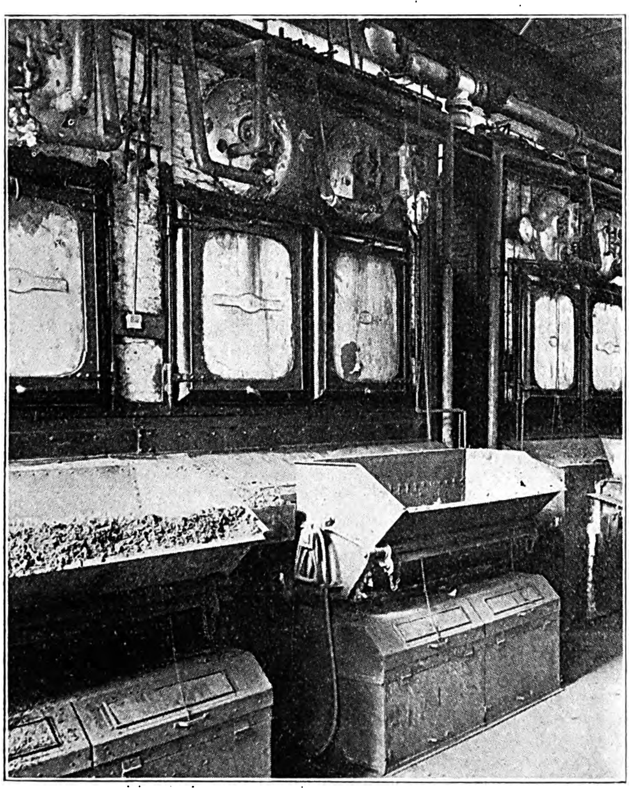
PROVISION FOR WATCHING FORCED-DRAFT CHAIN-GRATE STOKERS.

Window in Casing Enables Chain to Be Watched and Troubles to Be Avoided by the Breaking of Links.

When forced draft is applied to the chain-grate type of stoker, it is necessary to install wind plates underneath the grate to guide the air blast to the position where it is wanted, and to encase the stoker so that the air is forced through the fuel bed and not out into the boiler room or between the stoker grate and the bridge wall, etc.

There is, however, an objection to encasing or enclosing the chain-grate stoker in that the chain, or the grate bars, cannot then be seen. If a link or chain breaks, and these do break sometimes, it is necessary to replace the broken link otherwise the damage will spread and the chain will spread and finally fail altogether. The remedy is, of course, watchfulness on the part of the fire-room crew. When a link breaks, the rate of stoker travel can be reduced—the fire can be banked and the stoker stopped altogether, if necessary—until new links have been put in. This is a comparatively simple job, and is looked upon as merely an incident in a year's work.

With the stoker encased with sheet metal, which is invariably chosen, a link may break and the grate continue to be revolved without the fact being known, because the grate is invisible to the firemen. Under such conditions a broken link becomes a menace because of the extensive damage that may follow. The accompanying illustration shows the manner in which one company has overcome the objections to enclosing its chain-grate stokers, which was necessary when equipping their stokers with forced draft.



Windows in Stoker Casing as Used Successfully with Chain-Grate Stokers Using Forced Draft and High Rates of Combustion.

Two windows are provided in the casing of each stoker, these windows being of leaded glass. In the casing are installed two electric lamps, so arranged that they cast their light upon the grate. In this way the grate is visible at all times, and trouble due to broken links existing without knowledge is no more probable than when the grates are not encased.

The boilers shown are of 250 boiler hp., of which there are twelve in the station, and operate at ratings of 185% above normal. The use of the glass windows has reduced troubles due to breaking links which is, of course, more likely to occur with mechanical forced draft than with natural draft, because of the more rapid combustion rates and higher rate of travel of the grate and tendency toward higher fuel-bed temperatures.

AUTOMATIC RAILWAY SUBSTATION AT BUTTE PROVES ECONOMICAL.

Economy of Investment and Reliability in Service Cause Second Installation to Be Planned.

It was necessary for the Butte Electric Railway Co. to rearrange its railway distribution system because an existing power contract was lapsing and in order to reduce leakage current in the return because of electrolysis of underground pipes. This latter was eventually accomplished by adopting the insulated return-feeder system.

Were a railway substation located at the load center of the down-town of the company's system the cost was estimated to be $19,800 for copper plus $1700 expended for line loss in excess of that occurring if one substation were located in the down-town district and another in the South Butte residential district. As station operators receive $7 per day it would have been more economical to suffer the line loss than to install a manually operated substation on the basis of two 8-hour shifts for operators at $7 per diem, or $5110 per annum.

It was therefore decided to install an automatic substation, the decision being based upon the following estimates. The cost of the land, building, synchronous converter and control apparatus would be $9000, giving the fixed charges. One day's cleaning and inspection per week would cost $7 per day, or $364 annually. Materials and such incidentals as oil, brushes, contacts for the contactors, wiping cloths, etc., would cost about $256 per year. The total an-

Powerful Electric Locomotive for Mountain Division—Automatic Light Plant—Automatic Projector—Carpet Washer

New Direct-Current Gearless Passenger Locomotives for C., M. & St. P. Railway.

The new 3000-volt direct-current locomotives here described are now being placed in operation for the passenger service on the Othello-Seattle-Tacoma electric zone of the Chicago, Milwaukee & St. Paul Railway.

A large group of railroad officials, mechanical and electrical engineers inspected this new type of passenger locomotive at the General Electric works at Erie, Pa., on Nov. 7. After detailed inspections, the locomotives were subjected to numerous running and control tests.

The original electrification from Harlowton to Avery, 440 miles, has now been operating for a number of years under the extremely bad weather conditions of the Rockies and Bitter Root mountains and, as a result of its unqualified success, the same system will now be used to meet the severe grades and snow conditions of the Cascade range. All the equipment for the original electrification was manufactured by the General Electric Co. including substations and locomotives. The motive power consisted of 42 locomotives for freight and passenger service and four switchers. Of this original equipment, the freight and passenger locomotives were practically the same and differed from each other only in the gear ratio between motors and driving axles.

The new locomotives are an entirely different design, built distinctively for passenger service and possess some very interesting mechanical and electrical features. They will be used on the new Cascade electrification strictly for passenger service and the present passenger engines will be adapted for freight service by changing their gear ratio. The new locomotives are of the bipolar gearless type, with motor armatures mounted directly on the driving axles. In this fundamental feature, they follow the design of the gearless locomotives in use on the New York terminal of the New York Central Railroad, which have given remarkable operating results during the past ten years. The chief advantage of this method of construction is the great simplicity of mechanical design which eliminates all gears, armature and suspension bearings, jackshafts, siderods or other transmitting devices. The remarkably low cost of maintenance of the New York Central locomotives over the entire period is attributed largely to the gearless type of construction.

Each of the new C., M. & St. P. passenger locomotives weighs 265 tons with 229 tons on drivers. They have 14 axles, 12 of which are driving and two guiding axles. The weight of the armature and wheels is the only dead weight on the track and this is approximately 9500 lbs. per axle. The total weight on drivers (458,000 lbs.) is 86% of the weight of the locomotive but, being distributed among 12 axles, results in a weight of only 38,166 lbs. per axle.

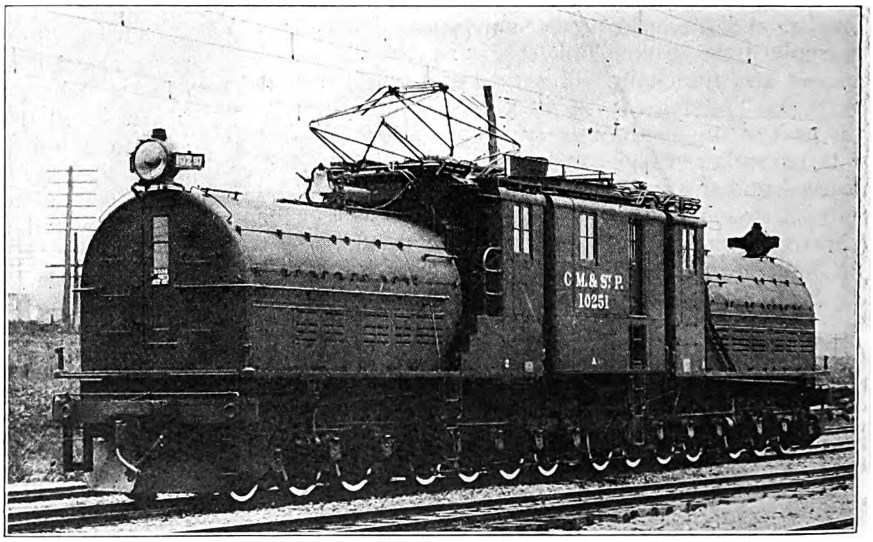

Fig. 1.—3000-Volt, Direct-Current, Gearless Passenger Locomotive for C., M. & St. P. Cascade Electrified Zone.

One of the most interesting and important features of the locomotive is the design of the leading and trailing trucks and the method of suspension of the cab weight upon them. The successive trucks are coupled together in such a way as to deadbeat or break up any lateral oscillations which may be caused by inequalities of the track. The weight of the main cab is so supported on the front and rear trucks that any lateral thrust or kick of the leading or trailing wheel against the track is cushioned by the movement of the main cab, which increases the weight bearing down on the wheels at the point where the thrust occurs, and automatically reacts to prevent any distortion of the track. The result of this design is such as to give riding qualities at high speeds which have probably never been attained before in a double-ended locomotive. Exhaustive tests on the General Electric test tracks at Erie, Pa., have demonstrated the remarkable riding qualities of the new locomotive at speeds as high as 65 m. p. h., which is the limit of speed on the length of test track available. These tests also indicate that the locomotive will operate at much higher speeds with equal success.

The locomotive is designed for handling in normal service a 12-car train weighing 960 tons trailing against a grade of 2% at 25 m. p. h. This performance requires 56,500 lbs. tractive effort which is equivalent to a coefficient of adhesion of 12.3% of the weight upon the driving axles. The wide margin thus provided between the operating tractive coefficient and the slipping point of the wheels, as well as the ample capacity of the motors, will allow this locomotive to haul trains with as many as 14 cars in emergencies. For continuous operation, the locomotive is designed to operate at 42,000 lbs. tractive effort at a speed of 25 m. p. h.

The total weight supported on driving axles is practically the same as that on the present geared passenger locomotives, weighing a total of 300 tons. The table below gives the principal dimensions, weights and capacity of the gearless locomotive.

Length inside knuckles	76 ft. 0 in.
Length over cab	68 ft. 0 in.
Total wheel base	67 ft. 0 in.
Rigid wheel base	13 ft. 11 in.
Diameter driving wheels	44 in.
Diameter guiding wheels	36 in.
Weight electrical equipment	235,000 lbs.
Weight mechanical equipment	295,000 lbs.
Weight complete locomotive	530,000 lbs.
Weight on drivers	458,000 lbs.
Weight on guiding axle	36,000 lbs.
Weight on each driving axle	38,166 lbs.
Number of motors	12
One-hour rating	3240 hp.
Continuous rating	2760 hp.
Tractive effort—1-hour rating	46,000 lbs.
Tractive effort — continuous rating	42,000 lbs.
Tractive effort — 2% ruling grade with 960-ton train	56,500 lbs.
Coefficient of adhesion ruling grade	12.3%
Starting tractive effort—25% coefficient of adhesion	115,000 lbs.
Rate of acceleration starting 2% ruling grade	0.48 m.p.h.p.s.

Control equipment for the new locomotive is similar in most respects to that used on the original locomotives which have now been operating nearly four years. Modifications were, of course, necessary to comply with the different arrangements of motors. Advantage is taken of a new scheme of connections by means of which four of the main locomotive motors are utilized to furnish exciting current during regeneration, thus reducing the size of the motor-generator set used for control, accessories and train lighting. An appreciable reduction in the weight of control equipment is obtained, at the same time providing for effective regenerative electric braking on the down grades. The motor-generator set furnishes control current for operating the contactors and for charging an 80-volt storage battery which supplies lights and power for the accessory apparatus. This battery is, in general, similar to those used on the passenger coaches. The master controller is constructed in three sections arranged for both motoring and regenerating, all of the cylinders being suitably interlocked to prevent incorrect manipulation.

Each of the 12 driving motors is bipolar, two fields being supported upon the truck springs with full freedom for vertical play of the armature between the pole faces. Fig. 2 shows the end outline of the locomotive with a sectional view of one of the motors indicating the location of the armatures and the magnetic section. For full-speed operation, the 12 motors are connected three in series with 1000 volts per commutator. Control connections are also provided for operating 4, 6 or 12 motors in series. Additional speed variation is obtained by tapping the motor fields in all combinations. Cooling air for each pair of motors is supplied by a small motor-driven blower. This arrangement avoids

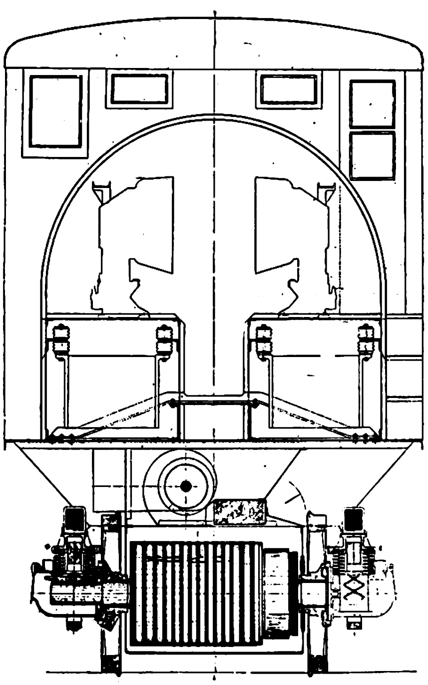

Fig. 2.—End Outline and Motor Cross Section of New Gearless Locomotive.

the heavy duct losses encountered with a single large blower.

As may be seen from the curves of Fig. 3, the gearless locomotive shows a much better efficiency at high speeds than the geared type, owing to the elimination of the gear drive. In passenger service, where there are long stretches of level track and stopping points are comparatively few, a much higher efficiency is obtained in all-day service. These curves show an efficiency at 50 m. p. h. approximately 10% higher than the geared type of locomotive.

The 3000-volt contactors and grid resistors are mounted in the curved end

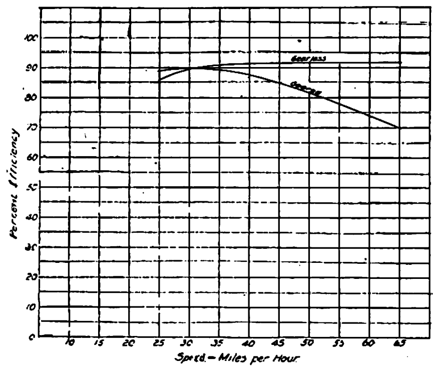

Fig. 3.—Comparative Efficiency Curves of Geared and Gearless Locomotives.

cab at each end of the locomotive. In one of these cabs there is also located the 3000-volt air compressor and storage battery. In the other is located a small motor-generator set and the high-speed circuit-breaker. The operating cabs contain the master controller, indicating instruments, and a small air compressor (in No. 2 cab) operated from the battery circuit with sufficient capacity for raising the pantograph when first putting the locomotive in operation. Near the controller are the usual air-brake handles for standard braking equipment.

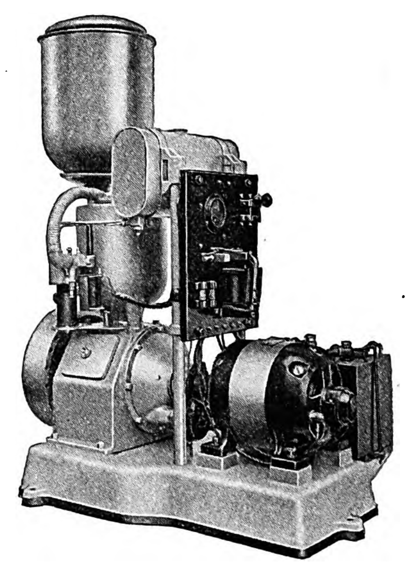
In the center cab is the oil-fired steam boiler for heating passenger trains with accessories including tanks for oil and water, circulating pumps and a motor-driven blower for furnishing forced draft. A slider pantograph, similar in construction to those now in use, is mounted on each of the operating cabs. This pantograph has two sliding contacts, giving a total of four points per slider with the double trolley. The pantograph and flexible twin trolley construction enable the locomotives to collect currents as high as 2000 amperes at speeds up to to 60 m. p. h. without noticeable arcing at the contact points. The second pantograph is held in reserve as a spare. Sand boxes, with pipes leading to each pair of driving wheels, are located directly beneath the pantograph and outside of the operating cab.

The new locomotives will operate over the section between Othello, Seattle and Tacoma, including 17 miles of 2.2% grade from the Columbia river west and 19 miles of 1.7% grade between Cedar Falls and the summit of the Cascades. The traffic over this division consists of the heavy main line transcontinental passenger trains "Olympian" and "Columbian," carrying from 8 to 12 steel passenger coaches which will be handled over the maximum grades without helpers. Freight pushers are already in operation on the 2.2% grade using two of the locomotives from the original electrification. It is expected that electrical operation during the coming winter will assist in overcoming many of the delays which are commonly met with during almost every winter's operation in this district in Washington.

Holt 110-Volt Automatic Electric Light and Power Plant for Rural Service.

Among farmers and other rural residents who cannot secure electric service from central-station lines there is an increasing call for a simple, self-contained electric light and power plant of standard voltage. Such a plant permits of a standard wiring installation, use of standard-voltage lamps and appliances, eliminates need for a large storage battery, and enables a change-over to be made readily at any later time to central-station service when power lines are brought near to the farm or ranch. A plant to meet this need has been developed by the Automatic Light Co., Inc., Ludington, Mich. It is known as the Holt 110-volt automatic power-light plant.

This plan thas been developed during several years and incorporates the results of much experience in this line. It consists of a four-cycle, water-cooled gasoline engine with a six-volt ignition and starting storage battery o1 86 ampere-hour capacity. The engine is direct-connected to a General Electric 750-watt compound geenrator with double armature winding and double commutator, one for 6 volts and the other for 110 volts. The 6-volt winding feeds the ignition and starting battery; the 110-volt winding the load. On closing a switch on any of the load circuits the battery is thrown on the low-voltage winding which acts as motor and starts the engine just like any standard automobile self-starter. The control is simple and compact. Constant voltage is



Holt Automatic 110-Volt Power and Light Plant.

secured through the compound winding regardless of the amount of load up to the capacity of the set.

The Owen Automatic Stereopticon.

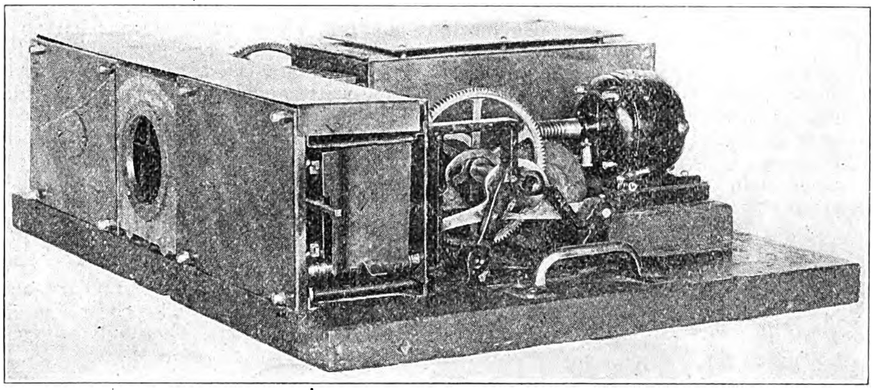
The Owen automatic stereopticon illustrated herewith demonstrates a new use of electricity and is a simple device that can be carried in a suitcase. It is claimed that it costs little to operate, it has nothing to wear out or replace, and will last practically a lifetime.

Its essential parts are a 1000-cp., gas-filled Mazda projection lamp, condensing and objective lenses, a screen upon which the pictures are to be projected, the necessary slides, and a small General Electric motor to be attached to an electric light socket and which operates on either direct or alternating current.

The usual size projects 46 slides upon the screen, allowing each to remain in position twelve seconds, when it is automatically replaced by the next. Machines which project 100, 200 or more slides may be built to order.

The picture may be shown either large or small by merely varying the distance of the objective lens from the screen. The projection is in the form of a cone with the small end at the lens, and the large end on the screen, and the farther the screen from the machine, the larger the picture.

This automatic stereopticon is invaluable for store and window advertising, for educational work, home entertainments, and for a variety of purposes that will suggest themselves. Attractive and interesting, tireless and reliable, it is one of the best sellers of all commodities.



Easily Portable Stereopticon for Automatically Exhibiting Advertising or Educational Slides.

Electrically Operated Carpet Washer for Hotels, Clubs and Similar Institutions.

One of the displays at the recent Chicago Electrical Show that attracted special attention from the thousands who daily visited the Coliseum was the electrical carpet washer, shown for the first time. The machine is a brand new invention and was demonstrated daily in the booth of the Hamilton-Beach Manufacturing Co., of Racine, Wis. This machine scrubs and cleanses rugs of any size right on the floor.

For demonstration purposes, an offer was made to all attending the show to clean without cost all rugs brought in. Hundreds of rugs, ranging all the way from priceless orientals to humble domestics, were cleaned daily. The hundreds who wedged themselves about the exhibit were astonished to behold rugs, which had been given hard wear and become so dirty that scarcely any pattern or design could be distinguished in them, emerge from the washing process looking as bright as on the day they were purchased.

The washer is extremely simple in construction and does not require experienced help to operate it. Soap suds are made from pure water and a special soap compound. This compound is said to be free from all chemicals and animal fats, its base being a vegetable oil that leaves the carpet sweet-smelling and sanitary. The suds are poured into an aluminum container and are fed through a small tube into a heater and mixer which is electrically warmed. From there, the rich, creamy suds flow down to the brushes which rest lightly on the surface of the rug. The brushes are made of the same soft porous rubber as a bath sponge and when the washer is in operation oscillate 500 times a minute. The movement of the human hand is thus exactly duplicated by the machine, only hundreds of times more effectively. The cleaning compound is scrubbed down to the very bottom of the nap, cleaning every fiber of the rug or carpet and bringing back all the colors that delighted the eye when the rug was new. A vacuum suction draws all the dirty suds back into a separate container and when the cleansing of the rugs is completed this dirty water is thrown away.

Rug experts who have watched the machine in operation state that it is harmless to the finest rugs and they have no hesitancy in endorsing it in the highest terms. Reports received from hotels, clubs and other institutions which have tried the machine indicate that it cleans the rugs in a very satisfactory manner and at a minimum cost.

The saving effected in cleaning rugs without removing them from the floor will quickly offset the cost of the machine. The additional advantage offered is that it does not become necessary to leave bare and unsightly floors while rugs and carpets are being cleaned. The work is done very quickly and at a very low cost.

Ship Cleaning by Electricity.

An important invention has recently been made in connection with the cleaning of ships' hulls while afloat. The present method is to dry-dock the vessels periodically and set a small army of workers out to chip away the marine growths which have accumulated during a voyage. The expense involved is heavy. For the dry-docking of a 7000-ton ship a charge of about $750 a day is incurred, exclusive of the cost of cleaning, which is a big additional item. With the new apparatus described below it is claimed that this operation can be performed in eight hours by a party of four men, and without any necessity of dry-docking. The new patent is known as the torpedo submarine ship cleaner, and the Rapid Submersible Ship Cleaner Co., London, Eng., has acquired the existing patent rights in connection with it. The apparatus consists of a frame containing a revolving cylindrical brush worked by a submersible motor. At the back of the frame is a screw propeller which forces the brush firmly against the side of the vessel. The power is supplied by a generating set on board a barge carrying a jib from which the machine is suspended, and the only connection between the barge and the ship being cleaned is the fore and aft mooring ropes used for maneuvering purposes. In operation the machine is lowered overboard from the jib, the motor is started, and the screw at once forces the brush against the side of the vessel, and while rotating is lowered down to the required depth, cleaning as it is moved up and down.

New Storage-Battery Jar That Has Proved Practically Unbreakable.

The storage battery in the mind of the average layman is apt to mean a "black box of mystery" mounted on his automobile to start his motor and furnish current for his lights. He is very apt to regard the battery as being delicate in construction, whereas the storage battery actually is today playing a very important part in the most strenuous service. As an instance of this the mine locomotive may be cited.

This mine service is usually very severe and the battery must be exceptionally rugged to withstand the bangs and bumps they receive. The tracks as a rule are bad and head-collisions are not unusual. The battery has in this service, however, made a wonderful record. In the past there has been but one serious objection—the battery jars would sometimes crack under an unusually severe jolt.

The Electric Storage Battery Co., Philadelphia, manufacturer of the Ironclad-Exide battery, realizing this, has for some time been experimenting to develop an unbreakable jar. What is known as the Giant jar is the result. This was briefly described in our issue of Nov. 1, 1919, since which time the following additional data have been secured.

The Giant jar of the Ironclad-Exide battery is made of a semiflexible compound, exceptionally tough and strong. Exhaustive tests have proved that these Giant jars will stand a pressure of 2000 lbs. at their weakest point, whereas the old type jar broke at less than 1000 lbs.; that the Giant jar will support at its weakest point the weight of four husky men, whereas the old jar would not support the weight of one man; that an electrical test of 30,000 volts does not puncture the Giant jar.

Moreover, thousands of these jars have in actual service demonstrated their ability to withstand the hardest and most severe service. This jar is now the standard for the Ironclad-Exide battery that is so very extensively used for mine locomotives, industrial trucks and tractors.

Trade Activities

Mack Searchlight Truck Exhibit—Sterling Manufacturing Erecting New Plant—Special Literature Distributed

Belden Manufacturing Co., Chicago, is sending out Bulletin 1214 on winding machines and coil winding apparatus. This bulletin, which is issued in advance of the new catalog No. 8, introduces a number of new machines which have been developed for use by the trade. These machines are described in detail with illustrations accompanying the text.

Attachment Plug Patent Litigation.—In the suit of Harvey Hubbell, Inc., vs. the General Electric Co. and Bryant Electric Co., for infringement of Hubbell patent Nos. 774,250 and 774,251 covering attachment plugs, decisions have been filed by Judge Thomas in the United States District Court upholding the Hubbell patents and finding infringement thereof. In the suit of Bryant Electric Co. vs. Harvey Hubbell, Inc., charging infringement of the Burton patent, a decision has been filed by Judge Thomas in the United States District Court, finding the Burton patent invalid.

Sterling Manufacturing Co., Cleveland, Ohio, manufacturer of ammeters and voltmeters, is constructing a new plant, which it is expected will be ready for occupancy within three weeks. The building, which is of reinforced concrete construction, is two stories, 65x100 ft. Provision has been made for the erection of another story should this be found necessary. In addition to this structure, the company is now planning to erect an office building, 60x75 ft. and expects to start construction work very shortly.

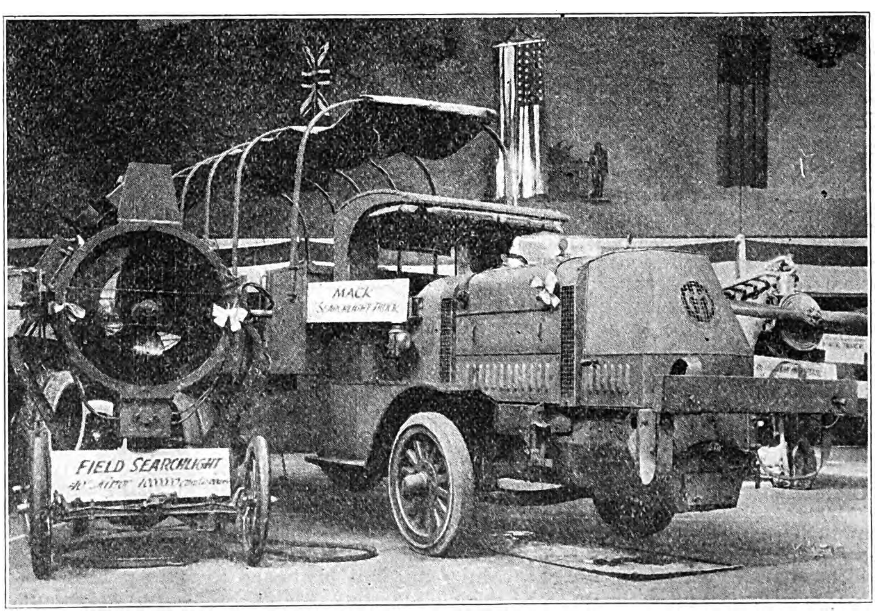
Benjamin Electric Manufacturing Co., Chicago, is sending out a new and very complete catalog of 96 pages descriptive of Benjamin illuminating and wire devices and specialties. Several pages are devoted to illustrated descriptions of new Benjamin material, comprising elliptical angle and other reflectors, reflector socket with wire-glass guard, shade-holder reflectors, moisture and dustproof fixtures, safety flash receptacles, clusters for stand lamps, etc., which are bound in the front of the catalog. For the convenience of the user, the standard line of Benjamin products is grouped in schedules as follows: wireless clusters and plug clusters, reflectors and lighting fixtures, special Mazda C fixtures, wiring devices and specialties, accessories, tool sets and automobile devices. In addition to the detailed and illustrated descriptions of these products, the catalog contains considerable valuable data on illumination. A convenient feature of this publication is the numerical index, which gives full details covering standard package quantities, weights and discount schedules.

Hugh L. Cooper & Co., 101 Park avenue, New York City, has issued a neat book of views of water power projects entitled "Hydro-Electric Developments." The projects illustrated are some of those in the construction of which the company has been engaged and include the Mississippi development at Keokuk, Iowa, the Electrical Development Co.'s plant at Niagara Falls, N. Y., the McCall Ferry development at Holtwood, Pa., the Sao Paulo dam in Brazil, and the Winnipeg. Electric Railway development at Lac du Bonnet, Canada. The views indicate some of the difficulties that the water power engineer has to contend with in some instances.

Ingersoll-Rand Co., 11 Broadway, New York City, has issued a number of new pieces of literature on its various products. Form 8707 is a 40-page bulletin on "Little David" pneumatic drills, grinders and saws. Various sizes and models of the different machines are illustrated and detailed descriptions concerning the particular tool to use for a given purpose are included. The descriptive matter is supplemented with a number of tables giving air consumption of the various tools, etc. Another publication is entitled "'Tis a Good Investment," illustrating and briefly describing Class ER and Class FR compressors in small machine shops, power houses, garages, etc. A third bulletin describes the air lift method of pumping and shows a view of the installation of the Ingersoll-Rand air lift in a Georgia water works. The company will soon have ready for distribution Form 9029 which will be a pictorial products catalog, illustrating and describing practically the entire line of products marketed by this concern. Copies of these bulletins will be sent free on request to either the New York office or any of the branch offices.

Mack Searchlight Truck Exhibited in New York.—One of the interesting exhibits made during the Motor Transport Corps' show in New York on Oct. 16-18, was the Mack 5-ton searchlight truck illustrated herewith. This truck was made by the International Motor Co., New York City, and formed one of a fleet of trucks used by army engineers for night work in building roads, bridges and similar works. The engine on the truck is arranged to drive the truck and also to drive a 15-kw. generator, for furnishing energy to the 1,000,000-cp., 40-in. field searchlight. The latter is mounted on a separate chassis and can be easily removed from the truck and placed in any position desired.

The Motor Transport Corps controls all army motor equipment except heavy artillery tractors, tanks and hospital ambulances. When we entered the war, the United States Army did not own more than a thousand motor trucks. A year and a half later it had 124,800 trucks and passenger cars and 21,780 motorcycles in France, and 33,700 trucks and passenger cars, and 10,170 motorcycles in this country. Of this total of 190,450 motor vehicles, all but 7800 were American made.



Mack 5-ton Searchlight Truck with Portable 40-in. Searchlight Displayed at Motor Transport Corps Exhibition.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Rutland, Vt.—Rutland Railway, Light & Power Co. has recently completed the installation of a new generating unit in its Mendon station, and it is expected that service will be inaugurated at once.

Springfield, Vt.—Colonial Power & Light Co. has been awarded a contract for furnishing additional service for the proposed addition to the Orchard Park Hotel, Manchester, Vt., as well as to the new addition to be erected by the Equinox Co., operating the Equinox Hotel.

Boston, Mass.—Charles H. Tenny & Co., 201 Devonshire street, operating gas and electric light plants in the vicinity of Boston and throughout New England, have completed arrangements for the purchase of the Worcester Gas Light Co., Worcester. It is understood that the new owners will continue the operation of the plant.

Lowell, Mass.—A number of the large textile plants in this vicinity are arranging for the use of fuel oil at their power plants, and oil burning equipment, including burners, pumps, tanks, etc., will be installed. These mills include the Merrima Manufacturing Co. and the Tremont & Suffolk Mills. The American Woolen Co. is now using oil fuel almost exclusively at its mills at Lawrence, Mass.

Meriden, Conn.—Cuno Engineering Co. is having plans prepared for a two-story steel and reinforced concrete plant, 190x230 ft., on a site recently acquired on Colony street. Max J. Unkelbach, New Britain, is architect.

Brooklyn, N. Y.—Brooklyn City Railroad Co. has completed negotiations for the disposal of its property on Flushing avenue and Hopkins street, between Nostrand and Marcy avenues, formerly used for power station and other service, to new interests.

Middleport, N. Y.—Niagara Spray Co. is having preliminary plans prepared for the construction of a number of local manufacturing buildings, including a large machine shop, chemical buildings, with power plant for general works operations, and auxiliary structures. The buildings will be of brick and reinforced concrete construction.

Rochester, N. Y.—American Laundry Machinery Co. has awarded a contract to John Luthere & Sons, 176 North street, for the erection of a new one-story machine shop addition to its plant, located in the Lincoln Park district, about 160x200 ft. Considerable electrical equipment will be required. The structure is estimated to cost $50,000.

Schenectady, N. Y.—General Electric Co. has filed plans for the erection of a new one-story brass foundry addition to its local plant, to be erected at Building No. 89. The structure will be about 100x100 ft., and is estimated to cost $30,000. Contract for construction has been awarded to the H. K. Ferguson Co., Cleveland, Ohio.

Dover, N. J.—New Jersey Power & Light Co. has arranged plans for the construction of a 33,000-volt transmission line to the Replogle mine of the Wharton Steel Co., for furnishing additional electric service for the operation of the properties, at which location a quantity of new machinery is now being installed. The plans include the erection of a new 33,000-volt substation at the mine. The company has also been awarded a contract for furnishing electric power for the operation of the proposed plant of Paul Guenther & Co., Inc., to be located at Wharton.

Harrison, N. J.—Crucible Steel Co. of America, Middlesex street, has completed plans for the construction of a new one-story brick and steel boiler plant addition to its works, to be located on South Fourth street.

Jersey City, N. J.—Pennsylvania Railroad Co. has filed plans for the erection of a new brick cable building at Railroad avenue and Warren street.

Newark, N. J.—Splitdorf Electrical Co., 98 Warren street, has had plans prepared for alterations and improvements in its plant. It is proposed to commence the work at once.

Newark, N. J.—In connection with the construction of the proposed group of hospital buildings at the County Hospital, Overbrook, contracts for which were recently awarded, considerable new electrical and mechanical equipment will be required. The work will include the erection of five structures, and contracts for all miscellaneous work, including heating, plumbing, etc., have been awarded to insure the early completion of the work.

Philadelphia, Pa. — Philadelphia Storage Battery Co., Ontario and C streets, has completed negotiations for the purchase of property at the southwest corner of Ontario and C streets, about 120x195 ft., for a consideration of approximately $13,500.

Philadelphia, Pa.—Plans and specifications for the proposed improvements in the filtration plant at the municipal waterworks plant, Queen Lane station, have been approved by the State Commissioner of Health, and it is proposed to call for bids immediately. The new improvement will approximately double the present capacity of the plant, and is estimated to cost $500,000. Considerable electrical equipment will be required in connection with the work.

Philadelphia, Pa.—Board of managers of the Chester Hospital, Chester, has had revised plans prepared for the construction of a new boiler plant at the institution, as well as other improvements and alterations, including the installation of new heating equipment, plumbing, etc. Ballinger & Perrot, 17th and Arch streets, Philadelphia, are architects.

Pittsburgh, Pa.—Negotiations have been completed by the J. A. Williams Co. for the leasing of the three-story brick building at Shadyside station on the Pennsylvania railroad, about 212x222 ft., on property 212x275 ft., formerly used by the Westinghouse Electric & Manufacturing Co. for the manufacture of shells. The structure comprises approximately 170,000 sq. ft. of floor space.

Reading, Pa.—Metropolitan Edison Co. is arranging for extensive improvements and extensions in its plants and system, including the completion of work on the construction of new high-tension lines. The company, which operates in West Reading, Reading, Lebanon, and Norristown, as well as neighboring sections, has recently authorized an increase in its capital stock from $5,000,000 to $8,000,000, a portion of the proceeds to be used for the proposed expansion.

York, Pa.—Otto Eisenlohr & Brother, Ninth and Market streets, Philadelphia, have completed plans for the erection of a new boiler plant, one-story, to be constructed in connection with other additions at their local plant. The entire work is estimated to cost $50,000. John Hamme, 31 West Market street, York, is architect.

Baltimore, Md.—Park commissioners have approved an appropriation of $18,000, of which $12,000 will be utilized for the lighting of the Mill Race Drive; $3000 for improvements in the lighting system in Carroll Park; and $3000 for improvements in the electric lighting system in Druid Hill Park.

Riverton, Va.—Shenandoah Valley Milling Co. will install a 1600-hp. hydroelectric plant on Shenandoah river and will let contract for electrical equipment. Address Alfred M. Quick, consulting engineer, 418 Equitable building, Baltimore, Md.

Stanley, Va.—Pool Brothers are having plans prepared for the construction of a new electric transmission system and plant.

NORTH CENTRAL STATES.

Cincinnati, Ohio—As a means of protecting the city against possible shortage of electric power, W. W. Freeman, president of the Union Gas & Electric Co., asked the Rapid Transit Commission to let the water into the canal again between the present dam and Charles street. Mr. Freeman proposes to build a dam at Charles street and to use the water power until such a time as the city is ready to proceed with its work on the new rapid transit system.

Dover, Ohio—The $100,000 bond issue for extension to the city light plant and waterworks probably will be submitted to a referendum vote.

Lebanon, Ohio—The city has under consideration the erection of a municipal electric power plant.

Marion, Ohio—An ordinance was passed by the council authorizing the Columbus, Delaware & Marion Railway Co. to install a large number of street lights in this city. Address city auditor.

Columbus, Ind.—S. J. Peabody Lumber Co. will double the capacity of its hardwood mill. The machinery will be operated by electricity.

Portland, Ind.—The city will expend $100,000 building a municipal electric light and power plant, the public service commission having given authority to issue bonds.

Carlinville, Ill.—Standard Oil Co. is making plans to bring the electric power from the big Schoper power to the Berry mine. When this is done the electrical machinery will be installed and the steam engines will be taken out. The power will also be brought to Mine No. 1-A and the steam plant taken out as soon as the work is completed to the Berry mine. The wires will be brought underground from Barry to Mine No. 1-A.

Chicago, Ill.—Chicago Electric Manufacturing Co., 2811 South Halsted street, will build a two-story plant, 100x133 ft., to cost $60,000. George Knouff, president.

Chicago, Ill.—Century Rubber Works have plans for erection of a large plant, to cost $300,000, to be ready for occupancy June 1, 1920.

Chicago, Ill.—Crane Medicine Co. will erect an eight-story concrete factory building, 99x130 ft., at an investment of $300,000.

Chicago, Ill.—Architect E. H. Froh-man, 64 West Randolph street, has prepared plans for a $125,000 electric specialty factory to be erected by Birdman Electric Co. Brick and stone construction. Specifications include freight elevator, steam heating, plumbing and electric lighting. A. Appel, 1422 West Randolph street, is president of the company.

Chicago, Ill.—Kirk D. Holland will erect a three-story factory building, 25x130 ft., for the Double Seal Piston Ring Co., to cost $80,000.

Chicago, Ill.—Plamondon Co., manufacturer of transmission machinery, has purchased property on which it proposes to erect a plant to cost $1,000,000. Work has started on a 200x500 ft., one-story concrete building, to cost about $250,000, which will be the first unit of the plant; and will have approximately 100,000 sq. ft. of floor space.

DATES AHEAD.

Electrical Supply Jobbers' Association. Semi-annual meeting, Cleveland, Ohio, Nov. 18-20. Headquarters, Hotel Cleveland. Secretary, Franklin Overbagh, 400 South Clinton street, Chicago.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

American Institute of Chemical Engineers. Annual meeting, Savannah, Ga., Dec. 3-6. Secretary, J. C. Olsen, Brooklyn, N. Y.

Electric Power Club. Meeting, Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

American Electrochemical Society. Annual convention, Boston, Mass., April 7-10, 1920. Friday, April 9, joint session with American Institute of Electrical Engineers on "Electrically Produced Alloys." Secretary, Joseph W. Richards, Bethlehem, Pa.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

Chicago, Ill.—Wilson-Jones Loose Leaf Co. will erect a two-story building, 260x360 ft. at Franklin boulevard and Spaulding avenue and will cost $750,000. The new building will have a total floor space of 187,000 sq. ft.

Chicago, Ill.—Property has been purchased by the Union Wire Mattress Co. on which it is proposed to erect a plant to cost $500,000, with a floor area of about 200,000 sq. ft. The first unit of the plant will be started in spring.

Chicago, Ill.—Arthur Jones Electrical Co., 2837 South State street, is planning to build a two-story plant, 125x125 ft., to cost $60,000.

East St. Louis, Ill.—Home Ice Cream Co. will erect plant, 98x100 ft., three stories high, to cost $70,000.

Galena, Ill.—Several short electric extensions to serve farmers near Platteville and Hazel Green are being run by the Interstate Light, Heat & Power Co. at the expense of the farmers.

Mound City, Ill.—G. Murphy will expend $20,000 for the equipment for the Mound City ice plant.

Ottawa, Ill.—Illinois Farmers Packing Co. will erect $100,000 addition to plant and will install $50,000 worth of equipment. The new building will be 95x45 ft., four stories and basement.

Springfield, Ill.—The sum of $600,000 in bonds has been authorized to finance the municipal light plant. Address Commissioner Walter J. Spaulding.

Antigo, Wis.—Red River Manufacturing Co., whose plant at Phlox was destroyed by fire Nov. 4, will rebuild on a larger scale.

Oshkosh, Wis.—Doman Manufacturing Co., which has acquired the assets of the Oshkosh Washing Machine Co., will build a one-story plant addition, 40x200 ft., and enlarge its power plant. H. C. Doman is general manager.

Grand Rapids, Minn.—Prairie River Power Co. has been granted permission to construct a dam in falls of Prairie river as soon as construction contract can be let. A high-tension transmission line will also be constructed.

New Ulm, Minn.—Minnesota Flint Rock Co. contemplates erection of a high-tension line from light plant to its quarry at Redstone. Address A. R. Voss.

Shevlin, Minn.—The city contemplates erecting an electric light plant. John N. Desjardins, village recorder.

St. Paul, Minn.—A 100-kw. electric brass furnace has been installed by the Union Brass & Metal Co., and will be in operation within thirty days. Electric current will be supplied by the Northern States Power Co.

Ulen, Minn.—J. F. Heiberg will install electric lighting system and power.

Sac City, Iowa—Thirty farmers of Sac county have incorporated the Pleasant Hill Electric Co., which will construct and operate a high-tension electric line in Clinton and Bayer Valley townships.

Sioux City, Iowa—The work of inspecting the Bell telephone line between Sioux City and Sioux Falls has just been completed by a crew of men working under the direction of John Duncan of St. Cloud, Minn. This inspection is a preliminary survey, the ultimate object of which is the virtual rebuilding of the line in 1920. The improvement work on this is expected to begin in the spring. Estimated cost $100,000. Copper wires will replace the worn copper and steel wires with which the line is equipped at present.

Koshkonong, Mo.—It is reported that the Missouri Iron & Steel Corp., St. Louis, plans a hydroelectric development here.

Lexington, Mo.—Lexington Electric Co. contemplates the erection of a transmission cable across the Missouri river and to Richmond. Estimated cost, $50,000.

Richmond, Mo.—A new lighting system to cost approximately $35,000, will be installed by the city. Address city clerk, Richmond.

Wichita, Kans.—An estimate of $6250 was presented the city commissioner as the cost of installing system of lighting on First street, from Main to Water street, and on Water street from First street to Douglas avenue. The cost will be apportioned among property owners.

Kimball, Neb.—Bond issue for $25,000 issued for additional electric light construction was purchased by the Lincoln Trust Co., 126 North 11th street, Lincoln.

Armour, S. D.—Townships of Ethan and Dimock have raised $25,000 for installing lights here.

Claire, S. D.—Special election has

been held which authorized village to construct an electric distributing system and purchase current from New Effington Electric Co., New Effington.

Hartford, S. D.—Hartford Light & Power Co. will extend its wires to Chancellor to furnish electric lights.

Sioux Falls, S. D.—A local quarry will increase its daily output to 800 cu. yds. or four times its present capacity by means of new machinery to be installed soon.

Calvin, N. D.—Plans are in progress for establishing an electric light plant.

Carthage, N. D.—City granted L. W. Liddle a franchise to install an electric light plant.

Fargo, N. D.—The city commission will take immediate steps to obtain estimates on the cost of an electric light plant of sufficient capacity to supply the city.

Sawyer, N. D.—Cook Robinson has been granted franchise to install an electric light system. Contracts have been let to Northwestern Electric Co., Minot, N. D.

SOUTH CENTRAL STATES.

Covington, Ky.—Willard Manufacturing Co., manufacturer of machine tools, plans the erection of a one-story building, 63x160 ft.

Harland, Ky.—Bowers Manufacturing Co. will install electrically driven lathe, hammer, etc.

Kaplan, La.—Electrical equipment will be purchased for the light plant. Address Eugene Clymer, mayor.

Hobart, Okla.—City is planning for the issuance of bonds for $135,000, the proceeds to be used for the installation of a new municipal electric light plant.

Miami, Okla.—Miami Traction Co. is understood to be arranging plans for the rebuilding of its electric power plant recently destroyed by fire, with loss estimated in excess of $75,000. B. B. Tatum is president.

Oklahoma City, Okla.—Deignan Motor Co. will construct a $200,000 factory for rebuilding Fords.

Pawhuska, Okla.—The system of municipal electric lighting and water works will be improved here shortly through the addition of new generating machinery and pumping apparatus. The present lighting equipment has proved inadequate to meet the demands of the city.

Tonkawa, Okla.—Bonds to the amount of $15,000 have been voted for improving electric light service. Johnson & Benham, consulting engineers. Firestone building, Kansas City, Mo.

Albany, Tex.—Albany Light & Power Co., which has been incorporated with a capital of $30,000, will install an electric light and power plant. The incorporators are: T. B. Wood, J. J. Mahan and R. A. Cox.

Brady, Tex.—Contract has been awarded by the city council for the installation of a new municipal electric plant.

Kileen, Tex.—City Light & Power Co. has had plans prepared for the reconstruction of its electric light and power plant, recently destroyed by fire with loss estimated at about $28,000.

Wichita Falls, Tex.—Wichita Falls Electric Co. has increased its capital stock from $775,000 to $1,775,000. It plans to make large additions to its electric light and power plant here.

WESTERN STATES.

Drummond, Mont. — Drummond Light & Power Co. has organized with capital stock amounting to $10,000. H. J. Faust, chairman of board of directors. Work on the installation of the plant will be started at once.

Superior, Mont.—Montana Power Co. is now surveying a line from Taft to Amazon Dixie at Sildix to furnish power to that mine. Construction of the line will be commenced when the survey is completed.

Yuma, Ariz.—New King Mining Co., operating in the Kola mining district, is understood to be arranging plans for the construction of a new high-power transmission line from Yuma to its properties, a distance of approximately 70 miles. W. J. Johnson is manager of the mine.

Millville, Utah—City council has recently completed work on the construction of a new electric distributing system to be used for municipal service.

Boise, Ida.—Ashton-St. Anthony Power Co. has filed application with the Public Utilities Commission for permission to make extensions in its transmission system to the municipality of Drummond, Fremont county.

Sandpoint, Ida.—Western Pole Preserving Co. is installing an additional 43 hp. in motors for the operation of the plant at Sandpoint. Electrical energy is furnished by the Mountain States Power Co.

Petersburg, Alaska—City council has acquired a site for a hydroelectric power plant, and the plans are to build a plant of the capacity of 5000 hp.

Burbank, Wash.—The Burbank Irrigation district has voted a bond issue of $400,000, the proceeds of which are to be used to complete the water system of that project. An expenditure of $200,000 will be required to line 18 miles of canals with concrete. Another requirement will be the installation of two auxiliary pumping units for which electric motors will be used.

Centralia, Wash.—The city commission has signed a contract with the Sherman County Light & Power Co. to furnish current to the city for the five-year period from Oct. 1, 1920.

Centralia, Wash. — Washington Light & Power Co. is considering the erection of a plant here.

Wenatchee, Wash.—As a solution to the power problem of the Wenatchee Valley, General Manager George D. Brown of the Wenatchee Valley Gas & Electric Co. has submitted to the power users and the public a proposition to buy the bonds necessary to finance an enlargement of the Chelan Falls plant. It is estimated that the cost of adding another 1000 hp. to the Chelan Falls plant will be $80,000. The company proposes to issue first mortgage bonds bearing 6% interest, secured by this plant and the contracts for the sale of the power and asks the power users of the valley to buy these bonds, so that the machinery can be ordered and the unit installed in time for next season's business. The Wenatchee Valley Power Users' Association and the special committee of the commercial club voted unanimously to endorse the plan.

Astoria, Ore.—The Port Commission has taken up the matter of installing an underground electric power system throughout the port property.

Astoria, Ore.—Power house of the Pacific Power & Light Co. has been damaged by fire. Loss amounting to $20,000.

Astoria, Ore.—Pacific Power & Light Co. has recently inaugurated work on the construction of its proposed electric station. It is understood that large oil-operated turbines will be installed.

Portland, Ore.—Canadian Marconi Wireless Co. is understood to be arranging plans for the construction of a large new high-power wireless station in the vicinity of Vancouver, B. C., which will be the most powerful radio depot in the British Empire, it is said, when completed. The station is estimated to cost in the neighborhood of $2,000,000.

The Dalles, Ore.—Cluster lights will be installed along Second street, the main thoroughfare of the city. Ten city blocks will be lighted with three clusters to each block.

Avalon, Calif.—City council has completed plans for the installation of new generating equipment at the municipal electric light plant.

Calipatria, Calif.—Imperial Utilities Corp., which recently completed negotiations for the acquirement of a waterworks plant at Calipatria and Niland, as well as at Monterey Park. The company operates a water works and ice manufacturing plant at Barstow, and has filed application with the Railroad Commission for permission to issue bonds for $54,000, a portion of the proceeds to be used for the construction of a new ice plant and improvements in the various plants.

El Centro, Calif.—An election will be held to decide the question of issuing $30,000 in bonds for a new light system. Address Mayor George Watkins.

Fillmore, Calif.—Board of trustees is considering plans for the issuance of bonds to cover the cost of the installation of a new water supply system, including necessary equipment such as pumping units, drilling of wells, etc.

Fullerton, Calif.—City council is arranging plans for the installation of a new electric lighting system in sections of Spadra and Commonwealth avenues, as well as in the residential districts. It is proposed to utilize cast-iron lighting standards for the former installation, and Marbelite standards for the latter service.

Los Angeles, Calif.—The city attorney, city engineer and city electrician were instructed by the city council to prepare the necessary ordinance for the ornamental districts of Los Angeles. It is proposed to ask for bids covering the period of 5 years, from July 1, 1920, to June 30, 1925, on 41 ornamental lighting systems. The city's proportion of the cost of maintaining the systems is $23,893 per year.

Richmond, Calif.—City council is considering plans for the installation of a new electrolier street lighting system in the business section of the city. The installation will cover Washington, Macdonald, Barrett, and Richmond avenues, as well as other thoroughfares.

Salinas, Calif.—City council has plans under consideration for the installation of a new ornamental street lighting system on Market and North Main streets.

NEW PUBLICATIONS

Some Tests of Light Aluminum Casting Alloys; the Effect of Heat Treatment is the title of technologic paper No. 139 issued by the Bureau of Standards, Washington, D. C. The mechanical properties of a number of different compositions of cast light aluminum alloys have been determined as well as the resistance to the action of alternating stresses of three commonly used alloys. Comparison was made of the resistance of some well known alloys to corrosion in the salt spray test. It was found that the effect of heat-treatment of cast alloys, consisting of annealing at 500°C and cooling in air from that temperature, followed by aging for several days before testing, produced an increase in the tensile strength and the hardness, with an attendant decrease, usually, in the elongation. The application of such a heat-treatment to light aluminum castings seems to have commercial possibilities. The price of this publication is 10 cts. and copies may be obtained by addressing a request to the Bureau.

Electrical Goods Trade on the East Coast of South America—Opportunities for American electrical goods in Argentina, Uruguay, and Brazil are described in this booklet now being distributed by the Bureau of Foreign and Domestic Commerce, Department of Commerce. It is the work of Trade Commissioner Philip S. Smith, whose previous reports on other Latin-American markets are well known to the trade. The use of electricity is widespread in Argentina, Uruguay, and Brazil, but especially so in the last named, where there is abundant waterpower. In all three the work of the American manufacturer is cut out for him, as competition will soon be keener than ever it was before the war. The price of this booklet is 20 cts. and copies may be obtained by addressing the Superintendent of Documents, Washington, D. C., or to any of the district offices of the Bureau of Foreign and Domestic Commerce.

PROPOSALS

Electric Pumps.—Bids will be received for the purchase of four electric pumps to be installed in the city pumping station, Sault Ste. Marie, Mich. Address A. J. Eaton, city clerk.

Ranges and Ovens.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for 8 electric ovens for delivery at eastern yards, and 6 electric ranges for delivery at South Brooklyn and Mare Island yards. (Schedule 4937.)

Pumping Equipment, Etc.—Eugene Eleazar, mayor of Kaplan, La., will receive bids until Nov. 25 for extensive improvements in the municipal light and water plants, including the installation of new pumping equipment, alternator, switchboard, and auxiliary apparatus. Xavier A. Kramer, Magnolia, Miss., is consulting engineer.

Electric Light Plant.—Bids will be received Nov. 19 by the mayor of Rolling Fork, Miss., for furnishing all materials and constructing a water works and electric light plant. The work consists of a power house building, oil-engine pumping machinery, alternators, switchboards, reservoir, water pipe lines, tower and tank, electric lines and street lighting system. Address J. B. Sinai, mayor. Xavier A. Kramer, consulting engineer, Magnolia, Miss.

Machines and Machine Tools.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for electric hoisting cranes, delivery at various navy yards (Schedule 4938); electric portable drills, delivery at various eastern and western yards (Schedule 4968); electric bench grinders, delivery at various eastern and western yards (Schedule 4968), and one motor-driven shaping machine, delivery at Washington navy yard (Schedule 4994).

Electrical Material.—Bids will be received by the Bureau of Supplies and Accounts, Navy Department, Washington, D. C., for the following material: 2 Type B annunciators, for delivery at Brooklyn navy yard (Schedule 4993); 3000 ft. brush-holder cable and 300 lbs. underwriters' wire, delivery at Mare Island (Schedule 4983); a miscellaneous quantity of lighting and power cable, lighting and power wire, incandescent lamp cord and 15,000 ft. triple-braid weatherproof wire, for delivery at Mare Island (Schedule 4982); turbogenerators, delivery at Puget Sound (Schedule 4810); 9 automatic motor compensators, delivery at Washington navy yard (Schedule 4809); miscellaneous electrical equipment, f. o. b. (Schedule 4806); 150 lbs. phosphor-bronze wire, delivery at Boston (Schedule 4966).

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Copper Wire (31,183).—A merchant in Argentina desires to purchase iron in bars, woods, construction materials, copper wire, hardware in general, and will also accept commissions, shipments and agencies. References.

Electrical Measuring Instruments (31,190).—The general purchasing agent of a firm in Spain desires to purchase and secure an agency of iron-piping installations, with faucets, valves, connections, etc.; belting for power transmission; greases and mineral oils; electrical measuring instruments (meters), and electrical equipment of all kinds; and gas motors. Quotations should be given c. i. f. Spanish ports. Correspondence should be in Spanish. References.

Motors, Turbines, Etc. (31,191.)—A commercial agent in Belgium desires to secure an agency for the sale of all kinds of articles connected with heating installation, such as boilers, radiators, taps, ventilators, turbines, motors, hydrometers, thermometers, regulators, tools, and joints in asbestos and rubber. Quotations should be given c. i. f. Brussels or Antwerp. Correspondence may be in Spanish.

Electrical Goods (31,194).—Agencies are desired by a firm in France for the sale of textiles, rubber goods and electrical goods. Correspondence should be in French. References.

Electrical Machinery (31,203).—An agency is desired by a man in Italy for the sale of hydraulic turbines, machine tools, electrical machinery and supplies, and mechanical goods in general. Correspondence may be in English. Reference.

Motors, Machinery, Cables, Etc. (31,207)—A company in Greece desires to secure agencies from manufacturers for the sale of iron concrete reinforcement bars; structural and shipbuilding sheets; steel iron and copper pipes; internal-combustion engines; Diesel and semi-Diesel engines, principally of small power; 2 to 6 hp. engines suitable for well pumping, also 10 to 25-hp. engines for small flour mills, etc.; marine engines, 100 to 300 hp.; windmill pumps; cylinder flour mill of from 5 to 10 tons daily output for country districts; electric motors and other electrical machinery and appliances, telephones, etc.; plain and insulated electric cables and wires; and steel ropes and wires. References.

Vacuum Cleaners (31,209).—A company in England desires to secure agencies for the sale of electric vacuum cleaners and all kinds of labor-saving devices for the home. Quotations should be given c. i. f. English port, or f. o. b. New York. References.

Personal

H. L. Everest Sales Manager of Hart & Hegeman — L. H. Kinnard New President of Pennsylvania Bell Telephone

GEORGE M. GRIFFITH is now in the construction department of the Oklahoma Gas & Electric Co., in charge of substation construction at Sapulpa, Okla.

R. C. GOSROW, sales engineer for the Pittsburgh Furnace Co., Milwaukee, Wis., has opened a branch office for that company at 504 Maynard building, Seattle, Wash.

C. C. DAVIS, field representative of the California Electrical Co-operative Campaign for the San Francisco district, has resigned to become manager of the electrical department of the Turner Hardware & Implement Co., Modesto, Calif.

WILLIAM A. BAEHR, consulting engineer of Chicago, through the purchase of the Southern Illinois Light & Power Co., Hillsboro, Ill., has been elected president of that company, taking up the duties of J. J. Frey, of St. Louis, formerly president of the company.

WARREN B. LEWIS, Providence, R. I., has been appointed provisional manager of the Taunton (Mass.) municipal lighting plant. Mr. Lewis maintains consulting engineering offices in the Grosvenor building, Providence, but will devote considerable time to problems of the Taunton plant.

O. A. JENNINGS, formerly manager of the oil field electrification department of the Oklahoma Gas & Electric Co., has been appointed manager of the commercial department of the company with supervision of the commercial activities of the company throughout the state of Oklahoma, with headquarters at Oklahoma City.

J. P. DAVIS, purchasing agent of the Belden Manufacturing Co., has been elected president of the Purchasing Agents Association of Chicago. Mr. Davis was formerly assistant purchasing agent for the Standard Underground Cable Co., of Pittsburgh, coming with the Belden Manufacturing Co. as purchasing agent in 1916. The position in the Purchasing Agents Association, which he now holds, is especially important since the 1920 convention of the national association is to be held in this city.

E. B. CRAFT, assistant chief engineer of the Western Electric Co., delivered an interesting address at a meeting of the Rochester (N. Y.) Section of the American Institute of Electrical Engineers, held at Rochester, N. Y., on "Wartime Electrical Communciations." Mr. Craft served as a major in the United States Signal Corps, and the lecture was illustrated with stereopticon slides, showing pictures of wire and wireless telegraphy and telephony, airplane control, airplane and gunfire detection, as well as submarine detection.

JAMES H. MANNING, consulting hydraulic engineer for Stone & Webster, was recently appointed assistant engineering manager. Mr. Manning joined the Stone & Webster staff in 1910 and served as superintendent of construction in the Franklin, Verdi and White Salmon hydroelectric developments, besides preparing various engineering reports. He later was placed in charge of the hydraulic division, and in 1917 he became chief engineer of the American International Shipbuilding Corp. Early in 1919 Mr. Manning was made consulting hydraulic engineer for Stone & Webster, continuing in this capacity until his recent promotion.

H. L. EVEREST, one of the best known and most popular electrical men in the Middle West, has just been appointed general sales manager of the Hart & Hegeman Manufacturing Co., Hartford, Conn. Although a native of the East, Mr. Everest has resided in Chicago for the past 12 years where he has made a host of friends who rejoice at his well earned promotion. He joined the sales force of the Hart & Hegeman company Jan. 29, 1907, his headquarters being in the Chicago territory. In October, 1914, owing to the death of G. S. Searing, he was made western sales manager, which position he has held continuously since. In this capacity Mr. Everest obtained a thorough understanding of the problems of the electrical industry that will be of peculiar advantage to him in his new position. He was born at Lyon, N. Y., and spent his early life at New Haven, Conn. Previous to his connection with Hart & Hegeman he was employed for five years by the New York, New Haven & Hartford railroad. He is a member of the Jovian Order and the Electric Club of Chicago, having been particularly active in the latter.

Haynes L. Everest.

B. H. GARDNER, for the past two years manager of the New Britain district of the Connecticut Light & Power Co., has been promoted to the position of sales manager of the commercial department of the company with headquarters in Waterbury, Conn. He is succeeded by N. S. Franklin, assistant superintendent.

CHESTER BARNHART, formerly auditor of the Oskaloosa Railway, Light & Gas Co., Oskaloosa, Iowa, has accepted a position as office manager and auditor of the Urbana & Champaign Railway, Gas & Electric Co., with headquarters at Champaign, Ill. Both properties are owned by the Illinois Traction System or the McKinley syndicate as it is known.

L. H. KINNARD, after 30 years' service with the Bell Telephone Co. of Pennsylvania, has been elected president of the company and head of the eastern group of telephone companies of the American Telephone & Telegraph Co., to succeed Frank H. Bethell, resigned. Mr. Kinnard entered the service of the old Pennsylvania Telephone Co. at Harrisburg in 1888 as clerk, a year later became assistant local manager, and after a few years local manager at Carlisle, then at Harrisburg. In 1896 he became division superintendent of the southern division of that company, with headquarters at Harrisburg, and in 1902 was advanced to general superintendent and the same year was made general manager. In 1908, the Bell Telephone Co. was formed, the various companies being consolidated, and Mr. Kinnard moved to Philadelphia as general contract agent in charge of what is now known as the commercial department. In November, 1912, he became second vice-president and general manager of the companies, continuing in this capacity until the present time, the word "second" being dropped from his title in 1913. Mr. Kinnard's career in the telephone field has been a long and comprehensive one and he has helped to lead the service and the Bell system through its difficulties and has contributed much toward making the system what it is today. Mr. Kinnard will continue to make his headquarters in Philadelphia. He will be succeeded by John C. Lynch, general superintendent of traffic.

Obituary.

FREDERICK W. WALLACE, Plainfield, N. J., general manager and treasurer of the Waclark Wire Co., Elizabeth, N. J., died on Oct. 30 at his home, following a short illness with pneumonia. Mr. Wallace was 55 years of age.

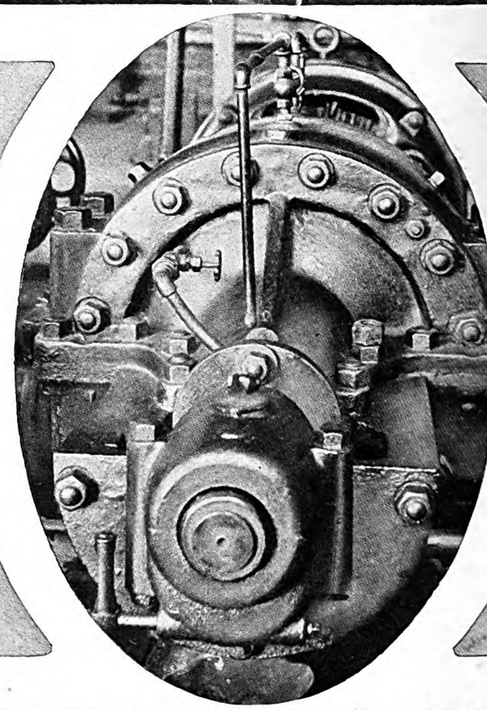
ALLIS-CHALMERS Centrifugal Pumps In Fairmont Have No Maintenance Expense



The three Allis-Chalmers Centrifugal Pumping Units in the Fairmont, Minn., pumping station lift the city water 4½ feet from the lake to an elevated tank 212 feet above the pumps.

Two of the Centrifugals are each of 800 G.P.M. capacity, driven by a 75 H.P. motor. They have been in operation eight years. The other, of 350 G.P.M., with a 35 H.P. motor, has been running five years.

These Units have required practically no expense for maintenance other than repacking once in a while, during the entire life of the apparatus, a fact that greatly pleases the Fairmont Water and Light Commission.

As Allis-Chalmers Pumping Units are designed and built complete by one concern, under the supervision of a single group of engineers, they are remarkably efficient in operation. Furthermore, all responsibility for satisfactory performance is centered in one concern.

Bulletin sent on request.

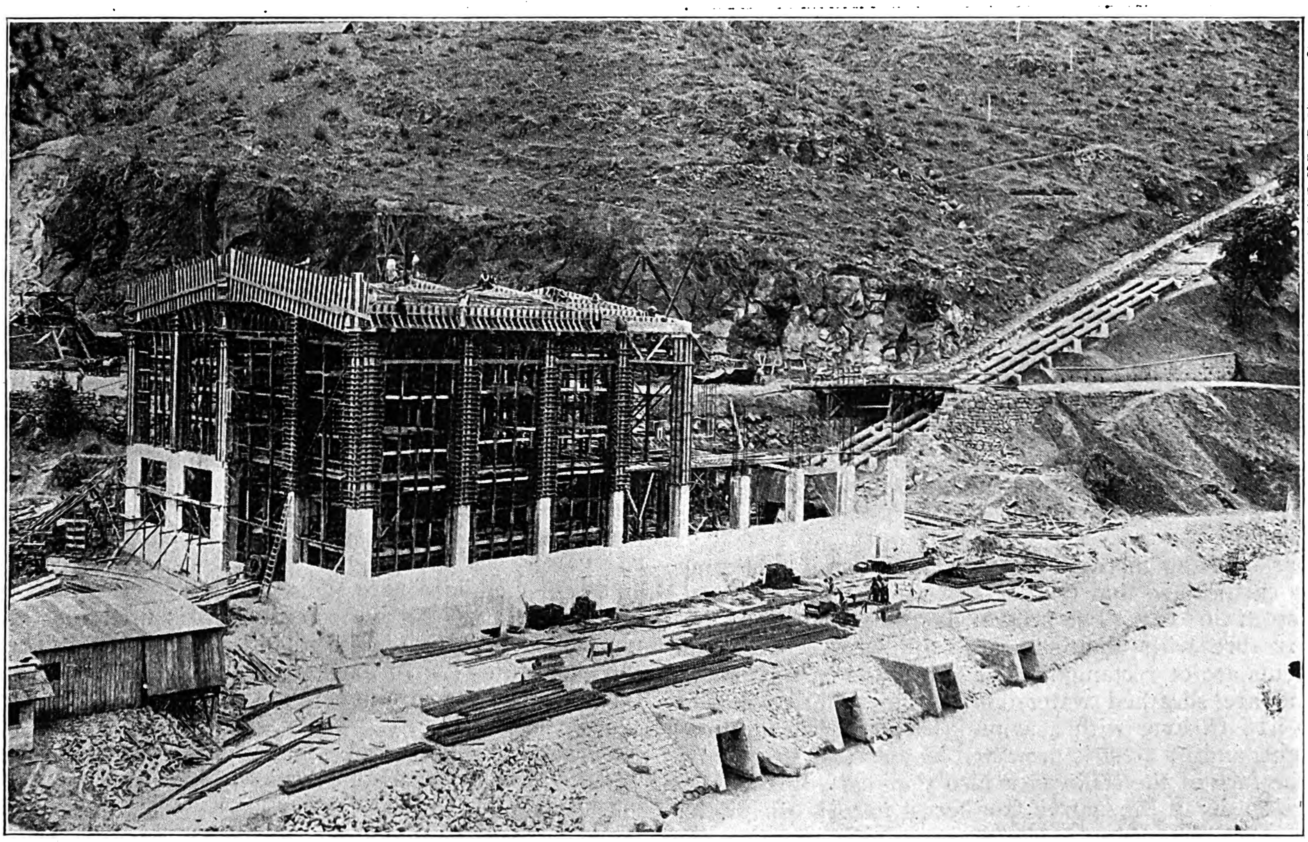
VOL. 75—No. 21. CHICAGO, SATURDAY, NOVEMBER 22, 1919. PAGE 853



Pangal Power House of Braden Copper Company While in Course of Construction.

New Hydroelectric Power Plant at Rio Pangal, Chile

Construction Features of Diversion Dam, Seven-Mile Pipe Line, Penstocks and Waterwheels for New Plant Built by the Braden Copper Co. to Supply Power to Its Works at Sewell, Chile

By HUGH L. COOPER

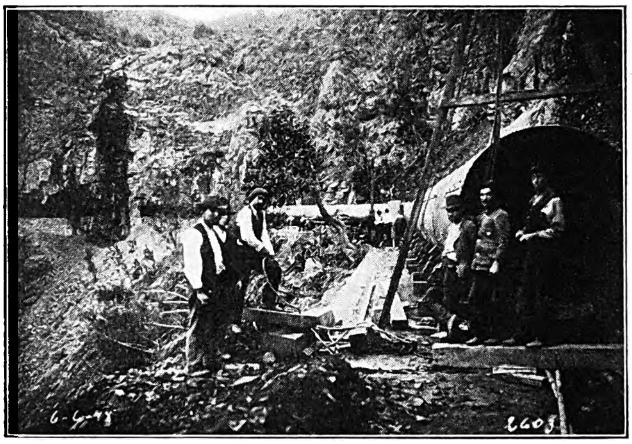
FOR the purpose of supplying additional power to its works at Sewell, Chile, the Braden Copper Co. is building a new hydroelectric plant, which is a development of Rio Pangal for power purposes. This stream, which is a tributary of Rio Cachapoal, has its headwaters in the high mountainous regions along the Argentine boundary, and its course is westward through a deep and precipitous valley to its junction with the Cachapoal, 20 miles east of Rancagua.

The waters of the stream will be impounded by a diversion dam at a point about 10 miles up the river. Water will be conducted from the diversion dam by a combination wood-stave and riveted-steel feeder pipe about 7 miles long, located along the north side of the canyon, to a surge tank. From the latter point it will be conducted down the mountain side in a straight line to the power house, by means of a welded-steel pipe penstock about 4000 ft. long.

Above the diversion dam is a drainage area of about 220 square miles, which is in precipitous mountain slopes, practically devoid of vegetation and subject to torrential storms. The estimated quantity of water available for power purposes has been based upon continuous records of runoff kept by the company for several years. A comparatively large quantity of stored water will be secured by means of the diversion dam. A large storage reservoir site has been located further up stream, which may be utilized to augment the natural stream flow. The plant has been designed to utilize 220 cu. ft. of water per sec.

Diversion Dam and Head Works.

The diversion dam was first built to its low level with its crest at an elevation of 4610 ft. Provision was made to increase its height at some future time by earth fill so that the pond level will be at an elevation of 4680 ft. The present dam is a framed timber structure with abutments and spillway. The abutments are of rectangular crib construction, rock filled, and are sheathed water-tight. The spillway section is 215 ft. long with a sloping back, sheathed water-tight, and its crest is protected by armored steel plate. The face of the spillway is also sloping, with the lines broken in an easy curve from crest to toe—all for the purpose of carrying discharge water safely away from the foundations of the dam. The entire structure is founded upon a deposit of compacted gravel, with some sand and boulders. This accounts for the extreme width of its base and the care used in providing suitable bearing for the bed timbers. The heel of the dam and the abutments are connected and sealed to a continuous concrete cutoff or core wall, which fills a trench excavated to bed rock or to a stratum which is considered impervious.



Pangal Hydroelectric Development—One of the Riveted Steel Sections of the Pipe Line Which Were Installed on All Curves of Less Than 375-Ft. Radius.

In addition to the dam, the head works comprise an intake tower, located 100 ft. upstream from the core wall of the dam, and a feeder-sluice conduit, extending from the intake tower through the dam to a point 500 ft. downstream. Concrete was used in the construction of the intake tower, which is octagonal in plan. with an operating deck on top connected to the dam abutment by a front bridge.

The central circular well is the beginning of the main feeder pipe supplying water to the power house by connection through the feeder-sluice conduit. Water is admitted to the well by seven radial ports, which are simultaneously controlled by a large cylindrical valve in the well. Each port is provided with a removable steel screen and a timber gate or stop log for emergency use. At the bottom of the tower and near its outer circumference are seven circular sluice openings, each controlled by a cylindrical valve. These holes open downward and merge into the lower opening of the feeder-sluice conduit. The purpose of these openings and valves is to remove deposits of sand, silt, etc., from the immediate vicinity of the tower, by sluicing from time to time, and thus prevent their entry into the feeder. The entire tower, including the sluice valve, may be closed by the outside stop logs provided. All valves, screens, stop logs, etc., are operated by a crane at the top of the tower.

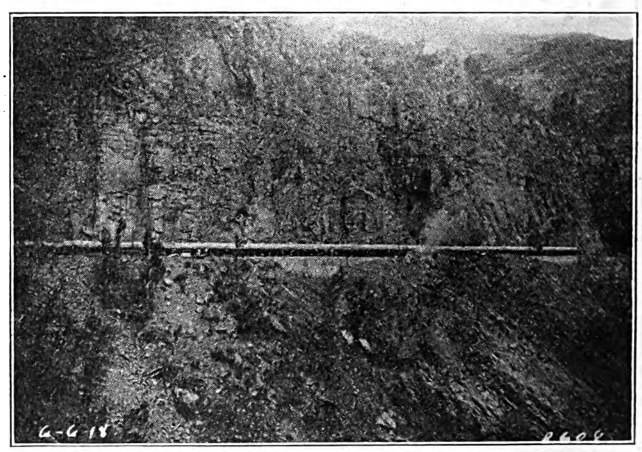
Concrete with steel reinforcements was used for the feeder-sluice conduit, which has an upper opening 80 ins. in diameter, which is an extension of the feeder pipes, and a lower opening 54 ins. in diameter from the sluice valves for discharge into the river. The two openings, or pipes, are conected by a cross-over valve near the end of the conduit. This valve is so constructed that in case of accident or necessity for repair to the main control valve in the intake tower, backwater may be excluded from the well and water for power purposes supplied by the sluice valves, thus contributing to uninterrupted service.

Construction of the Feeder Pipe.

The feeder pipe is 80 ins. inside diameter and 36,723 ft. long from the dam core wall to the surge tank. The center line is at an elevation of 4590 ft. at the intake tower, from which it slopes uniformly downward 15 ft. per mile along its developed length to an elevation of 4485.67 ft. at the surge tank. In plan it follows a winding course along the tortuous side of the canyon. All bends of less than 375-ft. radius are of riveted-steel pipe, built from 3/8-in. plates in 6-ft. inside and outside cylindrical rings alternately, with single-riveted transverse joints and double-riveted longitudinal lap joints.

Standard wood-stave construction is used for the remainder of the pipe, which is its principal part. The staves are of California redwood, finished true to form all over, 48 in number, 3½ ins. thick and of an average length of 14 ft. When delivered, the redwood lumber was rough sawed. It was finished at the site by special wood-working machinery installed for this purpose by the Braden Copper Co.

The bands are of 7/8-in. diameter mild steel rods, in two parts around the circle, with standard malleable iron shoes at the connections. The band spacing varies, according to pressure, from 26 to 54 per 10-ft. length of pipe. The pipe terminates in an expansion joint and cast-iron tee connection to the surge tank.



Pangal Hydroelectric Development—Showing Some of the Difficulties Met in Construction of Pipe Line.

Framed timber saddles, spaced 6 ft. apart, are used to support the entire feeder pipe line. Manholes are provided at intervals of 500 ft. and drain valves with piping are fitted near the surge tank.

Preparation of foundation along the mountain sides was a difficult undertaking because of the great length of pipe, inaccessibility and the varying conditions and nature of materials encountered. This work involved many timber bridges, masonry culverts and retaining walls, tunnels and other special construction.

Surge Tank.

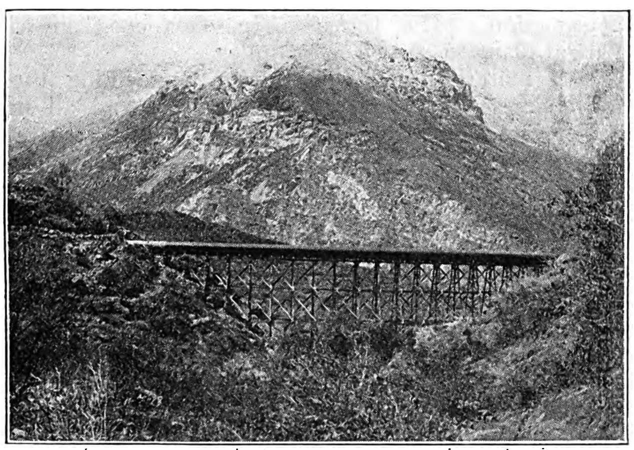
The surge tank is of the differential type, selected because of its economy and effective control of sudden fluctuations in flow. It is built of steel throughout. The outside shell is 16 ft. inside diameter and 129 ft. high, with base at elevation 4525, thus providing for a maximum surge of 34 ft. above the pond surface. The inner tube is 64 ins. outside diameter.

To insure stability and true form because of the great height and small diameter, the inner and outer shells are connected and braced from top to bottom by four lines of radial trussing in vertical planes. The feeder pipe approaching the surge tank and its extension from surge tank to penstock is placed in a tunnel through a spur of the mountain. This was done for the purpose of removing the surge tank back from the sloping surface and so reliable rock foundations could be secured.

Penstocks.

In plan, the penstocks are in a straight line from the end of the feeder pipe to the power house, a distance of 4000 ft. They are connected to the feeder pipe by an expansion joint and Y-lateral, for its upper portion (about one-third) consists of two pipes of 46 ins. inside diameter. Each of the 46-in. pipes branches into two pipes of 30-in. inside diameter by means of Y-laterals, and the four pipes extend to the power house, the last 600 ft. being reduced to 28 ins. inside diameter, each to serve one of the four waterwheels.

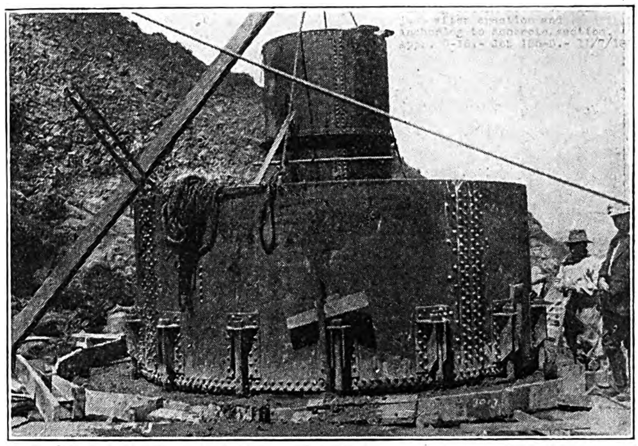
Standard construction is of pipes 20 ft. long, providing a length of 19½ ft. from center to center of joints. The joints are known as trumpet joints, with heel and spigot ends specially formed to receive rubber packing secured by cast-steel flanges and gland. The bell or female end of each pipe is the uphill end



Cerrillos Bridge on Pipe Line of Pangal Hydroelectric Development of Braden Copper Company.

and the shoulder of the bell rests in a molded concrete saddle. The pipes are therefore supported every 19½ ft. along their center line, and the nature of the joints is such that no other provision for expansion and contraction is necessary. Heavy concrete anchorages are provided at vertical breaks in alignment and elsewhere as required. A special flanged section with manhole is inserted immediately below each anchorage to facilitate repair or replacement anywhere along the line.

Each pipe is bedded and anchored into the concrete substructure of the power house and terminates in a heavy Johnson hydraulic valve for the control of flow to the wheel nozzle. The upper end of each 30-in. pipe line is also fitted with a Johnson valve and air inlet valve. These valves are about 2600 ft. from



Surge Tank at Pangal Hydroelectric Development, Showing Bottom Steel Section Just After Erection and Anchoring to Concrete Section.

the power house and are operated electrically from the switchboard. Any accidental break, resulting in a drop in pressure below these valves, will cause them to close automatically, and the time of such closure may be adjusted as desired.

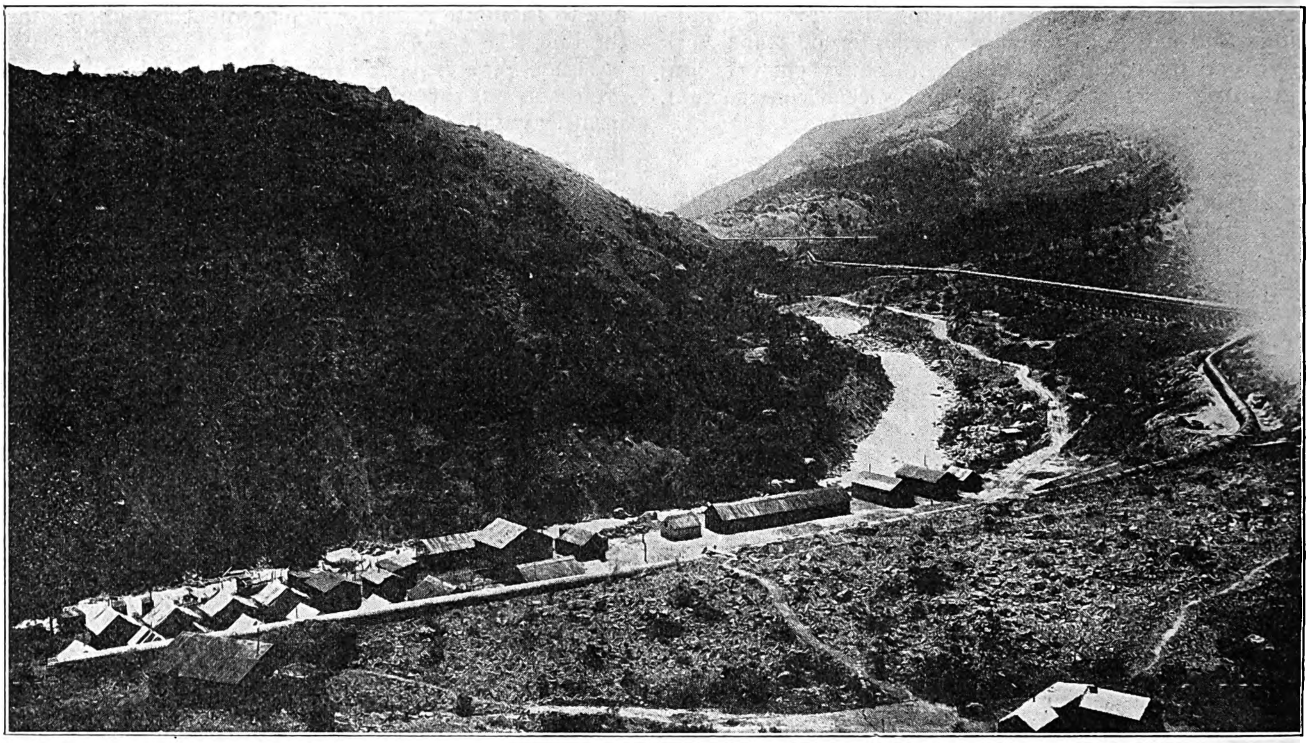
Waterwheels.

The waterwheels are of the impulse type, direct-connected to horizontal-shaft generators. The runner disk is of annealed cast steel and is bolted to the flanged end of the generator shaft. The buckets are of annealed cast steel with spare sets of bronze for comparative trials against erosion, and are secured to the disk by press-fit steel studs. Great care has been taken in fitting the buckets and holding studs to insure accuracy and interchangeability. Each bucket has been brought to uniform weight and the complete number will remain accurately balanced even if parts are interchanged. The complete runner is guaranteed to withstand a runaway speed of 720 r.p.m. without causing stresses of more than 85% of the elastic limit of material in any part affected.

The manufacturer's guarantees as to performance, regulation, etc., of the waterwheels are based upon an operating speed of 360 r.p.m. and direct connection to an a-c. generator of 5000 kv-a., 90% power-factor and 400,000 ft-lbs. flywheel effort. At 1475 ft., net operating head, each wheel will deliver a maximum of 8700 hp. at 82% efficiency and 7300 hp. at maximum efficiency of 84%.

The power nozzle providing a jet of water for each wheel is at elevation 3015 ft. and is of the type known as a needle valve nozzle. This valve is operated by direct connection of the needle stem to the piston of a high-pressure service motor. The pressure medium is oil and its service to and from the motor is controlled by a hydraulic governor with speed element actuated by the generator shaft in the usual manner.

Direct connected to the power nozzle is an auxiliary relief nozzle of the same type and size. The



View From Diversion Dam of Rio Pangal Development, Looking Downstream and Showing a Section of the Seven-Mile Pipe Line.

auxiliary operates automatically, is subject to regulation, and its function is to prevent excessive pressure rise in the penstock from sudden drop in load without undue waste of water. Such pressure is limited to 10% for a decrease in load of any magnitude within the capacity of the equipment. In case of full load suddenly thrown on, the governor apparatus is capable of adjustment so as to limit the resulting pressure drop in the penstock to 15% below static.

Speed regulation is well within the standard practice for impulse wheels. The governor is equipped with hand-control mechanism and also with a hand-power high-pressure oil pump of sufficient one-man capacity to operate the service motor in emergency. A jet of water from the auxiliary relief nozzle or from the power nozzle in case of accident will not appear outside of the power house but will be caught and made inert by a vortex baffle plate secured in the masonry surrounding the wheel pit.

Power House.

Tailwater discharged by the wheels will be conducted to the river by underground concrete passages, where provision has been made to gage the quantity of water so discharged by standard weir measurement. It is expected that the tailwater side of this power house will be clear and accessible, even though impulse wheels are employed.

Oil at high pressure for the governor system is supplied by a central power-driven pumping plant, containing sump, pumps, accumulators, air compressor, filter, piping, etc. This plant is in duplicate as to pumps and accumulators and either side is capable of supplying the station. The pumps are driven by motors or by waterwheels interchangeably. Full supply of oil at constant pressure is insured by automatic control of the pump motors or waterwheels.

The superstructure of the power house is of reinforced concrete and contains the electrical machinery and apparatus and other features usual in generating stations of this kind.

The total static head obtained is 1595 ft., with pond surface at an elevation of 4610 ft., the crest elevation of the diversion dam as now built. This may be increased to 1665 ft. at some future time by raising the diversion dam.

The plant capacity will be 20,000 kv-a., available at the low-tension busbars of the generating station. When generating this amount of power the net operating head will be about 1460 ft. and the quantity of water utilized will be about 204 cu. ft. per sec.

The company owns and operates a hydroelectric plant located on the Cachapoal five miles below the new power station. The two plants will operate in conjunction. The transmission distance from the Pangal plant to Sewell is 18 miles.

All materials for construction (excepting those for concrete and some of the timber) and all machinery and apparatus have been shipped from the United States. All construction work is being done by the Braden Copper Co. through its own construction organization.

The hydraulic work for this plant was designed in detail by Hugh L. Cooper & Co., consulting engineers, New York, who have also supervised the manufacture of all parts shipped from the United States. The electrical work was designed by Percy H. Thomas, consulting electrical engineer of the Braden Copper Co.

NEW INSULATING MATERIAL.

A new product suitable for use in electrical insulation is being obtained from the treatment of kelp in Australia. The moist precipitate is subjected to pressure and formed under pressure, after which it is hardened by treatment with formalin. The finished article is made by turning on the lathe, a process which is said to be perfectly successful, and a high polish is applied. The raw product is to be found in large quantities around the coast of Australia and in particular on the Tasmanian shores.

Central-Station Rates in Theory and Practice

Twentieth Article—Arithmetical and Algebraic Analysis of Rate Schedules—Making Seemingly Involved Rates Simple — Calculations Simplified and Basic Errors Exposed

By H. E. EISENMENGER

This series of articles, of which this is the twentieth, began in the issue of July 12. Part I included seven articles on the cost of electric service. Part II contained six articles on the principles determining the selection of a rate system. In Part III, comprising six articles, the various systems of rates found in practice were described. The present article opens Part IV on rate analysis; this subject will be concluded in next week's article. The remaining five articles will constitute Parts V and VI and deal with accuracy of rates and the practice of rate regulation by commissions.

PART IV—RATE ANALYSIS.

SECTION 157. In case of the more complex rate systems it is not easy to get a clear general conception of what the rate means to the various customers. It is, of course, very easy to figure out what the amount is which a certain given customer has to pay under the rate system, but that is not enough for a critical examination of the character of the rate. A little arithmetic, algebra or geometry can be applied with astonishing results to get an insight into the nature of a certain rate or rate system.

I. Arithmetical and Algebraic Rate Analysis.

158. The arithmetical system of rate analysis has been demonstrated incidentally in a few of the simplest cases in the previous sections and will now be discussed more fully.

Let us call

a = the *amount* of the customer's total bill in cents for the period to which the bill applies.

d = the customer's maximum *demand* in kilowatts, horsepower, number of rooms, or whatever else the unit is.

e = the customer's *energy* consumption in kilowatt-hours.

Let us now take first the example of the straight meter rate, for instance, charging 10 cents per kw-hr. Then we obviously get $a = 10e$, or in the general case if z cents[1] are charged per kilowatt-hour we get $a = ez$.

Likewise, we get in a straight demand rate $a = dy$, where y is the demand charge in cents per kilowatt, horsepower, or per room, etc.

In a Hopkinson rate we get $a = dy + ez$
and in a Doherty rate: $a = x + dy + ez$,
where x is the specified customer charge.

Conversely, if we can express a rate by a formula composed of three members, one of them being constant (x), the second (dy) being proportional to the demand d, and the third (ez) being proportional to e, we have the equivalent of a three-charge system as follows: The member (x) which is free from demand and energy consumption is the equivalent customer charge, the member containing the demand d indicates the equivalent unit demand charge times the multiplier of d, and the member containing the energy consumption e indicates the equivalent unit energy charge times the multiplier of e. Since x, y or z, or any two of these values may be zero, we may accordingly get a two-charge or a single-charge system.

If we include those cases where one or two of the values x, y and z are zero, we can state that practically every rate system can be reduced to an equation of the type described and we have in every rate, whatever its apparent shape, the equivalent of a three-charge, a two-charge or a single-charge rate with the unit charges expressed in the way described above.

The quickest and easiest way to show the working and the principles of this arithmetical and algebraic analysis is to work out a few examples. The generalizing deductions will then offer themselves automatically.

159. Supposing we have a block meter rate which charges 10 cents per kw-hr. for the first 100 kw-hr. per month (first block), 9 cents per kw-hr. for the next 50 kw-hr. (second block), and 8 cents per kw-hr. for the balance (third block). The amount of the bill is then in the first block,

$$a = 10e$$

In the second block ($100 < e < 150$) it is

$$a = 10 \times 100 + 9(e - 100) = 100 + 9e$$

This means that all customers in the second block are charged just the same amount as they would have to pay under a rate having a customer charge of 100 cents ($1), plus an energy charge of 9 cents per kw-hr. We can thus say, although we have no customer charge *specified* in the rate system, yet we have the equivalent of a customer charge of $1. We have no equivalent demand charge, or, more accurately expressed, the equivalent demand charge is equal to zero.

Likewise we get in the third block

$$a = (10 \times 100) + (9 \times 50) + 8(e - 150) = 250 + 8e.$$

The equivalent customer charge has increased to $2.50, the demand charge is still zero, and the energy charge has decreased to 8 cents per kw-hr.

A customer, for instance, who has used 200 kw-hr. will have to pay, being in the third block, 250 cents +

[1] Although the symbols x, y and z are usually employed to designate variable quantities, they are used in the following equations for the quantities: customer charge, unit demand charge and unit energy charge, respectively, although these charges are constant in the first rate systems to be discussed and the variables are d and e. The reason for this choice of symbols will become apparent later.

$(8 \times 200) = \$18.50$, which means a simplification of the computation even in this simple case.[2]

160. Next let us take the example of a plain Wright demand rate charging, for instance, 10.5 cents per kw-hr. for the first 35 hours' use of the demand, 8.5 cents per kw-hr. for the next 25 hours, 5 cents per kw-hr. for all the balance. In the first zone, block or "range," that is from 0 to 35 hours' use, we have

$a = 10.50e$; this means $x = 0$, $y = 0$, $z = 10.5$ cents per kw-hr.

In the second block (35 to 60 hours' use) the customer is made to pay for all kilowatt-hours which correspond to the first 35 hours' use of the demand at the rate of 10.5 cents per kw-hr. and the balance at 8.5 cents per kw-hr. The number of kilowatt-hours which corresponds to the first 35 hours of use of the demand d is $= 35d$ and the unit price to be paid for these $35d$ kw-hr. is 10.5 cents, so that the total price for them is $10.5 \times 35d$. The balance of $e - 35d$ kilowatt-hours is to be paid at 8.5 cents per kw-hr. and the total amount paid for that balance is therefore $8.5\,(e - 35d)$. The total bill is therefore

$a = (10.5 \times 35d) + 8.5\,(e - 35d) = 70d + 8.5e$.

This means a customer charge $x = 0$, a demand charge of 70 cents per kilowatt per month and an energy charge of 8.5 cents per kw-hr. (equivalent of a Hopkinson rate).

In the third block we get likewise $70d + 8.5e$ to be paid for the kilowatt-hours corresponding to the first 60 hours' use, that is for $e = 60d$, and 5 cents per kw-hr. for every kilowatt-hour of the balance. Therefore

$a = 70d + (8.5 \times 60d) + 5(e - 60d) = 280d + 5e$.

A customer having, for instance, 1.5 kw. demand and 100 kw-hr. energy consumption would have to pay $(280 \times 1.5) + (5 \times 100) = 420 + 500 = \$9.20$. Compare this simple calculation with the explicit method of figuring the price for 100 kw-hr. at 1.5-kw. demand under this rate:

I.	(35×1.5) kw-hr. $\times$ 10.5c/kw-hr.	= 551.25c
II.	(25×1.5) kw-hr. $\times$ 8.5c/kw-hr.	= 318.75c
III.	$(100 - 60 \times 1.5)$ kw-hr. $\times$ 5c/kw-hr.	= 50.00c
		920.00c

161. As the next example, consider the St. Louis Residence Lighting rate, which is a Wright demand rate on the number-of-rooms basis, but no longer a simple load-factor Wright rate but of somewhat more complicated specifications as given below. The charges are as follows:

8 cents per kw-hr. for the first 4 kw-hr. for each one of the first 4 active rooms, plus 2.5 kw-hr. for the excess rooms;

6 cents per kw-hr. for the excess up to 7 kw-hr per room for all active rooms;

3 cents per kw-hr. for the excess.

The unit for the demand d is here not the kilowatt but the active room. To determine the different "ranges" or "zones" in which the three unit kilowatt-hour charges of 8, 6 and 3 cents per kw-hr., respectively, apply, it is convenient to draw a diagram (Fig. 8), plotting the number of rooms in horizontal direction (as abscissæ) and the number of kilowatt-hours in vertical direction (ordinates). The 8-cent-per-kilowatt-hour zone reaches from

0 to 4 kw-hr. for 1 room
0 to 8 kw-hr. for 2 rooms
0 to 12 kw-hr. for 3 rooms
0 to 16 kw-hr. for 4 rooms.

This means, anything below the straight line OA in Fig. 8 is to be paid at 8 cents per kw-hr. For 5 rooms and upwards we have to add only 2.5 kw-hr. for each room, which means the 8-cent-per-kw-hr. zone reaches

from 0 to 18.5 kw-hr. for 5 rooms
0 to 21 kw-hr. for 6 rooms
0 to 23.5 kw-hr. for 7 rooms
..........etc..........., see line AM.

The range below the line OAM is therefore a straight meter rate at 8 cents per kw-hr. or $a = 8e$.

The 6-cent-per-kw-hr. zone (zone 2 in Fig. 8, consisting of $2a$ and $2b$) reaches from this line up to the line ON, which represents 7 kw-hr. per room (7 kw-hr. for one room, 14 kw-hr. for 2 rooms, etc.). What is the equivalent three-charge system in this zone?

Dealing first with that part where the number of rooms is not greater than 4 (zone $2a$), we find in the same manner as before (using the symbol d for the demand in rooms):

$$a = (8\text{c/kw-hr.} \times 4d) + 6\text{c/kw-hr.}(e - 4d)$$
$$= 8d + 6e \quad \ldots\ldots (1)$$

The customer charge $x = 0$, the demand charge $y = 8$ cents per room per month, and the energy charge $z = 6$ cents per kw-hr.

Where the number of rooms is greater than 4 (zone $2b$) we have to pay 8 cents per kw-hr. for a certain number f kw-hr. and 6 cents per kw-hr. for the balance, so that

$$a = 8f + 6(e - f) = 2f + 6e \quad \ldots\ldots (2)$$

where f is composed of two parts: 4 kw-hr. for every one of the first four rooms and 2.5 kw-hr. for every room in excess of 4, so that $f = (4 \times 4) + 2.5(d - 4) = 6 + 2.5d$. Substituting this into the equation (2) we get

$$a = 12 + 5d + 6e \quad \ldots\ldots (3) \text{ zone } 2b$$

We see, therefore, that for all customers in this range ($d > 4$ rooms) the equivalent of a three-charge system applies with

a customer charge $x = 12$c per customer per month,
a demand charge $y = 5$c per room per month, and
an energy charge $z = 6$c per kw-hr.

Thus this is practically a Doherty rate, although the rate schedule mentions nothing but kilowatt-hour charges.

On the dividing line between the two portions $2a$ and $2b$ of the 6-cent-per-kw-hr. zone, that is, for $d = 4$ rooms, we can, of course, use either of the formulæ (1) or (3) as each one furnishes $a = 32 + 6e$ for $d = 4$. Likewise, we can, of course, use the formula for either zone on the dividing line between any two zones in any rate system, because the formulæ must of necessity furnish identical numerical results for the dividing line that lies between them.

The bill in the third zone (3-cent zone) where $e > 7d$ (zone 3, consisting of $3a$ and $3b$) is figured for $d < 4$ (zone $3a$ in Fig. 8) in analogy with what has been explained previously [using equation (1)] $a = 8d + (6 \times 7d) + 3(e - 7d) = 29d + 3e$ (equivalent of Hopkinson rate).

Or, if we wanted to work this out without reference to formula (1), applying to the second zone, we

[2]Using general symbols where $z_1, z_2, z_3 \ldots$ are the energy charges in the first, second, third, etc., block and $e_1, e_2, e_3 \ldots$ are the sizes of the successive blocks in kilowatt-hours we get in the first block $a = ez_1$
in the second block, that is for energies between e_1 and e_2 kw-hr.,
$$a = e_1 z_1 + (e - e_1) z_2 = e_1 (z_1 - z_2) + ez_2$$
The customer charge is $e_1\,(z_1 - z_2)$, the energy charge is ez_2.
In the third block: $a = e_1 z_1 + e_2 z_2 + (e - e_1 - e_2) z_3$
$$= \underbrace{e_1 (z_1 - z_3) + e_2 (z_2 - z_3)}_{\text{Customer Charge}} + ez_3$$
Energy Charge $= ez_3$. Likewise we get analogous terms for the customer and energy charge in the following blocks.

get $a = (8 \times 4d) + 6(7-4)d + 3(e-7d)$ with the same result as above.

For the third zone with $d > 4$ (zone $3b$ in Fig. 8) we get, using the formula (3) for zone $2b$, as far as that zone applies, that is up to $e = 7d$, $a = 12 + 5d + (6 \times 7d) + 3(e - 7d) = 12 + 26d + 3e$; this means $x = 12$ cents per customer per month, $y = 26$ cents per room per month, and $z = 3$ cents per kw-hr. (equivalent of Doherty rate).

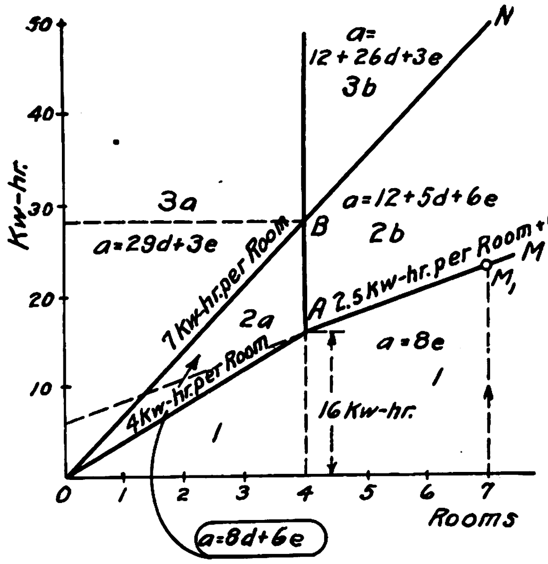


Fig. 8.—Analysis of Number-of-Rooms Rate.

162. Another example for the working of this method will be given in the analysis of the High-Tension Wholesale Lighting and Power rate of Boston. This rate is a double-block Hopkinson demand rate as follows:

Demand charge

$60 per year per kw. for first 15 kw. of demand
36 per year per kw. for next 40 kw. of demand
30 per year per kw. for next 100 kw. of demand
15 per year per kw. for next 100 kw. of demand
12 per year per kw. for excess demand

plus an energy charge of

5 cents per kw-hr. for the first 1,500 kw-hr.
3 cents per kw-hr. for the next 4,000 kw-hr.
1.5 cents per kw-hr. for the next 50,000 kw-hr.
1.25 cents per kw-hr. for the next 50,000 kw-hr.
.... etc. ....

We will restrict ourselves to the investigation of the rate for such customers who come into the highest demand block ($d > 255$ kw., or the $12 demand block) and into the energy block of more than 55,500 kw-hr. per month (1.25-cents-per-kw-hr. block).

$$a = (6000 \times 15) + (3600 \times 40) + (3000 \times 100) + (1500 \times 100) + 1200(d - 255) + (5 \times 1500) + (3 \times 4000) + (1.5 \times 50{,}000) + 1.25(e - 55{,}500).$$
$$= 403{,}125 + 1200d + 1.25e \text{ (in cents).}$$

We see that we have in this rate a very considerable customer charge amounting, for instance, to $4031.25 per month per customer for all customers with a demand over 255 kw. and an energy consumption between 55,500 and 105,500 kw-hr. Yet the rate schedule mentions only demand and energy charges.

163. The great importance and extreme usefulness of a proper rate analysis is clearly demonstrated in the following example of a rate of a large company in the West which the present author analyzed in the *Journal of Electricity, Power and Gas* of July 27, 1912. Quoting from there: Under the rate the consumer had to pay a certain monthly fixed charge f cents per kilowatt maximum demand; let us say[3] $4 per kw. ($f = 400$ cents). This entitles him to use current up to the load-factor L (for instance, $L = 300$ hours' monthly use of the maximum demand), the excess to be paid at z cents per kw-hr. (for instance, 2.5 cents per kw-hr). Without mathematical analysis, this rate looks perfectly correct and harmless, and it was not until the customers themselves happened to find out the defects and took advantage thereof that the rate was revoked. With a little mathematical analysis, as follows, the defects of the rate would have shown up glaringly at once and the rate would never have been put into effect.

In the range of load-factors smaller than L hours (300 hours) we have $a = fd$, where a is again the customer's bill and d his maximum demand; and if L is larger than 300, the customer with a total energy consumption of e kw-hr. has to pay, on top of this, for the excess of e over Ld kw-hr. at the rate of z cents per kw-hr., so that his total bill will be:

$$a = fd + (e - Ld)z$$
$$= (f - Lz)d + ez \qquad (4)$$

The first term on the right side is proportional to d and independent of e; the second term is proportional to e and independent of d. Consequently, $f - Lz$ is the equivalent demand charge and z is the equivalent energy charge in the range of load-factors larger than L hours.

Substituting now the above values from the schedule for f, L and z, we get

$$a = (400 - 300 \times 2.5)d + 2.5e = -350d + 2.5e.$$

We thus have a *negative* demand charge of $3.50 per kw.!

In other words, all the customer has to do in order to reduce his bill—provided he has a load-factor of more than 300 hours' use per month—is to *increase* his maximum demand before the meter reader comes, with as little increase of the energy consumption as is feasible, until he has reduced the load-factor to 300 hours per month. For instance, let us assume his demand meter reads 50 kw. near the end of the month and his kilowatt-hour meter 30,000 kw-hr.; his bill therefore would be

$$50 \times 400 = 20{,}000 \text{ cents}$$
$$(30{,}000 - 50 \times 300) \times 2.5 = 37{,}500 \text{ cents}$$
$$57{,}500 \text{ cents} = \$575.$$

If now, before the meter reader comes, the consumer for a short time purposely puts on a heavy load on his motors, or for instance lets them all work simultaneously (instead of with the diversity they show under ordinary operation) and thus runs his maximum demand meter up to 80 kw. with a practically unchanged kilowatt-hour consumption, he will have to pay

$$80 \times 400 = 32{,}000 \text{ cents}$$
$$(30{,}000 - 80 \times 300) \times 2.5 = 15{,}000 \text{ cents}$$
$$47{,}000 \text{ cents} = \$470.$$

He has increased his demand by 30 kw.; therefore, his bill must be smaller by $30 \times \$3.50 = \$105$. This reduction of the bill with increasing maximum demand of course goes on until the load-factor is reduced to 300 hours.

To avoid this drawback with a rate of the type quoted we must choose f, L and z so that $f \geqq Lz$, then the demand charge will be $\geqq 0$, as equation (4) dem-

[3] The figures are changed for obvious reasons, but in such a way that the characteristic features of the rate are preserved.

onstrates. If, for instance, we maintain f at \$4 per kilowatt and z at 2.5 cents per kw-hr., L must not be chosen larger than $400/2.5 = 160$ hours per month. If f is just equal to Lz (in our case, if L is chosen at just 160 hours per month) the demand charge is zero and the rate for all customers with a load-factor above 300 hours is a straight kilowatt-hour rate; if $f > Lz$ ($L < 300$ hours' use) the rate for all load-factors above L is a Hopkinson rate. In both cases the rate for all load-factors $< L$ is a straight demand rate

(To be continued.)

THIRD HARMONICS IN ALTERNATOR WINDINGS.

Peculiarities of Harmonic Voltages and Their Effects on Grounding Practice of Large Systems.

The third harmonic is the most troublesome of all harmonic voltages and is present in practically all generator windings. Unless steps are taken to deal with it from the commencement, says L. C. Grant in the London *Electrical Review*, it is likely to give a great deal of trouble to those having to deal with the working of electrical plant.

The harmonic frequency may be such that it runs in opposition, or, on the other hand, it may run in phase, with the power waves. In the former case the respective voltages coincide at their peak values, giving to the power wave a peak formation; when, however, the waves are in phase the peaks do not coincide and the power wave is altered in an entirely different manner. This results in a flattened formation, with a dip instead of a peak, but broadens out the wave considerably. Should the harmonic be entirely out of phase—not out of step, of course—it merely results in a complicated wave form, in which the two halves of the cycle are dissimilar.

With a polyphase generator the phase windings have an important bearing on the harmonic voltages. Should the machine be wound in delta, a difference in potential will exist at various points of the delta, which should normally be at similar potential; this results in circulating currents flowing through the windings which will dissipate the harmonic, but in a questionable manner.

Now, if the phases are connected in star, the line voltage will be the sum of two phase voltages displaced by 60°. The result of this phase displacement is that all harmonic frequencies are displaced by a like amount. For the third harmonic this means that the frequencies are displaced in each phase by half a cycle, resulting in their cancelling one another through being in opposition. Obviously the same holds good with any other harmonic frequencies which are a multiple of three. Thus, as far as the line is concerned, the third harmonic is wiped out. It must be borne in mind, however, that the harmonic frequencies still exist between any phase and the neutral point of the star.

With generators operating in parallel it is usually necessary to ground the neutral point, to limit and define the voltage to earth and also to allow the protective apparatus to operate. It is also essential that one generator neutral be grounded if absolute reliability is to be depended upon, as in case of a generator failure should only one neutral be grounded, and this machine be the one to fail the supply system will then be minus a neutral and circuit-breakers will be rendered useless.

On the other hand, should there be more than one neutral connected to earth all phases will be paralleled through the neutral points and earth, and the harmonic voltages again exist and may assume extremely dangerous proportions. In consequence it becomes necessary to ground through some current-limiting device such as a resistance or reactance; a reactance is advantageous in that it has a much greater impedance for third and any other harmonics than for the power frequency.

In any case, circulating currents of greater or less magnitude will be set up unless the harmonic voltages happen to coincide exactly at all points and all times, and this, of course, is too much to expect, even with the best of machines with varying loads, irregularities of material, etc. These circulating currents may very easily reach a high value and can be up to the full-load current of the machine; hence the value of the neutral resistance or similar device.

On account of the modern generator now being of purposely high reactance in itself, third and other harmonic trouble is not now so pronounced as it was some years back, when the main feature in generator design was good regulation, and consequently low reactance in the windings.

As previously pointed out, this reactance opposes a considerably higher impedance to harmonic frequencies than to the power frequency, and thus, in some cases, it is found quite feasible to parallel two generator neutrals directly without the use of external current-limiting devices.

In grounding generator neutrals it is always advisable to use a fairly heavy oil switch and to include an ammeter in the circuit, as with the two machines it is not possible to gauge even approximately the earth current by comparison with machine and feeder readings, owing to the wide variation that may exist in the load and earth components.

TESTS OF TELEPHONE RECEIVERS FOR RADIO USE.

Bureau of Standards Determining Best Types of Receivers for Specific Radio Purposes.

A comprehensive study of the telephone receivers used in radiotelegraphy and in radiotelephony is in progress at the Bureau of Standards, Washington, D. C. The tests include measurements to determine the loudness of response given by different types of telephones, as well as the electrical characteristics which determine how satisfactorily they fit the electrical apparatus in which they are used. Accurate methods are being devised for these measurements. It is expected that observations will be made by a large number of persons, so as to express results in terms of the average ear. It is also expected to use an electrical or artificial ear, and determine the relation of the average ear to this device which will then serve as a standard.

The results of these tests should make it possible to determine which type of receiver is required in a given radio apparatus in order to obtain the loudest signals. The methods developed will be of value in making measurements of the strength of signals received at radio receiving stations and will be utilized in connection with a study of the properties of electric waves, in which it is expected to obtain the co-operation of a large number of observers throughout the country.

Limitations and Performance of Large Steam Turbines

Papers Presented Before New York Meeting A. I. E. E. —Salient Features Given in Somewhat Abridged Form

Present Limits of Speed and Power of Single-Shaft Curtis Turbines

By Erskil Berg
General Electric Co.

For the purpose of discussing the limitations of the types of turbines used in the more important work now done by the General Electric Co. and to show the relative results which can be accomplished with such designs under different conditions of load, two machines have been selected, one representative of the largest size built for 1800 r.p.m. and one of the largest size now built for 3600 r.p.m. The figures given relate to the turbine alone and do not include generators.

The turbines in question are both of the single-flow type and may be considered representative of capacity limitations of that type. The single-unit turbine and generator is naturally preferable over the tandem and compound type on account of simplicity, lightness and efficiency. There are, however, certain definite limitations in the size for a given speed that these units can be built with material available at the present time. The limitation in the size of a unit for a given speed is entirely dependent upon the turbine and not upon the generator.

Fig. 1 shows the load curve of the large 1800-r.p.m. machine above mentioned, designed to operate with 250 lbs. steam pressure, 28.5 ins. vacuum and dry steam. This turbine has 23 stages, all wheels being of the single-bucket type. The first stage wheel has a pitch diameter of 35 ins., which increases with each successive stage until the last wheel, which has a pitch diameter of 88 ins. This curve shows that for 1800 r.p.m. a turbine can be designed for a 28.5-in. vacuum, giving its best efficiency at 21,000 kw. This curve also shows that with a sacrifice of 5% in efficiency, an output of 36,000 kw. can be delivered to the turbine shaft. Above a load of 21,000 kw. live steam is bypassed to the eighth stage shell, the effect of which is shown by the break in the curve.

The dotted line gives the load curve of a similar turbine in which the first 11 stages are replaced by one two-bucket stage. This turbine is designed with multiple valve steam admission, a modification that may be desirable for the purpose of simplification or where better efficiency at very light loads is important, as in propulsion of warships.

Many large size turbines are now designed for a vacuum of 29 ins. The volume of 1 lb. of steam at this vacuum is 652 cu. ft., almost 50% greater than at 28.5 ins., and about twice as much as at 28 ins., which calls for a corresponding increase in the area of the steam passage in the last stage wheel. If this area is made too small, the steam when leaving the last row of buckets must have a high velocity, giving a large loss of energy, this loss being in proportion to the square of the velocity. That this area be made as large as possible and that the exit angle of the blades be made small enough to give good extraction is therefore important.

Efficient action can only be accomplished by using a bucket speed that bears a proper relation to the steam velocity. Consequently to get the largest capacity, long buckets moving at a very high speed must be used. In order to obtain good bucket action, the buckets should not be more than about one-fourth as long as the pitch diameter of the wheel. If made longer than this, poor bucket action with consequent loss in efficiency will result, due to the great difference in peripheral speed between the base and the tip of the bucket, the design being made correct for the middle point or pitch line. The flare also becomes excessive so that the space between the buckets at the tip will be so large that steam can flow between the buckets without doing any work.

The use of a high steam speed in this last stage naturally implies that a relatively large proportion of

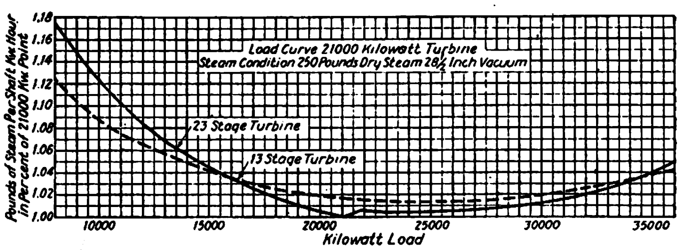

Fig. 1.

the total steam energy must be utilized there. Such concentration of work into a single stage has its disadvantages, since even if the best relation of velocities is maintained, such a stage doing a large amount of work is naturally less efficient than one of similar character doing less work.

The design of the last stage in such a turbine constitutes the most important limitation. The large 23-stage 1800-r.p.m. turbine already mentioned is designed to operate at 250 lbs. steam pressure, 28.5-in. vacuum and dry steam. The pitch diameter of the last wheel is 88 ins., length of buckets 22 ins. and bucket angles 60 deg. entrance and 40 deg. exit. The wheel is subject to the following stresses at normal speed:

Stresses in hub, 23,450 lbs. per sq. in.
Stresses in web, 22,950 lbs. per sq. in.
Stresses in bucket, 20,100 lbs. per sq. in.

Elastic limit (limit of proportionality) of material, 55,000 lbs. per sq. in. The material of the wheel and bucket is quenched and tempered 3% nickel steel.

The wheel is stiff enough to avoid vibration effects and in the absence of such effects the centrifugal strains afford ample factors of safety even if we assume considerable irregularities and imperfections of metal structure.

Cause of Wheel Breakages.

In some of the first large machines of the type here discussed, very serious trouble has developed due the formation of cracks in the forged wheels, causing

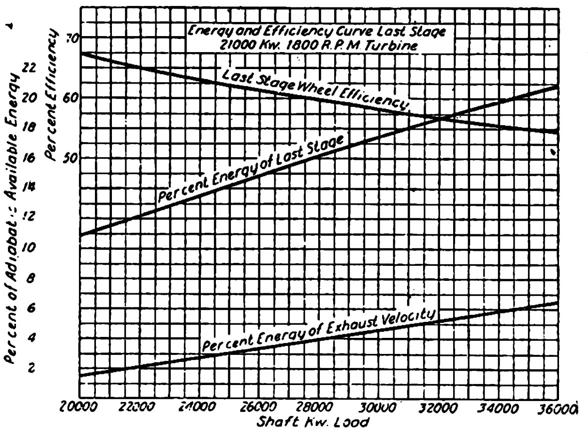

Fig. 2.

wheels to break in three important installations. The cracks formed in these wheels have started at holes in the wheel provided either for balancing steam pressures on the two sides of the wheel or for the attachment of balance weights. Calculation showed that the wheels which broke were less stressed than many which were made from weaker metal and had operated for long periods of time. Holes in a centrifugally stressed wheel greatly increase the fibre stress in the vicinity of the hole itself, but such conditions had not caused the formation of cracks in large numbers of wheels in which such localized high stresses existed. Many evidences have now shown that the trouble with these wheels has not resulted from stresses in excess of those which had been previously found to be practicable, but has been caused by fluttering and vibrations of the wheels, which had become possible through the lightness and thinness of their construction. Such vibrations give a periodic character to the stresses normally imposed and so give rise to the formation of fatigue cracks.

In machines of this type relatively light and narrow buckets have been used and the wheels have been

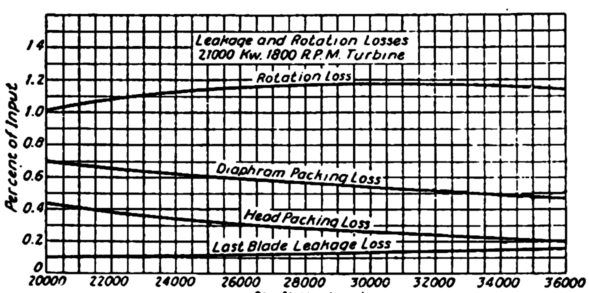

Fig. 3.

proportioned with a view to ample centrifugal strength but with maximum economy of space and weight, consequently these wheels have had much less lateral stiffness than wheels used in turbines of previous types. To overcome such troubles as have developed, it is simply necessary to make the wheels stiffer and to put in holes in parts of the wheel near the hub where a suitable reinforcement of thickness can be provided which both stiffens the wheel and reduces stresses near the holes. Very slight changes of this kind make a great difference in the vibrating characteristics of such wheels, and the proportions used are such that they can easily be brought to the same standards of safety in these respects as have long prevailed in wheels of heavier construction in machines having less numbers of stages.

In the absence of a tendency to form fatigue cracks through vibration, overspeed in such turbine wheels involves relatively little danger as compared with other types of high-speed machinery. Experimentally and in actual service, wheels have been stretched to a considerable degree of enlargement without the formation of any cracks, and such stretching is a normal condition if the cracks do not exist.

It has been discovered that such fluttering or vibration of the web of wheels has not only been responsible for the formation of fatigue cracks in the wheels themselves, but has also caused loosening and breakage of buckets. The remedy is to use stiffer wheels, and such wheels can carry stiffer buckets, so that the whole structure is incapable of vibration of any amplitude through such forces and periods as arise from the conditions of operation.

Fig. 2 gives the energy and efficiency curves of this last stage. It will be noticed that at the most efficient

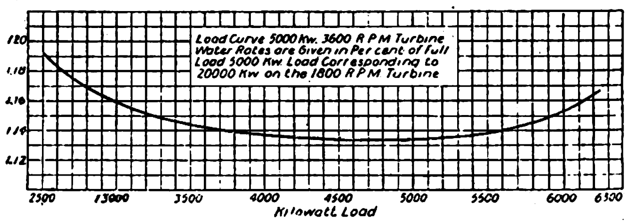

Fig. 4.

point (21,000 kw.) this stage absorbs 11.5% of the total adiabatic available energy and that the wheel efficiency is 66.25%. The energy represented by the exhaust velocity which is all wasted in the condenser is 1.5% the total energy. As the load increases on the turbine shaft, the energy in this stage also increases, decreasing its efficiency until at 36,000 kw. the energy in the last stage is 20.9% of the total energy. The wheel efficiency however has been reduced to 54.2% and the energy represented by the exhaust velocity has been increased to 6.4%. This great amount of work in the last stage at such poor efficiency naturally lowers the efficiency of the whole turbine, and in this case the efficiency at 36,000 kw. is 5% lower than at 21,000 kw.

Fig. 3 shows leakage and rotation losses of the same turbine in percent of input. From the above it will be seen that for 1800 r. p. m., a turbine can be designed efficiently for 21,000 kw. which, with a sacrifice of efficiency can deliver 36,000 kw.

Fig. 4 gives a load curve of the smaller 3600 r. p. m. turbine. The water rates are here given in reference to that of the larger machine, the load of 5000 kw. corresponding to that of 20,000 kw. on the 1800-r. p. m. turbine. This turbine has only five stages, one two-bucket wheel in the first stage, the other four stages having single-bucket wheels. The first wheel has a pitch diameter of 35.5 ins., and the remaining four wheels a pitch diameter of 51 ins. The bucket height of the last wheel is 9.125 ins., the turbine being designed for a maximum of 6250 kw.

The reason for such a discrepancy in the number of stages calls for explanation. As the output of a turbine, keeping approximately the same stresses, goes up inversely as the square of the r. p. m., if the same number of stages could be used and clearance and all dimensions proportionately reduced, a 5000-kw. machine at 3600 r. p. m. could be made nearly as efficient as a 20,000-kw. machine at 1800 r. p. m., and developments of smaller multi-stage machines at our Lynn Works have already been made which approximate such possibilities. Constructions however which are practicable on a large scale are not practicable on a small scale, consequently there are difficulties in getting the space economy in small high-speed machines which would be necessary for accomplishing the result stated. One of the difficulties has lain in the construction of diaphragms, the casting in of nozzle partitions being easy in a large diaphragm and very difficult on a small one. We are working upon types of diaphragms, and other parts which may make possible the development of multi-stage high speed machines which afford improved degrees of economy.

If a 10,000-kw. turbine is designed for 1800 r. p. m., the only change necessary would be to make the nozzle and bucket heights about half the height of those in the 20,000-kw. unit. This reduction in height of buckets and nozzles would affect the weight, size, and cost of the turbine very little as compared with the 20,000 kw. unit. In regard to economy, the lower bucket heights would reduce the rotation loss somewhat but far from 50%. The diaphragm packing loss, head packing losses, and bearing losses would be practically the same as on the 20,000-kw. unit, so that while a turbine designed for 10,000 kw. would be more economical than the large turbine running at half load, the difference would be small, being only about 6%.

It will be seen from this paper that for a given speed there is one particular size of turbine which can be designed to be most economical as to steam consumption, weight, space, and price per kilowatt. Even if a size smaller than this is required, it would in many instances pay for the central station to install the larger unit, even though it would have to run at reduced load for some time before the station load increased sufficiently to utilize the full capacity.

Present Limits of Speed and Power of Single-Shaft Turbines

By J. F. Johnson

Westinghouse Electric & Manufacturing Co.

With the employment of high vacua, such as is the present universal practise, the limit of power of a turbine operating at a given speed will be determined largely by the area obtainable through the last stage for the final expansion and passage of the steam power to its entering the condenser. The significance of this will be apparent when attention is called to the fact that whereas a pound of steam, when entering the first stage, has a volume of less than 2½ cu. ft., when passing through the last stage it has a volume of approximately 395 cu. ft. when expanded to 28½ ins. vacuum, and 585 cu. ft. when expanded to 29 ins.; a ratio in the latter case of 1 to 234.

Consequently, in any discussion of limits of power, it will be necessary to assume conditions of pressure and superheat of the steam entering the turbine, the vacuum to which the steam is to be extended in the blading, and the efficiency or rate of steam flow per unit of power. For these conditions 250 lbs. gage pressure with 200 deg. F. superheat and 29 ins. vacuum referred to a barometer of 30 ins., and efficiencies as are commonly obtainable with them, will be used.

Limiting factors may be divided into three classes: First; Theoretical, including limiting steam velocities and effect on efficiency of velocity remaining in steam after leaving the last stage, and the area through the blades as affected by blade angle. Second; Physical, including methods of construction, material, stresses, factor of safety against rupture, reliability factor, and limitations of transportation facilities. Third; Economic, including limits beyond which it may be physically possible, but economically inadvisable, to go, such as effect of size of structure or of character of materials employed on cost, and time required to make inspection and repairs. This paper will be restricted to a discussion of some of the factors which determine or influence such limits as applying particularly to turbines of the reaction type.

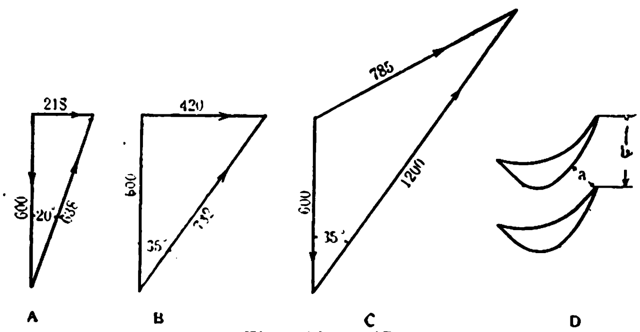
Theoretical Limits.

In this class there are but few limitations as affecting capacity at a given speed because with materials of infinite strength and rigidity available it would be possible to build units of infinite capacity; but for a given diameter and blade height the capacity will be limited by chosen maximum values of steam speed through the blades, in order to keep the leaving losses, or available energy in the steam discharged to the condenser, within permissible limits. Throughout the entire turbine, with the exception of the last few stages, steam speeds only about 25% in excess of the corresponding blade speeds are employed in order to secure maximum efficiency. In the latter stages, however, the volumes become so great that a compromise between maximum theoretical efficiency and physical dimensions becomes advisable by increasing the steam speed sometimes to approximately 100% in excess of the blade speed. The steam after being discharged from the last stage, therefore, still contains a small portion of available energy the recovery of which would involve disproportionate expense.

For example, if the pressure drop in the last stage is such as to render available for work thirty heat units which will produce an equivalent velocity of 1225 ft. per sec., and if the blade speed is such that the steam after leaving it still has a velocity of 600 ft. per sec., which is the equivalent of 7.2 B. t. u., this 7.2 B. t. u. will be totally lost, whereas probably 80% of it (or 6 B. t. u.) might be recovered were it practicable to use an additional stage of proper proportions. This would improve the total efficiency of the turbine approximately 1½%. Higher blade speeds will tend to improve the efficiency by reducing leaving losses, but generally not as effectively as would larger blade areas with lower steam velocities and correspondingly increased number of stages.

With height of a row of blades fixed, the area of the steam space is dependent upon the angle formed between the center line of the row of blades and the outlet portion of the blade. The smaller this angle is the smaller will be the area and vice versa. On the other hand the smaller this angle the higher the efficiency because of the lesser absolute velocity left in the steam leaving the last stage to discharge to the condenser.

In Fig. 1A is shown a relation between steam speed and blade speed to give highest efficiency. The blade speed is 600 ft. per sec., steam speed 638 ft. per sec., blade angle 20 deg. and steam speed after leaving



Figs. 1A to 1D.

blades, 218 ft. per sec. in direction at right angles to direction of rotation. Fig. 1B shows a similar condition giving maximum obtainable efficiency employing a 35 deg. blade angle and Fig. 1C a condition in which the steam speed is 100% greater than the blade speed.

The leaving losses are, in Fig. 1A, 218 ft. per sec., Fig. 1B, 420 ft. per sec., and Fig. 1C, 785 ft. per sec., which is the equivalent of 0.95, 3.5, and 12.3 B. t. u. respectively.

The steam area is ordinarily expressed as a ratio of the perpendicular distance between blades, to the pitch of the blades, as a/b (see Fig. 1D). Highest actual efficiency is obtainable by keeping this ratio between 0.25 and 0.3, and this is done in all stages except the last few in high vacuum machines where it is increased to a maximum of 0.5, the equivalent angle being about 35 deg. which includes proper allowance for blade thickness; this ratio having been determined upon as a proper compromise between cost of increased blade height and loss of efficiency due to increased terminal loss.

Some European manufacturers have employed ratios as large as 0.65 and 0.7.

Physical Limits.

Chief among the physical factors limiting turbine capacity are the physical characteristics of the material employed and the chosen limits to which these materials may be safely stressed, bearing in mind that either uniformity of quality, or factor of safety sufficient to cover all possible variations, together with inaccuracies in calculation and irregularities of operation, must be provided for. While alloy steels possessing exceptionally high physical characteristics are procurable, their high qualities depend on relatively sensitive metallurgical processes which in the opinion of some engineers cannot as yet be carried out by regular workmen as a manufacturing process with a sufficient degree of reliability to justify their use, and that until this can be done, conservatism demands adherence to the lower strength, lesser sensitive materials. Such materials may, with suitable forms of construction, be safely stressed under the maximum test condition to within a few thousand pounds of their true elastic limits.

When the construction of the rotor is not limited to any one special form, the design may be varied so as to take full advantage of the low speeds in the high and intermediate stages (where low speeds must be used in order to secure high efficiency) by employing a drum the thickness of which may be varied to keep the stresses within desired limits; while in low-pressure stages where the stresses are highest, either disks carried on a shaft, or solid disks suitably held together, may be employed. With the solid disk construction the stresses may be kept within any reasonable limits up to speeds at which the design becomes too massive and expensive.

The steel regularly used by the Westinghouse company for turbine rotors conforms to the following characteristic specifications:

Test rings taken as close as possible to the point of maximum stress must show the following characteristics with standard 2-in. specimens:
Tensile strength 65,000 to 70,000 lbs. per sq. in.
True elastic limit 22,000 to 25,000 lbs. per sq. in.
Elongation 15% of 18%.
Reduction of area 20% to 25%.
The steel must be of best quality, having approximately 0.25% carbon, 0.50 to 0.60% manganese, 0.25% silicon, and not over 0.025% sulphur or of phosphorus.

The material is obtained ordinarily in the form of castings, though occasionally as forgings. The specifications in either case are the same. Especially in the larger sizes the forgings have been difficult to obtain, excessively expensive, and no more uniform or reliable in quality than the castings.

Fig. 2 shows the form of casting for a rotor end. It is cast vertically with the small end down, and after casting is allowed to cool very slowly in the sand. After removal, the entire upper portion which constitutes the riser, is cut off and the casting then thoroughly annealed by being heated slowly and evenly to a temperature of about 1650 deg. F. and allowed to cool very slowly. It is then rough machined to within about ¼ in. of finished surface, after which it is put in a furnace and heated to about 1100 deg. F. and allowed to cool slowly to remove any possible internal stresses set up by reason of the metal removed in machining. It is then finish machined and given no further treatment of any kind.

The limit of stress to which this material is sub-

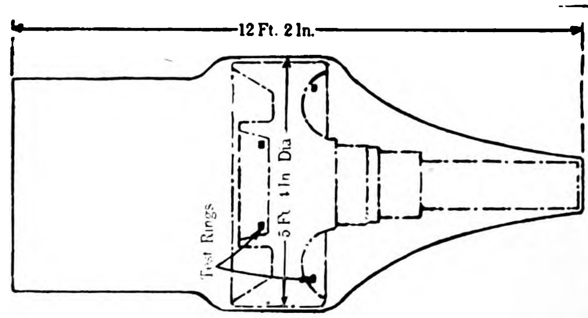


Fig. 2.

jected is 20,000 lbs. per sq. in. when operating at a speed 20% in excess of the normal operating speed.

The stress at normal speed is therefore $\frac{20,000}{(1.20)^2} =$ 13,900 lbs. This stress is 63% of the minimum allowable true elastic limit, about 46% of the yield point and 21½% of the minimum ultimate strength. It is not generally appreciated that should the stress, by reason of defect or excessive overspeed, exceed the true elastic limit, no injury will result other than a slight permanent stretch, together with such blade damage as may result therefrom. In an extreme case of overspeed the rotor drum or solid disk will stretch sufficiently to cause blading to rub to such an extent as to practically insure entirely destroying it, and thus prevent further overspeed, before the ultimate strength and elongation of the material is reached.

If the rotor design can be so modified as to always keep the stresses within necessary limits, then the stress at the base of the blades, or in blade fastenings, determines the maximum capacity obtainable with a given speed.

There exists two interesting relations between the stress at the base of blades, steam passage area through the blades and rotative speed. For any given rotative speed and blade angle, the steam capacity or steam area through the blades is directly proportional to the stress at the base of the blades, regardless of the diameter and blade height selected. This stress can only be modified by unevenly varying the cross sectional area of the blades such, for example, as thickening the blade near the base. Also for any given stress the area through the blades will vary inversely as the square of the speed, i. e., if at a speed of 1800 r.p.m. a given stress and area are obtained, then at 900 r.p.m. the area will be increased four times if the stress is kept constant.

The area and stress are therefore each equal to a constant times the product of mean diameter and blade height, and when the stress is constant this product will vary inversely as the square of the revolutions per minute. The ratio of blade height to rotor diameter is, therefore, not a factor in determining physical limit of capacity, but only in determining efficiency, cost and, to some extent, reliability of the turbine.

Blading used in impulse stages and in low pressure reaction stages in which stresses exceed 15,000 lbs. per sq. in. at 20% overspeed is made of a 5% electric furnace nickel steel in which the carbon sulphur and phosphorus are kept very low. It is really a nickel iron having a very fine close structure.

Its physical and chemical characteristics are as follows:

Tensile strength	65,000 lbs. per sq. in. minimum
True elastic limit	35,000 lbs. per sq. in. minimum
Elongation in 2 ins, %	30
Reduction of area, %	60
Carbon, %, not over	0.08
Silicon, %, not over	0.10
Phosphorus, %, not over	0.025
Sulphur, %, not over	0.04
Manganese, %	0.40 to 0.50
Nickel, %	4.5 to 5.5

This material is annealed by heating to 1425 deg. F. and cooled in open air after rolling into sections required for forming into various blade shapes and is given no further heat treatment.

The maximum stress at 20% overspeed to which this material is subjected is 25,000 lbs. The corresponding stress at normal speed is, therefore, 17,350 lbs., this being 49% of the true elastic limit and 26½% of minimum ultimate strength.

For the lower stress reaction blading, a copper, tin and phosphor bronze is employed, consisting of:

Copper, %	97 to 98
Tin, %	2 to 3
Phosphorus, %	0.03 to 0.07

Satisfactory methods of blade fastening involve no problems unless allowable stresses in the blades are very materially higher than those in the blade carrying element.

Increased capacity without decrease of rotative speed or increase of stresses may be obtained by employing multiple low pressure stages. This well-known and popular expedient possesses the merit of permitting high-vacuum turbines to be built at speeds and capacities up to approximately the present limits of generator construction, without exceeding moderate diameters, blade lengths and stresses.

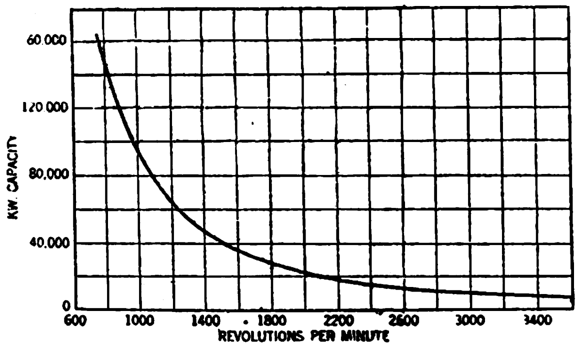

Fig. 3.—Limits of Capacity of Steam Turbines With Double-Flow Low-Pressure Stages.

Having steel blades of uniform cross-section stressed to 25,000 lbs. per sq. in. at base of blades at 20% overspeed and maximum efficiency at 80% of rating—250 lbs. steam pressure—200 deg. superheat—29-in. vacuum referred to a 30-in. barometer—with steam velocity through blades of 1225 ft. per sec. at a volume of 585 cu. ft. per lb.

Fig. 3 is a curve showing approximate maximum capacities at various speeds which are physically possible, employing double-flow construction without exceeding the limits of stresses previously given. For equal capacities employing single-flow construction the stresses would have to be doubled. The points marked (x) at 3600, 1800 and 1500 r.p.m. represent capacities which have already been built. This curve must not be interpreted as indicating suggested practicable present or ultimate limiting capacities of turbines, but merely as showing a physical relation between speed and capacity with given limiting stress values and operating conditions.

An important limit of size and capacity now being approached is that imposed by transportation facilities. Stationary elements may be readily sectionalized as required and assembled after shipment. Ways may be devised also for partial dismantling of rotor elements, although diameter will be one of the limiting factors, and this cannot be reduced beyond the point of omission of blading.

While the physical dimensions and capacities of turbines are being constantly increased it is essential that the reliability factor be not decreased. The employment of special materials and higher stresses does not usually permit increased capacity or efficiency without a corresponding increase in weight and cost unless reliability be compromised.

If, having given a satisfactory reliable design of a given capacity employing low stresses, it is proposed to transform it by modification of design and substitution of higher stresses into a unit of larger capacity, greater blade lengths and probably greater blade weights, operating at higher speeds and involving higher centrifugal forces will be necessary, in order to secure the required area. The rotor structure may possibly be shortened somewhat but unless its total weight is increased nearly in proportion to the increase in stored energy in the individual blade, the unbalanced effect or disturbance caused by one or more blades breaking (which must be recognized as an inevitable occurrence in any turbine) will be greater, imposing higher stresses in the rotor shaft, bearings and bearing supports, and a greater factor of strength will be required to withstand these stresses. The greater blade weight and higher speed will also require increasing the mass of the casing in order to prevent the blades from permanently injuring and possibly breaking through it if they should fail. The endurance factor of a turbine when operating under imperfect or abnormal conditions will be higher in proportion to the ratio of stator mass to rotor mass and of rotor mass to blade mass. The incorporation in the design of a turbine of features which increase the endurance factor will appreciably increase its cost but will also (to a very much greater extent) increase its value to the user.

In the study of economic limits of turbines of large capacity, consideration must be given to the fact that as yet such units are not required in sufficient quantity to warrant equipping and operating shops for their exclusive manufacture and that they must, therefore, be produced by largely the same processes and equipment as are used for smaller sizes which are built in greater quantities. As sizes become larger, a greater proportion of special equipment and processes becomes necessary, resulting in increased rates of cost unless accompanied by very material increase in quantity of production. Under present conditions this economic limit of capacity agrees closely with the physical limit of 1500 r.p.m. units.

In the larger low-speed structures the physical proportions become such that using ordinary steel and cast iron, to which we are limited by the metallurgical art, the distortions due to temperature changes and elastic properties of the materials are such that increased clearances and bracing have to be employed in order to maintain equal reliability and rigidity to a degree which causes the cost per kilowatt for a given efficiency to increase with increasing capacity. Further development of the allied arts and increased demand for larger units will tend to reduce the influence of this limitation factor.

Another factor tending to limit capacity of single units is the generating capacity loss resulting from suspension of service for inspection or repairs. For example, if a 30,000-kw. unit must be kept out of service ten days for a certain inspection or repair, a 60,000-kw. unit would have to be kept out probably 14 days for a similar purpose because of the greater time required to handle the larger structure. Therefore, if two 30,000-kw. units were used and each held out of service 10 days, the outage loss would be only five-sevenths as great as if a single 60,000-kw. unit were kept out 14 days.

In order to avoid the limitations or undesirable characteristics just referred to, a number of turbine units of capacities varying from 30,000 to 60,000 kw. have been built in which the turbines have been divided into two or three separate compounded elements, each driving its own generator and each capable of operating alone on high pressure steam in emergencies.

It is believed that units of this type will continue to be employed for the larger capacities because of the advantages not obtainable in single cylinder types which will justify their somewhat greater cost.

Turbine blading of the low-pressure stage should be designed so as not to throttle unduly the enormous volume of steam passing through it to the condenser. A turbine utilizing 28.5 ins. vacuum will be less expensive than one designed for 29 ins. The turbine chosen should be one able to utilize the best vacuum economically justified.

BRITISH COOKING AND HEATING APPARATUS USED IN WAR SERVICE.

A Total of 160,650 Pieces of Apparatus Aggregating 164,050 Kw. Used by British Army and Navy.

A. B. Gridley and A. H. Human in a report on electric power supply during the war contributed to the *Journal of the Institution of Electrical Engineers* (England) review various sections of electrical industry which contributed their part in providing requirements for the forces. In cooking and heating apparatus production there was great activity and much of the heating apparatus supplied to British Government departments was of a special nature. It is impossible even now, we are told, to give details that would be of the greatest interest because of "the confidential purpose of many of the processes adopted." We may give some data, however, affording some indication of the abnormal amount of work done for the particular purposes named.

There were provided for canteens, munition works, hospitals and national kitchens 4800 pieces of electrical cooking apparatus, aggregating 71,055 kw. capacity, which enabled 316,500 persons to be catered for daily. Electrical cooking apparatus supplied for use afloat consisted of 12,750 pieces, aggregating 27,750 kw., serving 63,000 persons daily. There were produced 55,500 heaters for gun mountings to prevent guns from jambing or freezing when in use in airplanes, aggregating 1020 kw. Some 24,000 pieces of apparatus (12,000 kw.) were made in the form of heaters for airplane engines to prevent freezing when standing awaiting orders. In addition, 39,600 pieces of auxiliary plant or apparatus, aggregating approximately 52,500 kw., were used in connection with the heating of oil for furnaces, primers for airplane engines, smoke screens, decoys, metal baths, muffles and crucibles, branders, glue pots, soldering irons, special heaters for explosive works, band heaters for shrinking bands onto shells, wood-seasoning ovens for seaplane work, armature dryers, airmen's suits, resin boilers, radiators and heaters, immersion heaters, copper circulator heaters for seaplane engines. The foregoing figures total out at 160,650 pieces of apparatus with a total capacity of 164,050 kw.

The material used was almost wholly of British manufacture, with the exception of regulation switches and, to a small extent, the wire used for heating, such as Nichrome. In the earlier part of the war the importation of Hart switches and Nichrome and Nichrome-2 from America was permitted, but later on British manufacturers supplied a good deal of the heating wire, and the import of Nichrome was prohibited. The type of element employed afloat differed from that employed on land. In the former case mica was almost universally used, and in the latter case fireclay. There was some slight difference in the method of construction, but the main feature in each case was similar.

Among a great deal of information respecting manufacturing operations in the United Kingdom during the war, Messrs. Gridley and Human give the following approximate particulars of the annual rate of production of electrical equipment during the latter half of the war period:

Generating apparatus........	400,000 kw. per annum
Motors	600,000 kw. per annum
Transformers	500,000 kw. per annum
Converting apparatus........	110,000 kw. per annum

Value of Statistics in Central-Station Operation

Manifold Uses of Statistical Data — How They Should Be Used—Methods of Organizing and Maintaining the Work of Compiling Essential Statistics for the Central Station

By EDWIN J. FOWLER

Statistician, Commonwealth Edison Co., Chicago.

FINANCIAL reports from the accounting department of a central-station company are usually shown only in dollars and cents. Statistical reports, using as a basis the dollars-and-cents figures from the accounting department and the kilowatt-hours, number of meters, number of customers and other unit figures, as obtained from the operating and engineering departments, consolidate these, showing figures on a per-unit, a percentage and perhaps on a graphical basis. In other words, statistics connect up the engineering side of the business with the accounting and financial sides.

Central-station statistics should deal, not only with what has happened, but should also estimate the probable demands and tendencies of the future. An enumeration of some of the principal uses that are made of statistics should give some idea of their real value in central-station operations:

Uses Made of Statistics.

(1) To compare operating expenses and other operating results and also construction costs, in order to know where and how the best results are being obtained and in order to follow up operating forces and instill some rivalry and pride in results.

(2) Statistics are absolutely essential in case of rate revision, either voluntary or taken up by the Public Utilities Commission or local regulating body, and in case of other investigations by the authorities; they are necessary in connection with the questions submitted by the government census officers.

(3) As a basis for estimates in advance of the probable maximum load, in order to determine how much additional capacity should be ordered for the coming year and as a basis for future fuel requirements.

(4) Load diagrams are considered necessary and are used regularly by those in direct charge of operating the distribution system.

(5) Load diagrams and statistics are also furnished daily and used regularly by the large railway customers of the Commonwealth Edison Co. in operating their extensive systems of substations and in an effort to hold their maximum demands within bounds, their primary charge per kilowatt being based on the maximum demand.

(6) To supply bond houses and bond salesmen facts regarding the business that are very useful, if not essential, as an aid in selling securities.

(7) Some of our statistics have been very useful for advertising purposes. Such advertisements have been used in the newspapers, in the street cars, in the financial magazines and publications, and by the contract department.

(8) Detailed statistics are usually necessary whenever a bonus or commission system of paying employes, such as solicitors, meter readers and billing clerks, is in use.

(9) Statistics are the foundation on which the studies of diversity-factor have been made in recent years. These studies have disclosed the great importance of this factor in the central-station business. This knowledge, heretofore so little understood or appreciated, has suggested the advisability of and pointed out the way to the making of rates which have materially helped in the development of a large industrial load and income.

(10) Statistics have been helpful, perhaps necessary, in many other ways in connection with rate making. For instance, in connection with street and interurban railway contracts, statistics reveal the relation between the maxima of various periods of time—half-hour, one hour or average of several hours—also they reveal what rate each class of business should pay from a cost standpoint and many times avoid the making of rates which would be unprofitable.

(11) The investment budget and property records in connection with fire insurance are reports which are usually and appropriately kept by the statistical department. As to their value, probably mention of them is all that is necessary.

(12) Customers' statistics, showing the load characteristics of all kinds of industrial or wholesale customers and of retail power customers, and showing the average bills and average rates earned by various classes of business served on retail schedules, have proven of great value.

Examples of Graphic Statistics.

For instance, there is a great deal to be gained from the statistics given graphically in the accompanying illustrations.

Fig. 1 gives the sources of the earnings of the Commonwealth Edison Co. It shows that the receipts from wholesale light and power customers increased nearly four times in five years. It also shows that the economic advantage arising from the diversity of different classes of demand in the community is being utilized by the development of not only retail electricity supply but also wholesale and railway electricity supply. The wholesale power load has increased from 65,450 hp. in 1913 to 110,200 hp. in 1916.

Fig. 2 shows the reduction in rates of two typical wholesale customers, each having a maximum load of 75 hp., one using the equivalent of his maximum six hours a day and the other twelve hours a day. These reductions in rates have been made in spite of the advancing cost of labor and fuel. The last reduction shown, in 1916, reduced the bills of wholesale customers $216,000 per annum.

Fig. 3 is a diagram showing the relative growth in investment and in electricity sold during the years 1896 to 1915.

Who Should Use Statistics and How Statistics Should Be Used.

The large companies do much of the pioneer work along statistical lines and work out many of the reports and much of the data on which changes in policy in the various engineering, operating or commercial branches of the business are based. Some smaller companies not having statistical organizations to work out their own problems often adopt the policies of the larger companies without knowing all the facts regarding their own business. Assuming that what is correct for one is correct for another, the smaller companies sometimes make expensive mistakes.

We have reached the time when there are relatively few companies whose operations are restricted to the corporate limits of any single village or small town. A large proportion of the former small companies have enlarged their operations and supply adjacent communities or have been absorbed in one of the group utility companies which operate over a considerable territory. Outside of a few remaining companies which operate in a single small community, electric lighting companies cannot afford to be without a distinct statistical organization, even though it consists of only one man of the right type devoting his entire time to the work. The larger and more complicated or varied the business or organization the greater the necessity for statistics and the greater their value.

A comparison of costs and other operating results as presented in the form of statistical reports usually results, after analysis and investigation, in uncovering certain definite causes for any differences that may exist. Usually these causes cannot be altered or changed, but in some cases these comparisons bring to the attention of the operating head conditions or methods of operating which, upon more careful analysis, it is found can be improved, with resultant economies or better service.

Another point regarding the value of statistics is that after having prepared the statistics in proper form and on the right subject at the right time it is necessary to *study* and *use* them if any benefit is to be realized. This, of course, is self-evident, but the point is that the statistical man must not only be able to prepare statistics but he must also study them and be able to discover the important facts which are hidden herein and to recommend and bring to the attention of the higher officers such action as is advisable.

Organization for Statistical Work.

The statistical man should not be tied down to routine work, but at least a considerable part of his time should be free for special studies of the various phases of the business and in keeping informed on what is being done elsewhere, both within and outside of his own organization.

His work should partly consist in keeping the essential basic records on (a) analyzed expenses in dollars and cents (as obtained through the auditing department from a properly balanced classification of accounts); (b) the number of customers, the important divisions of earnings according to rate schedules, kilowatt-hours sold, and according to towns or territory, and (c) maximum output and kilowatt-hour

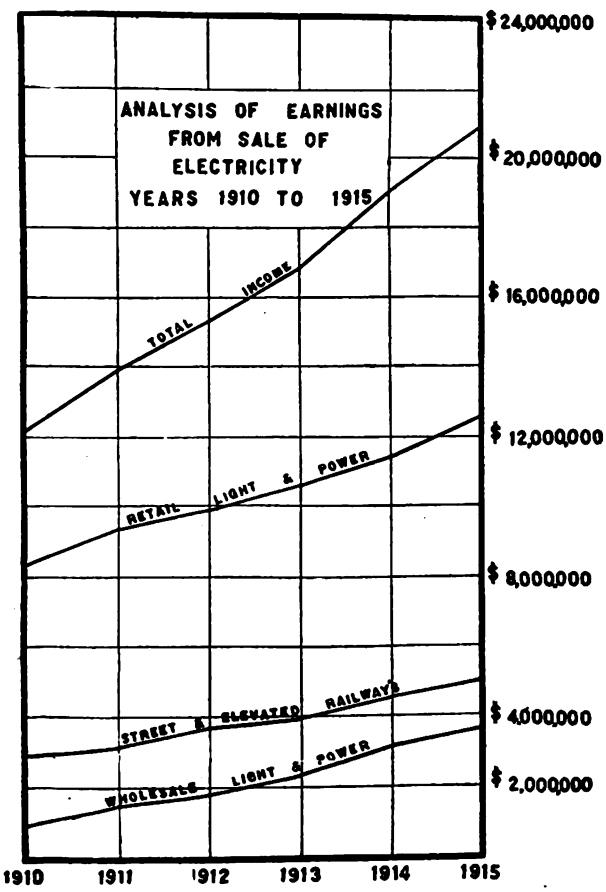

Fig. 1—Analysis of Earnings from Sale of Electricity.

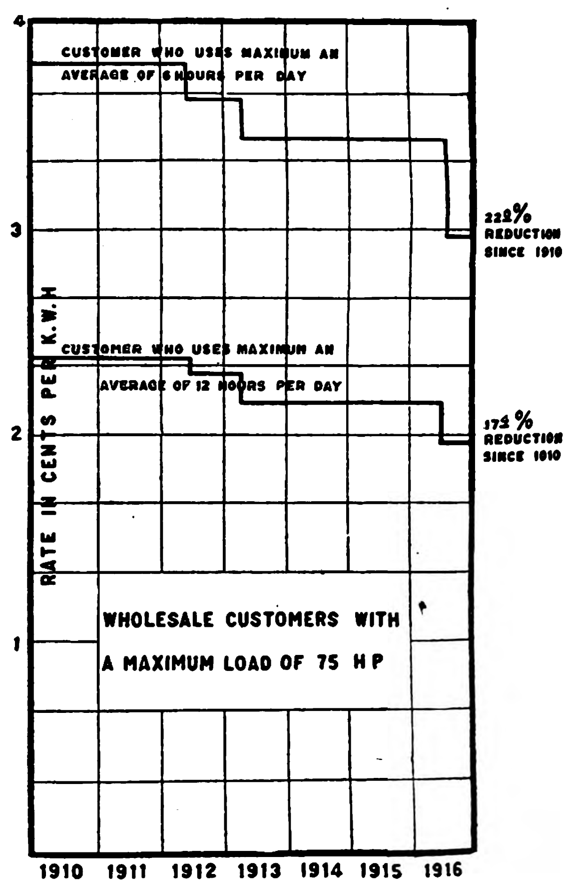

Fig. 2—Reduction in Rates to Wholesale Customers.

output of the stations and substations as obtained from the load records.

Another part of the statistical man's work should consist of obtaining such reports and comparisons from these basic statistics and from other sources, and in making investigations and special reports of any company matters which involve statistics to any extent.

The statistical department, to be at all successful, should have authority to go into other departments of the business and get any information or figures necessary. This information should be not only that easily available, but within reasonable limits the statistical department should have authority to have any special data or figures worked up by other departments. The statistical men should be independent and should have the privilege of reporting on any branch

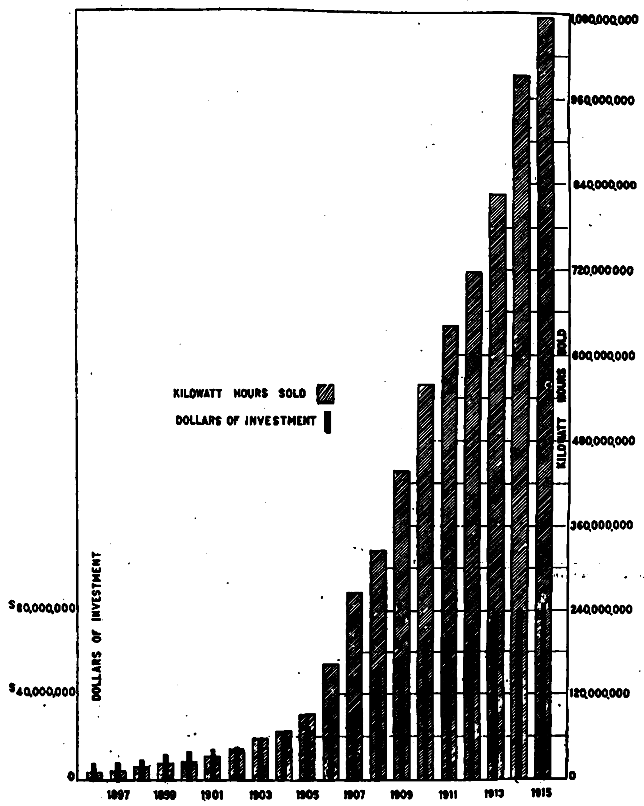

Fig. 3—Relative Growth in Investment and in Electricity Sold

of the business, even though the report may reflect in a way upon results that are being obtained in that branch. These reports should be made to the department interested and should be given enough circulation among the other higher officials so that the matter may receive general attention. This, of course, must not be in the spirit of censure, but in the spirit of educating and keeping the officials informed on what is developing and what is being accomplished, whether it is favorable or unfavorable. It goes without saying that the statistical department should be conducted on the highest plane of disinterested service for the good of the whole enterprise.

It is important to keep a record of only the essential statistics, which should be as simple as possible and usually without comparisons and without adding percentages or unit costs. Few printed forms are usually advisable. It is preferable in a great many cases to typewrite the forms once a year, filling in the data each month as the year progresses. These basic statistics are usually kept only in the statistical department and are available for drawing off any information requested and for making up special reports and special comparisons.

An occasional timely report made up specially and in complete form usually commands much more thorough and immediate attention than a regular periodical report on a printed form and costs very much less.

In the foregoing it is not meant that there should be no regular periodical reports on printed forms showing percentages and comparisons. Some are really essential, but in too many cases a regular periodical report is started and then, after a short period, it falls into disuse, although the making of it and the consequent expense go on indefinitely.

The statistician should not find it necessary to build up a large organization—that is, a large number of employes—as he will usually find that a large part of the detail reports and data he wants is already prepared by and in the hands of the various departments of the company.

The man in charge of the statistical work should either have had some engineering education or be scientifically inclined enough to grasp the underlying engineering principles involved in the business.

Conclusion.

To sum up, every company, no matter how small, has an accounting record in dollars and cents of expenses, income and investment, but if it is to get the best results a study of the dollars and cents alone is not sufficient. The accounting figures should be coordinated with the other statistical facts of the business and the small company as well as the large should realize a definite advantage by developing or bringing into their organization some statistical talent.

Statistics should not be kept a little in this department, a little in that department and a little somewhere else, and given minor consideration as a relatively unimportant clerical matter, but the statistical work of any organization should be independent of the auditing and financial work and should also be independent of the operating, engineering and construction side of the business. Although small in number of employes and in expense it should be recognized and respected and given the independence of a separate department reporting to one of the higher officers, if not to the president.

EDINBURGH POWER PLANT ORDERED IN SWITZERLAND.

The lowest three out of 16 tenders submitted to the Edinburgh (Scotland) municipality for three turbo-alternator sets for its new Portobello generating station were from Swiss manufacturers. The municipality, acting on the advice of its consulting engineer, Sir Alexander Kennedy, accept the tender of Brown, Boveri & Co., of Baden, at $533,090. The tender of the British firm of C. A. Parsons & Co. was $350,000 higher and, as the British Government desires reasonable preference to be shown to British products when required for public undertakings, the matter was referred to the Board of Trade, which did not consider that so high a difference should be paid in order to keep the work in England. The Board invited British bidders to reduce their prices, but they intimated that they were unable to do so.

The contract for the boiler-house equipment for Portobello station (six boilers, etc.) went to the Stirling Boiler Co., at $1,003,305.

Editorial Comment

Some Factors Affecting the Coal Problem

COAL production is not keeping pace with consumption, and every day that passes brings nearer the time when, unless the striking miners go back to work, the country will face a serious situation. The coal strike will ultimately be settled by compromise, why delay?

Coal has assumed a prominent place in our national life. It seems as if at most only a few consecutive months can pass without coal coming into the limelight. During the war the demand for coal brought about the fuelless days, cessation of industry in some cases and lightless nights. Last winter, although the war was over, the question of shortage and of high cost, kept the consumer in uncertainty and suspense. This winter the bituminous coal miners are on strike for radical changes in their working week and in their rate of pay. Today, little coal is being mined and a famine comes nearer with every day of delay.

The fact is that coal is the beginning and the end, the *alpha* and *omega,* of our national life. It is vital, it is expensive now. It will be vital tomorrow and in the far future—and probably more expensive. The question, therefore, before every coal user, and everyone is potentially and indirectly a user of coal, is how best to solve this coal problem—a problem of transportation, of labor and of consumption.

There is every reason to believe that railroad freight rates will increase directly the roads are given back to their owners, perhaps before that takes place. The cost of haulage is a considerable item in the cost of fuel. The cost of coal at the mine will also in all probability increase before long, making more efficient use of coal imperative. The question as to how best to accomplish this, a difficult problem embracing many aspects, is a pressing one. But in attacking it, it is well to tackle those matters that are most easily accomplished.

The clean coal ruling instigated and somewhat enforced by the Fuel Administration when coal was a factor in winning the war should not only continue in vogue, but should be prosecuted more stringently than ever. Coal is already too expensive for the nation to continue to pay for slate and dirt at the price of coal. Freight rates are already too high without paying for the movement of slate and stone dirt, something that is of no use and whose presence does considerable harm. One of the most urgent needs then toward a partial solution of the coal problem and incidentally for placing our railroads upon a proper basis, is to institute coal inspection stations at the mines, adopt a clean-coal policy and adhere to it religiously.

Another practice that came with the war that should be made permanent gradually and yet early is that of insisting upon the use of local coals. It is estimated that with the present annual rate of coal consumption within less than ten years present railroad facilities would be completely occupied with the the movement of coal. The zoning of coal is a matter that is closely allied with those of transportation and lower coal costs.

If it were made compulsory, gradually of course, to use coal contiguous to the place of consumption, new methods of burning coal would be developed and new fuels would come into usage. There is no scarcity of fuel. But the fuels we have become accustomed to using are becoming more and more inaccessible, necessitating going further way from the markets for them or deeper into the ground after them. When the zoning of coal comes, and it will come eventually—it is only a matter of time—lignites and peat; culm banks and other sources of combustible now despised will receive the attention and the utilization that they deserve. Coal prices and high freight costs are bringing that day nearer.

The coal strike will, of course, be settled ultimately. Coal will be mined again and production and consumption will keep pace. But the coal situation will not have been solved. It will only have been shelved. The use of coals near at hand, the utilization of fuels now left in the discard, insistence upon cleaner coal or at least a charge based upon the heat value and cleanness of coal, a method of storage so that the miners may find steadier work by reason of continuous output instead of seasonal output, are some of the most apparent and some of the most promising contributing factors to the permanent solution of the coal situation.

Sticking to Business

IN a recent article appearing in the ELECTRICAL REVIEW a statement was made by the author that no equipment of a certain variety was available that met all requirements as regards flexibility demanded by average central-station practice. In an almost consecutive issue appeared an article upon the same subject, this time the author being the president of a manufacturing company, in which it was pointed out that absolute flexibility of the apparatus under discussion was now existent, and that any central station had almost infinite choice when it came down to choosing its equipment.

Now the statements of these two men, the one an operating engineer having a large transmission system under his charge, the other an engineer who has specialized upon one phase of central-station engineering, are contradictory.

The reason is that the operating engineer was not conversant with all apparatus upon the market, but had used and was still using, equipment manufactured by his own company to meet the needs as he and his associates understood them. He had not made himself conversant with apparatus already available, the evolution of which had occurred gradually through many years of practical trial and survival of fittest.

However, the point which it is desired to emphasize here is that practically every branch of engineering, or any commercial line of endeavor so far as that goes, is a matter of specialization. Producing a turbine is a specialized piece of work, as is also designing a voltmeter, producing a sewing machine or what not. The many who specialize in producing an oil switch or a phonograph will succeed better than one who attempts to make everything he uses; for the days are gone when everyone can produce the necessities of life.

The central station devoting its effort to producing and supplying electrical energy by means of equipment upon the market or produced by manufacturers already in the game, will do better than the utility that tries to make its own transformers, its own circuit-breakers, etc. Central-station supply, just as manufacturing, is a specialized job these days. And it can be done the better by not dabbling in other work, for failure only means that "service" suffers and that the public must pay for the experiment.

Regarding Large Turbine Units

ELSEWHERE in this issue will be found very frank statements by two of the engineers of two of the largest manufacturers of steam turbines. These statements deal with the limitations of turbine outputs, and physical and economic aspects of the situation.

However, regardless of whether large turbine units are reasonably reliable and the physical limitations as to maximum capacity, another question enters, and one which probably concerns more central stations than does the question of what is the largest size that can be made. That question is the most desirable capacity of the individual turbine to the total station capacity. This question is important because it affects not only reliability and the factor of safety of operation, but operating economy. For most central stations, all except perhaps the largest, the question is of more concern than knowing the largest turbine that can be manufactured with reasonable assurance that it will be capable of being placed in and out of service and subjected repeatedly to the other uncertainties of service without danger.

For example, 50,000-kw. turbines may prove very economical and the best choice for a station containing 300,000 or even 250,000 kw. in generating capacity. Units of such size in a station of such size permit of economical operation, which means operating the individual units at loads corresponding to their highest efficiency and at high load-factor, thereby resulting in low water rate of the individual units and a further low over-all fuel consumption by reducing to a minimum coal used for stand-by service, starting and running lightly, banked fires, etc. At the same time, if one unit should become *hors de combat*, a possibility that must always be taken into consideration with any form of prime mover or apparatus in general, not so much because of the machine itself but because of the ancillary apparatus, condenser, boiler, stoker, etc., the remaining units should be able to carry the load of the unit not available without creating undue difficulties.

Reduce the station capacity to 200,000 kw., still retaining 50,000 kw. turbines, and the loss of one unit immediately becomes a very much more serious matter. Going further still, suppose a station contains only two or even three units, and one fails. It is probably true, if not axiomatical, that the larger the central station the greater the dependence placed upon it for power supply. To what extent is it advisable to put all the eggs in one basket—to use an old expression—or in other words place reliance upon one machine where two machines would give higher factor of safety of reliability with little loss of economy of floor space and initial cost?

And then, again, the ability to obtain efficient operation depends very largely upon the load-factor of the station, the manipulation of individual machines according to load, or the co-ordination of machines to load so as to operate each unit at its best efficiency and highest load-factor. The fewer the units in a station the less the flexibility; thus while the larger the size of unit the higher the efficiency, the higher efficiency may be balanced and even counteracted by lower operating economy because of inefficient operation imposed by the fact that the size of the individual units have not been correctly co-ordinated to the station load as a whole.

It thus seems that for turbogenerators of about 35,000 kw. and above, or even for 25,000 kw. and above, decision as to the choice of capacity of unit devolves not only upon whether units of such size are reliable but as to what is the most desirable size for a given station of a given number of units for serving a given load. Higher efficiency is of little real value when it does not work for higher operating economy, which is the condition obtaining when units too large and too few are chosen for a given plant, because the turbines have not been adopted to conditions to be met.

In other words, the choice of capacity of a turbine devolves, eventually, upon operating conditions, since these embrace reliability, individual efficiency and the co-ordination of load and machines for operating at the highest over-all economy.

Turbo Units Discussed—Power Economy Conference Completing Organization — House Heating Studied in Idaho

LIMITATIONS OF STEAM TURBINES AND TURBOGENERATORS DISCUSSED BEFORE THE A. I. E. E.

New York Meeting Given Up to Problem of Construction and Operation of Large Turbine Generating Units.

Three papers of interest to engineers connected with plants having large turbogenerators were presented at the New York meeting of the American Institute of Electrical Engineers on Nov. 14. The papers were prepared at the request of the Power Station Committee in an effort to ascertain what, if any, limitations exist that will affect the size of large turbines and generators. The papers are the result of more than two years of work by the committee, of which Philip Torchio is chairman, and by the authors, Eskil Berg, of the General Electric Co., and F. D. Newbury and J. F. Johnson, both of the Westinghouse Electric & Manufacturing Co.

Mr. Berg's paper was entitled "Present Limits of Speed and Power of Single-Shaft Curtis Turbines." Mr. Johnson's paper had the similar title, "Present Limits of Speed and Power of Single-Shaft Turbines." These two papers are abstracted at considerable length in another part of this issue.

Mr. Newbury's paper, which is entitled "Present Limits of Speed and Output of Single-Shaft Turbogenerators," pointed out that output is determined broadly by rotor or stator dimensions. With speeds of 1200 r.p.m. and lower, the stator is the limiting member, while with higher speeds, the rotor is the limiting member. The most effective rotor diameter is not necessarily the largest diameter. To obtain maximum output at a given speed the rotor proportions must be chosen properly to balance mechanical stresses, rotor ampere-turns, and flux. American design practice has established 400 ft. per sec., approximately 4½ m.p.h., as an upper limit of rotor peripheral speed. The maximum length of core is determined by such factors as ventilation, bearing temperatures, critical speeds and limits to weight imposed by forging and transportation facilities.

Mr. Newbury presented a figure showing present limits to kilovolt-ampere rating at speeds from 3600 to 900 r.p.m. These limiting values are given as indicating present boundaries to knowledge and experience, rather than as real physical or other limits that cannot be exceeded. Mechanical forces due to short-circuit current and damage caused by armature winding failures are no greater in the very large generators indicated by the figure than in present-day 20,000 and 30,000-kv-a. units. No opinion is expressed as to the wisdom of installing very large single-shaft units. If operating engineers desire units of 50,000 to 100,000 kw., there is no question but that such generators can be conservatively designed and constructed.

Several engineers engaged in the discussion. Philip Torchio gave a short review of the progress of turbogenerator construction in this country. He said that the rotor is the limiting factor for speeds larger than 1800 r. p. m., whereas the stator is the limiting factor for speeds less than 1800. The development of this kind of machinery is indicated by the fact that a unit installed by the New York Edison Co. in 1895 was of 300 hp. capacity. One installed recently in the identical station was of 50,000 hp. The first American units were of a few hundred horsepower, but their capacities had increased to 5000 in 1906, 20,000 in 1912, 30,000 in 1913, and the large installations now being installed. Probably two-thirds or three-quarters of all central-station generating units are turbine units. Central stations supply only one-sixth of the total power generated in the country, of which 93% is developed by steam and 7% by water. An enormous saving of fuel can be effected by installing more turbogenerators.

B. A. Behrend called attention to the limitations imposed on the design of large rotating parts on account of the liability of metal to succumb to fatigue. The mechanics of the rotating parts of turbogenerators is not the same as that of members subjected to static conditions only. Since the stresses in rotors are alternating in a manner that cannot be ascertained accurately, the ordinary rules of the mechanics of static bodies do not apply to the problems met in the design of generators. Designers are coming to realize that the lessons in mechanics learned at school are not solutions of the problems of today. The fatigue of metal is a controlling element in motor sizes. Nonductile material must be avoided because ductility is a criterion of the ability of material to resist crystallographic deterioration. A turbine disk should be sufficiently ductile to bend flat on itself without cracking. It is incorrect, probably, to say that the limitation of capacity lies in the turbine. Machines cannot be increased in size indefinitely.

W. L. R. Emmet, consulting engineer for the General Electric Co., agreed with Mr. Behrend that there is a limit to the capacity of machines. There is a demand for large units, but there is no reason for them. He did not agree with Mr. Behrend, however, about the uncertainty and magnitude of stresses in moving bodies. Inelastic armatures on elastic shafts tend to produce dead running. By weighting bodies that vibrate excessively, the vibrations can be eliminated. In a series of experiments conducted recently by Mr. Emmet in which several hard rubber disks were mounted on shafts and revolved rapidly, the vibrations occurred in only one disk. This was the thinnest one. Vibrations could not be set up in the other disks by any speed. This experiment indicates that heavy disks should be employed in turbine runners.

W. J. Foster, discussing Mr. Newbury's paper, said that the rotor is the limiting part of a machine. There is no necessity for the occurrence of large eddy currents. It is entirely possible to build a 90,000-kv-a.

machine running at 1200 r. p. m. The matter of temperature control can be effected more successfully by radial than by axial ventilation. One thing worth considering is the advantage of 50 cycles. The construction of 50-cycle machinery will improve the opportunities of American manufacturers in foreign markets.

Among those who took part in the discussion besides those already mentioned were F. Hodgkinson, C. A. Adams and Farley Osgood.

SPECIAL MEETING OF OHIO ELECTRIC LIGHT ASSOCIATION CALLED.

One-Day Meeting to Be Held at Dayton on Dec. 3—Association Finances, Safety Code and Orders of Fire Marshal to Be Considered.

The Executive Committee of the Ohio Electric Light Association has called a special meeting of representatives of member companies to be held at the Miami Hotel, Dayton, Ohio, on Dec. 3. Three special subjects are to be taken up, the first being a change in the constitution relative to the payment of dues by active members. At present these contribute only about $1530 annually. Additional revenue is obtained through advertising in the association's monthly. It is proposed to increase the dues of member companies so as to secure about $6000 annually and permit the work of the association to go on unhampered because of increased costs.

Another matter to come up is in regard to the National Electrical Safety Code, especially Part II dealing with outdoor line construction. The present revision of the code, it is feared by many central-station interests, will increase the cost of line construction very much and a committee that has been considering this subject will report at this meeting regarding steps to be taken to protect the electric utility companies.

A third subject is to discuss action relative to the recent order sent out by the fire marshal of Ohio, requiring inspection of all buildings before central-station companies supply service thereto; the order also calls for installation of inclosed service switches and main line cutouts. As it is regarded by the central stations as an extremely sweeping order that will cause hardship, especially to the smaller companies, the subject will be given thorough consideration to secure uniform action.

MEETING OF EXECUTIVE COMMITTEE, INTERNATIONAL POWER ECONOMY CONFERENCE.

Plans for Permanent Organization to Be Carried Out Immediately by Executive Secretary Bolles.

A meeting of the Executive Committee of the International Power Economy Conference was called by Chairman C. A. Tupper for Nov. 17 for the purpose of formulating a plan of permanent organization. The chairman read communications from the only two members absent, expressing regret that important business engagements prevented their being present. Each, however, expressed great interest in the work and desired to be kept advised of progress made. One member made reference to interviews which he had with several important business men with reference to the work of the Conference and stated that all were deeply interested and desired to take an active part in the work at the proper time. These letters outlined ideas of organization which were thoroughly discussed by the members present.

It was reported by one member that in talks he had had with several local unions of the stationary engineers at Cedar Rapids, Ia., Milwaukee, Wis., and Louisville, Ky., with reference to the work contemplated by the Conference, the members invariably endorsed the idea and offered co-operation toward its success.

It was the consensus that the first work should embrace the formulation and printing of a statement of the objects sought, which should also give a tentative constitution, clearly point out the aims of the Conference, the general ideas of procedure to reach the goal aimed at and explain the organization necessary to accomplish the desired result.

A campaign should then be started to secure not less than 100 contributing members and more, if possible, to finance the greater work which must follow if success is to be achieved.

The executive secretary was directed to proceed immediately with this work as the situation with regard to fuel is already bad with absolutely no indications that conditions are likely to improve, at least in the near future. The success of such organizations as the International Power Economy Conference usually depends upon a few of its members who are willing to contribute considerable time and hard work. We believe that the Conference is fortunate in having the service of Col. F. G. Bolles, late of the War Department Claims Board, Washington, D. C., as executive secretary. Colonel Bolles is eminently well qualified for this work. His past experience in the national field of power development with such concerns as Westinghouse Electric & Manufacturing Co., Bullock Electric Manufacturing Co., Allis-Chalmers Co. and the Bucyrus Co., gives to him a firm grasp of the problem and its importance as a national conservation movement. Add to this his knowledge of foreign economic conditions gained through six years' travel in 14 European countries, also his wide personal acquaintanceship, and his value to this movement must be recognized as a most important factor in its success.

All the signs of the times point clearly to the great necessity for an organization such as is proposed to back up and co-operate with the Fuel Administration and, when it no longer functions, to continue the splendid work done by it during the war.

NATIONAL CO-OPERATIVE CAMPAIGN FOR MORE ADEQUATE OUTLETS.

Electrical Manufacturers, Central Stations and Others Urged to Bring Value of Convenient Outlets to Attention of Public by Advertising and Other Means.

In various discussions that have taken place among electrical contractors, central-station interests, manufacturers and others respecting the value of providing more wall and floor outlets in the average residence or apartment, there has been a general consensus of opinion that such outlets should be much more numerous, as liberal provision thereof will not only make the use of electrical appliances more convenient but more general. It has been pointed out that to bring this about the public will need to be educated to the convenience value of such outlets and away from the common and inconvenient method of attaching appliances to lighting fixtures with the resultant multiplicity of dangling cords, poor appearance and frequent interference with the use of the fixtures for lighting. This practice has come about largely through the custom of manufacturers of appliances and socket devices advertising various utensils connected to fixtures, the impression created in the public mind being that such connections are good practice.

One of the aims of the newly organized Advertising and Publicity Service Bureau of the National Electric Light Association, as set forth in the ELECTRICAL REVIEW of Oct. 4, is to stimulate interest in more outlets and for this purpose a special branch of the Bureau, known as the More Service Outlets Division, was organized. During the week of Oct. 20-25 several divisions of the Bureau met in Chicago coincidently with the Illuminating Engineering Society, among these being the More Service Outlets Division. The various means for most effectively reaching the public on the matter of convenient outlets were freely discussed and the conclusion reached that electrical manufacturers could doubtless offer the most important aid. The principal recommendations made on this and related phases of the problem were as follows:

> That this committee recommends that electrical manufacturers, in illustrating applications of their devices in advertising, show appliances connected with baseboard and chair-rail outlets rather than to lighting fixtures.
>
> That steps be taken to induce manufacturers of portable lamps to show their lamps connected to outlets in their illustrations in advertising.
>
> That it would be desirable for manufacturers of wire, wiring devices, etc., who do national advertising, to include in their copy an appeal to the public to use more outlets, and that such manufacturers who do no national publicity work, but carry on local newspaper advertising over the dealer's name, introduce the same argument into their copy.
>
> That central stations be urged to have some one man in each company cultivate the acquaintance of architects in their territory, and familiarize them with the advantages of specifying more outlets in their building plans.
>
> To recommend to central stations the desirability of frequently circularizing the public with direct-by-mail matter on the desirability of more outlets, and that the Society for Electrical Development be asked to consider the preparation of literature of this character.
>
> That the committee notify all manufacturers of outlets, wire, wiring devices, etc., of the desirability of having their printed matter, posters, folders, cartoons, etc., contrast the convenient outlet with the inconvenient one.

The committee also recommended that its name be changed to the Adequate Outlets Committee, this name being more descriptive of its work.

WORK OF THE SIGNAL CORPS OF THE ARMY.

Colonel Carty Explains Some Hitherto Secret Achievements of the Corps—Code-Deciphering Machine.

At a luncheon of the New York Electrical League at the Hotel McAlpin, New York City, on Nov. 12, Col. J. J. Carty, officer of the Legion of Honor and vice-president of the American Telephone & Telegraph Co., made the principal address, which dealt with the accomplishments of the American Signal Corps during the World War. Colonel Carty related some interesting incidents which had come to his notice during his time in the service.

One of the matters referred to was the danger that the Atlantic cables would be cut by submarines. As a matter of fact, two cables, one leading to Newfoundland and one to the south of Europe were cut at a point near New York. The means taken to combat this possibility were the construction of powerful radio stations at various points on the French and American coasts, the latter being connected by wire with Washington.

Colonel Carty also spoke of the desire of high army officers to devise a means whereby messages could be sent by cable and telegraph in plain English, thus eliminating the loss of time and uncertainty involved in using a code. This problem was solved by a device which the colonel spoke of as a cipher machine. By means of this device a message coming in from the printer telegraph could be run through this machine and the message obtained in plain English. This machine was in use on the lines between Hoboken and Washington and on those from Washington to Newport News. Colonel Carty paid a very sincere compliment to those whose duty kept them on this side and stated that their work was absolutely indispensable to the combat troops.

ELECTRICAL EXPORTS FOR SEPTEMBER BELOW AVERAGE.

Large Increase Shown Over a Year Ago, But Decrease From Preceding Month.

Decreases of approximately 20% are shown in the total of electrical exports of the United States for last September as compared with August and with the average of the first nine months of this year. As compared with September of last year, however, there was a gain of about 19%. The total of the nine months ended Sept. 30 last was $68,439,204, compared with $43,757,716 for the corresponding period in 1918, and $39,977,642 for the similar period in 1917.

These facts are disclosed in the monthly summary of the foreign and domestic commerce of the United States for last September published by the Bureau of Foreign and Domestic Commerce, Washington, D. C. The following classified figures, obtained from the same source, give the detailed data for September compared with the corresponding month last year.

Articles.	September 1919.	September 1918.
Batteries	$ 442,588	$ 250,037
Carbons	72,816	125,956
Dynamos or generators	525,040	269,276
Fans	49,768	26,396
Heating and cooking apparatus	91,881	48,552
Insulated wire and cables	301,315	548,640
Interior wiring supplies, including fixtures	146,729	88,139
Lamps—		
Arc	374	4,141
Carbon filament	10,861	6,369
Metal filament	358,396	282,518
Magnetos, spark plugs, etc.	226,843	206,160
Meters and measuring instruments	208,496	100,301
Motors	733,891	589,905
Rheostats and controllers	38,326	12,993
Switches and accessories	339,188	162,049
Telegraph apparatus, including wireless	31,262	42,289
Telephones	199,936	228,961
Transformers	153,508	392,026
All other	2,188,370	1,761,369
Total	$6,119,588	$5,146,077

The above figures do not include electric locomotives. During last September there were exported 11 of these locomotives valued at $502,200.

N. E. L. A. COMMITTEES ON ELECTRIFICATION AND RESOURCES OF NATION.

Two Committees to Undertake Important Studies for Next Annual Convention Organizing with Active Chairmen.

President R. H. Ballard of the National Electric Light Association reports that Frank M. Kerr, vice-president and general manager of the Montana Power Co., has accepted the chairmanship of the Committee on Steam Railroad Electrification. The Montana Power Co., of which Mr. Kerr is the operating executive, is now furnishing the power supply for the operation of 657 miles of track of the Chicago, Milwaukee & St. Paul Railroad in Montana and the Pacific Northwest, and consequently Mr. Kerr is in a position to speak with authority on the subject of railroad electrification from a practical standpoint. R. Beeuwkes, electrical engineer of the Chicago, Milwaukee & St. Paul Railroad, will act with Mr. Kerr on this committee, and the additional members will be from other power companies, manufacturers and banking institutions, so that every phase of this great subject will be intelligently handled in the report of the committee which will be submitted at the Pasadena, Cal., convention, May 18 to 21.

M. S. Sloan, president of the Brooklyn Edison Co., Brooklyn, N. Y., has accepted the appointment by President Ballard as chairman of the Committee on Electrical Resources of the Nation. Mr. Sloan is organizing a committee to handle this great subject representative of all branches of the industry. The committee's report to be presented at the next annual convention will be of inestimable value to the industry at large. It will be in the nature of a textbook of particular assistance to the small companies throughout the country. The present status of electrical development in the United States, both private and municipal, will be noted, and the comparisons, drawn between different sections of the country and between private and municipal operation, should prove to be very interesting.

IDAHO INVESTIGATION FINDS ELECTRIC HOUSE HEATING IMPRACTICABLE.

Public Utilities Commission Conducts Most Exhaustive Study of Practicability of Open-Air Heating From Hydroelectric Systems.

One of the most unique investigations ever conducted by a state utility commission was recently concluded in Idaho and its findings have just been made public. It was a study of the practicability of general house heating by electricity and remains the most thorough investigation of this subject yet undertaken. Hearings were held by the Public Utilities Commission of Idaho for nine days last December and a mass of expert testimony, data, charts, etc., presented which fills a large printed volume of 576 pages. Digest of this testimony and deliberation on the subject took many months; the final decision was entered on Oct. 17 and is now just off the printer's hands.

At various times articles had appeared in the Idaho newspapers calling attention to the abundant water powers of the state which were going to waste and which should be harnessed for heating homes throughout the state. The question of electrical development was also brought up in political campaigns and many speakers made such sweeping assertions relative to the possibility of using hydroelectric power that the public was liable to be misled and have hopes raised that could not be realized. In two districts in Idaho a certain amount of electric house heating had been carried out which gave the basis for this agitation. The Commission undertook this study so as to get the actual facts regarding the practicability of house heating in general.

It was generally conceded that it would not be practicable to use electricity generated by steam for house heating in competition with coal, because in the first case, there would be actually realized only about 13½% of the heat of the coal, while in using coal directly in the heating of the house from 40 to 50% of the heat is utilized. The common notion that hydroelectric energy is much cheaper than steam-electric energy is more or less a fallacy. In Idaho, hydroelectric energy is used almost exclusively.

For the basis of this study it was assumed that the average six-room house in the southern part of Idaho would require about seven tons of coal annually for heating and that this heating would be of an efficiency of about 50%; to obtain the equivalent heat electrically would take about 25,000 kw-hr. The average demand in such a house would be 9.3 kw., but to heat the house comfortably during the extremely cold weather would require much larger installation. This excess demand would in most instances be taken care of by some supplemental heat from stoves or furnaces. In 105 houses electrically heated in the city of Twin Falls all but six have provision for such supplemental heating during the very cold weather. The Idaho Power Co. serves a district with about 100,000 population or 20,000 homes. Allowing 25% for losses in transmission, distribution, etc., to heat these homes electrically would require an installation of 258,000 kw. The total installed capacity of all present hydroelectric plants in southern Idaho is about 75,000 kw. and it is estimated that it would take all of the water power feasible for development in the state to heat about 77,000 homes, which is much less than the present number of homes in the state. Similar studies in Spokane, Wash., and in Toronto, Ont., Canada, showed that an extraordinary capacity, greatly beyond the present hydroelectric development would be needed for house heating alone, and this would furnish a load only about seven months in the year, leaving an extremely large plant development idle during some five months.

To heat the average six-room house with seven tons of coal annually at $10 per ton costs $70 a year. The cost of electric heating would be, under the most favorable conditions at least four times greater and, by the testimony of Prof. H. V. Carpenter, this cost would be about $444 a year. Allowing for the fact that large additional installation would be required for proper heating, it is concluded that electric house heating would cost from six to nine times as much as coal in southern Idaho.

The favorable conditions under which electric house heating is carried on in cases where electric power is used for irrigation pumping during the summer, permit utilizing the capacity that otherwise would be idle in winter. The Minidoka government reclamation project now heats five towns at very low rates, averaging 66 cents per kw. per month during the heating season. These rates include practically no overhead expense and fixed charges and will be raised about 50%, effective next March, which will bring the cost to somewhat above that of coal for an equivalent amount of heat. Even under these conditions it has been found that the heating and irrigation load overlap during the early spring and the heating is then discontinued.

It was shown in the testimony that the heating of 15,000 homes in the district of the Idaho Power Co. would save about 100,000 tons of coal annually, whereas a smaller amount of electrical energy would serve to electrify the entire system of one of the trunk-line railroads in Idaho with a resulting saving of about 1,000,000 tons of coal annually.

The findings and conclusions of the Commission are substantially as follows: "Having made an earnest effort to secure all the light possible on the subject . . . we find no grounds for holding out to the people of Idaho a reasonable hope that electricity will ever be used generally for house heating in our state, and we are forced to the conclusion that the use of electric energy for house heating in Idaho in competition with coal is neither feasible nor practicable and would be unprofitable to any producers who might undertake to furnish the service, and further, that so long as there remains a field for the use of electric energy as motive power, its use for house heating is extravagant and wasteful." These conclusions were reached by Commissioners A. L. Freehafer and George E. Erb. They were concurred in by Commissioner E. M. Sweeley, who was not a member of the Commission when the investigation was begun.

PRINCIPLES OF RADIO COMMUNICATION WITH ANTENNA AND COIL AERIALS.

An extensive research on radio transmission and reception with various types of aerials has been in progress at the Bureau of Standards, Washington, D. C. One of the most interesting questions at the present time is as to the relative advantages of the antenna, or usual type of elevated aerial, and the smaller coil aerial. This question is answered by the studies of the Bureau.

As a result of this work it is possible to determine by simple calculation the distance at which a given receiving aerial will receive signals from any transmitting aerial when the current in the transmitting aerial, its dimensions, and the distance between the stations are known. The small coil aerial has many advantages, but is usually not as powerful a transmitting and receiving device as the antenna type of aerial. It may, however, have so much lower resistance than the antenna that it is equal to it in transmitting and receiving value.

Our knowledge of electric waves has been very incomplete. The work referred to has assisted in clarifying some of our ideas so that the way the two types of aerial operate can be better understood. It is shown that a special type of antenna, consisting of two large metal plates, has certain advantages. The fundamental principles of design of radio aerials have been developed. The investigation has opened up a large and most interesting field for further research and progress in the utilization of radio waves.

GERMAN USE OF SUBSTITUTES IN ELECTRICAL WORK.

In the course of some references to the effects of the war upon the German electrical industry, A. B. Gridley and A. H. Human state in the *Journal of the Institution of Electrical Engineers* that the Allgemeine Elektricitäts Gesellschaft and the Siemens-Schuckert group were the first to substitute aluminum for copper wire in machine windings, but it was soon found that the high cost and the growing scarcity of this metal necessitated recourse to the use of zinc wire. At first this wire was not successful owing to its brittle nature, but ultimately a more elastic and serviceable form was produced and firms commenced to manufacture motors with zinc wires which served their purpose more or less satisfactorily. The machines thus constructed were very nearly twice the size of the old type, and iron commutators were used. Transformers with zinc windings were also made, and the A. E. G. built transformers of this type of 7500 kv-a. capacity, which proved satisfactory.

At a later date, reversion was made partly to aluminum windings, and only in exceptional cases was the use of copper permitted in the construction of electrical machines. Conductors were made of iron, aluminum and zinc wires, little copper being permitted for this purpose.

Substitutes for rubber were adopted for the insulation of wires, the most satisfactory being impregnated paper. Resistances, controller contacts, etc., were made of iron. Switches, lamp bases, etc., were made of sherardized sheet iron. Iron was mostly employed in high-tension apparatus, current-carrying parts—except contacts—being made of zinc. Meters made of iron and zinc were produced.

Messrs. Gridley and Human report that, "Despite the restrictions and great difficulties which hampered them, the German manufacturing firms were far from nonprogressive, and while there are some in England who still have misgivings about using units of 25,000 kw. capacity, the A. E. G. manufactured during the war a 7000-volt turbo-alternator of 60,000 kv-a. capacity, the turbine blading of which was made of steel, without nickel, worked out of the solid. A second and similar machine has recently been constructed."

CHANGE IN EDITORSHIP OF LONDON ELECTRICIAN.

On Oct. 31, W. R. Cooper was presented by his colleagues of Benn Brothers with a silver rose bowl and Weston portable milliammeter, upon his retiring from the editorial chair of the *Electrician*, of London, after a period of thirteen years. Mr. Cooper has decided to devote the whole of his time to his consulting practice, the growth of which renders it impossible for him to continue his editorial duties at the same time. Mr. Cooper was appointed editor of the *Electrician* in 1906, and under his editorship the journal has made considerable progress.

His place will be taken by F. H. Masters who was chief assistant editor at the outbreak of the war in 1914. Mr. Masters received his technical training at King's College, London, and Finsbury Technical College, under the late Prof. S. P. Thompson. He was afterwards engaged in substation work on the Central London Railway, and in the Electrical Engineers' Department of the British Government Dockyard, Chatham. He joined the "Electrician" staff in 1906, and was subsequently appointed chief assistant to the editor. During the war he was engaged on coast defense electric lighting work and on searchlights used against enemy aircraft. He contributed considerably to the development of these defenses, and did very useful work in the training of the men engaged upon them. Mr. Masters was awarded the O. B. E. and was twice mentioned in dispatches.

Commercial Practice

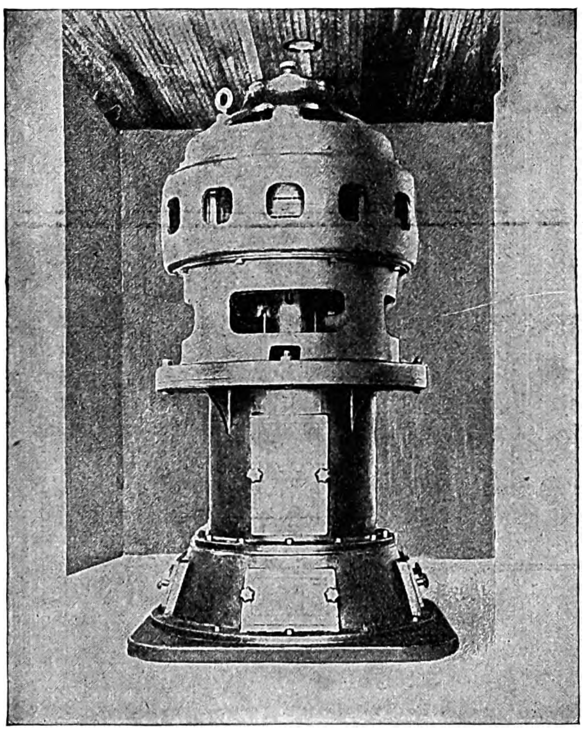
Electric Pumping Saves Money for City — Many Electric Elevators Being Installed — Dayton Flatiron Campaign

ELECTRIC PUMPING PROVES ECONOMICAL FOR CITY OF SAVANNAH.

First of Five Motor-Driven Centrifugal Water Pumps Shows Large Saving in First Cost and in Operation.

The city of Savannah, Ga., is now effecting a large saving every day on account of the installation of an electric motor-driven pump on an artesian well furnishing 4,000,000 gals. of water daily to the city. The plant from which the city formerly got its water supply cost $65 a day to pump a million gals. of water, while the new equipment pumps at the rate of $10 a million gals., or a saving of $55 for every million gals. pumped.

If the city decides to install electric pumps throughout, and the indications are that it will do so shortly, a saving of $57,500 a year will be effected in fuel and labor costs.



Centrifugal Water Pump Driven by 200-hp. Vertical Induction Motor at Savannah Water Works.

The artesian well is 519 ft. deep and was dug by the use of dynamite. A 24-in. casing was sunk to a depth of 110 ft. and from there to the bottom a 16-in. casing is used. The fact that this casing runs the full length of the well assures the city a supply of pure water. The pump is of the Layne & Bowler centrifugal type, is installed 100 ft. below the surface. It is driven by a 200-hp., two-phase, 60-cycle, 2200-volt, 1175-r. p. m., vertical induction motor which was built by the Westinghouse Electric & Manufacturing Co., and shipped to Savannah from the East Pittsburgh Works by express because of its urgent need by the city. Power for operation of the motor, is supplied to the city by the Savannah Electric Co.

Tests made on the water pumped from the well have proved its superiority over the water formerly pumped from the river station, and it is apparently much softer than any artesian water ever used in the city before. This softness is because it does not strike a strata of lime. The water is said to contain some sulphur, to lather fully, and to be unusually well adapted for all domestic as well as commercial uses.

A further evidence of the saving to be gained by the operation of the new outfit may be gained from the following figures submitted by the city officials. The original system with a capacity of 1,000,000 gals. was installed at an original cost of $750,000 and the operating cost amounted to $30 per million gals. To install the new system cost $10 a million gals., so that not only is there a large reduction in first cost, but the operating costs are reduced two-thirds. The pump was installed by P. D. Bowler, of the Layne & Bowler Corp., Memphis, Tenn., and the motor and control were supplied through W. C. Bryant & Co., Savannah.

The total number of wells completed, or for which contracts have been let is five, to be driven by motors of the following capacities: one 100-hp., two 200-hp., one 250-hp., and one 300-hp.

All of the motors are installed above ground on all these applications except one which is located under the street in a pit entirely inclosed and furnished with forced-draft ventilation.

The starting of the pump was the occasion of a large gathering of city officials, headed by Mayor Steward, and other prominent citizens. The mayor and other city officials express themselves as greatly pleased with the success which has already been attained in the operation of the new plant, and additional units will undoubtedly be installed at an early date.

ELECTRIC ELEVATORS IN DEMAND IN NEW YORK CITY.

Many Office Buildings Turn to Central-Station Service to Solve Problems of Elevator Operation.

One of the more recent elements of the tendency towards central-station electric supply in New York City is the increasing demand for electric elevators. The New York Edison Co. has compiled a list of 93 buildings that have done away with their old steam and hydraulic elevator equipment, changing over to electric, the estimated current consumption for this new elevator business being 2,000,000 kw-hrs. annually.

The cause for this renewed demand for electric elevators is two-fold. One is related to the building shortage, which is causing many old structures to be altered to suit some special industrial need; generally one of the desired features is better elevator facilities.

Another type included in this list is the good grade of office buildings, which have previously been equipped with hydraulic elevators. In these instances, the reason for the abandonment of the hydraulic machinery has been the greatly increased cost of operating it, the expense having mounted in some cases 100% in the last three years. Frequently, too, this situation is closely related to the private plant question, for where high-pressure steam is required to maintain elevator service, there is a tendency to operate electric generating apparatus as well. About half of the 63 office buildings that have changed over to electric elevators have closed down their generating plants at the same time.

VERY SUCCESSFUL FLATIRON CAMPAIGN CONDUCTED IN DAYTON.

In One Month 1500 Electric Irons Were Placed in Service —Excellent Results in Neighboring Towns Also.

The Dayton Power & Light Co. recently conducted an iron sale campaign in the city of Dayton, Ohio, which was unusually successful. Other towns served in the company's system were also covered. In Dayton, with a population of 165,000, there were sold 1206 irons. In Wilmington, with a population of 5000, the sales reached 145, while in Piqua, with a 15,000 population, 130 irons were sold. In Xenia, with a population of 10,000, the sales were 100 irons. In addition to the irons sold, there were found over 300 irons on customers' premises that were not in use, due to their needing some slight repair. These irons were brought in, repaired and put back into service, making approximately 1500 additional irons on the lines in Dayton over what existed before the campaign was begun. About the same proportion of irons were repaired in the other territories.

In addition to making direct sale of irons, lists of those who were interested in other appliances were made and turned over to the contractors, and it resulted in a large increase in the sale of sewing-machine motors, sweepers, toasters, etc. The campaign began on July 1 and ended August 1. General Electric irons were sold at the full retail price of $6.50 and as a premium a folding ironing board was given. The customer paid 50 cents on the order and $1 per month with his light bill until paid.

Another novel feature of this campaign was that it was carried out by the pupils in the company's cooperative school for high-school students. These students made a house-to-house canvass, each carrying a card which gave the name, number of the house and report whether the occupants had an electric iron, whether they were using it regularly, whether it was giving entire satisfaction, and whether it was in need of repairs, etc. With this information the company was able to get a very valuable line-up on what the customers had and what they needed. No great amount of advertising was done in laying the groundwork for the campaign, as it was found that the house-to-house canvass was in a measure all the publicity needed.

After the campaign was over, in checking up with the dealers all the prospects that were handed in, it was reported that in practically every case the prospect was sold. The campaign was the most successful one the company ever conducted.

FALL SALES PROVE NOTEWORTHY IN BROOKLYN, N. Y.

Electric Washers and Vacuum Cleaners Sold to the Amount of $100,000 in Two Months.

Sales of the Brooklyn Edison Company resulted in 325 orders for washing machines during September and 1173 orders for vacuum cleaners during October, making a gross sale of over $100,000 for the two campaigns.

The washing machine offered in September was of standard make, with a special galvanized iron body substituted for copper, which allowed for a special price during the month of $129.75, with payments extending over 12 months. The October sale of vacuum cleaners offered a well-known cleaner, with a special "Brooklyn Edison" set of attachments, for $49.50, with partial payments of $4.50 on delivery and $5 monthly.

The advertising procedure was the same in both sales. Special return post-card announcements were sent to residential customers and two-column newspaper advertisements in preferred position were used periodically to keep up the interest. Demonstrations in all of the display rooms of the company were made each week and a selected list of customers were invited to attend. The two campaigns surpassed the corresponding sales in 1918 by 219 washers in September and 427 vacuum cleaners in October.

CENTRAL STATION BUYS POWER TO SUPPLY DEMAND.

Mobile Electric Co. Secures Additional Capacity by Cooperating with Shipbuilding Concern.

A transmission line by means of which the Mobile (Ala.) Electric Co. will secure electrical energy from the Chickasaw Shipbuilding Co. has been completed and placed in operation. As a result of power demands made upon the company during the past two years it had become necessary to provide additional capacity involving a new power house at an outlay of $1,000,000 or more capital. Instead, Manager T. K. Jackson saw the possibility of purchasing additional power from the shipbuilding company and an agreement was entered into whereby the Mobile company is to receive one-half of its energy demand from the shipbuilding company on a 3000-kw. peak load basis.

The company is now serving a power demand nearly twice as great as in 1916, chiefly due to shipbuilding activity.

ELECTRIC LIGHT AND POWER INDUSTRY COMMENDED BY BANKERS.

Investment Bankers' Association Says Central Station Deserves Confidence of Public.

The public utility securities committee of the Investment Bankers Association of America makes the following statement in its annual report relative to the electric light and power industry:

"It should not be difficult to educate the public to renewed and increasing confidence in an industry which has proven itself, even in the crisis of war, so stable, resourceful, resilient and productive, and which offers convincing promise for safe and remunerative employment of enormous additional capital."

Operating Practice

Underground Steam Lines — Electrolysis of Cables in St. Louis—Boiler Efficiency and Gas Survey — Power-Factor

METHOD OF INSTALLING UNDERGROUND STEAM LINES IN WISCONSIN.

Recommendations Made by State Engineering Department for Steam and Hot-Water Lines.

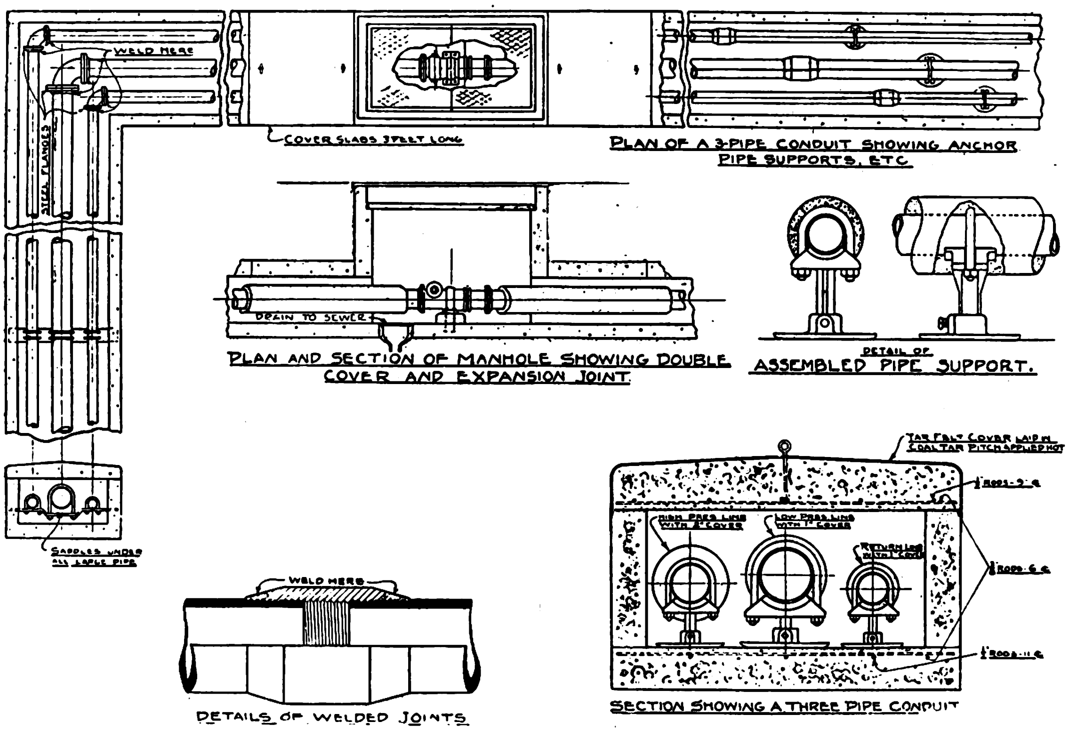
The state of Wisconsin has installations of almost every type of pipe conduit that has been devised and none of those as yet tried out has met the above requirements in a satisfactory manner. As a result of this experience the Department of Engineering worked out a method of installing such lines that has so far proven satisfactory, according to John C. White, state power plant engineer.

The conduit is made of concrete, of such size as may be required to accommodate the number of pipe lines and reinforced as necessary. The bottom slab is laid to grade for any section and is trowelled smooth. The sides are next poured and the work of installing the pipes may be started as soon as the forms may be safely removed. The cover slabs may be molded while the work of installing pipes is going on. These are generally made in 3-ft. lengths bedded in lime mortar. The top of the conduit is covered with a waterproof material such as tar felt before backfilling the trench.

Anchorage is so arranged that the pipes are permanently held in place at anchor points and expansion is taken either at the bends or by expansion joints. The supports are clamped to the pipes and move with them. They consist of a saddle clamp adapted to engage a round shoe which slides on the floor of the conduit as the pipes move under changes of temperature. Rollers are not used.

Insulation is applied as for exposed work and it is not subjected to mechanical injury nor to the action of water.

Drainage is provided for by making the conduit as nearly waterproof as possible and then conducting such water as does find its way into the conduit to drainage outlets at manholes or openings into the buildings. This water flows along the bottom of the conduit, each section of which is graded for that purpose, and by inspection at the drainage points the condition of the lines so far as water is concerned may be determined. Under-drains are not used.



Underground Pipe Line Arrangements Recommended by Wisconsin State Engineering Department.

By arranging the pipes in a horizontal plane either line can be removed and replaced by disconnecting at anchors and connecting points and uncovering a sufficient length of the trench to permit withdrawal of the section. A line should be attached to the section before it is withdrawn for use in pulling in the new pipe.

Where steel or wrought iron pipe is used, the joints are made up with couplings and the backs of the couplings are then welded up until the section of the pipe that has been cut away by the threading process is built up to the original section of the pipe. The joint is thus equal to the solid pipe in thickness and it is sealed against that form of leakage which is so persistent a cause of failure in the ordinary construction. Cast-iron flanged pipe may be used for low-pressure steam or hot-water lines. Lead joints cannot be used where temperatures change to an appreciable extent.

The accompanying illustrations clearly show the essential features of the method without further explanation. The first line was installed about two years ago for carrying high-pressure steam and so far has given no trouble whatsoever.

ELECTROLYSIS OF CONDUCTOR SHEATHS IN ST. LOUIS.

Use of Cambric Insulation Results in Time Lag Between Corrosion and Cable Failure.

The Bureau of Standards' investigation of electrolysis of underground cables in St. Louis has now practically been brought to a conclusion. The occasion of the work was a very serious case of corrosion of lead cable sheaths which appeared to be different in some respects from that ordinarily found. After extensive investigations regarding conditions both past and present under which these cables have been operated, and supplementary studies on the conditions under which lead is corroded, the conclusion has been reached that most of the burnouts now occurring are the result of electrolytic corrosion which occurred during the first few months after the cables were installed. The serious difficulty and large expense which are now being experienced are, therefore, the result of damage done several years ago. The long period which elapsed between the injury to the sheaths and the burning out of the cables is accounted for by the slowness with which moisture penetrated the varnished cambric insulation. As the insulation became moist, the dielectric losses increased and in many instances the immediate cause of failure of the cables has been overheating resulting from the large dielectric loss. A considerable number of failures were found to arise from surges of electric current resulting from other burnouts.

The peculiar appearance of the lead sheaths which gave rise to the belief that the failures were due to some hitherto unknown cause was found to be due to chemical action which had little to do with the failure of the cables.

In this case the damage has already occurred and can be repaired only by installation of new cables. Consequently, the Bureau's investigation of the problem has resulted in no saving to the company. The investigation has, however, been well worth while in that it has afforded a forcible object lesson of the importance of prompt attention to electrolysis conditions when new installations are made and it will, therefore, be of value in promoting careful consideration of electrolysis problems.

TEMPERATURE SURVEY AND GAS ANALYSIS IMPROVE BOILER EFFICIENCY.

Early in 1918 F. W. Dean, of the Emergency Fleet Corporation, made the request to the Bureau of Mines that it furnish the personnel and equipment to make determinations of the temperatures existing in the gases throughout the setting of a boiler. This was to be done in connection with the test of a boiler which the Corporation was conducting at Erie, Pa. O. P. Hood was in charge of the test and Henry Kreisinger, both of the Bureau of Mines, detailed to make the determination. The results obtained clearly indicated the necessity for further work on the problem of boiler efficiency, as was also forcibly brought out at the International Power Economy Conference held in Chicago recently.

The fact is not generally appreciated that sufficient air cannot be admitted through the fuel bed of a hand-fired furnace to provide for complete combustion. This fact is independent of the kind of fuel used or the rate at which air passes through it. Unless there are holes in the fuel bed through which the air can pass without coming in contact with the fuel, there is always 20 to 32% of combustible gases with no free oxygen to burn it. This important fact is generally overlooked, because in ordinary furnace practice there are so many holes in the fuel bed and so many leaks around the furnace doors and in the boiler setting that an excess of air commonly exists in the flue gases. In other words, two errors compensate for each other so that the existence of one is masked. The excess air which leaks into the furnace, however, does not usually serve the purpose of bringing about complete combustion of the fuel, because it is not properly mixed with the combustible gases, nor is it under control as to quantity. In other words, for proper combustion excess air should not leak through holes in the fuel bed, but should be introduced above the fuel bed in such a way as to bring about complete combustion of the gases.

Another point revealed by the temperature measurements was that changes in the design of the baffles were necessary in order to provide for proper absorption by the boiler surfaces of the heat in the gases. In boiler practice the design is commonly made from empirical data and not from exact determinations, so that the baffling of the gases to guide and retard their passage through the boiler setting until their heat is absorbed with maximum efficiency is not properly accomplished.

As a result of the information obtained from temperature measurements and gas analyses the design of the boiler was so modified that six tons of coal were enabled to do the work of seven.

USUAL ECONOMICAL LIMIT FOR POWER-FACTOR CORRECTION.

It has long been recognized that the additional amount of capacity required of a synchronous motor, to effect a given percentage increase of power-factor in the neighborhood of 100%, is several times that which would obttain at, say 60%. And this fact becomes more and more conspicuous as the power-factor comes nearer to unity or 100%.

While the lower the power-factor the more injurious the effect upon voltage regulation, investment, etc., it is also a fact that as the power-factor approaches toward unity the investment in corrective apparatus—a synchronous motor, for example—becomes so high that it does not pay to improve power-factor above a certain limit. In general, it may be stated it is usually not economical to correct above 90% and in most cases not beyond 85%. The chief reason for this is that most generators are able to maintain voltage sufficiently well at 90% power-factor and to release the 10% of generator capacity between 90 and 100% power-factor would require, on the part of the synchronous motor, about 40% of the capacity of the generator.

Contracting-Construction

Factory Lighting and the Contractors—New Construction Rules in Ohio—Connections Between Buildings Discussed

CO-OPERATION IN SELLING GOOD INDUSTRIAL LIGHTING.

Part That Contractors Can Play in Improving Lighting Conditions in Existing Factories and Planning for Good Lighting in New Factories.

Realizing that managers of industrial plants, as a general rule, have little knowledge of what constitutes good lighting and of increased production that results from it, the Committee on Illumination of the Ohio Electric Light Association has been conducting an investigation leading to methods for improving industrial lighting in that state. It is apparent that the electrical contractor is one of the most important factors in promoting good industrial lighting in existing plants as well as those under construction, and the following comments of the committee, which apply equally well to contractors in other states, should be well taken.

There seems to be a general appreciation on the part of the electrical industry that the industrial lighting field could profitably be given more attention. In this connection it is conceded that local electrical contractors must take a more active part in this work if it is to be very effective. It is obviously impossible for the contractor to undertake to bring existing lighting installations up to the high standards recognized today unless he pays particular attention to new aspects of the industrial lighting problem. It would seem, therefore, that the first step in any program that can be undertaken jointly by the contractors and central stations to encourage higher standards of industrial lighting would be for each contractor interested to delegate some one individual in his organization to make a special study of the subject and to acquaint himself with the latest lighting practice so that he can cooperate in selling industrial lighting.

While the work of laying out the lighting installation in existing plants according to the latest practice will fall in most cases upon the local electrical contractors, there is no question but that the central-station representative can approach a prospect for improved industrial lighting to better advantage than can a representative from an electrical contractor or manufacturer of lighting equipment. It would seem, therefore, that in the general plan of improving industrial lighting conditions the central station could undertake to make the initial call on its industrial customers with a view of discussing with the plant executive the general questions relating to the lighting service it is rendering the plants and to try to interest the plant managements in the value of good lighting to such an extent that they are willing to go into the question in detail. When the prospect is brought into this frame of mind he could be referred to local electrical contractors who are thoroughly conversant with what good industrial lighting work is and they could follow up the lead.

Other plans will have to be made, for the time being, to take care of lighting installations in buildings now in the process of construction, in which lighting layouts are made by construction engineers. However, buildings which will be put up next year and the years to follow will in most cases be occupied by industries now operating in old buildings and, if the managements of these industries really have been impressed with the value of lighting their plants properly, this will automatically insure good lighting in their new buildings.

OHIO FIRE MARSHAL REQUIRES INSPECTION OF ELECTRICAL INSTALLATIONS.

No Service to Be Connected Unless Installation Complies with National Electrical Code—Inclosed Safety Switches and Cutout Cabinets Also Required.

Electrical contractors and central stations in Ohio are much interested in, if not alarmed by, a recent ruling of the fire marshal of Ohio. By an order that was supposed to become effective Oct. 15 it is required that before making connection for light or power service all central stations are to make or cause to be made satisfactory inspection of the wiring on the premises to ascertain whether it is properly installed according to the requirements of the National Electrical Code; no service connection must be made until it is found that any changes required have been made.

It also was ordered that main service switches must be of the inclosed safety type and installed so as to be readily accessible, an exception being made if the switch is mounted on a switchboard under competent supervision. All other knife switches used for light, heat or power circuits, other than those used on switchboards or inclosed panelboards, must also be of approved safety inclosed type if installed within 7 ft. of the floor or elevated platforms. A further requirement of the order is that all automatic cutouts within 7 ft. of the floor or elevated platforms and in the vicinity of easily ignitable material must be inclosed in approved metal cabinets.

Furthermore, the order also provides that all alternating-current motors above 5 hp. must have approved starting devices; starters for direct-current motors must be equipped with no-voltage release attachment, and all motor starters having exposed contacts must be installed and placed so that accidental contact by person is reduced to a minimum.

No provision is made in the order for putting it into effect, since the state has no inspection department especially delegated for this purpose, and there are only a few municipal electrical inspection departments in the state.

This order is regarded as so important by Ohio central stations that it is one of the questions to be discussed at a special meeting of the Ohio Electric Light Association on Dec. 3.

Discussion of Code Rule on Inter-building Connections

Uncertainty of Intent of Rule 17*d*—Analysis of the Rule and Suggested Changes—Paper Presented to National Association of Electrical Inspectors

By H. S. WYNKOOP

THE existence of Rule 17*d* of the National Electrical Code is due to a desire to limit the indiscriminate ramification of electric light and power systems throughout private properties, where supervision and maintenance of equipment are difficult and where accidents may readily happen to workmen engaged in altering or tearing down buildings, through the unsuspected presence of these conductors. Municipal authorities, furthermore, object to the use of house mains instead of street mains because the former evade franchise charges. Neither the rule nor the reasons for its existence seem to be well understood, even by those who have most occasion to use it.

It is contended by some that the rule does not clearly convey its intent, by others that it does not say what its framers supposed it to say, and by still others that its requirements, under whatever interpretation may be assigned to them, are unreasonably severe, and perhaps altogether unnecessary. Rule 17*d* reads as follows:

> "No underground service from a subway to a building, and no service from a private generating plant, shall supply more than one building, except by special permission, unless the conductors are properly protected by fuses and are carried outside all the buildings but the one served. Conductors in conduit or duct under two inches of concrete under a building, or buried back of two inches of concrete or brick within a wall, are considered as lying outside of the building. These requirements do not apply to factory yards and factory buildings under single occupancy or management."

There are two corrections which it is generally agreed should be applied to the rule: (1) It should include overhead services and (2) "*one* served" should read "*ones* served."

An explicit definition of the term "factory yard" is difficult to find. Perhaps the following will suffice: "A factory yard is any group of buildings, with no street intervening, which is under one ownership or occupancy and which provides physical access between buildings without the necessity of going upon the street." A dwelling and its private garage on one plot would constitute a "factory yard," as would a group of buildings comprising a brewery. But if some of the brewery buildings were located across the street from the main group the former would be classed as one "factory yard" and the latter as another. This interpretation may not be necessary or even desirable in the smaller communities but in the larger cities it is of considerable importance.

Having divested Rule 17*d* of its non-essentials, the first difficulty in interpretation which we encounter lies in the word "building." What is a "building?" The Electrical Code of the City of New York says that a building is "any edifice, structure or enclosure, whether roofed or unroofed." I have been at considerable pains to call for definitions from electrical authorities throughout the country. Few replies have been received; and I cannot evade the conviction there exists a lack of appreciation of the importance of the subject and in some cases an inability to phrase an answer. These are all the definitions that have come to me:

> "A building, in the case of apartments in a row, is that part which is separated from other parts by standard fire walls; that is, 12-in. walls and double fire doors."

> "A building is a structure originally erected as one building by one owner and where the structural details are such as to plainly indicate this, and, further, where the building is so constructed that any one part of it could not be sold by itself. The same heating plant, ventilating system, janitor service or similar service would, as a general rule, indicate a 'building.' The fact that a building may be separated by partitions or even by solid fire walls does not alter the ruling of this department in regard to a structure being a 'Building'."

> "A building is a structure under one roof, the entire area of which is accessible from within."

> "A building is a property entirely separated from adjacent properties by fire walls or otherwise, and individually owned and controlled by a party or agent, as a business block which may contain a fire wall or other dividing member within its outer limits."

> "A building is that portion of a structure or succession of structures which is separated from every other portion by unpierced fire walls."

The last definition is the one employed in New York.

It will be observed that all these definitions convey more or less clearly the idea of detachment through non-intercommunication, showing most explicitly that all the authorities are generally in accord in the desire to limit the spreading of electric light and power systems throughout blocks, and are casting about for some happy phraseology which will properly describe the zones into which all the structures in the block are considered to be divided.

Some one has said that a row of buildings in a block is comparable to a pile of floors in a skyscraper which has been laid on its side, and that, if we allow risers to run unrestricted from basement to top floor, we should permit a horizontal main to run from the first building of the row straight through to the last building. The comparison is unfortunate; for in one case we have a number of floors not separated by unpierced fire barriers (and consequently, interaccessible) while in the other case each building is so separated from its neighbor.

But we must not dwell too long on what a building is. In the fullness of time—probably within six months—we shall have the answer. Let us now consider the rule with a view to determining just what it calls for and in an effort to agree upon the end to be accomplished by this rule or by some better substitute for it.

Discussion of the Rule.

Rule 17*d* says, in effect, that you cannot feed through from one building to another, whether the first building has a company service or an isolated plant *unless the conductors are properly protected by fuses*. If, then, fuses are provided you can run feeders all through the block, but you must not enter any building except "the ones served."

Did the framers of the rule mean to say this? Is anyone willing to subscribe to such a broad permission, with all its resultant disadvantages and dangers? Subcommittees of the Electrical Committee of the National Fire Protection Association are now grappling with this problem and it is expected that definite recommendations for an amended rule will be considered at the meeting in March, 1920.

With one more comment we shall dismiss the rule as it now stands. The requirement of concrete or brick over the conduit is only a means of securing the equivalent of a line carried outside. A short-circuit in a street main would introduce no hazard into the building. A short-circuit in a house main laid in a brick wall would introduce no hazard. But a short-circuit in a main run through a basement might cause a very serious fire. The man who replaces fuses on a line leading to some other fellow's building usually sees to it that they shall not readily blow again. In brief, he is very apt to adopt the time-honored central-station practice of "burning off the ground." If we have concrete or brick over the conduit a reasonable protection against this has been provided.

The ideal condition would exist if an isolated plant never had to serve other than its own building and if the electric light company always could provide a separate service for each building. But in practice we find that the continually improving economy of the incandescent lamp releases generator capacity which can be used next door, that the lighting company cannot open a new pavement which has just been laid, that some influential industry on a rear street where there is no main must be supplied, and that some person who has no franchise sets up a block lighting plant and schemes in every devious manner to evade Rule 17*d*. Manifestly, the line must be drawn somewhere—but where?

It seems that we shall have to make the answer hinge upon inter-accessibility. We cannot use the one roof or structural idea, for a business may expand from a three-story building into a four-story building next door, and the occupant may cut doors between the two premises and run both places as one establishment—one building. We cannot base our ruling upon the occupancy, as the occupant may control a number of adjoining warehouses which he prefers to keep separated from each other by unpierced fire walls in order to reduce the insurance rate. Nor can we be governed by the ownership, as one individual may own an entire row of apartment houses, each absolutely separate from each other, and each constituting a separate building.

Fortunately, the analysis leaves us on firm ground. The lighting company does not desire to have connected to its system any equipment over which it cannot exercise at least supervisory control. If its service enters a building it has such control. But if the feed is taken from another building instead of from a street main, the company may be unable to enter the premises with which it has no direct relation. This is a dangerous situation, for in one case at least, in the Middle West, the court has held the public utility company directly responsible for accidents occurring on equipment which it is supplying, on the theory that it is the company's duty to assure itself of the safety of these equipments. How such a theory would work out in a case where the company sold electricity in bulk to a customer who resold it at retail throughout the block, is hard to say.

Similarly, the electrician of an isolated plant prefers to serve only the equipment in his own building. Defects in the equipment next door blow his fuses and trip his circuit-breakers, keeping him continually on the jump. If he attempts to remove the cause of his troubles he is told to stay in his own building and run his plant. This is particularly exasperating to the man whose own equipment is always kept in first-class condition, and he sometimes yields to the temptation to "burn it off."

Municipal authorities, too, consider that it is well to limit the supply to the building directly served, as this offers the simplest control. In giving approvals of equipment, in listing defects, in disconnecting dangerous work, in controlling franchise rights, in setting under way legal action, the one-building-on-one-service plan establishes clean-cut conditions, which do not otherwise prevail.

Suggested Changes.

Undoubtedly it will be agreed, after this brief review of the situation, that Rule 17*d* should be rephrased in some manner which will satisfy the following principles:

(1) Only such equipment may be connected to a service as can be considered to be directly under the control, through ready access, of agents of the serving party—whether lighting company or isolated plant.

(2) Where it is necessary to serve a second building from a building having a service, instead of from a direct street main, the construction must be such as to give the equivalent in safety and control of that which would be provided by a direct service.

(3) No electrical energy shall be carried into a building which is not used in said building.

(4) The equivalent of a street main and a direct service may sometimes be secured by the use of conduit or duct covered by concrete or brick, where it is absolutely necessary to feed through from one building to another.

(5) A service which is split before entering a building and is carried along the exterior face of several buildings, either overhead or underground, does not come within the scope of this discussion.

(6) It is probably impracticable, at least in our larger cities to adhere absolutely to the rule of one-building-on-one-service.

I trust that I have succeeded in laying before you fairly one of our big-town problems. Do not, however, assume that the smaller cities are not concerned. Every electrical inspector, every lighting company, and every franchise-granting authority should be interested in amending Rule 17*d* so the laxness and uncertainty of the present rule will be eliminated. And to that end I look to the National Association of Electrical Inspectors and its friends to present that helpful discussion without which we cannot progress.

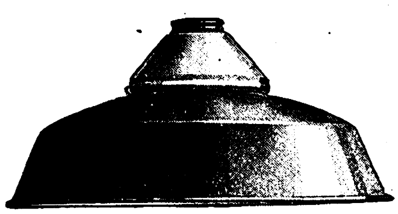
New Appliances

Steel Reflectors with Luminous Glass Tops — Portable Flood Lamp—Safety Motor Switch—Marine Lighting Set

Ivanhoe-Regent Works Announces Metal Reflectors with Glass Tops.

A decidedly new development in reflectors for industrial service, of both dome and bowl types, is announced by the Ivanhoe-Regent Works of General Electric Co., Cleveland, Ohio. The new reflectors afford all the advantages of porcelain-enameled reflectors while permitting the distribution of some light above the units, thus relieving the gloomy appearance often prevailing when no light is directed above the level of the lamps.

The metal part of the reflector is of



Dome Type Metal Reflector with Glass Top to Permit Some Light to Reach Ceiling and Upper Walls.

Bowl Type Metal Reflector with Glass Top to Remove the Customary Gloomy Contrast of Dark Upper Parts of Rooms with Bright Working Areas.

one compact piece, the form and the heel being connected by legs securely welded to each part. The contour of the metal part of the dome type approximates that of the Ivanhoe RLM standard reflectors of the same size.

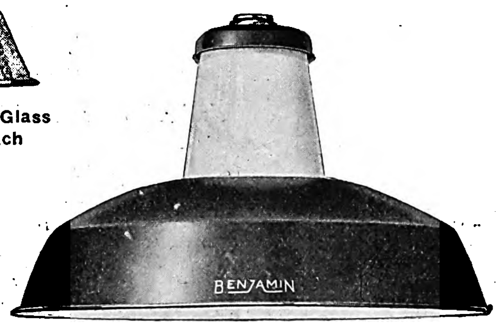
The glass top is in little danger of being broken as it is small and well protected. Well diffused light reaches the space above the lighting units through a small section of opal glass of good quality firmly fitted in the top of the reflector. This light gives the room a more cheerful appearance and assures better diffused lighting because of the light reflected from the upper part of the room, softening shadows and reducing reflected glare.

Possibility of eye strain because of the sharp contrast between the dark region above the lighting units and the bright region below them is eliminated.

Ivanhoe glass-top reflectors are of special advantage, both in rooms with light or dark walls and ceilings, because of the more uniform distribution of light over walls and ceilings than is possible with reflectors which permit no light to pass upward. The efficiency is not seriously affected because much of the light which reaches the upper parts of the room is thence reflected downward.

Benjamin Luminous-Top Reflector With Opal-Glass Hood.

It is known that the great contrast between an unlighted surface and an adjoining brightly illuminated one is very trying to the eyes. Formerly illuminating engineers used to pride themselves on industrial lighting installations in which opaque reflectors were used to cut off *all* of the light that otherwise would strike the ceilings and upper parts of the walls. The result was a high efficiency of utilization because practically no light was *wasted*



Benjamin Luminous-Top Reflector to Give Soft Light in Upper Part of Room and High-Efficiency Illumination on Working Plane.

in the upper part of the room. Nowadays, however, it is realized that if a moderate amount of light does reach the ceiling and upper parts of the walls it is *not* wasted, for it reduces the great contrast between the intensively bright sources and highly illuminated working surfaces on one hand and the otherwise dark and gloomy ceilings on the other.

This idea is being applied to certain enameled-steel reflectors made by the Benjamin Electric Manufacturing Co., Chicago. The neck or hood part of the reflector is made of opal glass, permitting a soft light to be projected to the upper part of the room. In factories with dark walls and ceilings, this unit through its luminous top diffuses a certain amount of light to the upper portions of the room, thus bringing out in detail the belting, pulleys, etc., occupying that space. The effective illumination of the area above the rim of the reflector also serves to increase the apparent height of the ceiling and thus produces a sense of greater freedom of action among the workmen. It also makes the room a more cheerful one by removing the gloomy and forbidding aspect of very dark ceilings.

In factories with white or light-colored walls and ceilings, this unit serves to increase the effectiveness of the illumination. Sharp contrasts are reduced and a better quality of illumination results. The light which otherwise would be lost in the recesses of the fixture is put to useful work. Where the walls and ceilings are light part of this light is reflected back upon the working plane and in this way increases the efficiency of the lighting system.

Benjamin luminous-top reflectors are built in the RLM standard dome shape and at present are made in the 14 and 16-in. sizes. The former is suitable for 100 and 150-watt Mazda type C lamps, whereas the larger size is suitable for 200-watt lamps. It is also possible to secure the opal glass hoods separately to allow for replacements of any broken parts, although the construction of the unit is such that the breakage should be very small.

Western Electric Portable Utility Light for Nearby Flood Lighting.

A new type of modified projector for highly localized lighting has recently been placed on the market by the Western Electric Co. This unit, which is to be known as the Western Electric portable utility light, is for use at close ranges where the light is to be located at distance not greater than 125 ft. of the object or surface to be illuminated.

With the light operating on a 100-ft. throw, a 100-ft. spread is obtained at an angle of 60°. The unit gives a smooth white light without serious gleam or glare. This is made possible by a new development—the hammered glass reflector. A 200-watt Mazda type C lamp is used. The unit is of especially rugged construction throughout and will withstand rough usage in service.

The hammered glass reflector is spring-suspended in a one-piece cast-iron housing. The housing is closed by a wire-glass front which is fitted into a recessed cast-iron ring. This forms a door which is hinged at the bottom and secured by a hand latch, thus affording easy access to the interior of the housing. The recessing in the ring makes the interior fully weatherproof.

This lighting unit can be furnished in either a black or gray weatherproof enamel finish. It is 19¼ ins. high and weighs approximately 30 lbs. This light weight makes the unit very easy to carry from place to place. The base is 9 ins. in diameter, giving the light stability when mounted on a flat horizontal surface. The unit can also be mounted on either vertical or flat surfaces such as walls, poles or roofs, by virtue of a heavy universal joint which fastens the housing to the base. All adjustments can be made by hand; no tools are necessary.

The Western Electric portable utility light has a wide range of applications. In railroad work it can be used for lighting transfer tables, coaling stations, inspection pits, loading platforms, cranes, roundhouses and drawbridges. On marine work it can be used for lighting docks, dredges, slips, loading operations, canal locks, dry docks and pile drivers. Its industrial applications cover even a wider variety of uses, such as lighting shop yards, material yards, coal yards, well drilling, coal tipples, erecting shops, machine shops, tramways and inclines, conveyors and all kinds of emergency work.

Other uses will be found in illuminating playgrounds, skating rinks, signs, street corners, alleyways, swimming pools, monuments, flags, building fronts and construction work in general. In other words, it can be used for general flood lighting of nearby areas for which the ordinary floodlight projector gives too concentrated a beam.

New Westinghouse Safety Motor-Starting Switch.

A new type of motor-starting switch, which is low in first cost but provides complete protection to both the operator and the motor, has just been placed on the market by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa. It is known as the type WK-100 switch and is designed for connecting single or polyphase alternating-current motors of from 1 to 10 hp., 250 and 550 volts, directly to the line without the use of autotransformers or resistance.

All of the mechanism with the exception of the operating handle is inclosed with a steel box. The protective devices are easily accessible on opening a door in the cover; but this door can not be opened except when the switch is in the off position (nor can the switch be closed when the door is open) and all parts accessible are then dead. Therefore it is impossible to receive injury from contact with live parts when either operating the switch or making ordinary adjustments.

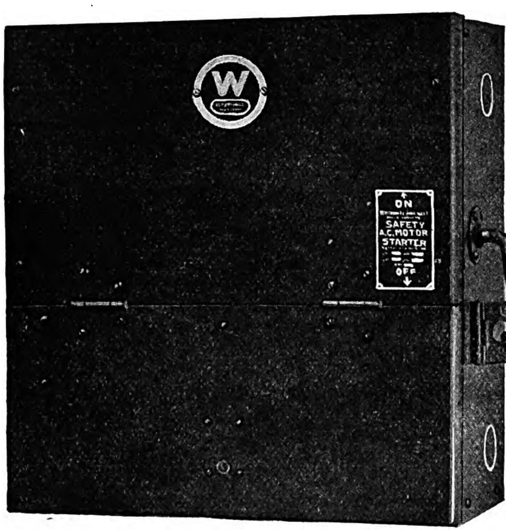
No-voltage protection to the motor is provided by a magnetic release which opens the switch automatically on a failure of voltage. Overload protection is provided by means of relays, resembling cartridge fuses in appearance, each of which contains a contact connected in series with the release magnet. Harmless momentary overloads have no effect on the relays, but as soon as the load on the motor becomes dangerous, the relay contacts open the magnet circuit and the switch automatically flies open. The relays then automatically reset themselves.

A New Marine Lighting Outfit.

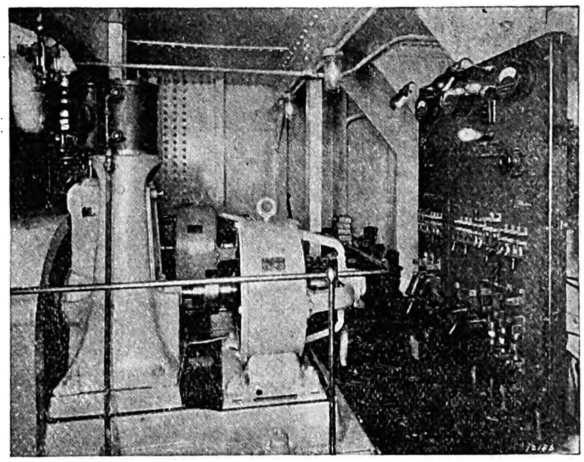
A new line of engine-driven marine lighting generators, designed especially to insure reliability of operation, has recently been developed by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa. The sets range in size from 2 to 50 kw., and each consists of a steam engine coupled to a generator, the whole being mounted on a bedplate so as to form a compact unit. The 15-kw. size, shown in the illustration, is 6 ft. long, 3 ft. wide, 5 ft. high and weighs about 3300 lbs.

The engine used in these sets is manufactured by the Clarage Fan Co. It is of the single-cylinder, vertical inclosed V-type with automatic lubrication. It can be supplied for operation on steam pressures of from 80 to 250 lbs. and is suitable for either condensing or noncondensing service.

The generator, while in general of standard Westinghouse construction, is specially designed for marine service. The bearings are arranged so that perfect lubrication is assured regardless of the tossing of the vessel. The windings are specially insulated to protect them from salt and dampness. Metal parts subject to corrosion are made of noncorroding alloys. A special feature of these generators is their freedom from sparking at the commutator, even under heavy overloads. They are supplied for either 125 or 250 volts, direct current, and for either two or three-wire systems.

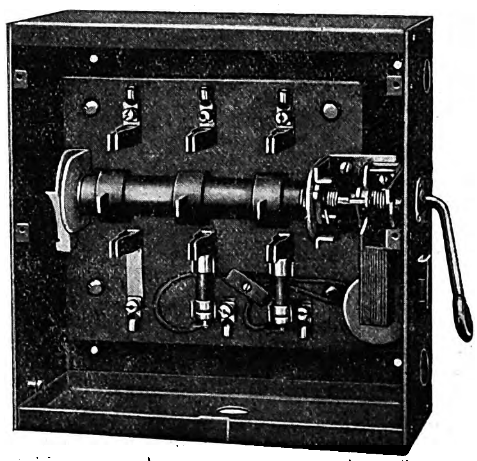


New Westinghouse Safety Inclosed Motor-Starting Switch With Switch Handle Locked in "Off" Position.



Two 15-kw. Westinghouse-Clarage Engine-Driven Lighting Generators on Steamer New Britton.

Inclosed Motor-Starting Switch in "Off" Position, Permitting Fuse Compartment to Be Opened.



Safety Motor-Starting Switch With Cover Entirely Removed, Which Can Be Done by an Authorized Person.

Trade Activities

Course in Production Methods Conducted for Crocker-Wheeler Foremen—Kallmerten & Warner Electric Formed

The C. Y. Engineering Co., Newark, N. J., of which C. W. Yerbury, a former Western Electric man, is manager, has taken over the business of the late C. McIntire, for many years a manufacturer of high-grade connectors and electrical specialties. The new firm aims to maintain the same high standard of production as was maintained by the C. McIntire Co.

Cooper Hewitt Electric Co., Hoboken, N. J., in order to secure more space for factory expansion, will remove several departments of the offices, on or about Dec. 1, to 95 River street. The departments affected are the executive, auditing, sales, purchasing and patent. The engineers' department will remain at the present location in the factory at Eighth and Grand streets.

Kallmerten & Warner Electric Co., 120 Lovell street, Charleston-Kanawha, W. Va., is the name of a recently incorporated concern, which will carry on a manufacturers' agency to sell and erect for mines such units as power plants, substations, ventilating fans, pumps, locomotives, etc. The company will also sell transformers, motors, small light plants, lamps, etc., and is equipping its shop with machinery to make armature coils, rewind and rebuild motors, armatures, field coils, transformers. The officers of the company are as follows: G. E. Warner, president and treasurer; O. W. Kallmerten, vice-president and general manager, and Ira W. Belcher, secretary.

General Electric Co., Schenectady, N. Y., has issued a handsome booklet entitled "The Electric Ship," which describes at some length the electric propulsion of the battleship *New Mexico*, which is considered one of the most remarkable engineering feats that has thus far been accomplished. How the electrical machinery looks, how it works, and why the electric drive is preferable to other forms of propulsion in terms understood by the average non-technical reader are described in Part I. Part II relates "what the experts say," and sets forth in their own words how America's leading experts regard electric ship propulsion and its economic and military advantages. A chapter on "The Electric Propulsion of Ships" is included by W. L. R. Emmet, consulting engineer of the General Electric Co., who in co-operation with the Bureau of Steam Engineering, U. S. Navy, developed electric drive for ships. Another chapter by Eskil Berg reviews the propelling equipment and operation of the *New Mexico*. The publication is profusely illustrated and contains considerable valuable data on the subject.

Webb Electric Furnace Corp. has established offices at 36 Church street, New York City, and has taken over the manufacture and sale of the furnace developed by the Old Dominion Iron & Steel Corp., Richmond, Va.

Jenkins & Knowles, with office and shop at 34 Wells street, Hartford, Conn., is the name of a new firm recently organized by H. E. Jenkins, Hartford, Conn., and Elmer J. Knowles, Worcester, Mass., which will specialize in power installation in factories and power plants. The firm will also do a general electrical business.

Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., has completed negotiations for the sale of its holdings in the British Westinghouse Manufacturing Co. for a consideration said to exceed $5,000,000. The company has completed arrangements for taking over the East Springfield plant of the New England Westinghouse Co., Springfield, Mass., and is planning to commence operation at once on the production of industrial motors and automobile starting and lighting systems. This plant will be operated as an additional unit to the East Pittsburgh works of the company and will afford employment for about 5000 persons.

Pyroelectric Instrument Co., Trenton, N. J., has issued an illustrated catalog entitled "Pyrovolter Type Instruments." The catalog which is perforated contains 40 pages of text and illustrations that indicate the details of the instruments, the different types and sizes, wiring diagrams, prices, the uses to which instruments can be placed, and other information. The Pyrovolter, which is an instrument designed, as the name implies, to indicate and measure high temperatures, was placed on the market in 1916. It is distinguishable from ordinary pyrometers in that the former measures potential and the latter current. In effect, the Pyrovolter principle provides a means of operating a deflection instrument on the potentiometer principle wherein the accuracy and permanency of the instrument depend basically upon a permanent magnet rather than upon a standard cell. Operation of the instrument is effected by balancing a potential drop against an unknown c. e. m. f. and then changing the connections of the instrument suddenly and observing the drop across an accurately adjusted fixed resistance. The connection is changed by turning a button. The instrument does not require the use of a standard cell nor does it have any temperature resistance coefficient. It is applicable to all situations in which high temperatures or minute temperature changes are sought.

Pierce Fuse Corp. of Canada, Ltd., Bridgeburg, Ont., capitalized at $250,000, was recently incorporated to manufacture renewable electric fuses. Officers of the company are: President, W. N. Pierce; vice-president, F. A. Myer, and secretary, B. C. Candee.

C. & P. Electric Works, Springfield, Mass., is sending out catalog No. 1 dealing with barrier panels, barrier cabinets, type "S" cabinets and steel boxes and cabinets. This catalog comprises 15 pages and contains illustrated descriptions of each product. The barrier cutouts are made of white glazed porcelain, with a patent upturned end which, when the cutouts are placed together, forms a barrier around the wiring gutter, and is one of the most convenient arrangements devised for panel construction. The feature of having a barrier made a part of the block reduces the number of parts and simplifies the operation of making up a panel. One of the principal advantages of the barrier panel is a substantial barrier between the busbars so that accidental short circuits are impossible. These products are of the N. E. C. standard and have been approved by the Underwriters' Laboratories.

Crocker-Wheeler Co., Ampere, N. J., has just inaugurated a plan of training for its foremen and other factory supervisors which is of considerable interest. A group of 62 men has been formed to pursue a three months' course in modern production methods, which comprises the study of specially prepared text units, the solution of problems relating to the units and the discussion of this material at six biweekly meetings held after hours in the plant. These meetings will provide an opportunity to bring home the application of the work to the special problems of the Crocker-Wheeler Co.'s production. At each meeting a lecture will be delivered by an experienced production man and the lectures will be followed by a round table discussion. Included in the group aside from the foremen are the superintendent and three assistant superintendents, and insurance is given that the meetings will be highly beneficial to the members of the class. The subjects to be studied are: How to promote team work in the shop; handling men in a way to increase production and promote harmony; how production should be organized; efficient purchasing, scheduling, routing, repairing, etc.; keeping down the overhead by stricter cost keeping and major problems of management. The course is under the direction of the Business Training Corp. of New York City which supplies the study material and the class instruction.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Medford, Mass.—American Radio Research Corp. has completed arrangements for the erection of a new one and two-story radio building, about 60x120 ft. and 60x140 ft. on College avenue. Alonzo D. Wright, 40 State street, Boston, is architect.

New Britain, Conn.—Landers, Frary & Clark will erect a building 96x289 ft. to cost $200,000, and a three-story tempering building 40x68 ft.

Pawtucket, R. I.—Potter & Johnstone Machine Co. will build a two-story 63x72 ft. foundry addition and will alter buildings Nos. 1 and 2 at a cost of $60,000.

Pawtucket, R. I.—James M. Carpenter Tap & Die Works has recently broken ground for the construction of a one-story brick boiler plant on Newell avenue, about 20x30 ft. Willmarth-Mackillop, Inc., Freeman street, is the contractor.

Woonsocket, R. I.—Harvey Electric Co. has filed notice of organization to operate at 19 Sayles street. Harvey Lamy, 100 Arnold street, heads the company.

Bath, N. Y.—The question of issuing $35,000 municipal light bonds will be submitted to vote. Address town clerk.

Brooklyn, N. Y.—Metal Hose & Tubing Co., 253 Tillory street, has under advisement the erection of a $75,000 plant. Plans call for a three-story structure, 80x100 ft.

New York, N. Y.—Plans are under consideration by the Commission of Water Supply, Gas and Electricity for extensions and improvements in the electric street-lighting system in sections of 42nd street, including a rearrangement of lighting units in the vicinity of the Grand Central Terminal.

New York, N. Y.—In connection with the proposed construction of the large new motion picture studio building, about 200x600 ft. to be erected by the Selznick Picture Corp., 729 Seventh avenue, large quantities of electrical equipment will be required. The structure will be of reinforced concrete, and is estimated to cost $2,000,000. Contract for erection has been awarded to the Thompson-Starrett Co., 49 Wall street.

Rochester, N. Y.—Notice has been filed with the Secretary of State by the North East Electric Co., 348 Whitney street, of an increase in its capitalization from $1,000,000 to $3,000,000, for business expansion.

Schenectady, N. Y.—General Electric Co. is having plans prepared for the construction of a new five-story brick administration building about 54x219 ft. The structure will cost in excess of $350,000. Harris & Richards, Drexel building, Philadelphia, Pa., are architects.

Schenectady, N. Y.—Mica Insulator Co., Villa road, manufacturer of insulation specialties, has awarded contract for the construction of a one-story plant on Villa road. The structure is estimated to cost about $15,000 and will be used for increased output. Hanrahan Brothers, Wendell avenue, Schenectady, are the contractors.

Solsville, N. Y. — Public Service Commission has approved the application of the Solsville Electric Light & Power Co., operating in Solsville, Madison county, to construct an addition to its local electric plant, to provide for increased capacity. The company will also arrange for the acquirement of the local hydro-electric plant for operation.

Utica, N. Y.—Held Electric Co., manufacturer of electrical goods, etc., has filed notice with the Secretary of State of an increase in its capital from $5000 to $10,000, to provide for general business expansion.

Wayland, N. Y.—Wayland Light & Power Co., Inc., has been granted permission by the Public Service Commission to construct an addition to its electric plant at Wayland, and to construct and operate a new plant at Conesus, Livingston county, for local service, franchise for the latter having been granted by the municipal authorities recently.

Califon, N. J. — Califon Electric Light & Power Co. is making rapid progress on the construction of an additional power line from Hackettstown to Long Valley, to provide increased capacity. The company purchases its electric energy from the Hackettstown Electric Light & Power Co., Hackettstown.

Freehold, N. J.—Board of Chosen Freeholders of Monmouth county is having plans prepared for the construction of a new power plant at the County Court House. Douglas Sprague, 39 Cortlandt street, New York, is architect.

Irvington, N. J.—Plans are under consideration for improvements in the municipal police signal system.

Jersey City, N. J.—Leeds Phonograph Co. has filed plans for the construction of a new one-story brick engine house, to be located at 143 Morgan street.

Newark, N. J.—In connection with the proposed new additions to the plant of the Duratex Co., 768 Frelinghuysen avenue, estimated to cost about $500,000, plans are being prepared for the construction of a one-story addition to the power plant, about 60x75 ft.

Newark, N. J. — Cowan Brothers have filed notice of organization to operate at 123 North Sixth street as a general electrical repairing establishment. Arthur G. Cowan heads the company.

Newark, N. J.—American Transformer Co., 178 Emmet street, has completed arrangements for the disposal of its plant at 484-86 New Jersey Railroad avenue, to new interests. The property consists of a one-story brick structure on a plot about 45x140 ft.

Trenton, N. J.—Trenton Malleable Iron Co. will erect a $20,000 power plant.

Trenton, N. J.—City commission is having new plans and specifications prepared covering the installation of the proposed steam, electric and hydraulic equipment at the municipal waterworks plant. A resolution was recently passed awarding the contract for the proposed work to Harry E. Stahl, the lowest bidder, and this resolution has been withdrawn. Under the new plans, the equipment is estimated to cost about $65,000.

Trenton, N. J. — Fay & Youngs, Inc., 75 Spring street, New York, is planning for the installation of new boiler equipment in the plant of the Fidelity Pottery Co., Trenton, N. J., recently acquired.

Bethlehem, Pa.—Traveler Tire & Rubber Co., 819 North Broad street, Philadelphia, Pa., has completed foundation work in connection with the construction of its proposed local plant, including large power house for works operation. The works will be one-story, about 90x332 ft. located at Traveler avenue and Auburn streets and estimated to cost $125,000.

Easton, Pa.—Easton Hospital Association has awarded a contract to Bechtel & Bechtel, Easton, for the construction of a new three-story hospital building, about 165x230 ft., to be supplemented by a power plant for general operation, the structures to be located at Lehigh, 20th and 22nd streets. The project is estimated to cost $150,000.

Erie, Pa.—Burke Electric Co. has recently completed negotiations for the purchase of the business of the C. & C. Electric & Manufacturing Co., Garwood, N. J., manufacturer of direct-current motors and generators, etc. It is understood that the equipment will be removed to Erie. James Burke is president.

Harrisburg, Pa.—Charles A. Fair, 128 Sylvan terrace, will build a two-story machine shop and auto repair works, 70x120 ft. This work will involve an expenditure of $20,000.

Philadelphia, Pa.—A boiler house involving an expenditure of $50,000 will be erected by the American Preserve Co.

Philadelphia, Pa.—Wicaco Screw & Machine Works, Seventh and Wood streets, is preparing plans for a plant to cost approximately $100,000.

Philadelphia, Pa.—H. O. Wilbur & Sons, Inc., 235 North Third street, has awarded a contract to the Turner Construction Co., 1713 Sansom street, for the construction of a new seven-story and basement brick and concrete power plant and warehouse building, about 80x92 ft.

Pittsburgh, Pa.—Follansbee Brothers Co., operating steel mills at Follansbee, W. Va., has completed arrangements for the construction of a new steel plant at Toronto, Ohio, estimated to cost approximately $5,000,000. The structures will include machine shop, open-hearth and hot mills, annealing departments, scrap shed, and power plant, about 60x100 ft., for general works operations, as well as auxiliary structures.

Pittsburgh, Pa.—Atlantic Refining Co. has filed plans for the erection of a new one-story concrete and steel pumping plant to be located at 57th and Butler streets. The structure is estimated to cost about $35,000.

Rittersville, Pa.—Hildebrand Knitting Co. is having plans prepared for the construction of a large new stack at the power plant at its mills located at Rittersville, near Allentown.

Scranton, Pa.—City is having plans prepared for the construction of a new municipal electric light plant. Frank Koester, 50 Church street, New York, is engineer; Robert W. Allen, City Hall, is director of public works.

Shepherdstown, Pa.—Plans are understood to be under consideration by local interests for the installation of electric service in the municipality. An electric plant will be installed.

York, Pa.—Read Machinery Co., 231 North George street, is having plans prepared for the construction of a one-story brick, concrete and steel boiler plant, about 40x50 ft. The structure will be located on Grantley street, and is estimated to cost $20,000. Gemmill & Billmeyer, 37 West Market street, architect.

Baltimore, Md.—In connection with the proposed improvements in the municipal water supply system, plans have been submitted before the city council covering the construction of a large tunnel from McCall's Ferry to Baltimore over the right of way of the Pennsylvania Water & Power Co., for the tapping of the Susquehanna river for the proposed supply. It is estimated that this project would cost approximately $50,000,000. Howard Bryant is president of the second branch of the city council.

Ehrhardt, S. C.—City will establish an electric light plant according to plans prepared by the Ryan Engineering Co., National Bank of Sumter building, Sumter, S. C.

Jacksonville, Fla.—Installation of a new 10,000-kw. generator will be effected at the municipal electric light and power plant about Jan. 1. This will give the plant a total generating capacity of 19,000 kw. per hour. Additional improvements are also contemplated in the municipal plant.

DATES AHEAD.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

American Institute of Chemical Engineers. Annual meeting, Savannah, Ga., Dec. 3-6. Secretary, J. C. Olsen, Brooklyn, N. Y.

Electric Power Club. Meeting, Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

American Electrochemical Society. Annual convention, Boston, Mass., April 7-10, 1920. Friday, April 9, joint session with American Institute of Electrical Engineers on "Electrically Produced Alloys." Secretary, Joseph W. Richards, Bethlehem, Pa.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

NORTH CENTRAL STATES.

Lima, Ohio.—Rates for boulevard and arc light service in Lima will be submitted to the joint committee of clubs and civic organizations by the Ohio Electric Co. The Ohio Electric Co. is to submit its figures for the boulevard in two ways, under one of which it will install and own the equipment, and under the other the city will install the posts and wires and buy only the current.

Oberlin, Ohio.—The city proposed to erect an electric power plant.

Evansville, Ind.—Evansville Metal Bed Co. has purchased two entire blocks adjoining its factory and a large addition will be built.

Brockton, Ill.—The council is planning ways and means to secure electric lighting. Address C. B. Miller.

Chicago, Ill.—Central Manufacturing Co. will erect a $900,000 six-story warehouse, 260x174 ft.

Chicago, Ill.—Central Bag Manufacturing Co. is erecting a new factory building to cost $350,000.

East St. Louis, Ill.—St. Louis Pressed Steel Co. will erect the first unit of a factory plant, the building to be a steel and brick structure, 200x100 ft., and the estimated cost $65,000. The Sutherland Building Construction Co., St. Louis, Mo., has the contract.

Elgin, Ill. — Donald Hubbell will erect two-story brick building to cost $28,000.

Monticello, Ill. — Township has voted to erect $200,000 community high school.

Sorento, Ill.—The sum of $5000 in bonds has been voted to secure electric lighting.

Bangor, Mich. — The village, after operating a municipal electric plant for about 15 years, has sold it and granted a franchise to the Benton-Harbor-St. Joe Railway & Light Co.

Detroit, Mich. — Notice has been filed with the Secretary of State by the Detroit Edison Co. of an increase in its capital stock from $35,000,000 to $60,000,000, to provide for general expansion.

Hartford, Mich.—The village has granted to Anderson Brothers a substantial increase in rates for electric current. In return for the higher rates, Anderson Brothers will install a new power plant with new waterwheels and vertical direct-connected generators. Orders for this machinery will be placed this year for delivery about next June.

Lawton, Mich. — A committee has been appointed to obtain information relative to the amount necessary to install a modern electric light plant. It is probable that a special election will be called this year. Address village clerk.

Muskegon, Mich. — Shaw Electric Crane Co. contemplates an addition to its plant which will double its capacity.

Westphalia, Mich.—The council has received an estimate for construction of a municipal lighting system. The expert figures will not exceed $15,000 to install the system and to build a suitable shelter for the dynamo and engine. The council will submit the question to the voters some time in December.

Manitowoc, Wis. — Chamber of Commerce is interested in ornamental lighting system on several streets. Arthur Zander, city clerk.

Waupaca, Wis.—Waupaca Electric Service & Railway Co. has under consideration the erection of a new electric plant.

Faribault, Minn.—The Faribault division of the Northern States Power Co. will shortly furnish 100-hp. of electrical energy for operation of a stone quarry on the outskirts of the city.

SOUTH CENTRAL STATES.

Gadsden, Ala. — City council has called a special election on Jan. 6 for the purpose of voting on a bond issue of $100,000 to cover the cost of the establishment of a municipal electric light plant. Ernest Smith is city engineer.

Huntsville, Ala.—The new transmission line of the Alabama Power Co., which will bring power from Goose river near Gadsden to Huntsville for distribution throughout northern Alabama, will be finished by the first of the year. Preparations are being made for the erection of two large steel towers on each side of the Tennessee river at Whitesburg, where the crossing will be effected. A line is being extended to Decatur and Albany, which will be completed about the same time.

Jackson, Miss—Plans are being arranged by the city for the installation of new equipment in the municipal electric plant. Bonds for $15,000 have been voted to cover the cost of the proposed work. F. M. Trussell, is clerk.

Hominy, Okla. — City considering plans for the installation of a new electric street lighting system. C. E. Lee is engineer.

Shattuck, Okla.—City Council, A. C. Oliver, Mayor, has taken bids for the installation of a quantity of new equipment in the municipal electric plant, including boilers, generating apparatus, lifting equipment, heater, pumping units, switchboard, and auxiliary apparatus. Improvements and extensions will also be made in the municipal water supply system, pole lines, etc. Burns & McDonnell, 402 Interstate building, Kansas City, Mo., are engineers.

Sapulpa, Okla. — The 66,000-volt transmission line of the Oklahoma Gas & Electric Co. connecting Drumright and Sapulpa has been completed and much needed additional capacity is now available for the Sapulpa division.

Abilene, Tex. — Work will begin Dec. 1 on the construction of a combined power and ice plant in Abilene to cost $700,000, according to an announcement made by A. Hardgrave, Dallas, vice-president and general manager of the American Public Service Corp. The building will be of reinforced concrete throughout. A turbine of 2600 hp. will generate power for the plant, which will supply electric current to seven towns in this section.

Brady, Tex.—City has let first contract for electric light plant. Address Mayor.

Houston, Tex.—It is planned by the Harbor Board and city council of Houston to take up for consideration soon the matter of extending the municipal belt railroad to Morgan's Point, situated on the south side of the Ship Channel, and to Goose Creek, situated on the north side and to convert the system into electric traction. It is also proposed that the lines be double-tracked and equipped to carry passenger as well as freight traffic. The plans also include the merging of the Municipal Belt railroad and the city's port properties at Port Houston into a terminal corporation for the issuing of bonds. It is stated by City Engineer McVea that these properties have a value of more than 2,500,000, including 465 acres of land on the Ship Channel. It is estimated that the cost of the main line extension to Morgan's Point and Goose Creek would be about $1,000,000.

Killeen, Tex. — Fire recently destroyed the plant of the City Light & Power Co., with loss estimated at $28,000. It is understood that plans will be arranged for immediate rebuilding.

WESTERN STATES.

Hardin, Mont.—Big Horn Canyon Irrigation Co. with a capital of $5,000,000 will build reservoir 60 miles long. About 1,500,000 yds. of concrete will be required for dam. Approximately 40,000 acres of land will be irrigated with the aid of pumps operated by power generated from the dam. Address secretary of company.

Chehalis, Wash. — City Engineer Bantz will report his complete specifications for the proposed new lighting system for Chehalis' streets at the next meeting of the city commission. The plan proposed a concrete or steel standard with a single globe and 400-watt lamps at reasonable intervals in the business center of the city and make Chehalis one of the best lighted Northwest cities.

Goldendale, Wash. — The power house is to be entirely overhauled. The flume and piping are to be repaired and replaced when necessary.

Bend, Ore.—At a recent meeting of the city council the mayor suggested that an adequate system of municipal lighting should be adopted.

Roseburg, Ore.—The question of issuing $500,000 electric light bonds is under consideration. Address Mayor Hamilton.

Modesto, Calif. — On Dec. 9, the question of issuing $20,000 bonds for street lighting equipment will be submitted to vote. Address city clerk.

CANADA.

Bala, Ont.—Bala Electric Light & Power Co., is constructing a 14-mile pole line, and also contemplates the construction of another line the same length.

Vancouver, B. C. — Canadian Marconi Wireless Co. contemplates the erection of a wireless station to cost $2,000,000 and is negotiating with the Government for license.

PROPOSALS

Transformers—Bids will be received by the Committee of Fire, Water, Light and Power, Winnipeg, Man., at the office of C. J. Brown, city clerk, until 3 p. m., Dec. 1, for the supply and installation of six 1000-kv-a. step-down, single-phase transformers for the city light and power department. Specifications may be obtained at the office of the city light and power department, 54 King street.

Fire Alarm Boxes.—Bids will be received by the commissioner of gas and electricity, Room 614, City Hall, Chicago, on Nov. 28, for furnishing and delivering to the city, 20 fire alarm boxes complete, in accordance with specifications on file in the office of the above official. William G. Keith, commissioner of gas and electricity.

Electric Elevators. — Bids will be opened in the office of the supervising architect, Treasury Department, Washington, D. C., at 3 p. m., Dec. 2, for remodeling the electric freight elevators in the United States Post Office, Court House and Custom House at Providence, R. I., in accordance with specifications, copies of which may be had at the above office, in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

Electrical Work.—Bids will be received at the supervising architect's office, Treasury Department, Washington, D. C., on Dec. 18, for furnishing materials for the construction of the United States Post Office at Thomasville, N. C., including millwork, painting, glazing, hardware, heating, electric work, etc., in accordance with drawings, specifications and bills of quantities attached thereto, copies of which may be obtained from the custodian of the site at Thomasville, N. C., or at the above office, in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

NEW PUBLICATIONS

Safe Practice in the Use of Wire Ropes in Mines.—The Bureau of Mines in the course of its investigations of safety in mining, the fuels and mechanical equipment has collected much information bearing on the use of wire rope. In this paper by R. H. Kudlich and O. P. Hood, the authors outline approved practice and the most important precautions to insure safety. It emphasizes the essentials of good practice and gives the reasons underlying such practice.

Abatement of Corrosion in Central Heating Systems is the title of technical paper No. 236 by F. N. Speller and issued by the Bureau of Mines, Department of the Interior, and serves as a guide to engineers in the design of heating systems. The author emphasizes the fact that whether hot water or steam is used as the medium for conveying heat to the consumer, a heavy toll in upkeep must be faced sooner or later if the corrosion of piping is not taken into account in the design of the plant. It has been found that the main source of corrosion has been traced to dissolved gases brought into the heating system either with the feed water for the boiler or through leaks in return lines under a pressure below that of the atmosphere. This publication discusses piping material, theory of corrosion and the engineering problem involved in heating systems. The price of this publication is 5 cts. and copies may be secured by addressing the Superintendent of Documents, Government Printing Office, Washington, D. C.

Photoelectric Spectrophotometry by Null Method.—The Bureau of Standards, Department of Commerce, has issued scientific paper No. 349 by K. S. Gibson, entitled "Photoelectric Spectrophotometry by the Null Method." In connection with the color-standardization work of the Bureau of Standards, it was found desirable to have available a number of independent methods of making spectrophotometric determinations, especially in the visible part of the spectrum; for it is generally admitted that the fundamental basis of color specification is spectrophotometry. To supplement the other methods at present in use at the Bureau, the author was given the problem of developing a method for accurate and convenient photoelectric spectrophotometry suitable for routine determinations, and the results of his study are described at length in this publication. It discusses the apparatus, method and errors and accuracy in spectral transmission, diffusion of spectral reflection and other applications of the apparatus. The price of this bulletin is 5 cts. and is sold by the Superintendent of Documents, Government Printing Office, Washington, D. C.

INCORPORATIONS

Holmesville, Neb. — Consolidated Electric Co. has incorporated with a capital of $10,000. Plans to build electric line from Holmesville, taking in towns of Rockford, Filley and Virginia.

Cylon, Wis.—Cylon-Forest Electric Co. has incorporated with a capital of $25,000. Herman Frey & John F. McNamara.

Carthage, Miss.—Carthage Light & Ice Co. has been incorporated with a capital of $30,000. R. L. Jordan and others.

Wenatchee, Wash.—Articles of the incorporation were filed by Columbia Railway Electric Co. for $5000 by W. L. Chrysler, and Edith F. Chrysler.

Chesterfield, Ill.—Chesterfield Electric Co. has been incorporated with a capital of $15,000 by W. J. Finch, D. Ambier and L. Ambier.

Indianapolis, Ind.—Adams-Coulter Manufacturing Co. has been incorporated with capital of $35,000 for the manufacture of machinery. L. P. Adams, A. L. Coulter and Walter G. Holt are the incorporators.

Muncie, Ind.—Star Storage Battery Co. has been incorporated with capital of $25,000 to manufacture electric storage batteries. Address W. O. Haymond, Muncie, Ind.

New York, N. Y.—Worth Lighting Fixture Co. Capital, $10,000. To manufacture electric and gas fixtures, etc. Incorporators: J. Pecker, B. Shapiro and B. Leavitt, 311 East Ninth street.

New York, N. Y.—Blair Reseater Co. Capital, $50,000. To manufacture engines, motors, and kindred equipment. Incorporators: A. Hall, F. R. Howe and D. M. Gerard, Huntington.

Brooklyn, N. Y.—Aws Manufacturing Co. Capital, $10,000. To manufacture electrical and gas appliances, etc. Incorporators: A. Schachne, I. Kantrowitz, and A. W. Schenker, 469 West 164th street.

Brooklyn, N. Y.—Art Fibre Productions, Inc. Capital, $20,000. To manufacture lighting fixtures, etc. Incorporators: M. Appelbaum and F. and H. Adlow, 37 Linden street.

Buffalo, N. Y.—Huron Electric Co. Capital, $10,000. To manufacture electrical goods, etc. Incorporators: E. A. Heller, S. Eckert and E. J. Hanks.

Danville, Pa.—Penns Creek Hydro Electric Co. Capital, $30,000. To operate a hydroelectric power plant. Incorporators: Miles A. Ziegler, New Berlin; F. Q. Hartman, and A. Pritchard, Danville.

Wilmington, Del. — Extemp-Fone Company. Capital, $125,000. To manufacture telephone attachments, equipment, etc. Incorporators: M. Butler, B. M. Barrett, and M. M. Lucey, Wilmington.

Charlotte, N. C.—Owen Light & Power Co. Capital, $100,000. To operate a local light and power plant. Incorporators: S. D. Bagwell, J. V. Simms, and H. C. Irvin.

Walnut Cove, N. C.—Dan Valley Power Co. Capital, $50,000. To operate a local electric light and power plant. Incorporators: O. N. Petree, H. L. Mitchell and J. W. Slate.

Gurdon, Ark.—Gurdon Light & Power Co. Capital, $20,000. To operate a plant for the generation and distribution of electric energy. T. Neely is president.

Albany, Tex. — Albany Light & Power Co. Capital, $30,000. To operate a local electric light and power plant. T. B. Wood is the principal incorporator.

Logan, W. Va.—Newman Electric Co. Capital, $10,000. To manufacture electrical goods. Incorporators: J. G. Biggs and L. Niederlenner, Jr., Huntington, and H. C. Newman, Logan.

Toledo, Ohio—Lucas Electric Co. has incorporated with a capital of $25,000. Frank L. Lucas and George I. Michener, incorporators.

Grand Rapids, Mich.—Grand Rapids Electric Service Co. has incorporated with a capital of $8000. Ora E. Richards, Grand Rapids, William J. Burns, and William W. Pennington, Detroit.

Washington, D. C.—Federal Battery Manufacturing Co. Incorporated under Delaware laws with a capital of $3,000,000. To manufacture electric batteries, etc. Incorporators: M. E. Jones, Richard B. Owen, and William H. Benjamin, Washington.

Tulsa, Okla.—W. H. Youse Electric & Supply Co. Capital, $25,000. To manufacture electrical supplies, etc. W. H. Youse is the principal incorporator.

New York, N. Y.—Rice & Ganey, Inc. Capital, $40,000. To engage in a general electrical contracting capacity. Incorporators: W. H. Schneider, O. L. Perrault, and H. T. Cooper, Albany.

New Rochelle, N. Y.—Ameritoy Co., Inc. Capital, $20,000. To manufacture electrically operated toys and novelties, etc.. Incorporators: A. M. Joslyn, J. O. Miller, and A. M. Nowell, New Rochelle.

Albany, N. Y.—Fine Wire Insulating Co. Capital, $10,000. To manufacture insulation specialties, wires, etc. Incorporators: M. D. Shiverick, and F. H. and D. H. Tyler, Albany.

Binghamton, N. Y.—Southern Tier Electrical Supply Co. Capital, $35,000. To manufacture electrical supplies, etc. Incorporators: E. A. and A. H. Hyde and E. C. Wehle.

Philadelphia, Pa.—Daynix Engineering & Power Co. Incorporated under Delaware laws with a capital of $200,000. To engage in general electrical engineering, etc. John C. and V. H. Daynix and H. Frances Taylor, Philadelphia, are the incorporators.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Electrical Goods (31,158).—A commercial agent from Australia desires to purchase and secure agencies for the sale of hardware, draperies, electrical goods, tools, stoves, clothing, dry goods, knit goods, cosmetics and pumps. Reference.

Machine Tools, Etc. (31,223).—A business man in England desires to secure an agency or act as sales manager or representative of electrical and mechanical engineering firms, motor-car manufacturers, machine tools, automobile accessories; and also manufacturers of gas and chemicals, as he is familiar with these products. Payment, salary and commission basis. References.

Electrical Instruments (31,227).—An agency is desired by a commercial agent in Switzerland for the sale, of foodstuffs, machines, colonial products, iron articles, cotton, animal hair, electrical instruments and apparatus, typewriters, etc. Quotations should be given c. i. f. Genoa. Payment in Italian currency, account current, within 30 to 60 days. Correspondence should be in Italian, French or German. References.

Electrical Supplies (31,228). — A commercial agent in Spain desires to secure agencies for the sale of iron and steel sheets, hardware, electrical supplies, drugs and chemical products. Quotations should be given c. i. f. Spanish ports. Payment preferred 30 days from shipment. Correspondence should be in Spanish or French. References.

Electrical Material (31,269).—A firm in Spain desires to secure agencies for the sale of steel electrical material and supplies, copper, steel and iron wire, office supplies, cheap jewelry, rubber goods, etc. Correspondence should be in Spanish. References.

Turbines, Boiler Equipment (31,271).—An engineer in Belgium desires to purchase and secure an agency for the sale of industrial material and machines, turbines, boiler equipment, lathes, planers, shapers, etc. Quotations should be given c.i. f. Antwerp and Brussels. Terms, payment against documents or with bank credit. Correspondence should be in French. Reference.

Electric Light Plant (31,279).—The partner of a firm in Uruguay will shortly arrive in the United States and desires to secure agencies for the sale of textiles, industrial chemicals, medicinal and industrial oils, electric light plants for farms, automobiles, etc. Quotations should be given c. i. f. Montevideo. Correspondence may be in English. References.

Personals

Paul M. Lincoln Becomes Consulting Engineer of Lincoln Electric—G. T. Seely Joins Youngstown Utility—Changes

E. W. DOTY, formerly connected with Doty & Bienemann Public Utility Service, Columbus, Ohio, has become associated with Nau, Rusk & Swearingen, 901 American Trust building, Cleveland.

CHARLES S. HAMMOND, recently with Lockwood, Greene & Co., has joined the Georgia Railway & Power Co., Atlanta, Ga., in the capacity of power sales engineer, succeeding J. E. Mellett, resigned.

WILLIAM L. MOORHEAD, who recently resigned as vice-president of the Duquesne Electric Manufacturing Co., Pittsburgh, is now affiliated with Henry T. Parsons, who will conduct a general machinery business under the name of Parsons-Moorhead Machinery Co. at 237 Fourth avenue, Pittsburgh.

HAROLD H. SMITH, formerly electrical engineer with the Edison Storage Battery Co., has resigned to become chief engineer of the Transportation Engineering Corp., 200 Fifth avenue, New York. This company acts as railway distributor for Edison storage batteries, "Automatic" industrial trucks and tractors and accessories.

L. S. HORNER, vice-president of the Acme Wire Co., New Haven, Conn., has been honored with a special citation received from the Brtish Government, awarded in recognition of his war work as chief of the executive staff of the Bureau of Aircraft Production, engaged in the development and production of aircraft during the late war.

CAPT. C. E. GRUNSKY, JR., has resumed his engineering work in San Francisco with the C. E. Grunsky Co., a reorganization of the American Engineering Corp. Captain Grunsky had been with the U. S. Army for two years, during which time he saw active service at the front and supervised the valuation of war losses in French mines.

JOSEPH JACOBS, recently returned from overseas service with the U. S. Army, has resumed his engineering practice with offices at 1317-18 Smith building, Seattle, Wash. He will specialize, as heretofore, in diking, drainage irrigation and general water supply and land development projects, public utility valuations and engineering consultation in connection with cases before the courts.

CLIFTON R. HAYES, manager of the Fitchburg Gas & Electric Co., Fitchburg, Mass., has become associated with Charles H. Tenney & Co., Boston, engineers and managers of gas and electric light plants, as engineering manager of their system from Maine to New Jersey, with headquarters at Boston. Mr. Hayes is president of the New England Section of the National Electric Light Association.

PAUL M. LINCOLN, for many years commercial engineer of the Westinghouse Electric & Manufacturing Co., East Pittsburgh, has resigned from that organization to enter the consulting engineering field, and in that capacity will have active charge of motor application engineering for the Lincoln Electric Co., Cleveland, Ohio. Mr. Lincoln is well known in the electrical engineering profession and to him are accredited many notable pieces of engineering work, the following being perhaps the best known: The design and installation of the first hydroelectric power plant at Niagara Falls, the operation of which he subsequently directed for six years, and the development of the first high-voltage transmission lines. On this latter subject he is considered the best known authority in the world. He has also perfected many other notable inventions including the Lincoln synchronizer for paralleling large electric alternators for which he has received various medals and awards. He was elected president of the American Institute of Electrical Engineers in 1914 and has served for many years on the Board of Directors and on the Transmission Comittee of the Institute.

Paul M. Lincoln.

The work which Mr. Lincoln will take up with the Lincoln Electric Co. involves the entire problem of motor drive for machinery, and especially the determination of the proper type, characteristics and sizes of motors best adapted for direct connection to various sizes and types of machinery. After this problem has been worked out for each particular machine, the motor will then be direct-connected to the machine at the plant where the machine is made and delivered to the user as a complete, self-contained unit. The Lincoln company is indeed to be congratulated on securing the services of one who has had such extensive experience in the profession and unlimited ability to solve this very important problem in electrical and mechanical engineering; and it is expected that its solution will tremendously increase the efficiency of electric motor drive and will make for increased production and efficiency in general manufacturing work.

F. C. BIGGERT, JR., for a number of years chief engineer and second vice-president of the United Engineering & Foundry Co., Pittsburgh, has been made president of the company. He succeeds Isaac W. Frank, who recently resigned, but who will serve as chairman to the executive board. K. C. Gardner, former manager of sales of the rolls department, has been elected to succeed Mr Biggert as second vice-president.

C. J. COOPER, JR., who recently resigned as general manager of the Mineral Point Public Service Co., has become connected with the Chicago office of the Hoover Suction Sweeper Co., where he will engage in sales promotion work. Prior to his connection with the Mineral Point company, Mr. Cooper was superintendent of heating and assistant general manager of the Merchants Heat & Light Co., Indianapolis, Ind.

E. L. MILLIKEN, secretary and manager of the Houghton County Electric Light Co., Houghton, Mich., has resigned to become manager of the Houston Electric Co., Houston, Tex., and will handle street railway problems. Mr. Milliken is a native of Maine, and has spent the greater part of his business career with the Stone & Webster organization. While with the Houghton company, he had charge of both the street car system and extensive interurban lines and the lighting system, and the experience he has gained while engaged in this work eminently fits him for his new duties with the Houston company.

JOHN C. LYNCH, general superintendent of traffic of the Bell Telephone Co. of Pennsylvania, Philadelphia, has been promoted to the position of vice-president and general manager, succeeding L. H. Kinnard, now president of the company. He is a New Englander by birth, having been born Jan. 15, 1875, at Stockbridge, Mass. After attending Williams Academy he entered Cornell University, and was graduated from the latter institution with the degree of mechanical engineer in 1896. In the same year he entered the telephone business, his first position being traffic inspector for the New York Telephone Co. in Manhattan. A year later he was made assistant traffic manager of Franklin central office. After being transferred to other New York offices, he was made manager at Riverside in 1899, each of these positions being an advancement, carrying with it larger responsibilities. He was for six years traffic engineer of the New York Telephone Co., and later became division superintendent of traffic for the New York & New Jersey Telephone Co., which company was later consolidated with the New York Telephone Co. About 1909 when the organization of the New York "Up-State" Bell companies was effected, Mr. Lynch was largely instrumental in making the traffic force a highly efficient organization. In 1913 he removed to Philadelphia to accept the position of general superintendent of traffic, and continued in this capacity until his recent promotion.

GARRETT T. SEELY, for the last eight years assistant general manager of the consolidated system of Elevated Railroads of Chicago, has been elected vice-president and general manager of the Mahoning & Shenango Railway & Light Co., with general offices in Youngstown, Ohio. Mr. Seely, who is a native of Illinois, having been born in Oswego, is a graduate of Beloit College Academy (1895) and of the University of Illinois (1899). During his college days and after being graduated he did engineering work from 1896 to 1900 on the Atchison, Topeka & Santa Fe Railroad system in various parts of Kansas, Colorado and Oklahoma. In the latter year and until he became engineer of maintenance of the Chicago South Side Elevated Railroad in 1901, he was engaged in engineering on track elevation work in Chicago. He continued as engineer of maintenance till 1908, when he became assistant general manager of the South Side Elevated and in 1910 he was advanced to second vice-president and general manager of the same road. In 1911 he became assistant manager of the consolidated system of Elevated Railroads, a position which he relinquishes to become operating head of the combined railway, lighting and power system in northeastern Ohio and northwestern Pennsylvania with headquarters in Youngstown. Mr. Seely is a member of the Western Society of Engineers, the Chicago Engineers Club, the South Shore Country Club and the Flossmoor Country Club. He also has been active in the American Electric Railway Association and is third vice-president of the American Electric Railway Transportation and Traffic Association. Mr. Seely and his family will remove from Chicago to Youngstown about Dec. 1, when he will assume his new duties.

Garrett T. Seely.

RUSSELL W. STOVEL, who recently returned from France, where as lieutenant-colonel of engineers, he served as chief of the Terminal Facilities Division of the Army Transport Service, has been appointed a consulting engineer of Westinghouse, Church, Kerr & Co., Inc., New York City, and, as a member of that organization, will devote his entire time to the company's electrical and mechanical work. Mr. Stovel has had an unusually comprehensive experience in the electrical and mechanical problems connected with central power station and steam railroad electrification work, from the fundamental economics involved, to design, construction, equipment and operation, together with a most valuable experience in mechanical handling at docks and terminals. He was graduated from McGill University in 1897 with the degree of Electrical Engineer, and the following year entered the employ of Westinghouse, Church, Kerr & Co. He soon became an assistant engineer, then successively engineer-in-charge and mechanical engineer of the company, and finally a managing engineer.

Some of the important work handled by Mr. Stovel while with the Westinghouse, Church, Kerr company was the design and construction of the power plants of the Utah Light & Railway Co., Salt Lake City, Utah; Meriden Light & Railway Co., Meriden, Conn.; Edison Electric Illuminating Co., York, Pa.; the design and construction of passenger terminal and steamboat pier of the Canadian Pacific Railway, Vancouver, B. C.; the design of the proposed power station of the Pennsylvania Railroad at Harrison, N. J.; the design of extension to the power plant at Cos Cob, Conn., of the New York, New Haven & Hartford railroad; design and construction of the power plant of the Wabash-Pittsburgh Terminal, Pittsburgh, and the design and construction of the machine shop of the Chicago Railway Equipment Co., Chicago, Ill. In 1914 Mr. Stovel left the company to become managing engineer for Gibbs & Hill, consulting engineers, New York. For this company he had direct charge of the Paoli and Chestnut Hill electrifications of the Pennsylvania railroad, the Elkhorn Grade electrification of the Norfolk & Western railway, and the electrification of the New York Connecting railway.

Lieutenant-Colonel Stovel's work in France is well summarized in the following letter from his commanding officer: "Entering the service Oct. 6, 1917, and arriving in France on Nov. 8, 1917, this officer was assigned to duty with the chief engineer, Transportation Service, and in view of the excellent results obtained in his work in connection with the provision and installation of the electrical and mechanical equipment of the Transportation Service, was on Aug. 22, 1918, transferred to the office of the director, Army Transport Service, as electrical and mechanical engineer in charge of the Pier Utilities Branch of the Terminal Facilities Division. His grasp of the problems involved in providing adequate facilities to permit the discharge of 100,000 tons a day necessary to meet the proposed program of an army of 4,000,000 men in France was so complete that on Sept. 2, 1918, he was designated as chief of the Terminal Facilities Division and placed in charge of all matters relating to the procurement, maintenance and operation of all terminal facilities under the jurisdiction of the Army Transport Service, including all dock, wharf and warehouse structures, cranes, conveyors, tractors, and all other electrical and mechanical appliances and installations. His wide experience gained as an engineer in civil life, his high technical attainments, tact, energy and force brought immediate results, so that within a comparatively brief time he had reorganized the Terminal Facilities Division at the principal ports and had well in hand all matters pertaining to the provision, maintenance and operation of the required terminal equipment. To the untiring, farseeing work of this officer and to his splendid administrative abilities are due the excellent results obtained by the Terminal Facilities Division of the Army Transport Service." Mr. Stovel is a member of the American Institute of Electrical Engineers and the American Society of Mechanical Engineers.

Russell W. Stovel.

Obituary.

E. T. PARDEE, manager of the New York office of the Allis-Chalmers Manufacturing Co., passed away on Nov. 14 at the New York Hospital at the age of 50 years. He had been in poor health and had had a serious breakdown early this summer. On Thursday, Nov. 13, he was taken ill in his office and taken to the hospital where he died on Friday morning of cerebral hemorrhage. He was born at New Haven, Conn., May 28, 1869. He was with the old Fort Wayne Electric Co. in its early days as a salesman and for about the last 20 years had been connected with the Bullock Electric Manufacturing Co. and the Allis-Chalmers Manufacturing Co. He subsequently held the offices of manager of the Boston office, manager of the power and electrical department, manager of the Bullock Works, and since 1915 up to the time of his death served the company as manager of the New York office.

Financial News

Public Utility Companies Financing Extensions with Stock.

Despite adverse conditions affecting public utilities arising from war prices and fixed rates and fares, these corporations have been able to do considerable financing recently by means of stock issues sold to the public. Total amount of stock sold by public utilities corporations so far in 1919 is $53,601,490. This compares with $614,858,600 preferred and $514,948,500 common stock sold by industrial corporations.

Many utility corporations, particularly traction and gas companies, are in need of money for expansion purposes but owing to their curtailed earning power wherever they have been obliged to operate under rates and fares which prevailed before the war, financing cannot be successfully promoted at present time. The situation, however, is slowly but surely improving and through courts and public utility commissions many of the companies have been authorized to increase rates and fares to meet higher operating costs.

With improvement in the general situation it is expected that much new financing will be done by public utilities and their securities which have always as a class been regarded highly in peace times, will eventually work back to their former position.

Public Service Co. of New Jersey sold the largest amount of preferred stock during the year, $10,000,000 8% stock. This was offered to stockholders at par. Ohio Cities Gas Co. sold $9,187,500 of common stock which was the largest issue of that class floated.

Below is given a list of public utility corporations which have brought out preferred or common stock, from Jan. 1 to Oct. 31 this year, with rate and amount as compiled by Dow, Jones & Co.:

PREFERRED STOCK.

Corporation.	Rate.	Amount.
Public Service of New Jersey	8	$10,000,000
Pacific Gas & Electric 1st..	6	5,000,000
Cities Service N. Y. Class B...		3,000,000
Central Utilities Securities Co.	6	2,195,000
Hackensack Water Co.	7	2,000,000
Dixie Terminal Co.	6½	1,500,000
Gt. Western Power of Cal..	7	1,500,000
Dallas Power & Light Co...	7	1,000,000
Colorado Power Co.	7	1,000,000
Wash., Balt. & Annapolis Elec. Ry.	6	783,190
Erie Lighting Co.	7	500,000
Indiana Coke & Gas Co...	7	500,000
*Miscellaneous		1,349,200
Total preferred stock		$30,327,390

COMMON STOCK.

Ohio Cities Gas Co.	$9,187,500
Lone Star Gas Co.	4,000,000
Oklahoma Natural Gas Co.	3,000,000
Southern California Edison Co...	2,500,000
Turner Falls Power & Electric Co.	2,409,100
Hartford Electric Light. Co.	1,500,000
*Miscellaneous	677,500
Total common stock	$23,274,100
Total preferred and common stock	$53,601,490

*Aggregate of issues less than $500,000.

Rochester Railway & Light Changes Name.

At a recent meeting of the stockholders of the Rochester Railway & Light Co., it was voted to change the corporate name of the company to the Rochester Gas & Electric Corp. An increase in capitalization of $1,000,000 was also voted, making the authorized capital of the company $18,250,000.

E. G. Long & Co., 50 Church street, New York, manufacturer of electric railway metals, has filed notice with the Secretary of State of an increase in its capital from $50,000 to $100,000, to provide for proposed business expansion.

Foreign Finance Corporation Formed.

The Foreign Finance Corp., with an authorized stock capital of $10,000,000, has been formed primarily to invest funds in enterprises or securities which held forth promise of safe and satisfactory return.

This new corporation is backed by a powerful group of bankers. Arthur M. Anderson of the firm of J. P. Morgan & Co. will be president.

The board of directors will include J. P. Morgan, H. P. Davison, James S. Alexander, George F. Baker, Jr., George W. Davison, Harvey D. Gibson, Seward Prosser, Charles H. Sabin, James Stillman, Albert H. Wiggin and A. M. Anderson. The new corporation is incorporated under the laws of New York and will deal in securities of foreign countries and go into any field that looks safe and attractive.

General Gas & Electric Revenue Increase.

Preliminary statement of earnings of General Gas & Electric Co., comprising all subsidiaries acquired through recent reorganization, shows total operating revenue of $853,873 for October, 1919, which compared with $687,290 for October, 1918, is an increase of $166,583, or 24.2%.

The month of October indicated the largest kilowatt-hour output of any month since the new plant of the Binghamton Light, Heat & Power Co., a subsidiary, has been in operation. Total generation for the month was 1,726,960-kw-hr., while it is confidently expected that the 2,000,000-kw-hr. output mark will be reached before the end of the year.

According to advices from Columbus, Ohio, the Logan Natural Gas Co., one of the largest gas producing companies in the Middle West and which supplies the city of Sandusky through the Sandusky Gas & Electric Co., subsidiary of General Gas & Electric Co., has asked the State Public Utilities Commission to allow it to abandon its service in 50 towns and cities in the state of Ohio.

Standard Gas & Electric Balance on Common Stock.

Earnings of Standard Gas & Electric Co., subsidiaries, exclusive of oil properties, which are applicable to Standard Gas & Electric Co., compare as follows:

	12 mos. to Sept. 30.	6 mos. to June 30.
Gross earnings	$2,509,837	*
Net after taxes	2,434,030	$1,377,011
Surplus after charges	1,530,737	890,365
Balance after preferred dividends	662,355	446,404
Balance after mort. of disc.	607,355	*

*Not available.

The balance for the 12 months ended Sept. 30, 1919, is equal to approximately $2.40 a share, or 4.8% on the common, including the increased common stock issued in payment of 13% accumulated dividends on the preferred. In addition applicable net earnings from Shaffer Oil & Refining Co. for the first nine months of 1919 are estimated at $675,000 on the majority common stock in this company acquired by Standard Gas & Electric Co. as of Jan. 1, 1919.

On the basis of current earnings of Shaffer Oil & Refining Co., the Standard Gas & Electric Co.'s share for the full 12 months of 1919 should be approximately $900,000, while the electric light, power, traction and other departments should contribute approximately $890,000. The latter estimate is based on the showing for the first six months of 1919, during which period the earning power of the company showed improvement which has been steadily maintained since that time.

The total from all departments, including oil subsidiaries, should therefore show approximately $1,790,000 for the calendar year equal to about $7 a share, or 14% on the outstanding common stock, after payment of the regular 8% dividend on the cumulative preferred stock.

Arkansas Company to Issue Stock.

Permission has been granted by the Arkansas Corporation Commission to the Arkansas Light & Power Co. and the Pine Bluff Co., an auxiliary, to issue certain amounts of preferred stock and bonds. The Arkansas Light & Power Co. proposes to issue $150,000 of 7% preferred stock and $50,000 6% bonds, and the Pine Bluff Co. $25,000 7% preferred stock and $25,000 6% bonds.

DesChutes Falls Company to Operate in Oregon.

DesChutes Falls Power Co., capitalized at $5,000,000, has been granted permission by the State Corporation Commission to operate and will engage in a general business in the distribution of electricity for heat, power and light. The main offices of the company, which is organized under the laws of Nevada, are in Carson City, Nev. A. M. Wright, vice-president of the United States National Bank of Portland, is named as attorney in fact.

Pennsylvania Utilities Income Shows Increase.

Pennsylvania Utilities System, composed of the Pennsylvania Utilities Co., the Eastern Pennsylvania Power Co., and the Easton Gas Works, has issued a statement showing an increase of 33½% in operating income during the month of September, as compared with the corresponding month for the previous year. The operating income for this month in 1919 was $50,317.47, as against $37,696.73 in 1918. The operating revenues in this month for each respective year were $155,571.66 and $133,494.21. This is an increase of 16.5%.

Idaho Power Earnings Show Substantial Gain.

Earnings statement of Idaho Power Co., controlled by the National Securities Co., for the 12 months ended Sept. 30, 1919, shows surplus after interest charges and other deductions of $407,379, equivalent to $39.55 a share on the 10,300 shares of 7% cumulative preferred stock outstanding, which includes 320 shares held in the treasury.

This compares with $39.23 and $37.41 earned on outstanding stock for the 12 months ended August and July, respectively.

Earnings for September and 12 months ended Sept. 30 compares as follows:

	1919.	1918.
September gross	$ 191,544	$ 159,006
Net after taxes	107,528	88,601
Surplus after charges	73,491	49,786
12 months gross	1,700,189	1,483,375
Net after taxes	806,306	715,054
Surplus after charges	407,379	325,925

The company has a total installed generating capacity of 36,315 kw. in plants leased or owned. With one exception all plants are interconnected by a comprehensive system of transmission lines aggregating 1106 miles in length. The population served is estimated at 150,000.

Public Offered Louisville Gas & Electric Stock.

In order that consumers of gas and electric power in Louisville may become partners and share in the profits of the Louisville Gas & Electric Co., the company through its board of directors has authorized the sale to the public of $2,000,000 of preferred stock. The stock will have full voting power and the money thus raised will be used only for retirement of bonds and for additions and extensions.

J. W. Smiley is in charge of the sales, which will be made on the partial payment plan. There is no preferred stock outstanding at present as in the past the company has financed such improvements by bond issues. The object of the company, according to its announcement, is to make the largest possible number of householders, stockholders of the company and at the same time retain responsible and experienced management.

Business Increase of Pacific Gas & Electric.

Gross earnings of Pacific Gas & Electric increased from $8,947,162 for the year 1906 to $25,498,400 for the year ended Aug. 31, 1919. During the month of September no fewer than 4830 customers were added to the company's distribution lines, bringing the total number of customers served at Sept. 30, 1919, up to 500,994. This is exclusive of the 10,565 customers of the Northern California Power Co., Consolidated, who will be added to the line as an incident of the recent acquisition of the properties of that company.

The rapid growth of business in the Bay region is shown by the fact that the net gain in consumers during September was 1798 in the San Francisco district and 1471 in the Alameda County district.

An estimate of the use of gas in the shipyards of the Pacific Coast submitted at the convention of the Pacific Coast Gas Association, places the consumption at 78,000,000 cubic feet each month, bringing the producers an average revenue of $41,000. It is also estimated that from gas used in the preparation of various food products the revenues amounted to not less than 53½% of the total output, revenues from sales to the shipbuilding industry not exceeding 10%.

Dividends.

Nebraska Power Co. has declared the regular quarterly dividend of 1¾% on preferred stock, payable Dec. 1 to stock of record Nov. 20.

The regular quarterly dividend of 1¾% has been declared on preferred stock by the Colorado Power Co., payable Dec. 15 to stock of record Nov. 29. The regular quarterly dividend of ½ of 1% has also been declared on common stock, payable Jan. 15 to stock of record Dec. 31.

Southwestern Power & Light Co. has declared a quarterly dividend of 1¾% on preferred stock, payable Dec. 1 to stockholders of record Nov. 22.

A quarterly dividend of 1½% on preferred stock has been declared by the Northern Ohio Electric Co., payable Dec. 1 to stockholders of record Nov. 18.

Ohio Cities Gas Co. has declared a cash dividend of $1 per share, payable Dec. 1 to stock of record Nov. 29.

The Philadelphia Electric Co. has declared a quarterly dividend of 1¾%, payable Dec. 15 to stock of record Nov. 20.

Earnings.

NORTHERN STATES POWER CO.

Gross and net earnings of Northern States Power Co. of Delaware and subsidiaries for the month of September, 1919, and year ended Sept. 30, 1919, compared with corresponding previous periods, are reported as follows:

September:	1919.	1918.
Gross	$ 769,620	$ 656,774
Net	276,539	245,906
12 mos. ended Sept. 30:		
Gross	9,477,907	7,943,132

Paper Rolls Are Difficult and Dangerous to Handle by Hand—The Electric Truck Handles Them Easily, Quickly and Safely.

Electric Trucks and Tractors in Printing Plants

Advantages of This Class of Apparatus in Printing Plants—Reasons for Its Special Consideration at This Time — Methods of Applying Electric Apparatus to the Handling Problems of Such Plants

By BERNARD J. DILLON

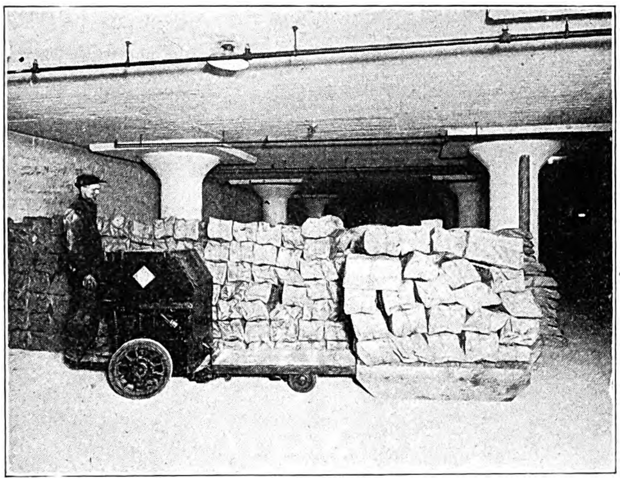
IN SOME respects the printing industry is among the most advanced along the lines of modern efficiency and in its adoption of mechanical methods as a substitute for hand labor. This is shown by the widespread adoption of modern typesetting and printing machinery of all kinds which is now in general use in the majority of plants and which represents a tremendous advance over the old-time manual methods and early crude machinery. It is also true that modern printing processes are a great improvement over the older processes not only with regard to efficiency of production but also in the quality of the results obtained.

Most of this advancement, except in a few of the later plants, however, can be partly attributed to outside influence. The adoption of modern printing machinery, for example, is as much, if not more, the result of the efforts of the manufacturers of such apparatus as it is of the printers.

From within the industry itself the advance in modern efficiency has been comparatively slow. This is shown by the poor lighting facilities usually found in print shops, despite the large amount of night work done, and by the layout of the machinery which is seldom arranged with a view toward securing the maximum of efficiency or production. In many other ways also the older practices still exist. When associated with modern machinery the inefficiency of such methods is even more apparent and complicated and, in addition, prevents realizing the advantages of the machinery to the fullest possible extent.

This latter condition applies particularly to the methods of handling employed in the great majority of printing plants at the present time. In all except a very few such plants the necessary handling of stock, type, forms and other materials is still accomplished by brute force and perseverance with manual labor that somehow is maintained in spite of its exorbitant cost and the difficulty of securing it.

In the majority of printing plants of any size it is safe to assume that the introduction of electric industrial trucks or tractors offers a valuable means of overcoming this condition. And right now is an especially favorable time to consider them. Competition in this field is very keen and largely on a price basis. Many new plants are being established wherein modern efficiency methods will prevail, and to meet this competition the older plants are being remodelled and enlarged and are adopting every possible means to improve their efficiency.



Awkward Loads Like This Are Handled Very Efficiently by Electric Lift-Trucks.

On account of the various types of printing establishments the real advantages of electric industrial handling apparatus can only be realized by a thorough investigation of the local conditions in each plant. However, it is worthy of careful consideration in every case for such apparatus offers one of the best means of reducing costs without making any expensive plant changes. Central-station men, contractors and others of the electrical field should also accept this opportunity of promoting the use of electric handling apparatus, for not only will it result profitably for them but in the majority of cases they will render a valuable service to the printers as well.

The principal advantages to be derived by the application of electric industrial trucks or tractors to the handling problems in the printing industry are: An actual dollars and cents saving in handling costs which can be easily determined; an opportunity for increased production and efficiency which is also especially desirable and which in many cases is even greater than the first; fewer and better workmen will suffice. These are more contented and satisfied with the result that the losses due to labor turnover are reduced.

The extent of the actual savings in labor will, of course, depend upon the amount of handling done and the conditions under which it is done. Modern printing machinery has eliminated handling to a great extent by multiplying the operations performed on one machine. In every establishment, however, there are usually performed several distinct operations frequently in different rooms or on different floors. Transferring materials for these various operations involves a considerable amount of hand labor that can be avoided by the use of an electric industrial truck or tractor.

The first handling operation in a printing establishment is the carrying of paper stock from the receiving platform to the storage space. Where flat-bed presses are used the paper stock is received in sheets of various sizes either in ream lots or in cases, according to weight. Usually the stock is uncrated and left to season and dry out before being used. The paper is then placed on skids or four-wheel trucks. Two-wheel hand trucks cannot be used generally due to the size of the sheets and because the possibilities of damaging the stock by such handling are very great. This operation, therefore, presents an ideal field for the elevating-platform truck or tractor. When used for such work either type will replace the labor of six or more hand-truck operators and perform the work quicker and without the confusion, crowding and rehandling that accompanies such operations when done by hand. In addition, it will often save further rehandling for enough stock can be piled on a truck or skid to make it unnecessary to unload and repile it. Where the stock must be piled very high, however, portable piling machines can be used with great success.

Where web presses are used the stock is received in huge rolls weighing up to 1800 lbs. each. These rolls are very difficult to handle or place in stock. There is also an element of serious danger involved in handling them by hand due to their tendency to slip and roll. As a rule, the rolls are placed on low dollies and pushed from place to place or rolled one at a time. In either case their transfer is a slow, tiresome process usually requiring two men to a roll. In an accompanying illustration an electric truck is shown carrying three such rolls. This does not overtax the truck's capacity and the rolls can be carried at a rate of about six miles per hour with ease and safety. It can also carry them up grades as high as 30% which will permit piling the rolls if a runway is available.

Only a very few printing houses, however, are in a position to use an electric truck profitably for this receiving operation alone. They must also be used to transfer the paper from the stockroom to the presses and usually for further operations as well. The first of these operations—that of carrying stock from the stockroom to the presses—involves practically the same conditions as those of receiving except that the length of haul is usually greater and elevators must be used more often. In many cases it will be found that the elevator capacity is not sufficient to accommodate the electric and its load at the same time. This condition can usually be met by carrying the electric and the stock separately or by using separate electrics on the various floors. For carrying directly to the press the electric offers the advantage that the stock can be placed in the most convenient position for the operator and the aisles and floor spaces in the vicinity of the machines can be kept clear.

After leaving the presses the number of operations through which the stock must be taken depends entirely upon the nature of the work. Usually there are several which include stuffing or gathering, binding, etc. Careful handling is essential in all these operations and the stock is usually very awkward to handle in this semi-finished condition. The greater power of the electric is, of course, a very desirable feature for such handling. Huge loads of stock can be carried quickly and smoothly without any jerking or jarring and the operator can easily avoid any obstacles or rough places without exerting himself in the least. He will, therefore, take greater pains to transfer the load without danger.

In transferring the finished product to the mailing and shipping rooms the electric is also very useful and efficient. Its advantages are especially desirable when facilities for such operations are limited, for the product can be kept in motion continually and overcrowding avoided.

The principal objection to the use of electric industrial trucks or tractors offered by printers is that common to all industries but is especially apparent in this —that is, that the aisles and passageways are too narrow and crowded to permit the use of the electric. This condition is usually exaggerated. The modern electric industrial handling equipment is so flexible in respect to steering and control that there are very few places where a hand truck is used that an electric cannot be used also. The majority of electrics can be turned around in a very short radius and their ability to go in either direction enables them to get into and out of very cramped quarters quickly and without endangering the adjacent walls or materials. Moreover, with electrics the materials can be handled more efficiently with fewer trucks which, in a large measure, will relieve crowding and congestion in the aisles and passageways.

In addition to the handling of paper stock there are many other materials to be handled in printing plants for which an electric is desirable, principally the handling of type and forms. These are composed chiefly of lead and are very heavy, an average 16-page trade magazine form weighing about 400 lbs. They are also bulky and difficult to handle by hand. Furthermore, they must be handled carefully for the type metal is soft and any marring or scratching will ruin it. For this, as well as for the other handling problems, the electric not only offers a more efficient and practical method of handling but reduces the possibilities of personal injury to the employes to a considerable extent.

There are also many other advantages to be obtained by the use of an electric industrial truck or tractor in printing houses, chiefly of a general utility nature, such as the moving of exceptionally heavy machinery or large parts. Very few such plants are equipped with cranes or other means of power handling and this work is usually accomplished by utilizing all the man power available. When an electric is used a little ingenuity on the part of the operator will often permit of such unusual operations being conducted quickly and without drawing on the strength of workmen who should be employed in other and more essential duties.

It is not to be expected that many printing plants can use a separate truck or tractor for each of these operations or for any one of them alone. When the amount of handling operations is considered, however, and the advantages of the electric applied to all or part of them, the possibilities of this apparatus in this field can readily be seen. The majority of electric industrial trucks or tractors on the market now are very sturdy, reliable, durable and efficient. Under ordinary conditions they will save the labor of six or eight men for a small portion of the present cost of hand labor. The operators, however, should be carefully chosen; they should be competent and careful and should be given complete charge of the equipment.

Nor is it to be expected that in every case the saving in labor alone will suffice to provide for an electric. In many cases the increase in efficiency or production or the maintenance of labor is the deciding factor.

One of the greatest advantages which the electric industrial truck or tractor offers for use in printing plants is that it eliminates a large amount of rehandling. Almost every time paper is handled a certain proportion of it is lost due to the fact that it is soiled in the operation. In large establishments the amount lost in this way is considerable and rehandling is avoided wherever possible. Where an electric is used this rehandling is reduced to a minimum, for the stock can be loaded in large quantities on skids or trucks and left to be transferred by the electric without any loading or unloading.

Another decided advantage is the ability of the electric to keep the stock moving and keep the machines supplied with work. It is not necessary for the operator to stop his machine to wait for supplies or go after them himself. This provides a maximum of production efficiency with a minimum of lost time. The printers are also better satisfied for they are not called upon to do any extra hard work and they can keep at the work for which they are specially employed.

As a means of solving the labor problem the electric also offers many advantages. Labor nowadays is not only high in cost but very hard to maintain. It will not perform the strenuous work it formerly would. In addition to relieving the workmen of the harder and more difficult tasks the introduction of an electric also has a certain moral effect that causes the men to be more contented and satisfied; for it is an indication from the management that it endeavors to relieve them of the hard work and its dangers of developing hernia and causing accidents. Those that are employed can also be paid higher wages without increasing the handling expense to any extent. As a result a better and more efficient class of workmen can be maintained which will do away with many of the labor troubles encountered and the losses due to excessive labor turnover.

Crowded and Congested Aisles Are Typical of Printing Establishments—This One Is Exceptionally Clear—They Can Be Kept Even More Clear Where Electric Handling Equipment Is Used.

Central-Station Rates in Theory and Practice

Twenty-First Article—Geometrical Analysis of Rate Schedules—Principles of Three-Dimensional Representation of Rates—Typical Examples Using Solid Models

By H. E. EISENMENGER

This series of articles, of which the present is the twenty-first, was begun in the issue of July 12. Part I consisted of seven articles on the cost of electric service. Part II included six articles on the general principles governing the choice of a rate system. Part III contained six articles describing various rate systems. In Part IV, of which this is the second half, it is shown how rate systems can be analyzed. The remaining four articles will constitute Parts V and VI, dealing respectively with accuracy of rates and the current practice of rate regulation by utility commissions.

PART IV—RATE ANALYSIS—Continued.

II. Geometrical Rate Analysis.*

SECTION 164. A rate system is nothing but a statement of the way in which the amount to be paid by the customer varies with his maximum demand and with his energy consumption.[1] We have therefore three variable amounts: the maximum demand *d*, the energy consumption *e* and the amount of the bill *a*. Some rate systems do not take cognizance either of the demand or of the energy consumption (pure meter rates and flat demand rates, respectively). In those cases we have therefore only two variables and we can demonstrate the way in which one of the two variables depends on the other one, by a graphic representation in a plane (see Figs. 4 and 5). If we want to extend the graphic representation to rates that are based on both demand and energy consumption we must add a third dimension. The rate will be represented by a surface in space or in other words by a solid model.

To explain this more fully: In Figs. 4 and 5 we stepped off the energy consumption to a certain scale in horizontal direction and the amount of the bill in vertical direction. We had, as it is termed, two *axes* standing normal upon one another. Now we will have to add the demand in another horizontal direction (assuming this page to be held vertically in front of the reader) normal to the direction in which the energy consumption has been stepped off, that is normal to the plane of the paper. We thus get three axes *OA*, *OD* and *OE*, of which each one stands normal to the two others, like three edges of a cube which meet in one point (Fig. 9). Given now a customer with a certain demand *d* and a certain energy consumption *e*, we choose a scale for the demand, for instance we say that every inch shall represent 10 kw. We then measure off the number of inches which corresponds to the given demand *d* from *o* in the direction towards *D*. Let this length be *Od* and we thus arrive at the point *d*. From this point we draw a parallel to *OE*, shown as *DE'* in Fig. 9. In the same manner as above we choose a scale for the energy consumption and step off on the parallel *dE'* the length *dP* corresponding to the energy consumption of the customer. We thus reach the point *P*.

Point *P* is called the characteristic point of the customer. As soon as the customer changes either his demand or his energy consumption, or both, his characteristic point will shift to another position. Fig. 10 shows the bottom plane *ODE* viewed vertically downwards from above. If we connect *P* with the origin *O* by a straight line all customers whose characteristic points are situated anywhere on this line (or its production beyond *P*) evidently have the same load-factor e/d as the customer with the point *P*. The smaller the angle λ is the smaller is the load-factor of all the customers whose characteristic points lie on that line. For the load-factor $l = e/d = 0$ the angle $\lambda = 0$, but for $l = 100\%$ the angle λ is not 90° as might be expected on superficial observation, but it reaches a certain maximum value λ_{max} which is smaller than 90°. Just how large it is depends on the scales which have been chosen from *d* and *e*, but it must of necessity always be smaller than 90°.

If we step off now in the vertical direction from the characteristic point of a certain customer the amount *a* (to a certain scale which we are free to choose) we get a point in space above the plane (*Q* in Fig. 9). The position of this point in space determines the customer's demand, his energy consumption, and the amount he has to pay for both, under the system of rates under investigation.

*The principles of geometrical rate analysis were first brought out by the author in the 1911 report of the National Electric Light Association Rate Research Committee.

[1]Engineers and other readers who are more familiar with mathematics may skip Section 164, and substitute the following briefer statement in lieu of the same: Mathematically expressed a rate system is nothing but the function $a = f(d, e)$. This function contains three variables *a*, *d*, and *e* so that three dimensions are necessary for a graphical representation. Demand *d* and energy consumption *e* are used for the horizontal axes of an orthogonal system of axes in space and the amount *a* is stepped off in the vertical direction. We thus get a surface in space representing the function $a = f(d, e)$. The surface and the rate determine each other.

Every customer is characterized by his "characteristic point" *P* on the bottom plane. The co-ordinates of this point are the customer's demand and energy consumption. The locus of the characteristic points of all customers with the same load-factor is a straight line drawn from the origin at an angle λ with the axis of *d*, where $\tan \lambda$ is proportional to the load-factor *l*. Consequently where $l = 0$ this line is identical with the *d*-axis, whereas for $l = 100\%$ it is not identical with the *e*-axis, but includes a certain angle λ_{max} with the *d*-axis. The size of λ_{max} depends on the relation of the scales for *d* and *e*. Any portion of the bottom plane as well as of the surface in space for which $\lambda > \lambda_{max}$ has no meaning in practice.

Now all rate systems, with practically no exception, are of such a nature that the function $a = f(d, e)$ is of the first order so that the surface representing the rate is a plane, at least for all customers within a certain range of demand and energy consumption. For other ranges we get another function for $f(d, e)$ which also, however, is of the first order so that the surface for all customers is a combination of planes.

If we now do the same thing as just described for every point on the bottom plane the upper ends of all the vertical lines will form a surface in space which determines and represents the demand-energy rate in the same manner as the plane curves of Fig. 4 or 5, for instance, represent pure meter rates. Instead of the surface we can also speak of the total space between the surface and the bottom plane, that is of a solid or of a solid model, always meaning, of course, in this case the upper surface of the model.

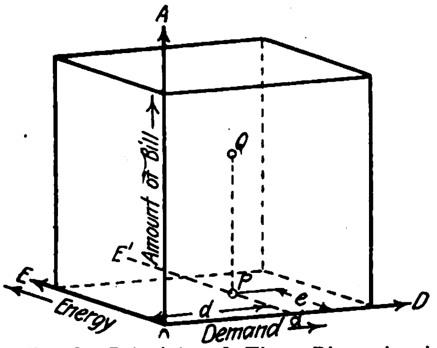


Fig. 9.—Principle of Three-Dimensional Rate Representation.

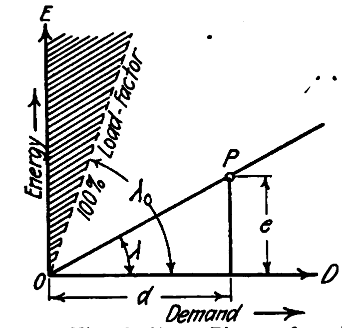

Fig. 10.—The Bottom Plane of a Rate Model.

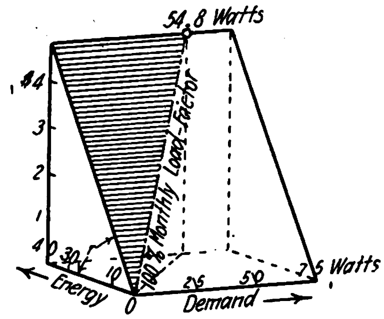

Fig. 11.—Straight Meter Rate.

A few examples will make this clearer.

165. One of the simplest cases is the straight meter rate. The charge is proportional to the energy consumption and independent of the demand. This rate is obviously represented by a plane passing through the demand axis and sloping at a certain angle r from the bottom plane upwards. Fig. 11 is, for instance, the model of a 12-cent per kw-hr. rate.

In designing a model of a rate we have first to decide over what portion of the bottom plane the model is to extend. Fig. 11, for instance, extends over the range from 0 to 75 watts demand and from 0 to 40 kw-hr. energy consumption. At $e = 40$ kw-hr., that is, at the rear end of the model the amount to be paid is $12 \times 40 = 480$ cents ($4.80) for any demand d.[2] The part of the solid which corresponds to load-factors of more than 100%, and which therefore has no practical meaning, is shaded in the drawing of this and the following models. It is found in the following manner: For 40 kw-hr., for instance (rear plane of the model) we have 100% load-factor (730 hours' use per month) at $d = 40{,}000$ watt-hours/730 hours $= 54.8$ watts. Place a vertical plane through this point and the origin O; the line of intersection of this plane with the surface of the model is the 100% load-factor line.

A similar surface or solid would represent a flat demand rate except that this model would have to be turned around by 90° with respect to the former, see Fig. 12.[3]

Supposing now that we have a Hopkinson rate, then it becomes clear that we will get a combination of the planes shown in Figs. 11 and 12. The plane will be in such a position in space that the angle r corresponds to the energy charge and the angle s to the demand charge (Fig. 13). A large energy charge will result in a large angle r and vice versa. The same applies to the relation between the demand charge and the angle s.[4]

The next example is logically the Doherty three-charge rate. The difference from the Hopkinson system is that a customer charge of constant size (to be called x) is added to the charges of the Hopkinson system.[5] This means that the plane of the Hopkinson system will simply have to be lifted up parallel to itself over a distance corresponding to the amount x (to the scale previously chosen) and if the demand and the energy charges are to be lowered the angles r and s will have to be made smaller. The plane or model will assume the general shape of Fig. 14.

166. Without going into theoretical details[6] we will investigate now how the plain Wright demand rate looks in this space representation, for instance a rate charging 10 cents per kw-hr. for the first 30 hours of use and 5 cents per kw-hr. for the balance. Assuming first a customer with a fixed demand of 1 kw. it is evident that the quoted Wright rate will be

[2]By mathematics: $a = f(d, e) = ze$, that is the equation of a plane passing through the axis of d and sloping at an angle r from the bottom plane, where $\tan r = z$.

[3]Mathematics: $a = f(d, e) = yd$, that is the equation of a plane passing through the axis of e and sloping at an angle s from the bottom plane, where $\tan s = y$.

[4]Mathematics: The equation of the plane in space is $a = yd + ze$. (It should be remembered that the co-ordinates are here not called x, y and z, as usually, but d, e and a, respectively, whereas x, y and z are co-efficients). The trace on the a-d plane of co-ordinates is found by setting $e = 0$ in this equation, resulting in $a = yd$. Likewise the trace on the a-e plane is found as $a = ze$. These two traces rise therefore at angles r and s from the horizontal which are determined by $\tan r = z$ and $\tan s = y$. The traces determine the position of the plane in space.

[5]Of course, if this shall not simply mean making the rates simply so much higher to every customer, the kilowatt-hour charges or the kilowatt charges, or both, will have to be lowered, just as the kilowatt-hour charges of a straight meter rate have to be lowered if we change over to a Hopkinson rate by adding a demand charge.

[6]For these see the author's article on "Space Representation of Central-Station Rates," *Electrical World*, Nov. 4, 1911.

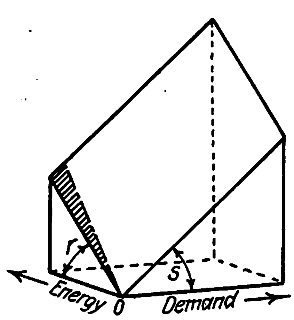

Fig. 13.—Hopkinson Rate.

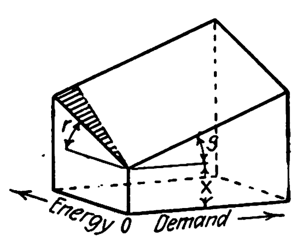

Fig. 14.—Doherty Rate.

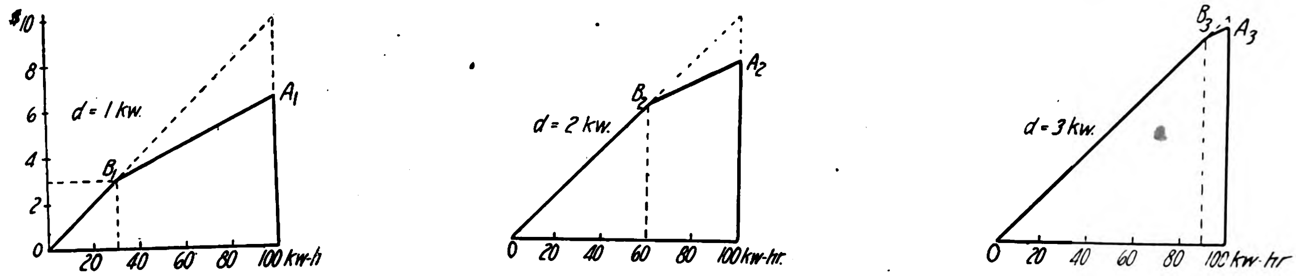
a block meter rate for all such customers (demand 1 kw.) charging 10 cents per kw-hr. for the first 30 kw-hr. and 5 cents per kw-hr. for the excess (See Fig. 15a, also Insert XII). For every customer with 2 kw. demand the Wright rate is the equivalent of another block meter rate, viz., 10 cents per kw-hr. for the first 60 kw-hr. and 5 cents per kw-hr. for the excess (Fig. 15b). For 3 kw. demand we get Fig. 15c, etc.



Figs. 15a, 15b and 15c.—Wright Demand Rate—Monthly Bills for Various Customers with Various Maximum Demands.

Supposing now that we cut these diagrams Fig. 15a, 15b, 15c, etc., out of stiff cardboard and arrange them behind one another in proper order and at distances from each other corresponding to 1 kw., as shown in Fig. 16. The interstices between these cardboards are then filled in by more cardboard diagrams representing the rate for customers with fractional-kilowatt demands, for instance 1½ kw., then 1¼ and 1¾ kw., etc., at the proper spacing, until we finally get a solid block of cardboards (Fig. 17). Then this block evidently represents the space model of the rate. Every point on the bottom plane is determined by the customer's demand and energy consumption and the vertical distance from there to the upper surface is the amount paid by the customer.

This surface consists of two planes ODB and $OBAF$ which intersect in the straight line OB. Plane ODB represents a straight meter rate. $OBAF$ is a Hopkinson plane (compare Fig. 13), as can be easily seen if we produce that plane until it intersects the vertical plane passing through axis OD (point E and dot-and-dash lines in Fig. 17). The line of intersection OB between the two planes where the 5-cent charge begins, corresponds of course to the 30-hour load-factor, this means that if we project it down on the bottom plane we get the 30-hours load-factor line.[7]

To construct this model the simplest way will be to proceed in the manner indicated above by the cardboard diagrams. We would place the last cardboard $D_3B_3A_3$ at the proper distance from the origin O (Fig. 17) and pass the plane ODB through DB and the point O (primary plane) and then pass $OBAF$ (secondary plane) through O and AB, or through O and AF. A check of the correctness will hardly be necessary in this simple case, but we could check whether the secondary plane $OBAF$ actually is identical with the Hopkinson plane as computed.

167. Turning now to a somewhat more complicated example, that of the St. Louis Residence Lighting rate, described and partly discussed in Section 161, we have in range 1 (see Fig. 8) a straight meter rate, of course. Ranges $2a$ and $3a$ have been found by the algebraical analysis to be represented by Hopkinson planes. The rate schedule is therefore equivalent to a simple three-block Wright demand system for all customers whose demand element does not exceed 4 rooms. If the demand is greater than 4 rooms, we have in range $2b$ a Doherty plane (see the inscription in range 2b of Fig. 8). This plane may be constructed in several different ways, one of which is this: The point of the rate surface corresponding to point A in Fig. 8 must be a point of the plane under construction. It belongs to range 1 as well as to range $2b$ (and incidentally to $2a$). The number of rooms corresponding to this point is 4, consequently the number of kilowatt-hours is 4×4 because the point lies on the dividing line. The amount to be paid is $4 \times 4 \times 12 = 192$ cents,[8] computed from range 1. We have thus located one point of the plane for the range $2b$ and in an entirely analogous way we can determine two more points of the plane, for instance those corresponding to B and M_1 of Fig. 8. Points on the dividing lines are of course preferable because they can be used for the determination of more than one plane and thus the work is simplified.

The whole model of the St. Louis residence rate (modified as per footnote 8) looks like Fig. 18.

168. The stipulation of a minimum bill in a rate schedule means that, whatever the rate surface may

[7]The mathematics of the case is as follows: Call p the primary charge in cents per kw-hr. and s the secondary charge and let l be the load-factor up to which the primary charge applies. Then we have in the primary range $a = pe$ and in the secondary range $a = p\,l\,d + s(e - ld) = (p - s)ld + es$. This means, in the secondary range we have a demand charge of $(p - s)l$ and the energy charge is s cents per kw-hr. We will therefore have in the primary range a straight meter plane and in the secondary range a Hopkinson plane with $\tan r = s$ (secondary energy charge) and $\tan s = (p - s)l$.

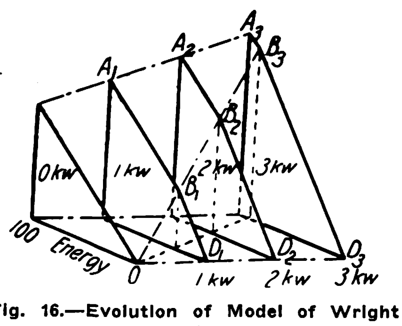


Fig. 16.—Evolution of Model of Wright Demand Rate.

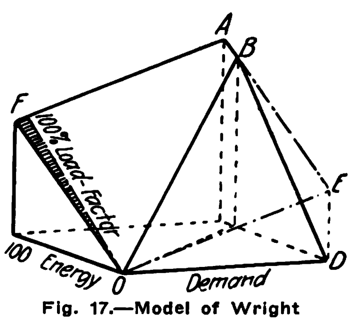

Fig. 17.—Model of Wright Demand Rate.

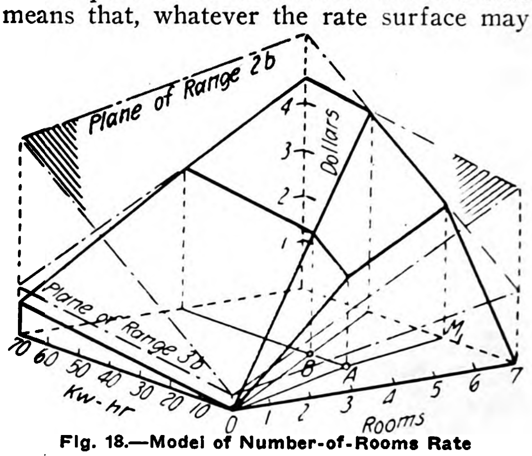

Fig. 18.—Model of Number-of-Rooms Rate (12-6-1c/kw-hr.).

be, no parts of it shall be considered which are nearer to the bottom plane than the distance corresponding to the amount of the minimum bill. We therefore draw a horizontal plane at that distance above the bottom plane and wherever that plane is higher than the surface of the model it replaces the latter. To demonstrate how this works out, Fig. 19 shows a model of a Wright demand rate[9] with a minimum charge (of $1), indicating also in the ground plane Fig. 19a in which range the minimum bill applies.[10]

Fig. 20 is the same Wright rate with the stipulation of a certain minimum number of kilowatt-hours instead of a minimum bill. Suppose, for instance, the rate would say that, whenever the actual energy consumption is less than 20 kw-hr. it shall be figured as being 20 kw-hr. for billing purposes. Then we have to draw a vertical plane *PQQ'20* normal to the axis of energy and at a distance from the origin *O* which is equal to the stipulated minimum number of kilowatt-hours (20 kw-hr. in our example). From every point of the line of intersection between this vertical plane and the rate surface we draw a horizontal line parallel to the energy axis. All these horizontal lines together then form a set of planes *pp'q'q*, *qq'r'r* and *rr's's* (Fig. 20) which determine the minimum charge. Fig. 20a shows the range of the minimum charge in this case.

We see from this at once the difference between a minimum bill and a minimum number of kilowatt-hours for billing purposes (see end of Section 108).

The stipulation of a minimum demand which is also sometimes found in practice results in an analogous set of planes to those shown in Fig. 20, but on the kilowatt-hour side of the model instead of on the kilowatt (or watt) side.

The stipulation of a minimum load-factor to be taken into account for billing purposes results (with the same simple Wright demand schedule) in a model like Fig. 21 (no load-factor considered for billing purposes smaller than 20 hours' use per month).

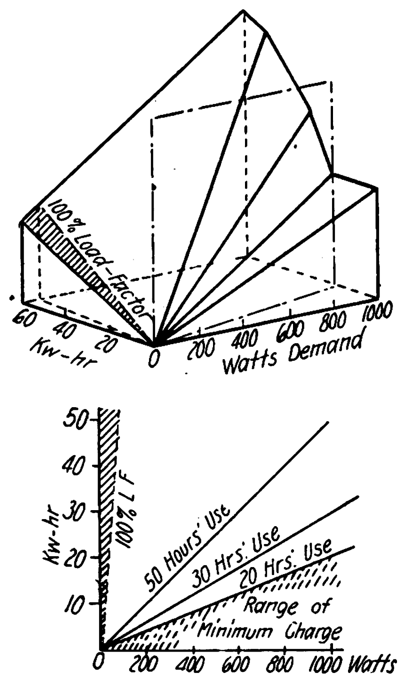

Fig. 19.—Minimum Charge.
Fig. 19a.—Plan of Fig. 19.

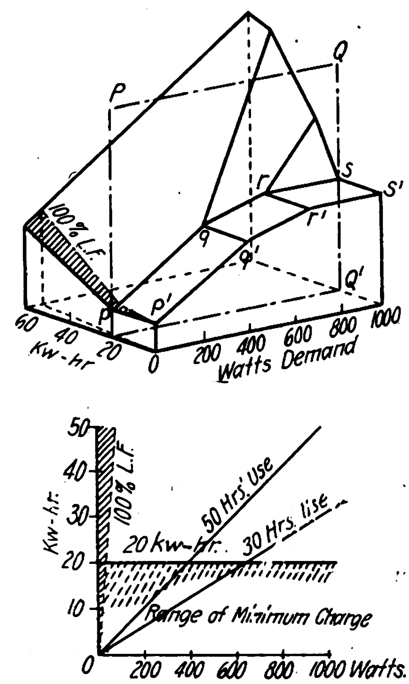

Fig. 20.—Minimum Energy Consumption.
Fig. 20a.—Plan of Fig. 20.

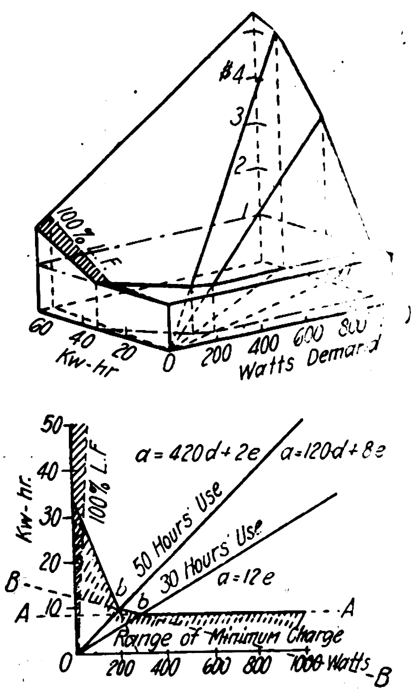

Fig. 21.—Minimum Load-Factor.
Fig. 21a.—Plan of Fig. 21.

It requires no further detailed explanation to show how a combination of minimum charges expresses itself in space representation. For instance, it may be stipulated that under the Wright schedule just discussed (Figs. 19 to 21) the minimum number of kilowatt-hours to be paid must correspond to a monthly use of the maximum demand of at least 20 hours, and that moreover no bill shall be made out at less than $1. The two minimum-charge steps of Fig. 19 and Fig. 21 will then combine in such a manner that that step applies which is the higher one of the two at the respective point of the bottom plane, in other words on the left portion of the model (small demands) the $1 minimum step (Fig. 19) will apply and for larger demands the load-factor-minimum applies. The demand at which the two "minimum" steps intersect one another can be found either graphically or by computation as

$$d_1 = \frac{\text{100 cents per month}}{\text{12-c/kw-hr.} \times \text{20 hours per month}} = 0.4166 \text{ kw.} = 416\ 2/3 \text{ watts.}$$

169. Fig. 22 shows a model of the rate referred

[8]To exhibit more plainly the characteristic qualities of this type of rate, the St. Louis rate has been arbitrarily modified for the construction of the model Fig. 18 from a 8-6-3-cent rate to a 12-6-1-cent rate which makes the angles between the various planes greater. The ground plane is unchanged.

[9]Assumed charges are 12 cents per kw-hr. for the first 30 hours' use, 8 cents per kw-hr. for the next 20 hours' use and 2 cents per kw-hr. for the excess.

[10]This range in which the minimum bill applies can be found either graphically from the tracing of the model itself or, if greater accuracy or a check would be required, it can also be computed, in the following way:

In the primary range where $a = 12e$ we get by setting $a = 100$ cents, $12e = 100$ and $e = 100/12 = 8\ 1/3$ kw-hr.; this means a straight line *AA* (Fig. 19a), normal to the axis of energy consumption (kw-hr.) and at the distance 8 1/3 kw-hr. from the origin. In the secondary range we have the equation of the rate surface $a = (12 \times 30d) + 8(e - 30d) = 120d + 8e$ and setting this = 100 cents we get $120d + 8e = 100$. This is the equation of the straight line *BB* in Fig. 19a. The portion *bb* between the 30-hour and the 50-hour load-factor lines determines the range of the minimum charge in the secondary range of the rate. To construct this line $120d + 8e = 100$ we find its intersection points with the axes of abscissae (watts) and of ordinates (kw-hr.) by setting first $e = 0$ and then $d = 0$. $e = 0$ gives $120d_0 = 100$ or $d_0 = 100/120 = 0.8333$ kw. = 833 1/3 watts on the axis of demand. $d = 0$ results in $e_0 = 100/8 = 12\ 1/2$ kw-hr. on the axis of energy consumption. In analogous manner we can find the range of the minimum charges in the tertiary range of the rate.

to and analyzed in Section 163. It demonstrates clearly how the plane for load-factors above 300 hours (plane *OST*) slopes in the wrong direction so that a negative angle *s* (that is, a negative demand charge) results.

170. Only simple rates have been dealt with here as far as their space representation is concerned. The more complex a rate system is the greater is the

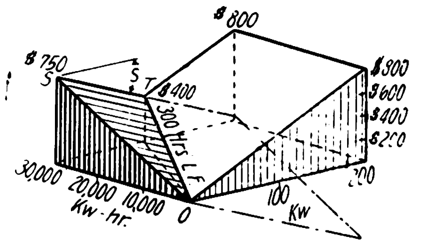

Fig. 22.—Negative Demand Charge.

advantage of a graphic representation for a clear insight into the meaning and the character of the rate.

More about this system of rate representation is contained in the author's article on "Space Representation of Central-States Rates" in the *Electrical World* of Nov. 4, 1911, which also contains many examples of various kinds of rates and numerous photographs of a large number of actual models of rates as had been made for the purpose of investigating these rates. It is, of course, not strictly necessary to have the models actually made in three dimensions. A good axonometric drawing, of the type of Figs. 17 to 22, or even pure imagination how the model looks, will also prove very helpful.

(To be continued.)

PROPOSED ELECTRIFICATION OF SOUTH AFRICAN RAILWAYS.

Experts Report to Union Government on Advantages of Conversion and Estimated Financial Results.

A London firm of consulting electrical engineers (Merz & McLellan) has submitted a report to the Union Government of South Africa on the possibilities and advantages of the electrification of certain sections of the South African railways. The sections of the railways considered for electrification are confined to four divisions.

The first comprises the main line from Cape Town to Touws river and suburban lines in the peninsula. A tabular statement, giving the cost of electrification and the profit, shows an estimated return on the net capital outlay of 1½% on the main line section, 10% on the Simonstown branch, 8.1% on the Sea Point line, 30.5% on the Docks branch, and 9.7% in the Docks area.

The second section comprises the Natal main line from Durban to Glencoe, on which a return of 40.3% is anticipated, and the Glencoe-Vryheid East branch with a return of 12.5%.

The third section is the Witbank-Germiston-Randfontein line, on which the return is estimated at 10.8%; while the fourth section is the Delagoa Bay line between Witbank and Komatipoort, and here the return is expected to be 5.6%.

Thus the conversion of the main line in Natal is by far the most profitable. This is to be expected on account of the density of the traffic and the very severe nature of the line, both of which tend to make operation of the line very difficult. The introduction of electric traction would avert the necessity for double-tracking the line, the traffic on which is approaching the limit of capacity for a single track.

This scheme embraces a route mileage of approximately 650 miles, a single-track mileage of nearly 1015 miles, with certain additions for sidings, etc.

A number of the advantages to be derived from the conversion are enumerated. They include:

(1) A higher average speed for long-distance passenger trains.

(2) An increase in the weight and a reduction in the number of freight trains, with a consequent improvement in the handling of traffic.

(3) Postponement of the necessity for doubling the track.

(4) Reduction of wear and tear on the permanent way.

(5) Elimination of the costs connected with the supply of water and coal for locomotives.

(6) Increased comfort for passengers and train crews.

(7) Abolition of expenditure in compensating farmers for fires caused by engine sparks.

As it is out of the question to take in hand simultaneously the whole scheme of electrification, the report recommends that steps for the conversion of the line between Durban and Glencoe be started immediately, then successively the Rand line, the Vryheid East branch, the Cape lines, and finally the Witbank-Komatipoort section should be electrified. The direct-current system and overhead transmission are recommended.

For main-line traffic it is proposed to use freight locomotives with a tractive effort of 48,000 lbs., compared with 53,750 lbs. of the present Mallet articulated type, and passenger locomotives with a tractive effort of about 30,000 lbs., which would be capable of hauling a 600-ton load up a gradient of 1 in 60.

In view of the fact that with electric working the most economical condition is obtained when the train travels at the highest possible speed, it is proposed to increase very substantially the general speed of the freight traffic. Provision would be made for a speed of 20 to 23 m.p.h. up the ruling gradients by freight trains, and 28 to 29 m.p.h. for passenger trains, as tending to the most economical working, while for level parts provision would be made for an express passenger locomotive to haul 15 main-line coaches at not less than 55 m.p.h.

A comparison is made with a test made with a locomotive of the 12th class on a run from Witbank to Germiston, which covered the distance in 3 hrs. 45 min., exclusive of stops, whereas an electric locomotive would take 2 hrs. 40 min.

The report does not anticipate any substantial gain from the utilization of water power for the generation of energy. It suggests for the Natal lines the erection of power stations at Durban and Tayside, near Glencoe. For the Rand line power might be taken partly from a station on the Great Olifant's River and partly from the existing network of the Victoria Falls Co. For the eastern line a power station should be provided at Komatipoort, and for lines radiating from Cape Town there should be a power station near Cape Town and another at Touws River. At Cape Town a combined station is suggested capable of developing power for railways, tramways and municipal requirements.

The proposed new service provides for an increase of 66% in train mileage on the ordinary week day.

Effect of Strike Upon Central-Station Supply to Coal Mines

Consensus of Opinion Foretells Higher Demand, Greater Energy Consumption and Increased Electrification — Central-Station Supply to be Encouraged—Other Effects

ELECTRIFICATION of coal mines has progressed steadily for many years, the rate being accelerated from time to time by such factors as high market value of coal, high cost of labor or its scarcity, and increasing necessity for efficient mining of coal. Many central stations have found the supplying of power to coal mines a profitable form of load. The coal operators have found central-station service equally profitable. The plan is mutually profitable.

Under these circumstances there has been every reason to expect that more and more coal mines would go over to central-station service in preference to operating their own isolated and inefficient plants. The conditions that may be created by the cessation of the bituminous coal miners' strike, which will be brought to a cessation by a compromise the details of which are not yet known, immediately cause one to ask as to the effect of the new conditions upon the central stations already serving coal mines and those that purpose to do so.

The miners originally demanded a 60% increase in wages, a 6-hour working day, the working day being considered as commencing from the time they started down the mine shaft to the time at which they emerged, and a 5-day week. There is every reason to believe, however, that a compromise will be made by increasing wages 30% or so, the coal operators guaranteeing more regular work, but insistence being made that an 8-hour day be retained. The question then that central stations already supplying coal mines are asking themselves is, whatever be the result of the strike, how will that result affect them? Likewise, utilities that have been looking to the coal mines as a potential load are concerned as to whether the new conditions soon to come about will help them or hinder them in taking on coal mines. There is every reason to believe, and this belief is backed by the opinions of a large number of central stations, that whatever the outcome, whatever the compromise between the striking bituminous miners and the coal operators, there will be added incentives for the coal operators to purchase central-station service.

The Penn Central Light & Power Co., located at Altoona, Pa., serves a territory where coal mining constitutes an active and extensive industry. The company operates two steam plants of its own and also purchases considerable energy from an interconnected hydroelectric system. Considerable energy is supplied for coal-mining operations, hence this company is closely interested and well versed in this phase of central-station supply.

Speaking of the result to be expected, should the bituminous coal miners gain their demands for a 6-hour day and a 5-day week, and not taking into cognizance the aspect of higher rate of remuneration, J. H. Shearer, general superintendent of the company, points out that the consideration of the immediate effect of capitulation to the miners' demands should be divided into two catagories; the first of these embraces haulage, the second ventilation.

"The country cannot get along on any less production than it is at present, in fact, we need considerably greater production," says Mr. Shearer. "The 6-hour day would, of course, mean a reduction in tonnage and, in order that the coal operators could maintain sufficient tonnage to meet the demand, they will undoubtedly resort to the electric mining machine in mines where the seam is so arranged that mining machines can successfully be applied. By maintaining the tonnage in this manner, the annual kilowatt-hours used for haulage will, in our opinion, remain practically constant, since a given tonnage can be hauled over a certain distance under a certain number of kilowatt-hours used.

"It will require heavier trips under a 6-hour day than under the 8-hour day, which will mean a higher demand on the machines handling the haulage which reduces the load-factor of the installation, thus producing a greater income from the kilowatt-hour to the power company selling the service on a load-factor basis.

"In connection with the ventilation of the mine, we see that the kilowatt-hours will be reduced, since the fans in many mines could be slowed down to half speed two hours earlier than at the present; this will also reduce the load-factor with corresponding effect on power cost. We believe, however, that the kilowatt-hours used by additional mining machines will go a long way to overcome the reduction in the kilowatt-hours required for ventilation, if not exceeding them. Should a mine be a gaseous one where it is necessary to keep the fans running 24 hours a day at full speed, there will be no reduction in kilowatt-hours used in ventilation due to the 6-hour day, and the additional kilowatt-hours used for mining machines will increase the present kilowatt-hours.

"Power for pumping could not be taken into consideration as to working hours as this function is necessary according to weather and water conditions.

"We, therefore, feel that a 6-hour day would ultimately mean an increase in the use of power over the present requirements, but there would be a period of reduced production and kilowatt-hours used immediately after the mines would go on 6-hour shift, and this condition would continue until the mining companies installed the mining machines and the production increased."

The Appalachian Power Co., Bluefield, W. Va., is located in proximity to the Pocahontas, Clinch Valley, Tug River, Winding Gulf coal fields and finds in them a good customer for power. The company has a total generating capacity of about 25,000 kw. and a connected power load of 70,000 kw., indicating a comparatively large power load. The coal fields supplied by the company are non-union fields, hence their load has been favorably affected since the strike in union coal fields, partly because of the greater effort put forward by the miners and partly because the supply of railroad cars has enabled a much higher rate of coal production to be maintained. However, if the striking miners win in their demand the company expects conditions in the non-union coal fields to gradually approach those of the unionized fields so that if the latter obtain shorter working hours, the former will eventually also.

The effect of shorter working hours, points out Herbert Markle, general manager, Appalachian Power Co., will be similar in effect to the conditions created during the war by a shortage of labor. In both cases there will be greater incentive for the installation of "machinery of all kinds, and this tendency seems to be increasing." The result is "an increased consumption of electrical power as well as resulting in decreased cost of mining coal, as electrical power is cheaper than man power. As yet coal loading machines are not commercially in use, but some mines are experimenting with this type of equipment, and when perfected, there is no question but what they will be quite generally adopted, as they will go a long way toward solving the labor difficulty."

Practically every one of the large number of central stations expressing an opinion is convinced that the demand per mine will be higher for the reason that effort will be made to maintain production. More tipple and mine working will necessarily be installed, resulting in lower load-factor and higher peak demand. As one power company states, the fact that the men will lose time in getting to work and getting to the surface again after their work, creating in effect a shorter day, taken in conjunction with the fact that effort will be made by the coal operators to maintain production, will tend to cause mine operation to be more regular, and forced cessation such as has occurred so frequently in the past because of inability to obtain railroad cars, will be less a factor in limiting coal production and forced idleness of the men than in the past. Another factor tending toward this is the fact that public opinion and the attention of federal and other bodies has been brought to bear upon this phase of the coal situation.

G. M. Gadsby, vice-president, West Penn Power Co., whose company supplies considerable power to the bituminous coal fields of Pennsylvania, looks for somewhat lower load-factor, higher peak demand and increased consumption of kilowatt-hours if the miners obtain concessions in the way of shorter hours. In part, he says:

"The consensus of opinion is that every possible effort will have to be made to maintain production. This will mean the installation of more tipple and mine working capacity, with the resultant higher peak demand on the central stations and a very much poorer load-factor. The kilowatt-hour output would be changed but little, the result of the 6-hour day being to do in 6 hours what is now done in 8.

"Investment cost of coal produced would necessarily be higher, and since most power rates are based either directly or indirectly on load-factor, the cost of power per ton of coal mined would also be higher.

"It might be of interest here to note that during the shortage in central-station power which prevailed in this district in the war time, all the various agencies who investigated the situation agreed that if the operation of the mines could be spread over a longer period there would have been adequate capacity to serve all desiring this service."

Isolated Plant to Give Way to Central-Station Supply.

Electric power is cheaper than man power, can be more easily controlled and readily changed according to the needs of the situation. While man power is costing more and more and becoming more and more difficult to handle, electric power is of fixed cost, tending toward somewhat decreasing cost, and gives less trouble the larger the quantity handled (because of better provision for its distribution and maintenance for equipment). Higher wages for man power, regardless of any possibility or probability of a shorter effective working day, means increased electrification. The above is the sum-total of the expressions of several public service companies supplying coal-mining regions with electric power.

If the miners' demand for a shorter working day materializes, it is not difficult to see what will be the result. Whatever happens, every effort will be made on the part of the coal operators to maintain the production of coal according to the demand. The shorter working day means that there will be a greater number of hours out of the 24 when the mines will not be actively engaged in mining coal. Coal-cutting machines, locomotives, drills, tipples, etc., will be shut down and only a quota of the fans for ventilation and the pumps for caring for the seepage, etc., will operate. The working load will be heavier than previously while it lasts. There will be a relatively light load for a relatively longer portion of the 24 hours. The influence of the promised load curve upon plant performance and choice of equipment is of interest, as is emphasized by one utility.

Plant efficiency depends upon the load and the load-factor. The operators of coal mines have always in most cases favored central-station supply exclusively. A shorter working day only makes the purchase of service by the mine from the central station even more advantageous for the former, notwithstanding the lower load-factor, as already foretold above by many public utilities. Coal wasted at the mine represents a loss to the mine operator since that same coal has a market value—a value considerably enhanced during the last year or two; therefore, power plant economy becomes of importance. The lower load-factor that will come with the miners' shorter working day means more inefficient operation than ever of the coal operators' isolated plants. The higher peak or demand means a greater investment than was necessary before the strike, another factor favoring the use of central-station service in preference to enlarging the existing isolated plants.

Many coal mine operators have found it profitable in the past to purchase their electric power. Higher wages coupled with a shorter effective working day will mean many more operators will go over to central-station service. One utility manager voices the opinion that there will be almost a stampede in the endeavor to connect up to the transmission line in preference to making isolated plant extensions to meet conditions that are at best inefficient.

The shorter the time in use, the fewer the hours out of the 24 that equipment is in use, the more important it becomes to keep to a minimum the investment in plant. This means, according to the manager of a utility in the Middle West serving many coal mines scattered over a large territory, that the outdoor substation will receive unprecedented attention in preference to any other type. Moreover, the flexibility of certain types of the outdoor station, which enables them to be expanded according to the needs of the mine in the way of power requirements, will solve many difficult problems that will arise if the coal operators capitulate to the demands of the miners for a shorter effective working day.

The consensus of opinion of the central stations supplying mines in the bituminous coal fields, as learned from a large number of replies received in reply to a questionnaire sent out by the ELECTRICAL REVIEW is that the load-factor of the individual mine will be lower; the maximum demand and kilowatt-hours consumed higher; that many coal mines now producing their own power will be forced to go over to central-station supply; and that very many mines will find it necessary to increase their consumption, hence additional electrical equipment for below as well as above ground will have to be purchased. The central stations in general look for increased revenue from coal mines, whatever capitulation be made to the striking miners, whatever the compromise. This will not accrue immediately upon the resumption of work because of a time lag until new equipment can be obtained to counteract the new conditions. But it will come eventually.

CENTRAL STATION'S APPEAL FOR VOLUNTARY COAL SAVING.

Commonwealth Edison Co. Asks Its Patrons to Forego Needless Use of Light and Power—Coal Pile Dwindling.

As the strike of bituminous coal miners drags on, the nation is consuming the supplies of coal on hand. The coal pile of the industrial plant, of the railroads and of the central stations is the buffer that stands between operation and shutdown. Every day the coal piles become smaller. Every day that the coal strike lasts the visible supplies of coal become less.

The central stations have always been great believers in the coal pile. Coal is such an important factor in the business of producing electrical energy that the average central station located any distance from the coal mines has felt it incumbent upon it to store coal in fairly close proximity to its power plants so that should strikes of miners or railroadmen, inclement weather and similar unforeseen emergencies arise, there would be a supply of coal from which to draw until the emergency had passed. Usually the emergency has consisted of bad weather, blockage of traffic, inability to obtain railroad cars and similar occurrences of short duration. Many companies have never found it necessary to use their coal in storage because of necessity. But they maintained coal piles because the possibility of something happening convinced them that to do so was a wise precaution.

The Commonwealth Edison Co. has always kept a very large amount of coal in storage, the coal piles being located at their Fisk and Quarry street stations and Northwest station, with other piles at Clearing and along railroad tracks. These coal piles, comprising nearly 400,000 tons, have been maintained for vears but until the present strike occurred the company had never been called upon seriously to fall back upon the supply of coal in storage because there was no alternative. They felt, notwithstanding, that the coal pile was a necessary precaution, a safeguard against something that might occur some time, however remote the possibility. That time has come and the 380,000 and more tons stored in readiness are now being used up at the rate of some 5000 tons a day. The coal pile is the factor that makes it possible to continue service to more than 400,000 customers. At the present rate of consumption the company's coal piles will be depleted in 30 days.

With no compromise yet reached between the coal operators and the miners, the company has taken steps to conserve its coal lest the delay in producing coal again is more protracted than is generally expected. The company has already refused to furnish peak-load service to some customers and it is appealing to its patrons in general to help save its coal supply by not using more power and light than is actually necessary. The accompanying advertisement is being published in the Chicago daily papers in the effort of the company to bring realization as to the seriousness of the situation.

An Appeal to the Public to Help Us Save Coal

Because of its great responsibility to the public and to the business interests of Chicago, the Commonwealth Edison Company feels that it should, at this time, make to the people an exact statement as to its coal supply. The Company supplies electric current in 400,000 Chicago homes and business institutions for lighting, power and elevator service and, moreover, the Company's current is absolutely essential to the operation of many of the food producing and distributing institutions of the city. The inability of the Company to supply current would seriously affect the city's water system, the telephone, telegraph and U. S. mail service, and would stop the operation of all surface and elevated lines.

Realizing this great rosponsibility, the Company long ago adopted the policy of maintaining a large reserve supply of coal to meet such emergency as the present coal strike. As a result, on November 1st, when the miners struck, the Company's reserve supply of coal in and near Chicago was in excess of 380,000 tons, enough to meet its normal requirements for 50 or 60 days. The Company obtains its coal from Illinois mines, all of which are affected by the strike. This is the twenty-fifth day of the period of non-production from these mines, and during this period the Company has been obliged to draw on its reserve supply. At the present rate of consumption the Company's reserve supply will be exhausted in thirty days.

In the hope of deferring as long as possible, and perhaps avoiding entirely, the drastic curtailment of the use of electricity which has been found necessary in many of the cities of the middle west, the Company feels obliged to ask the people of the city to economize in the use of electricity, and to stop using it where its use is not absolutely necessary. This means a direct saving of coal. Even if a settlement of the coal strike be made immediately, it will not prevent Chicago's coal situation from continuing to be bad throughout the winter, due to exhaustion of the usual winter stock of coal and inadequate railroad transportation, snow storms, blockades, and general conditions that may be expected in cold weather

To help in this emergency the surface and elevated lines have agreed, so far as possible, to stop the use of electricity in heating cars. It is believed that this will cause slight, if any, discomfort to the public at this time of the year, and will not affect the general health. It will save hundreds of tons of coal daily.

In the interests of the entire community the Company respectfully requests the co-operation of the citizens of Chicago in this crisis, and especially asks that they stop, as far as possible, the use of electrical energy for display lighting of every kind, and curtail the use of light and power, so that there will be no waste and the present coal reserve of the Company may be made to last as long as possible.

COMMONWEALTH EDISON COMPANY

Commonwealth Edison Co.'s Appeal to Its Patrons to Assist in Saving Coal by Eliminating All Non-essential Consumption of Light and Power.

SHIP LAUNCHED UNDER ELECTRIC LIGHT.

It is interesting to note that the American International Shipbuilding Corp., of Philadelphia, Pa., recently effected the launching of the new 7825-ton capacity steel cargo carrier *City of St. Joseph* at night at its big Hog Island shipyards. The company had installed powerful electric projector lamps to light the path of the steamer. It is said that this is the first night launching which has taken place in this country.

Present Limits of Speed and Output of Single-Shaft Turbogenerators

Importance of Rotor Dimensions—Influence of Ventilation, Temperature, Speed and Mechanical Forces Upon Capacity—A.I.E.E. Paper

By F. D. NEWBURY

Westinghouse Electric & Manufacturing Co.

REDUCED to the simplest terms, maximum output at any speed is attained when slot space is provided for the maximum possible ampere-turns (in either stator or rotor), and core cross-section is provided for maximum possible flux. These conditions require the most effective rotor diameter (or stator bore) and the maximum rotor and stator core length. All factors that limit rotor diameter (or stator bore) or core length have a possible bearing on limiting outputs.

The most effective rotor diameter for a given speed is not necessarily the largest diameter. For maximum output, the rotor should have maximum space for winding and maximum tooth and core section for flux. Obviously, these requirements are antagonistic and the actual design is a balance between slot area and tooth and polar area. Again, as the diameter is increased (with a given speed) there is more room for both winding and flux, but with increase in diameter each pound of copper exerts an increasing centrifugal force and the ratio of slot area to tooth cross section must be decreased in order to keep within desired stresses. Beyond a certain peripheral velocity, ampere-turns must be decreased, in spite of the increase in available space, and the most effective diameter has been passed. It is seen, therefore, that in order to obtain maximum output at a given speed, the rotor proportions must be chosen to properly balance mechanical stresses, rotor ampere-turns and flux.

Turbogenerator design has settled down to one type of rotor, so far as form is concerned. This is the so-called radial slot type, in which the ends of the winding project beyond the core body. This construction is shown in Fig. 1, indicating the slot arrangement. This type of design requires solid rings of very good material for holding these projecting coil ends. The hoop-stress in the coil retaining rings is an important limit to output and is, in fact, a more important limit than the tooth stress in the main rotor body.

In a large-diameter low-speed turbogenerator (1200 r.p.m. and below) it is generally possible to employ a larger rotor diameter and more rotor ampere-turns than can be properly balanced by stator ampere-turns. The density of stator ampere-turns is limited by the ability to dissipate heat (with permissible temperature differences) and by the permissible concentration of ampere-turns in a single slot. Obviously, there is no such rigid limit to weight or depth of copper in a single slot in the stator as is imposed by centrifugal stresses in the rotor, but there is a limit to the depth of stator slots determined by the rapid increase in eddy current losses with deep slots and by the ability to construct and insulate long coils having a very large ratio of depth to width.

Thus, in certain cases the rotor is the limiting member and in other cases the stator is the limiting member. In general, the rotor first reaches its limit in ratings of 1500 r.p.m. and higher speeds, and the stator first reaches its limiting output in ratings of 1200 r.p.m. and lower, considering commercial frequencies.

It is apparent that unless the ratio of rotor ampere-turns to stator ampere-turns is a fixed design relation, all generators could be designed for the maximum possible output as determined by the stator, and the rotor need never be the limit. As a matter of fact, there is a tendency in this direction, the restraining fact being that as the field is weakened, relatively to the armature, the increase in field current and exciting voltage as the load is increased becomes greater. A reasonable limit to increase in excitation with load is desirable from the standpoint of voltage regulator operation. Regulators can readily handle a range of one to two or one to two and a half and large generators are proportioned to meet this ratio of no-load to full-load excitation. Voltage regulation has ceased to be a limit to output. These field and armature proportions result in regulations of roughly 25% at 100% power-factor, and 40% at 80% power-factor. Obviously, such regulations could not be tolerated if regulation were a factor in operation.

A fundamental difficulty in laying down definite limiting outputs is the difficulty in arbitrarily stating limiting stresses. The two principal stresses in the radial slot rotor are the tooth stresses in the main rotor body and the hoop stress in the coil retaining rings. Soft carbon steel is employed for the main rotor body and a good quality ductile alloy steel (usually chrome-nickel or chrome-vanadium) is used for the coil retaining rings. Turbogenerators are designed for a maximum speed 20% above the running speed. At this over-speed, the tooth stresses should be approximately one-fourth the ultimate strength of the carbon steel and the coil-retaining ring stress should be approximately one-third the ultimate strength. This results in working stresses, in both cases, approximately half the yield point. It is important that the material be ductile: carbon steel with proper working can readily be obtained with 22% elongation and 35% reduction in area and the alloy steel should have 22% elongation and 50% reduction. These figures refer to standard 2-in. test pieces under tension.

American design practice has established 400 ft. per sec. as an upper limit of peripheral speed for maximum ampere-turns and output for rotational speeds of 1500 r.p.m. and higher. This, of course, assumes existing rotor materials and factors of safety.

It is apparent that having increased the rotor diameter to the most effective value, output will be proportional to the length of the rotor and stator cores and maximum output will be secured when the length is increased to its limiting value. This limit to length is even more a matter of opinion and judgment than is the limit to rotor or stator diameter. It is determined mainly by cooling air requirements, by bearing proportions, by limits to weight imposed by transportation facilities and the ability to secure forgings of necessary diameter and weight.

Ventilation.

The generator losses, and consequently the required volume of cooling air increase almost in proportion to the core length. In the simple radial or air gap system of ventilation, shown diagrammatically in Fig. 2, all of the cooling air must pass through the air gap entering the annular openings between stator and rotor at the two ends of the generator. The radial dimension of the air gap is constant with constant rotor diameter, consequently volume of cooling air can only be increased as core length is increased by increasing the air pressure. Also, as core length is increased, the diameter of the shaft extension of the rotor body must be increased and the fan intake becomes restricted. In the axial system of ventilation, illustrated in Fig. 3, the stator ventilation is taken care of independently of the air gap and the requirements as to cooling air become less important from the standpoint of limiting output. But with either system of ventilation, designers are already finding it

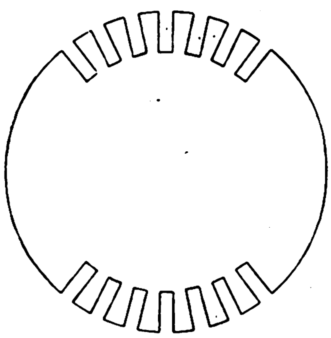

Fig. 1.

necessary to devise more complicated systems in order to take care of 3600 and 1800-r.p.m. ratings now in prospect.

Rotor Deflection.

As the core length is increased, necessitating an increased distance between bearings, the rotor deflection increases. This increases the reversing stress in the shaft material at the journals and reduces the value of critical speed. As the core length is increased the journal and bearing sizes must be increased in order to keep the shaft stress and the critical speed within desired limits and a limit may be imposed by bearing losses and temperatures.

Winding Temperatures.

The limiting ratings given in this paper are based on 150 deg. total rotor winding temperature and from 125 deg. to 150 deg. total stator winding temperatures. It is not probable that ratings will be increased by increasing these temperature limits. Higher temperatures would be of most value in connection with the rotor winding since the rotor limits rating in the two and four-pole designs commonly used. But temperatures higher than 150 deg. result in relatively little gain in rotor ampere-turns on account of the rapid increase in resistance of the winding. If the rotor winding temperature rise is assumed proportional to the loss, an increase in operating temperature from 150 deg. to 250 deg. (an increase in measured rise from 100 deg. to 200 deg.) results in an increase in ampere-turns of only 25%. Thus doubling the tem-

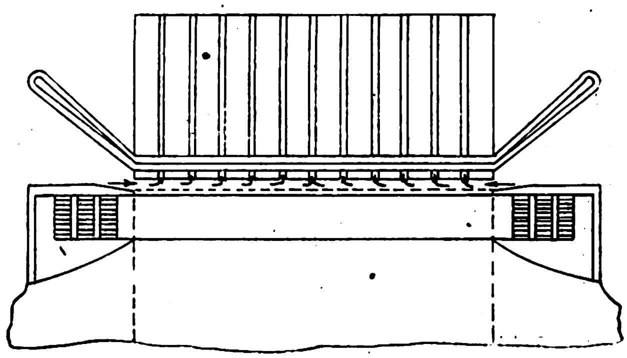

Fig. 2.

perature rise and rotor loss results in a gain of only 25% in output.

Temperatures much above 150 deg. in connection with very long rotors are not considered favorably on account of the danger of trouble from "creeping" of the winding caused by linear expansion.

Transportation Facilities.

Transportation facilities may impose a limit to size in the case of six and eight-pole, 60-cycle generators. With the larger two-pole, 25-cycle and four-pole, 60-cycle generators now being built, the stators are now too heavy for convenient handling and transportation, and they are assembled in place at the power station. Rotors, from the special nature of their design and the special skill and equipment required for winding and assembling, should be completed at the builder's factory and shipped as a unit. The weight of the complete rotor of a four-pole, 1800-r.p.m. generator of 40,000 kv-a. capacity will be roughly 90,000 lbs. This can be transported without difficulty, but the largest possible 1200-r.p.m. rotor would weigh more than 200,000 lbs. and would require rolling stock and trackage (in some cases) not now available.

Another general limitation to output that applies to the larger diameter rotors is that imposed by the forging facilities of the country. At the present time

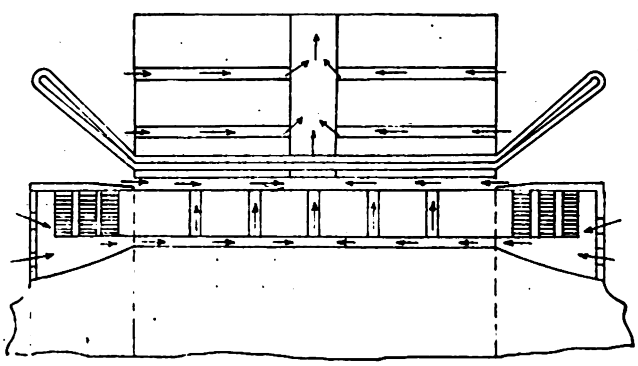

Fig. 3.

it is not possible to obtain forgings of suitable physical characteristics weighing more than 50 to 60 tons nor much larger than 50 ins. (assuming a minimum amount of working down from a 72-in. ingot). This limits the rotor, made from a single forging, to an output of roughly 50,000 kv-a. at 1500 r.p.m. and a proportionately decreasing kv-a. at lower speeds, assuming a solid rotor. By adopting the rotor construction involving 2 or 3-in. plates and up-set flanged shaft ends, the limiting diameter may be increased sufficiently for the largest 1500 and 1200-r.p.m. outputs, shown by Fig. 4. The design of 1200 and 900-r.p.m. generators for maximum output will be governed by questions of forging and shipping facilities, rather than by more strictly design matters.

Fig. 4 shows in curve form limiting generator capacities at various speeds. At 1500 r.p.m. and higher, the capacity is determined by the rotor and is inversely proportional to the revolutions per minute squared. At lower speeds, the capacity is limited by the stator and falls somewhat below the corresponding rotor limiting capacity as indicated by the dotted extension of the rotor curve. This curve is actually based on constant core length, when, as a matter of fact, the length can, with reason, be increased as the diameter is increased. The curve ratings, however, represent maximum lengths of core so far employed and material extensions in core length involve questions of linear expansion that must be very carefully considered. This limiting capacity curve represents capacities that can be obtained with existing commercial materials and without radical changes in stresses

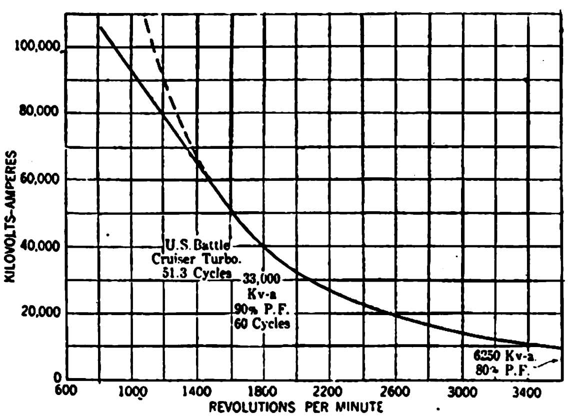

Fig. 4.

and bearing proportions. The curve does not represent limits that may not be exceeded in the future. It is, more properly, an indication of present boundaries—boundaries that will be extended as our knowledge and experience are increased. Its represents also the present judgment of designers, a judgment influenced greatly by the economic and operating advantages of still larger ratings.

The capacities shown by the curve are somewhat in advance of accomplished results. Ratings of several turbogenerators that are the largest that have been placed in operation or are under construction by the Westinghouse Electric & Manufacturing Co. have been added to Fig. 4 with self-explanatory comment.

As previously explained, the limiting capacities given for speeds below 1500 r.p.m. can only be attained by exceeding present transportation facilities if present design types are adhered to.

Incidentally it is interesting to note the advantage in limits gained by the use of 50 cycles as compared with 60 cycles. An increase of nearly 50% in rating is made possible by the 20% decrease in two-pole and four-pole speeds. This is of interest mainly when European and American maximum ratings are being compared.

The bare mention of ratings larger than 50,000 kv-a. raises the question of limits to size of individual generating units imposed by operating considerations, such as the relation between unit and station rating, the extent of the damage in case of winding failures, ability to withstand sudden short circuits, and so on.

While the detailed discussion of these questions is beyond the scope of the present paper, some design information affecting operating questions may be of interest. There is no reason for considering the larger low-speed generators less reliable than the high-speed generators indicated by limiting curve of Fig. 4. As a matter of fact, the lower speed ratings can usually be designed, both in stresses and in electrical factors, with more margin.

Mechanical forces developed by short circuits are determined by the short-circuit ampere-turns of the armature winding per inch of armature circumference, and, to a limited extent, by the density of the magnetic field set up by the rotor winding. Both the distribution of ampere-turns and the density of the air gap magnetic field are substantially constant for all limiting ratings of a given frequency. While the forces developed in a 25-cycle generator will be greater than in a 60-cycle generator—due mainly to lower reactance and the resulting greater values of ampere-turns—all 60-cycle ratings indicated by the limiting curve will have substantially equal forces developed on sudden short circuit. The stresses in the coil ends will be determined by these forces and by those factors determining the rigidity of the winding. Except possibly in the maximum size 1500-r.p.m., 25-cycle generator, with its long coil-end extension, there need be no material difference in the rigidity of the winding. Thus a 50,000-kv-a., 25-cycle, 1500-r.p.m. generator represents the most difficult design from the standpoint of short-circuit stresses. However, such a generator would not differ materially in short-circuit stress conditions from 30,000-kv-a., two-pole generators that have been in successful operation for three years. It can be stated with confidence that the danger of winding failure due to sudden short circuit, with generators of the indicated limiting outputs, will be no greater than 20,000 and 30,000-kv-a. generators that have been placed in operation in large numbers during the past six years.

Another question of interest to those responsible for the operation of large generating units is the extent of damage to winding in case of internal short circuits caused by failure of insulation between turns of the same coil or failure of insulation from copper to ground. Experience with large units now in operation has shown that, in the event of a winding failure that results in the flow of abnormal power current, the chances are that the entire winding will be destroyed and that a hole of considerable size may be burned in the core laminations. Generating units are already of such size that a winding failure usually results in the loss of output from the unit for several months. The results of failures in still larger generators will be of the same degree and will be no more serious except, of course, in that loss in kv-a. output will be greater. In this connection, it is pertinent to point out that the fusing of metal and other local effects of an internal generator failure is a function of station capacity rather than of individual unit capacity. The volume of metal fused at the point of failure is determined largely by the impedance of the generating circuits feeding into the vault. Therefore, the only difference between a failure in one of two 30,000-kva. units and a failure in a single 60,000-kv-a.

unit is in the impedance of the leads buses and other connecting circuits between the two 30,000-kv-a. units. The two 30,000-kv-a. unit installation has the obvious advantages that protective reactance may be installed between the units and the trouble is usually confined to half the station capacity.

The author has not intended to express an opinion as to the wisdom of installing very large single-shaft units. The only purpose has been to point out from the design standpoint the feasibility of certain ratings. Whether it is desirable or even wise to install very large units—above 50,000 kv-a.—will depend very largely on the growth and size of generating stations. When stations double in size—when stations of 300,000 kv-a. and 500,000 kv-a. become typical of American practice—there will undoubtedly be a demand of considerable volume for units of 50,000 kw., 75,000 kw. and 100,000 kw., and if single-shaft units are justified from the turbine standpoint, there is no question but that such generators can be conservatively designed and constructed.

REPORT ON HYDROELECTRIC POWER IN INDIA.

Government Investigation on the Available Water Power Resources and the Cost of Their Development.

The preliminary report of the systematic investigation by government engineers of the water power resources of India has recently been issued and is outlined in the British Government publication (*Board of Trade Journal*). While the data collected are admittedly incomplete, the facts gathered give a striking impression of the enormous potentialities of the development of hydroelectric power and the great benefits which the country must derive by a systematic exploitation of this national asset.

The report gives the following figures of known and probable sites where there is a reasonable prospect of obtaining power, and further states that a round estimate of 1,774,000 electrical horsepower in sight is vastly below the actual power which the final results of the survey will show:

Name of Province.	Continuous electrical horsepower.
Assam	51,200
Bengal	203,600
Bihar and Orissa	12,800
Bombay	258,300
Burma	439,000
Central Provinces	153,000
Cochin	25,000
Kashmir	30,000
Madras	106,000
Northwest Frontier Province	20,000
Punjab	260,900
United Provinces and Benares	32,200
Total	1,592,000

It is estimated that the capital cost of developing the water power of Burma and of the Punjab would be not less than $97,000,000 and $48,500,000, respectively. Of these sums there should be available for the hydroelectric departments $480,000 and $240,000, respectively, which, it is thought, should be sufficient to maintain staffs for the work.

Under the heading "Permissible Cost of Hydroelectric Development" the report deals very fully with and justifies the variations in capital expenditure necessary for different localities and under different conditions. The immediate detailed investigation of works estimated to produce up to 1,000,000 electrical horsepower is recommended and, assuming that only half of this to be ready for immediate development, an expenditure of about $162,000,000 would be necessitated. Prominent engineering authorities, however, are urging for more comprehensive and thorough investigation than the government seems willing to entertain.

The question of the control of water rights and the financing of works is also gone into, and extracts are quoted from the reports of both the British Water Power Committee and the Water Power Resources Committee of the Board of Trade. Both these authorities favor state control, to protect and serve public interests in the development of water power. At the same time, direct government control of a power scheme, once established, beyond that required for the purpose of finance, is generally deprecated.

AMBITIOUS POWER SCHEME PLANNED BY BRITISH MUNICIPALITIES.

Area of 2000 Square Miles to Be Covered at Cost Exceeding $60,000,000 on Proposed Linking Up of British Municipalities.

Plans are being prepared for the erection of a new generating station on the banks of the River Trent, to supply an area of 2000 square miles, 50 miles from north to south, and 40 miles from east to west. The area includes parts of Nottinghamshire, Derbyshire, Staffs, and Leicestershire. The first section of the station would cost £5,260,000, but supply authorities from Chesterfield to Leicester, on the one hand, and Burton-on-Trent to Newark on the other, would co-operate and bear a proportion of the cost.

It is estimated that the whole scheme will require about £14,000,000 to carry through, but it means much cheaper power, and would result in a saving of £40,000 per annum to the Nottingham Tramways alone. At the station, which would occupy at least 100 acres of land, many advantages are offered—an ample supply of condensing water, facilities for bringing coal by water and rail, for the disposal of ashes and coal storage, and, what was very important in future, a carbonization plant. The capacity of the station would be 200,000 kw., and it would require 580,000 tons of coal per annum (or 1500 tons daily) and 14,000,000 gallons of river water per hour.

The scheme outlined above is at present under consideration by the engineers and representatives of the various authorities concerned, but progress cannot be made until the Electricity Supply Bill becomes law, when no doubt the schemes will be submitted to the Government Department concerned and to the authorities which will be set up for dealing with electricity supply generally.

ELECTRICAL DEVELOPMENT IN FINNISH DISTRICT.

A stock company has been organized in the communities of Middle Osterbotten, Finland, for the development of the water power of Korpela Falls on the Lestijoki river. The cost of the development is estimated as follows: Dam and water division, 1,160,000 Finnish marks; power station, 380,000 marks; machinery, 650,000 marks; total, 2,190,000 marks (about $423,000 at the normal rate of 5.18 marks to the dollar; at the current rate, about $110,000).

Editorial Comment

The Burning Question of the Hour

WITH the strike of bituminous coal miners now in its twenty-sixth day, the coal situation assumes a vastly more serious aspect than it has assumed heretofore. The fact remains that the strike could have been settled by compromise the first day, just as well as on the twenty-seventh or the thirtieth day or whenever it is that the production of bituminous coal upon a national scale commences again. Meanwhile the visible supplies of coal on hand are diminishing and hardship and suffering and curtailment of industry come nearer.

A number of industrial plants have shut down completely and many more have curtailed production because of inability to obtain coal to keep going or because of limitations imposed by transportation or other factors arising directly out of the coal quandary. Public utilities, steam and electric railroads, especially, have curtailed their service by taking off trains and reducing schedules. Elimination of needless consumption of electrical energy as for sign lighting and advertising purposes has been made mandatory in some cities and in others the customers have been asked to voluntarily refrain from consuming needless light and power.

The strike of the bituminous coal miners will eventually be settled by a compromise. The pity is that that compromise could not have been made before, before such loss of coal production had occurred, before a strike was called at all. The reason why a compromise has not yet been made we cannot tell, a reason known only to those closest in touch with the stalemate—the coal operators and the miners' union managers. We want the strike settled, but we want it settled justly, which means not merely raising the price of coal and passing on that price increase to the ultimate consumer, but finding a solution at once equitable and sound.

The miners worked an average of 30 hours a week last year, a condition better than previous years, but a condition that needs remedying. The remedy appears to be to create a more steady demand for coal the year round instead of a seasonal demand as exists now; and ability to transport the coal when the demand for it occurs. If a demand can be created the question of railroad cars available at the mine to pick up coal mined as it is mined will tend to be answered, for the car situation is one that very largely determines how many hours the miners are able to work. It might be pointed out here that the domestic consumer is such a comparatively small consumer that his failure to purchase coal during the summer in readiness for the approaching winter is hardly a factor in giving the miners steady work. It is the public utilities, the industrial plants and the other large users of coal that must be made to distribute their purchase of coal throughout the year, and preferably during the summer months.

It is the coal pile that has saved the country from capitulation to the demands of the miners and saved the country from the mercy of the coal operators. It is the coal pile—the coal in storage—that has saved the day for the American public and American industries. "Store your coal now" is the advice that has been given the coal consumer during the summer and early fall in these columns, not once but repeatedly. That advice was sound and circumstances are now bringing home the wisdom of that advice in a vivid manner. But that advice to store coal during the months when it is not needed in readiness for when it will be needed holds for every year. To do so tends to give the miners steady work the year round—their due; it tends to lessen railroad congestion and difficulties that always come with the cold weather; it tends to create a more favorable price for the coal, since price tends to vary with demand; and favors the delivery of a better grade of coal.

The purchaser that buys his coal at the time when the mines are comparatively slack, when the nationwide demand for coal is below the normal, is likely to obtain a better price for his coal, likewise a better grade of coal. He is helping the country's railroads, helping the miners find steady work and helping the country as a whole. Those that bought their coal and stored it see now the wisdom of their act. The thing we wish to emphasize is the desirability of keeping up the practice year by year.

Relations Between Jobbers and Contractor-Dealers

ONE of the significant features of the convention of the Electrical Supply Jobbers Association held last week in Cleveland was the changed aspect from which the jobber viewed the contractor-dealer. Everyone seemed to agree that it was desirable to keep the merchandising of electrical products within the industry and likewise it seemed to be recognized that the most satisfactory way of doing this was to utilize existing channels of distribution, namely electrical contractor-dealers. This was not simply the view of one or two jobbers, but represented the consensus of opinion among all who attended and certainly was borne out by experiences recounted at a meeting of the Atlantic Division on Tuesday.

What this change of attitude implies can only be appreciated by those who are familiar with the sentiments expressed by many jobbers when the Goodwin plan was first launched. It was true that the contractor of old was a poor business man with anything but a bright outlook. But Mr. Goodwin in advocating his platform of co-operation held no brief for the contractor-dealer. He simply said that if we in the industry were to put our house in order we must begin somewhere and the contractor was the logical starting point, for obvious reasons.

The start was made—an organization was perfected and the contractor-dealer was "sold" on his own future. The work has just started, however. No one realizes this better than the contractor-dealer himself. But to carry on involves the co-operation of all branches of the industry, particularly of the jobbers. And at the Cleveland convention many jobbers publicly announced that they had co-operated and found that it paid and paid handsomely.

This sentiment in favor of greater recognition of the contractor-dealer, which was crystallized at the convention, should permeate the entire jobbing industry. What the contractor-dealer needs is a sympathetic understanding of his problems and his response will be rapid and complete. When all is said and done, all that the contractor-dealer asks is a fair opportunity to take his place as an economic factor in the distribution of things electrical to the great American public.

Coal Mining With Central-Station Service

CENTRAL-STATION service instead of power produced by isolated plant has so many advantages over the latter uneconomical and often unreliable source of power that coal mines have steadily been going over to the transmission lines of the public service company. There is every reason to believe that this movement will go on at an even more rapid rate in the near future, following the reaching of a compromise in the strike of the bituminous coal miners.

It appears almost certain that the miners will obtain a definite promise for a radical wage increase. It seems not unlikely that they will also be given what amounts virtually to a guarantee that they shall have opportunity to work more steadily, a condition that will be brought about through a more steady demand for coal and a greater availability of railroad cars. Again, there is every reason to believe that the eight-hour day will remain, the six-hour day being taboo in every quarter. The effective working day may, however, be reduced in that the working day will commence and terminate from the time the men reach the mine above ground instead of from the time they commence work below ground. These things mean a higher labor cost per ton of coal and a somewhat shorter working day, therefore curtailed production.

The country needs coal. Other countries are looking to our coal resources to an increasing extent. Therefore coal production must be maintained, and the most direct and perhaps only way of accomplishing this is to resort more to mechanical methods of mining, which means electrification entirely or in part. Central-station service will thus be called upon to reduce the cost of mining and to increase the rate of coal production, to counteract the higher wages on the one hand and the shorter effective working day on the other. Mines now producing their own power will find added incentives to go over to central-station service, while those already having done so will in all probability find it desirable to increase their connected load and thereby their demand, a condition that must obtain in any case in the endeavor to maintain coal output in face of a shorter working day. The fact that coal will increase in price will make it more and more advantageous for the isolated plant to shut down and take to central-station service, for after all, the fuel used has a market value, so that even the coal operators cannot afford to waste coal that could be sold otherwise.

Central stations that are already supplying coal fields expect that when the bituminous coal miners go back to work that the mines will make a greater demand upon their lines in the way of higher peak load and increased kilowatt-hour consumption per ton of coal mined. These things will not mature immediately, there being a time lag, of course, during which additional machinery will be installed and the movement for replacing man power by electrical power gets under way. During the interim coal production may be expected to decrease. Meanwhile many mines will prepare to go over to central-station supply, because there will be little alternative to do otherwise.

Giving Electrical Christmas Gifts

RESTRICTED spending, just as much as increased production of staples and necessities, is needed now to bring about more healthy conditions, such as are needed to bring the country back to a more normal state. The fact that America is the world's creditor has brought prosperity as it has never been known before.

However, bankers, captains of industry and economists are sounding a warning to save, to spend less upon non-essentials, to call a stop to the extravagances that now seem to have become our national habit. While a prosperous industrial future lies ahead, it is also a fact that the high cost of living, existing high wages and the incessant and limitless demand for higher wages to meet higher rates of expenditure on luxuries as well as for living are a source of danger.

It is fitting that the coming Christmas should be a typical American Christmas, a fitting Christmas following a victorious war. But let it be a thrifty Christmas, a Christmas in which the electrical gift—practical, eminently useful and economical—reigns supreme.

Current Events

Jobbers Discuss Relations with Contractor-Dealers—S.E.D. Elects New President—N.E.L.A. and S.E.D. Co-operate

ELECTRICAL JOBBERS SHOW FAITH IN CONTRACTOR-DEALERS.

Discussions at Cleveland Convention Indicate Evolution in Distribution of Electrical Supplies.

Increasing tendency on the part of electrical jobbers to recognize the contractor-dealer as a legitimate outlet for electrical supplies was strikingly demonstrated in the discussion at the convention of the Electrical Supply Jobbers Association at Cleveland, O., Nov. 18, 19 and 20. Numerous prominent jobbers who have made a genuine effort to cultivate and help in the development of the contractor-dealer reported results beyond the most sanguine expectations, indicating the tremendous possibilities in this direction. At least one jobber stated that since inaugurating a policy of co-operation with the contractor-dealer the ratio of sales has been reversed as between contractor-dealer and industrial plant, sales to the former averaging 75% of the total as compared to 25% in the past.

From every aspect the Cleveland convention was one of the most successful in the history of the association. There was a large attendance of jobbers and an unusually large delegation of manufacturers and their representatives, all of whom were invited to attend the sessions.

Meetings of the Atlantic and Central Divisions were held Tuesday morning and afternoon and general sessions were held the morning and afternoon of Wednesday, with a session at 8 p. m. The Central Division gave most of its attention to the subject of compensation of employees, particularly with respect to a possible reduction in the volume of sales and of corresponding reduction in profits.

The Atlantic Division held a very interesting meeting at which the contractor-dealer situation was ably discussed. The feature of the meeting was an address by W. G. Kennedy, of the Sibley-Pitman Corp., of New York, outlining the astonishing results secured by adopting a policy of close co-operation with the contractor-dealer. Other speakers recounted similar results following the development of a contractor-dealer policy. C. W. Peet, national chairman of the National Association of Electrical Contractors and Dealers, indorsed the new policy of the jobbers and bade them be patient. He outlined briefly the work that was being done to improve conditions in the industry.

At the general sessions addresses were made by W. L. Goodwin and Samuel Chase, both speakers expressing implicit faith in the future of the contractor-dealer. A resolution was unanimously adopted pledging support of the jobbers individually to the Bureau of Research of the National Association of Electrical Contractors and Dealers.

A resolution was also adopted requesting members of the jobbers association who conduct allied businesses to divorce these from the strictly jobbing end under a separately incorporated company.

The executive sessions were held on Thursday morning and Thursday afternoon. Resolutions regarding methods of billing goods for future delivery were discussed, and the report of the lamp committee taken up in detail with representatives of the lamp manufacturers. Various changes in methods of compensation were explained, and the report of the lamp committee of the Electrical Supply Jobbers Association adopted.

The action of the Hot Springs meeting in voting to hold the next convention at Del Monte, Cal., was re-affirmed, and Franklin Overbagh, general secretary of the Electrical Supply Jobbers Association, was unanimously elected chairman of transportation.

Ross G. Holabird explained the preparations which were being made to entertain the convention in California, and aroused great enthusiasm, the members present voting practically unanimously to attend.

At the afternoon session the report of the publicity committee was received, and the session was closed with an address by J. M. Wakeman, of the Society for Electrical Development, who explained the function of the society and the very considerable growth which had come about in its work and influence.

W. W. FREEMAN PRESIDENT OF SOCIETY FOR ELECTRICAL DEVELOPMENT.

Other Prominent Men Make Up New List of Officers—Brief Report of Society's Activities and Plans.

At a meeting of the Board of Directors of the Society for Electrical Development held at the society's offices, in the Engineering Societies building, New York City, on Nov. 11, W. W. Freeman was unanimously elected president of the organization succeeding Henry L. Doherty, who has held that office since the founding of the society nearly six years ago.

As president of the Union Gas & Electric Co. of Cincinnati, Mr. Freeman is well known to all branches of the electrical industry. Being vice-chairman of the Public Policy Committee of the National Electric Light Association, of which committee Mr. Freeman was chairman for a number of years, the new president brings to the society a broad experience in dealing with matters pertaining to the relations between the great electricity consuming public and the people who produce and market the energy and the devices through which it is used.

Under his leadership the society will continue its excellent work of co-ordinating and assisting all branches of the electrical industry to bigger and better business as well as carrying to the public the message "Do It Electrically."

Under the guidance of Mr. Doherty, its past president, the society has done a big work in getting the various branches of the electrical industry together and advancing their united interests. The extent of this work is made evident by a few extracts from the annual report of the society's general manager, James M. Wakeman.

This report emphasizes the fact that in spite of the handicap of the war, the society was able to continue its regular work of supplying articles on electrical subjects to newspapers, trade journals and popular magazines. A great deal of extremely valuable publicity for the electrical industry was thus obtained. Particular attention has been paid to developing the demand for household appliances and motors for industrial purposes. The society has under way a campaign for better industrial illumination.

When one realizes the effort that was previously required to sell washing machines, electrical ranges, vacuum cleaners or even irons, it is possible to appreciate in some measure the tremendous effect of the educational work the society has carried on during the past six years. The industry is reaping the benefit today, but as the effect is accumulative, still greater business is assured for the future.

The electrical range handbook prepared by the society has been pronounced by range manufacturers, dealers and salesmen the greatest help ever supplied to them in their work of selling the "idea of cooking electrically."

The *Monthly Sales Service* has been regularly issued and its general character not only maintained but greatly improved. The electrical men in all sections of the country are continually expressing their appreciation of the great help this publication is in carrying on their business.

Now that members have become familiar with the character of special services which they can receive from the society, requests for this sort of help are coming in daily. These requests range all the way from information wanted on voltages of lighting circuits in foreign cities, heating and cooking rates in American cities, numerous uses of electricity in the various industries, down to the names and addresses of manufacturers of this or that electrical device or the preparation of advertising copy and the outlining of a special sales campaign.

The staff of the society has always co-operated with other electrical organizations in every way possible. While there have been at times apparent duplications of the work of the society, it is believed that with a better understanding of the work of this organization there will be a better spirit of co-operation.

It is not only interesting, but extremely significant how the society has attracted the attention of other countries. Great Britain has started an "Electrical Development Association" patterned upon the Society for Electrical Development. This new organization has studied the literature, the aims and achievements of the American society and has decided to carry on the same kind of work to develop the industry in Great Britain. A member of that association has visited the society's offices and spent several days going over its files carefully.

Other visitors have come from Switzerland, from France and from Japan, all with the object of studying the methods of the society and with a view of inaugurating similar organizations in their own countries.

The society is now conducting another of its national campaigns. Through the drive for "An Electrical Christmas" the public is learning of the appropriateness of electrical devices as Christmas gifts. Reports from members and nonmembers alike indicate that the society is again doing the right thing at the right time.

In addition to the election of Mr. Freeman as president, two new vice-presidents were also unanimously elected. Fred Bissell, of the F. Bissell Co., of Toledo, is widely known as a progressive member of the electrical jobbers' fraternity. James R. Strong, of the Tucker Electrical Construction Co., of New York, stands high in the estimation of electrical contractors and dealers.

Charles L. Edgar, president of the Edison Electric Illuminating Co., of Boston, was appointed a director representing central-station interests in place of E. N. Sanderson, resigned.

Arthur J. Binz, of Houston, Texas, newly elected Jupiter of the Jovian Order, was appointed to the board in place of L. O. Ripley.

J. E. Montague was elected chairman of the new Executive Committee. The other members being: W. W. Freeman, L. P. Sawyer, W. D. Steele, E. W. Rockafellow, J. R. Strong, Fred B. Adam and J. Robert Crouse.

N. E. L. A. AND S. E. D. TO CO-OPERATE IN PUBLICITY WORK.

Meeting of Advertising and Publicity Service Bureau, N. E. L. A., Favors Eliminating Duplication of Work.

At a meeting of the Advertising and Publicity Service Bureau of the Commercial Section, National Electric Light Association, held recently in Chicago, important steps were taken to secure co-operation in electrical publicity work. In calling the meeting to order Chairman Gibbs stated that the Society for Electrical Development recently received the support of many large central-station and manufacturing organizations and that plans were being formulated to greatly expand its activities. It was desirable to so conduct the activities of both the society and the Commercial Section as to avoid duplication of effort. According to Mr. Gibbs, the Advertising and Publicity Service Bureau would function executively instead of handling in a production or mechanical way the work involved—that is, the Bureau's activities would be largely of an advisory and suggestive character. Mr. Gibbs outlined the organization of the Bureau, with particular reference to its relations with geographic sections of the association and with other bureaus and committees of the Commercial Section; also relations with other associations and various branches of the electrical industry, as indicated in the Bureau's organization chart.

No report was presented by the Division on Coordinate Advertising and Sales Campaigns, but in the discussion which ensued it was the consensus of opinion that this subject, originated by the Co-ordinate Advertising and Sales Campaigns Committee, now embraced in the Advertising and Publicity Service Bureau, was worthy of continuation and that a special effort should be made to obtain the co-operation of all related elements, particularly the manufacturers and central stations.

P. B. Zimmerman, chairman of the Division on Illuminating Engineering (nontechnical applications), stated that the work of this division would be largely that of effecting close co-operation with the Illuminating Engineering Society, Society for Electrical Development and the Lighting Sales Bureau, Commercial

Section, N. E. L. A., to the end that the electrical industry in general, as well as the public, would be informed regarding progress in the lighting art, as well as making understandable the technical phases of the work which were susceptible to commonplace translations.

Mr. Gibbs outlined the purpose of the Adequate Outlets Division, which was amplified by Chairman John G. Learned of the Commercial Section, the "father" of the general idea, which was to promote in every possible manner the installation of more electrical outlets, thus making it possible to use more extensively electrical appliances, portable lamps, etc.

For the Motion Picture Films Division Mr. Gibbs stated that Chairman Chas. H. Pierson, being located in Los Angeles, close to the center of motion-picture production activities, would be in a position to have consideration given to electrical applications in many films that could employ successfully material of such character.

In the absence of the chairman of the National Commodity Advertisers Division, Mr. Gibbs outlined the work of this division, which in general was to get in touch with advertisers, advertising agencies and others in an effort to have electrical appliances and their applications featured in advertising "copy" generally. It was the consensus of opinion that there was opportunity to do much educational work in this line which would react favorably on the electrical industry.

Mathias Turner, chairman of the Newspaper Advertising Compaign Division, referred to the general development of co-operative electrical pages, with particular reference to what had been accomplished in Cleveland. Frank H. Gale reviewed the general subject of advertising and publicity, dwelling on the rapidly increasing interest in electrical subjects and indicating that the time was now right to get before the public the electrical industry's message, especially as magazines and newspapers are carrying a considerable amount of electrical advertising and publishers are keenly alive to the future of the electrical industry, thus offering a big opportunity to travel on this wave of interest. J. M. Wakeman stated that 172 newspapers used regularly material furnished by the Society for Electrical Development. He reviewed the work of the society. Mr. Gibbs referred to possible co-operation of value with the American Newspaper Publishers Association.

Frank B. Rae, Jr., chairman of the News Syndicates and Magazine Writers' Division, emphasized the importance of central stations and others offering to the members stories of live interest written in an entertaining and informative manner necessary to justify and assure publication. Frank Kivel suggested development of "questions and answers" pages in magazines and newspapers, through which electrical information could be disseminated. Mr. Wakeman stated that the Society of Electrical Development was conducting work of a similar character at this time.

Cyril Nast, chairman of the Publications Division, advised that no program of activities had been outlined as he was awaiting specific instructions from Chairman Gibbs as to the scope of activities of this division.

O. H. Simonds urged that special consideration be given to co-operation with small central stations, indicating that one-half and full-page co-operative electrical advertising pages had been run successfully in Dubuque, Iowa, in close co-operation with electrical contractors and dealers.

R. S. Hale, chairman of the Wiring Committee, reviewed briefly the work of this committee, with special reference to standardization activities, all of which were calculated to help the public to use electric service conveniently and economically.

Clarence L. Law, chairman of the Lighting Sales Bureau, indicated his desire to co-operate with the Advertising and Publicity Service Bureau in every way possible.

John W. Meyer spoke of the work of the Power Sales Bureau and the opportunity afforded by the Advertising and Publicity Service Bureau for acquainting the electrical industry and the public of the advantages of central-station power applications.

Chairman John G. Learned of the Commercial Section referred to the desire of this section to co-operate closely with the Society for Electrical Development to the end that maximum results could be obtained with minimum duplication of effort and expense. He indicated that the prime object was to see that essential work was accomplished. Mr. Learned referred to the meeting of a special committee to consider co-operation between the two organizations and presented informally the following resolution, which was later to be presented before the Commercial Section's Executive Committee to form a part of the special committee's report on this subject to the National Executive Committee. The resolution follows:

> "Whereas, it is desirable that the activities of the Commercial Section of the National Electric Light Association and the Society for Electrical Development, Inc., be conducted to obtain maximum results and to avoid duplication of effort, and
>
> "Whereas, the Society for Electrical Development, Inc., has a trained and experienced staff with facilities for the general promotion of the use of electricity, electrical merchandise and other translating devices;
>
> "Be It Resolved That, A conference be held each month, or more often, if necessary, at the headquarters of the Society for Electrical Development, Inc., or the National Electric Light Association, to be composed of representatives of the National Electric Light Association and the Society for Electrical Development, Inc., as follows:
>
> "For the National Electric Light Association—Chairman (or authorized representative) of each National Special Section; chairman (or authorized representative) of each National Special Committee, and such other members of the respective Sections and Special Committees as desired;
>
> "For the Society for Electrical Development, Inc.—Such members of the Executive Committee (representing contractors, jobbers, manufacturers and central stations) as desire to attend; the general manager and such members of his staff as desired;
>
> "The conference to decide upon plans for producing, and publishing newspaper articles, publications, special campaigns and all related matters for the promotion of the use of electricity.

"The Society for Electrical Development, Inc., shall produce and distribute publications and related matter as authorized by the conference, with or without the imprint of either or both the National Electric Light Association and the Society for Electrical Development, Inc., as desired.

"For the purpose of assimilation, chairmen of the sections shall transmit to the conference information pertaining to the general activities of their respective sections.

"The sections shall issue publications as they are deemed advisable. Such publications, however, shall not be duplications of the printed matter heretofore referred to and they may be produced and distributed by the Society for Electrical Development under the direction of the section interested. Publications so produced and distributed shall be charged to the section interested at the invoice cost plus cost of distribution."

After extended discussion the resolution was unanimously adopted.

BYLLESBY UTILITIES TO BUILD THREE NEW POWER STATIONS.

Three Central Stations to Install 33,500 Hp. in New Power Plants in 1920—Additions Will Bring New Work to 100,000 Hp.

Rapidly increasing business in territories served by Byllesby electric properties has made imperative additional generating capacity. Three new power stations with a total initial capacity of 33,500 hp. have been planned for immediate construction and further necessary additions and extensions are receiving attention.

One of the new stations will be located in southern Minnesota, where demands of the southwestern districts served by the Northern States Power Co. have exceeded the capacities of the several divisions concerned. A new steam station will be constructed at this point and one 13,500-hp. steam turbine will be installed. Provision will be made for a second unit of 20,000 hp. to be installed later. Condensing water will be obtained from the Minnesota river and present equipment will include three 1165-hp. boilers with coal and ash-handling machinery, etc. The improvement is expected to be completed within a year.

A new station with an initial capacity of 10,000 hp. will be constructed in western Oklahoma to take care of the growing demands upon the Muskogee, Sapulpa and Drumright divisions of the Oklahoma Gas & Electric Co. Condensing water will be obtained from the Arkansas river.

The third station will be constructed at Pueblo, Colo., on the present power-house site of the Arkansas Valley Railway, Light & Power Co. The present power station with a capacity of 7500 hp. will be maintained and the new station with an initial capacity of 10,000 hp. will be constructed adjacent to it. This improvement, like the others, is necessary because of increasing business in the present territory and not because of expansion of territory.

With the new 40,000-hp. unit at Riverside station at Minneapolis (now under construction) and other enlargements or extensions at the properties either being built or contemplated, the combined properties of H. M. Byllesby & Co. will have available an additional 100,000 hp. of generating capacity before the end of 1920.

COLONEL ARNOLD NARRATES AIRCRAFT EXPERIENCES OF THE WAR.

Intensely Interesting Address Before the Electric Club of Chicago Explains Much of the Development Work.

The far reaching importance of much of the war work done by engineers and scientists who did not get to the battlefront or even overseas was explained by Col. Bion J. Arnold, the well known consulting engineer, in an address before the Electric Club of Chicago on Nov. 25. He spoke almost entirely of such work that he came personally in contact with, first as a member of the Naval Consulting Board and later when in active service as an engineer officer of the aircraft division of the Army and Navy.

Before we entered the war the Naval Consulting Board began studying inventions dealing with solution of the submarine menace and other weapons of warfare. Later the National Research Council and Council of National Defense took this over. Several thousand inventions were analyzed and all promising ones tried out. Out of this, for instance, came the submarine detector or listening device built on a simple principle. Colonel Arnold had long been interested in aeronautics and was chosen to make a comprehensive investigation and recommendation on speeding up of all aircraft production facilities, both for the Army and Navy. Subsequently he conducted the Congressional Committee investigating this matter to the various plants engaged on the work. Although there was considerable waste in this and other branches of our feverish war preparations, it was unavoidable and no more proportionally than would have occurred under private jurisdiction. An extraordinary amount of work was accomplished on a much bigger scale than was generally understood by the public.

Colonel Arnold also spoke of an extended investigation he made of our aluminum resources which showed these were ample for our war needs and those of our Allies, if conservation in miscellaneous consumption were affected. In the last months of the war he was engaged in co-ordinating and speeding up production of a special and very ingenious aerial offensive weapon of gigantic deadliness which was practically ready when the armistice was signed. During these months he had some thrilling flying experiences.

CONTRACTS FOR SEATTLE PLANT UNIT AWARDED.

The Seattle Board of Public Works, Seattle, Wash., has awarded contracts to furnish and install the equipment for the new steam-electric unit at its Lake Union auxiliary plant, for which bids were opened recently. The bid of Chas. C. Moore & Co., of San Francisco, was accepted on six watertube boilers of 825 hp. each, superheaters and stacks, oil heaters, oil pumps, feed-water heaters and piping system; also boiler-feed pumps and service pumps, high-vacuum jet condensers, with air and water pumps having both motor and turbine drive. This bid was $415,707.

To the Allis-Chalmers Mfg. Co. was awarded the contract for furnishing the 10,000-kw. steam turbogenerator with both steam and motor-driven exciter and all accessories at $195,500.

Commercial Practice

Electricity for Oil-Well Drilling—Explaining Increasing Light Bills—Louisville Company Sells Stock to Customers

OIL-WELL DRILLING BY ELECTRICITY PROVES ECONOMICAL.

Advantages of Electricity for Drilling Includes Savings in Cost, Small Depreciation, Simplicity and Flexibility of Operation.

It is stated that when the extensions of the high-tension transmission lines now under construction in north Central Texas are completed, most of the well drilling operators will discard the steam motive equipment on their drilling rigs for electric power. Many wells in the Burkburnett field are being pumped with electric power, and it is asserted substantial savings have been effected in the cost of drilling as well as pumping.

In one well in the El Dorado (Kansas) field engineers of the Empire Gas & Fuel Co. claim a saving of $3655.20 by using electric power instead of steam power. S. B. Severson, chief of the electrical engineering department of the company, in a report says that this well was the first one drilled in that field by electricity, although hundreds of the company's wells are being pumped by electric power.

"Attempts have been made in recent years to use electric motor equipment for drilling deep wells," says Mr. Severson, "but it has been only within the last year or two that much success has been attained. A number of wells have been drilled with electric motor in various parts of the world. The question of motor has been readily solved, but the perfect control necessary to satisfy all conditions in the drilling operation has been difficult to obtain. Results obtained in the drilling of the well in the El Dorado field and a subsequent well show conclusively that a combination of motor and control apparatus has been perfected to a degree that causes even experienced drillers to say electric drilling equipment is superior to steam. Reports from operation give ample proof that the trial was satisfactory and successful."

The veteran driller, it was believed, would not take kindly to the new method, but this did not prove to be the case. In a short time both crews became so familiar with the electric apparatus that the services of an electrician hardly were needed. This was the experience of J. G. Dickinson, electrical engineer, who was stationed at the well and who made a general report, which said:

"The maintenance of the electrical drilling equipment consisted principally of attention to the contact fingers and segments in the main controller due to the fact that these parts become pitted by the arcing caused in reversing the motor and prevent the fingers from making a good contact. This condition would not require the constant attention of an electrician, but could be handled by the regular inspector on his daily visit, and in the event of more serious trouble, the trouble-man of the electrical department could be summoned.

"The driller and tool dresser became familiar enough with the electrical equipment during the test to be particularly independent of outside assistance, so that electrical drilling equipment will not require the services of an extra man. On two or three occasions fuses were replaced, but at no time was there any serious electrical trouble. The principal delays incurred during the test were caused by rig equipment.

"While the operation during the test covered a period of 60 days, the actual drilling was accomplished in 34 drilling days, and the only water required for the test was water used in the hole for mixing the drillings.

"The controllers were so arranged that they provided 80 different speed variations. The controllers were operated by steel cable lines from levers on the 'headache' post. The weight of the motor was approximately two tons.

"The ammeter was located in the derrick close to the 'headache' post, and showed the driller the amount of power he was using. During drilling operations in hard lime, where the tools got a good rebound, it required 50 to 60 amperes, or from 30 to 35 hp. For drilling in shale, where the bit muddled up, the ammeter showed about 60 to 70 amperes, or about 35 to 41 hp. In pulling the tools out and in bailing water is usually required about 100 to 125 amperes, or about 57 to 75 hp. As the motor was 75 hp. and would stand a load of 100% continuously, a 25% overload for two hours and a 100% overload for two or three minutes there was ample reserve power for any emergency that might occur. By changing the taps in the transformer bank the voltage was raised so that while drilling it would be about 440 volts. In that way the motor received the rated voltage during the operation, which was nearly continuous.

"During the test, tachometer readings were taken while drilling in order to determine the 'kick' on the line when using a motor as compared with a neighboring steam drilling outfit, but there was not enough difference to be noticed, so the 'kick' on the line may be taken as identical on the two outfits.

"A perusal of the daily report will show that this well had more to contend with than the average well. There was much more bailing than usual, and this, in turn, caused considerable rig trouble. The bull-wheel, band-wheel and the sand-reel had to be replaced. This, with other difficulties, caused many delays that otherwise would have been avoided. Water and caving increased the cost per foot drilled more than the average for electric drilling in California.

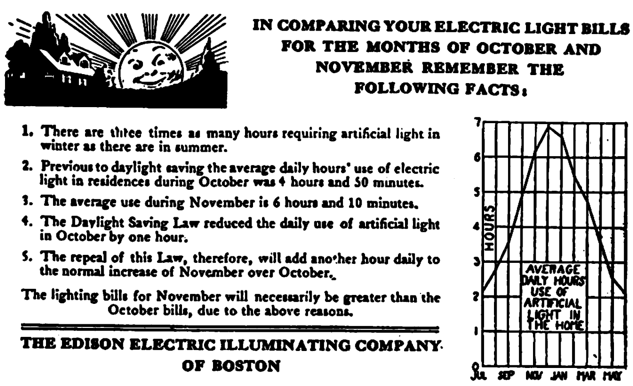
"The many advantages of electricity for drilling were realized on this well from the start. The saving in cost includes the building of one house that will suffice for both drilling and pumping without motor and control is less than the cost of boiler and engine. The cost per day for drilling by electric power is less than with steam. The water consumption is smaller. There is almost no fire risk, and it is not necessary to move the motor away from the rig if gas is encountered. The depreciation of the electric equipment is very small and repair parts are interchangeable. The motor used for drilling is supplied with screws at the bottom of the end shields, so that reasonable wear in the bearings may be taken up and thus the air gap may be kept balanced on all sides. With good oil for the bearings, it should not be necessary to do this more than once in eight months."

BUILDING UP THE CUSTOMER'S CONFIDENCE IN THE METER.

How Boston Edison Co. Explains Increasing Bills Due Shortening Days.

In spite of the fact that watt-hour meters have been proven uniformly accurate measuring instruments, that central-station companies have been continually decreasing their rates, and that electric service is practically indispensable to users, it is difficult to reconcile customers to the amounts of their monthly lighting bills. Central stations can generate electrical energy, but it is not so easy to generate the customer's faith in a device that measures the amount of money he has to pay for service.

The majority of complaints that come from customers are in the nature of claims for overcharges, meters "running fast" or "creeping." And just at this



Card Sent to Customers to Explain Increase In Lighting Bill.

time of year, when lighting service demands are increasing, the complaints come the most frequent. The difference between October and November bills is the most noticeable, due to the shortening of the days and to the change back to standard time.

In order to let customers know of these conditions affecting their lighting bill, the Boston Edison Co. prepared a card, reproduction of which is given, explaining the reasons for increased bills and mailed one to each customer. The explanations are frank and convincing, and serve to build up the customers' faith in the meter and the company.

INDIANA COMPANY ASKS CO-OPERATION OF PUBLIC.

Co-operation with the public has been the object of some excellent publicity work recently done by the Northern Indiana Gas & Electric Co., Ft. Wayne, Ind. The company addressed an open letter to the public, in advertising display type, showing the public what the company is anxious and willing to do in regard to good service. The company, in the same letter, addressed an appeal to its employes for greater harmony as relating to the company's interests and the rights of the public.

LOUISVILLE COMPANY STARTS CUSTOMER-OWNERSHIP PLAN.

The customer-ownership plan of distributing electric securities among the citizens served by Byllesby companies has been extended to the Louisville Gas & Electric Co. Within a few days after the announcement of the plan in the newspapers 520 inquiries had been received and nearly 100 residents of Louisville, Ky., had become preferred shareholders.

Customers and the public generally were invited to become profit-sharing partners in the Louisville Gas & Electric Co. in accordance with the new financing policy announced by the company. To make this possible, preferred stock will be issued and offered with a view of giving people of small as well as large means an opportunity to acquire part ownership. Investment on the partial payment plan will be a feature, and the company will henceforth maintain an investment department at its office, where citizens may purchase its securities direct. The new department will be in charge of J. W. Smiley.

The company has no preferred stock outstanding at present. Recent amended articles of incorporation were filed, authorizing the issue of 7% preferred stock, and the board of directors authorized the sale of $2,000,000 of such stock to the public. Proceeds of the stock must be used for the retirement of outstanding bonds or the construction of additions and extensions to the property which would otherwise require the issue of bonds. The new stock will have full voting rights.

In the past the funds required for construction purposes to serve the increasing demands of a growing city and business have been obtained by the company through the usual investment channels. The new plan marks the inauguration of a definite step toward the building up of a large number of customer-shareholders among citizens in all walks of life. The object of the company, according to the announcement, is to make the largest possible number of home shareholders by offering them an attractive security, so that eventually the utilities will be popularly owned, and at the same time retain responsible, experienced and economical management.

DETERMINING CARBON CONTENT OF STEEL ELECTROLYTICALLY.

The carbon content of steels may be determined rapidly and quite rapidly by absorbing the carbon dioxide resulting from direct combustion of the metal in oxygen in a solution of barium hydroxide. The carbon content is decided by measuring the electrical resistance of the barium hydroxide solution. Further particulars as to the method employed and the apparatus used will be found in Technologic Paper No. 141, by J. R. Cain and L. C. Maxwell, Bureau of Standards.

CLOSE MUNICIPAL PLANT.

Voters of Eldon, Ia., have ratified a contract between the municipality and the Ottumwa Railway & Light Co. for the purchase of the community's electrical energy requirements from the company. The municipally owned steam plant, which has up to this time generated electricity for street lighting and business and residential use, will be abandoned. The company is building an extension of its transmission lines to serve the town.

Operating Practice

Sealing Up Blown-Out Concrete Dam — Carbon Dioxide and Fuel Saving—Reducing Corrosion of Turbine Blading

INTERESTING MODE OF SEALING UP BLOW-OUT IN CONCRETE DAM.

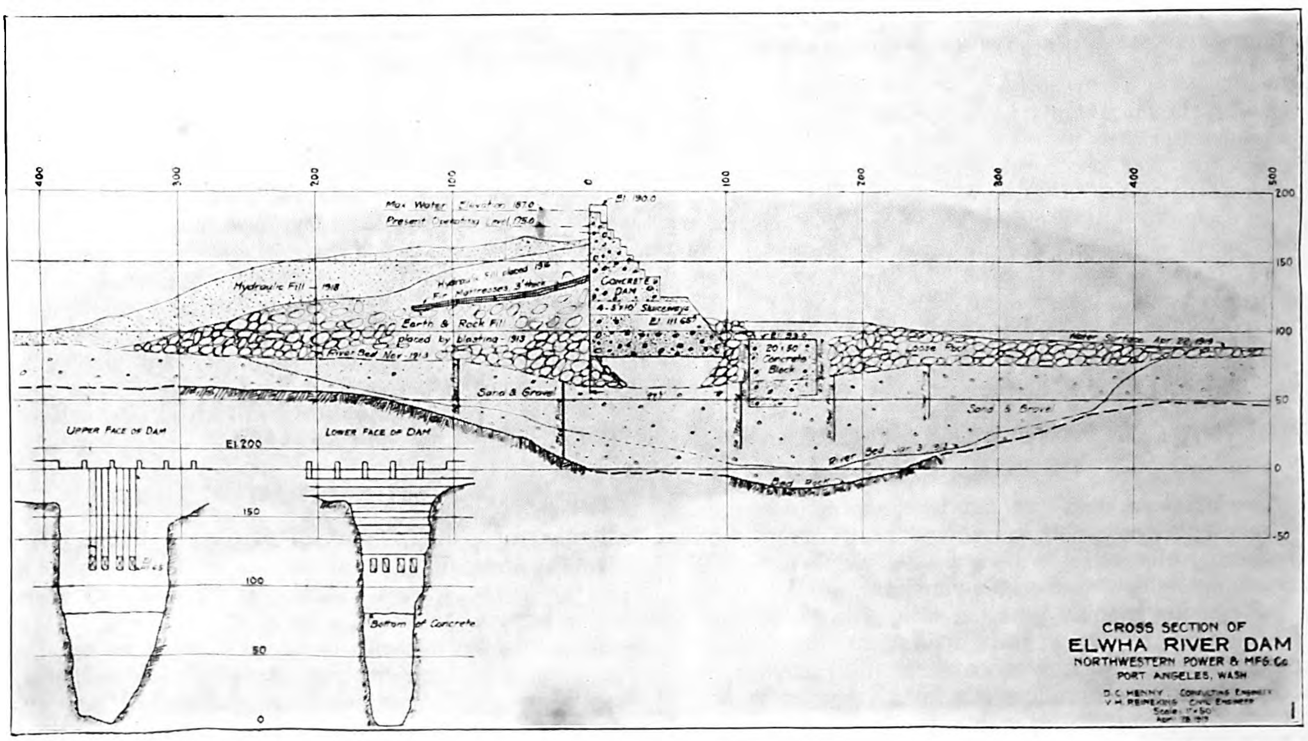
Outline of Measures Adopted to Stop Flow and Seepage Through Dam.

The blow-out which occurred under the Elwha river dam of the Northwestern Power & Manufacturing Co., in the vicinity of Port Angeles, Wash., about three years ago, created for that company the difficulty problem of building up a substructure that would make the dam available for the purpose for which it was originally built. The blow-out extended to a depth of 90 ft. below the base of the concrete dam and to a level about 10 ft. above bedrock in the canyon proper.

It was considered not practicable to unwater the stream sufficiently to allow the concrete to be extended down to bedrock, and the first step taken was to drive sheet-steel piling both above and below the dam and to run a heavy concrete block at a point just below the lower toe of the dam. Then, the canyon walls both above and below the dam were blasted in for the purpose of choking the flow of the river. This resulted in stopping about one-half of the normal flow of the stream. The next step was to fix in place a fir mattress upon the blasted-in portion of the dam and fill in on top of it 30,000 cu. yds. of material by hydraulic work. The result of this was to reduce the flow through the structure to 160 cu. ft. per sec.

At the conclusion of the work above described, the Puget Sound Bridge & Dredging Co., Seattle, was engaged to continue the hydraulic work, which has been continued and 180,000 cu. yds. of material have been filled in above the concrete dam, making about a 1 to 3 side slope. When this work was completed it was ascertained that the seepage loss had been reduced to 80 cu. ft. per sec. at the water elevation of 185.

It was decided that the hydraulic method of sealing, which had been adopted, would not in itself prove sufficient to entirely stop the seepage loss. Following this a plan was devised which it is believed will prove effectual, and the work of carrying it out is well along toward completion. First, a cofferdam was constructed of material previously sluiced in by using a drag-line scraper. The cofferdam served to cut off the portion of the basin immediately in front of and next to the concrete dam. The plan was that if, when the cofferdam was completed, a marked decrease in seepage loss was observed, a flexible copper joint would be set into the upstream face of the dam and joined to a reinforced concrete slab, 4 ft. wide and 12 ins. thick. The purpose of the flexible copper joint was to provide for possible settlement of the hydraulic fill against the face of the dam. Inasmuch as the anticipated reduction in seepage was in evidence after the completion of the cofferdam, the concrete slab with flexible copper joint was put in place. That phase of the work is being followed by a method of asphaltic sealing, to consist of joining onto the re-



Cross-Section of Elwha River Dam.

inforced concrete an asphaltic composition of such consistency as will not harden under cold water and which is to be extended over the entire area behind the cofferdam. The asphaltic sealing is to be covered with boulders and cobblestones to hold it in place. At the conclusion of this work observations will be made as to seepage loss, and if the entire method shall prove efficient, the other areas above to the dam will be treated in a similar manner.

CARBON DIOXIDE AND FUEL SAVING.

By F. A. Uehling.

I was greatly interested in reading your editorial article entitled "Air Supply to the Boiler Room" because it touches a somewhat neglected subject, yet one of prime importance to every steam power plant because it has an important influence on the amount spent for fuel. Every statement in the article is true and to the point, and still I fear it will leave the reader with the thought that too many plants suffer from an insufficiency of air for the furnace, whereas, exactly the reverse condition is true. In fact, I believe that for every boiler furnace that uses too little air there are at least a hundred that use too much.

For example, you state "Too many power plants suffer from insufficient air; too many stacks are taxed because of closed doors and windows during the cold weather. The fires in too many boiler rooms are partly asphyxiated because no proper provision for incoming air has been made. And the reason for these things is not because it has been overlooked that air is one of the three raw materials required in steam making by fuel, but because the vast volume and heavy weight involved are not fully appreciated."

By far the largest single loss in the steam power plant is found in the heat carried away up the chimney. The principal factor contributing to this loss is the excess air which enters the furnace through the ashpit door or through leaks in the boiler or furnace setting.

All air in excess of that actually required to support combustion increases the volume of gases passing up the chimney, thus supplying a greater vehicle to carry away the precious heat units. Likewise excess air mixes with the gaseous products of combustion, lowering their temperature alarmingly. It is obvious that the heat misappropriated in this way leaves fewer heat units to enter the boiler and evaporate water.

It is fortunate that there is a simple and accurate means of measuring this excess air so that it may be regulated. It is based on the fact that the percentage of carbon dioxide (CO_2) in the flue gases bears a definite relation to the percentage of excess air. The accompanying table shows how the percentage of Co_2 falls as the amount of air per pound of fuel is increased. The third column of the table shows how excess air lowers furnace temperature and the fourth column gives some idea as to the magnitude of the heat losses occuring with lower percentages of CO_2. Even slight increases in CO_2 percentages represent worth while fuel savings. For instance, an increase in CO_2 from 6.2 to 7.3% reduces the loss due to excess air from 35.7 to 30.5%. By maintaining even such a slight improvement as this the coal expense would be reduced 5.2%, not to mention other advantages.

As a matter of fact many plants are reducing their coal expense from 10 to 20% per annum by the intelligent use of CO_2 recorders. The cost of installing and operating such instruments fades into insignificance compared with the saving effected. The sixth column of the table enables the reader to estimate his actual losses up the chimney in dollars and cents. No better means could be found of driving home the fact that excess air costs money.

HEAT CARRIED AWAY UP CHIMNEY.

Based on data in "Steam Power Plant Eineering" by Prof. Geo. F. Gebhardt. Based on carbon of 14,540 B. t. u. calorific value as fuel, on dry chimney gases and 600 deg. F. chimney temperature and 60 deg. F. atmospheric temperature.

Percentages of CO_2 in flue gas.	Pounds of air per pound of fuel.	Fire temperature deg. F.	Heat wasted up chimney in B. t. u. per pound of fuel.	Percent of heat of fuel wasted up chimney.	Money wasted up chimney for every thousand dollars spent for fuel.

DUQUESNE LIGHT CO. USES KEROSENE FOR REMOVING TURBINE SCALE.

It is well known that the piping of heating systems become corroded in course of time, the corrosion being due to dissolved gases taken into the system either with the feed water or through leaks in return lines at a pressure below atmospheric. One of the chief aims in reducing corrosion is to eliminate the oxygen in the water, because when this is done water ceases to be a corrosive agent in the manner here understood. Carbon dioxide causes acidity, of course, but indications are that with oxygen absent water has little tendency to cause corrosion.

Open type heaters offer one solution to reducing corrosion of pipes, oil treatment another. The Duquesne Light Co. applied the use of oil-kerosene, actually—in one case of corrosion, and with very successful results. In one of its stations, this company had a steam turbine that was corroding seriously around the blades. This turbine had to be shut down about six hours per day, because of operating conditions, during which time condensation upon the blading occurred. Oxygen entered the turbine casing through leaks and with the steam, and this in the presence of the condensate, started corrosion. This continued more or less intermittently for some two years at which time the corrosion had become a serious matter.

At the suggestion of F. N. Speller, a pure heavy mineral oil with a paraffin base was dropped into the steam ahead of the throttle at a regular rate, the purpose being to cause a thin oil film to form upon the blading and casing. This treatment proved so effectual in stopping corrosion, by protecting the surfaces, that the practice has been continued. About one and one-half gallons of kerosene are applied every day at the time of shutting down, and five gallons are applied every Saturday before the weekly shutdown. The application of kerosene in this way cleans out whatever scale exists and lessens the likelihood of any more adhering. Corrosion is, likewise, reduced.

Contractor-Dealer

Potential Field for Fan Sales—Electric Reading Lamps as Suitable Christmas Gifts—Good Example of Dealer Helps

MAKING A MARKET FOR A MILLION ELECTRIC FANS.

Opening Up a Field That Is Rife with Possibilities for the Sale of Enormous Quantities of Fans in 1921.

By D. H. Colcord.

I am no more interested in electrical dealers marketing a million electric fans in the summer of 1921 than I am in yesterday's weather report, except that as an outsider not in the business I can see merchandising possibilities to which merchants may be blind. I can see clearly and logically how dealers in and salesmen of electric fans can create a potential market for the summer of 1921 that will tax every electrical manufacturer to the capacity of their plant. Why 1921 and not 1920? There hangs the tale.

I know nearly a million places where humanity swelters without the cool breezes of an electric fan—rooms where the occupants are doing the hardest kind of mental labor—studying when they don't want to. These folks have never dreamed of a fan and once they start in there will be a riot. They will rise up and demand fans. I know, because I spent seven years in one of those rooms—in April, May, June, September and October—close to the Mason and Dixon line—trying to pound a little knowledge into their hot heads. Why isn't every school child in the United States, especially in the South, entitled to the same comfort at his work during the warm days of the spring and fall that their fathers enjoy at the office? There is the proposition: *Every school room should be equipped with electric fans.*

You have already thought of the obvious objection: that there is no school during the hot months of the year, that fans for the few hot days at the beginning and close of the term are unnecessary.

I am writing this in Pittsburgh on the last day of October with a 14-inch electric fan stirring up a room full of sultriness and warm stagnant air. I'll bet that there are a thousand fans running now within five miles of my desk; and that at the same time a squad of instructors are leaving the high school in the next block, exhausted after a "blue Monday"—blue, because it's hot and muggy and rainy, and the youngsters were "dead" all day. But their dads are not; they snapped on the fan!

I'll grant that it would be foolish to install fans in Dawson or Halifax—but not in Austin or Tampa or even St. Louis. Even if electric fans were needed only two months a year, between the Mason and Dixon line and the Canadian border, they would pay in health and happiness for the kiddies. They are not costing anything when not in use. As a matter of fact anybody knows who has "passed" geography that the two most important months in the school year are the first and the last—and these are the hottest. In September it is hard for a child to get a good start, so essential for a successful year, with the thermometer at 90 deg. June is examination time and many of us "flunked" the final exams. because it was too gol-durned-hot to think. Am I right?

Are you convinced, Mr. Dealer? If not, put the idea up to your own youngsters. Take one to your office on a hot day in June when he comes home "all tired out" from school. Tell him to sit down at your desk and get out his "problems" for tomorrow. Then slip over and snap on your fan, placing it so he will get the full benefit of the breeze. If he isn't sold, I miss my guess. He will sell you, too. I know; I tried it. He will sell your board of education eventually if you work it right.

How are you going to start the campaign? I'm not a professional agitator, nor do I believe in making young Bolsheviks out of the coming generation, but I'd say, "Start with the kids themselves."

Understand I'm not selling fans nor do I intend to, but here's the way I'd begin if I were: Double-page spread in a national magazine with four contrasting pictures—father at his desk working, enjoying the cool breeze of a Wesgen fan; opposite, a school room full of exhausted youngsters with no fan; again, same youngsters, straightened up, bright, industrious, bombarded with the breezes of a couple of fans; again, the teacher, smiling at her desk, with a little 8-in. Whizzer to the right.

Of course the electrical dealer is not interested in this phase of the publicity effort, which is up to the manufacturer, but a little pressure brought to bear on the latter would start the big idea. I don't believe I would attempt to realize on the advertising until after about two years of publicity wisely conducted, until the youngsters arise and demand that boards of education provide electric fans for the school room. Then cash in!

THE UNWRITTEN GUARANTEE ON ELECTRICAL DEVICES.

"One thing that we have found," says George J. Beattie, proprietor of the Electric Shop, Toronto, Canada, "is that it pays to sell only a quality device and at the right price, and to stand behind it. Not over a year ago, we sold a device for $500 to a customer. After four months' use it developed defects and we replaced it with a new unit. As a direct result of this stand-behind-the-goods policy direct we have since received from this customer $1500 additional business, and from a personal friend of his over $2000—a total of $3500.

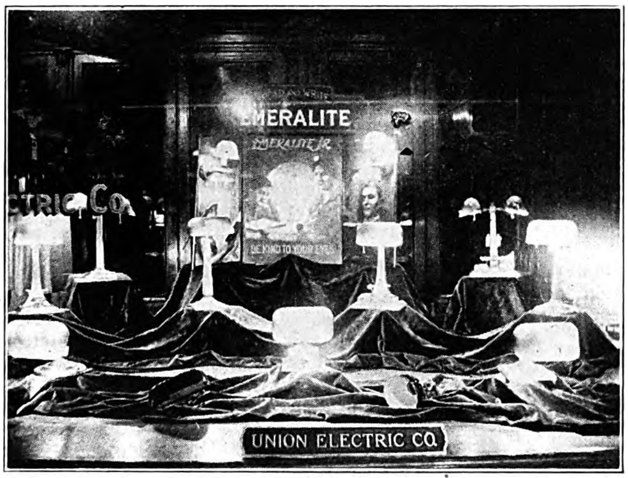
"All dealers should tie up with goods made by reputable manufacturers backed up by national advertising.

"Our policy is that our interest in the sale does not end when the goods are delivered and paid for, but extends as long as may be necessary. We not only demonstrate an article but we have a trained man who goes around to each customer about once a month to see that the device is operating satisfactorily."

MERCHANDISING READING LAMPS FOR ELECTRICAL CHRISTMAS GIFTS.

How a Progressive Pittsburgh Dealer Is Disposing of Many Lamps for Students as Well as General Household Reading and Similar Uses.

As an electrical Christmas gift for the college student or the professional man or woman nothing could be more appropriate than a reading lamp, and the old adage that "goods well displayed are half sold" applies with special force to this class of merchandise. The Union Electric Co., Pittsburgh, Pa., getting into the running at an early date, sent out cards to its patrons, explaining the advantage of good



Window Display Featuring Reading Lamps.

light, and especially recommending a reading lamp as a birthday or holiday gift to students. Quotations were made on a number of different styles, and an invitation made to inspect its full line of electric lamps and secure expert advice as to the kind best adapted to their particular use.

Backing up the publicity campaign was an excellent window display, advantage being taken of the manufacturer's aids to give force to the window advertising. In the background, on a long low platform covered with green velvet, was a three-panel cutout showing men, women and children reading by electric lamps fastened in different positions. Set on mounds of velvet throughout the window were many types of study lamps with brass standards and green shades. One of them, particularly adapted to the professional man, has incorporated into its base a complete writing set—ink stand, pen rack, etc.

LIGHTING FIXTURE MANUFACTURERS TO HOLD SHOW.

The first annual lighting fixture market and chandelier show is announced to be held Feb. 9-13 in Detroit by the National Council of Lighting Fixture Manufacturers. Conventions of the Lighting Fixture Dealers' Society of America and of the Illuminating Glassware Guild will also be held at the same time.

The demand for exhibit space indicates that such an exhibition is very desirable and assures that the show will be a success. C. H. Hofrichter is secretary-treasurer of the National Council of Lighting Fixture Manufacturers and is in charge of arrangements for the show. His address is 8410 Lake avenue, Cleveland.

DEALERS' HELPS DO A GOOD SHARE OF SELLING.

Appliances are easier to sell when suggestions as to the necessity and convenience afforded by them are pointed out. For instance, a feed-through switch casually displayed in window space or show case doesn't mean much to the layman who has never used one unless a demonstration of its usefulness is made to him. It is physically impossible for the dealer to show everyone just how useful each and all of the many electrical devices are, and, realizing this, the manufacturers step in and provide sales helps that simplify the problem.

A good illustration of this is given by the line of dealers' helps prepared by the Cutler-Hammer Manufacturing Co. in connection with its "70-50" feed-through switch. The handling of these switches by dealers as accessories and as part of flatiron and toaster equipments has become so standardized that a piece of permanent advertising seemed warranted. A large lithographed metal sign was the result and to accompany this selling suggestions, folders and lantern slides were prepared to convey the message to the uninitiated of the usefulness of such a device.

A Good Example of the Many Dealers' Helps Prepared by Electrical Manufacturers.

These helps relieve the dealer of much of the educational work that are part of the sales of electrical appliances and do much to increase the total volume of sales.

ELECTRICAL SHOW TO BE HELD AT WORCESTER, MASS.

During the week from Nov. 29 to Dec. 6 an electrical show will be held at Worcester, Mass., the electrical interests of that city combining to make an exhibition to stimulate holiday sales.

On Dec. 3 the Massachusetts State Association of Electrical Contractors and Dealers will hold its annual meeting at Worcester. Officers for the coming year will be elected and other business matters will come up before the association, after which J. A. Corcoran, of General Electric Co., will give an address on "The Merchandising of Electrical Products."

New Appliances

Westinghouse Safety Inclosed Service Entrance Switch—Washing Machine with All the Mechanism Safely Inclosed

New Electric Washer Combines Safety With Economy.

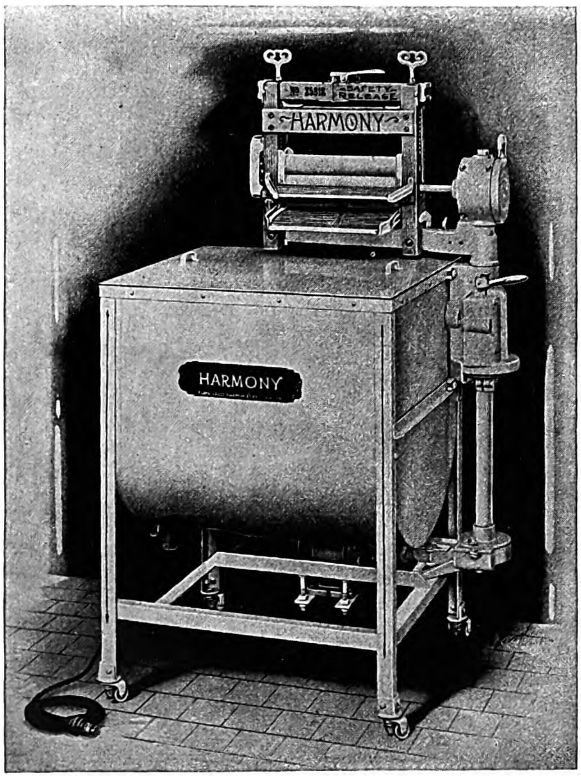
Equipped with devices which prevent accidental starting, and incorporating improvements resulting from many years of experience with washing problems, an electrically driven washing machine known as the "Harmony" and lately placed on the market by the Clark-Cadle-Harmon Corp., Rochester, N. Y., is becoming popular as a labor-saver in the home.

One of the safety devices consists of a lever which must be depressed before the machine can be started. This is especially advantageous in preventing the mischievous or accidental starting by children. Another safety device comprises a stop which prevents the wringer from being started under any conditions unless locked in position and ready for work. The wringer also has a safety release at the top to relieve the load if the clothes become clogged in the rolls. All working parts are inclosed so that there is no danger of fingers or clothes being caught in them.

The machine is driven by a ¼-hp. Westinghouse splashproof motor, which under test has proved durable and efficient.

It is noteworthy that the washing cylinder is made of selected white cork pine, a light, clear wood which absorbs little water and is easy to clean. An advantage of using wood is that it causes less wear on the clothes because of its elasticity and lack of thin sharp edges.

The frame is electrically welded into practically one piece, and is mounted on large ball-bearing, double casters which enable the machine to be easily rolled in any direction.



Electric Washer With Special Safety Features.

A New House-Entrance Safety Switch.

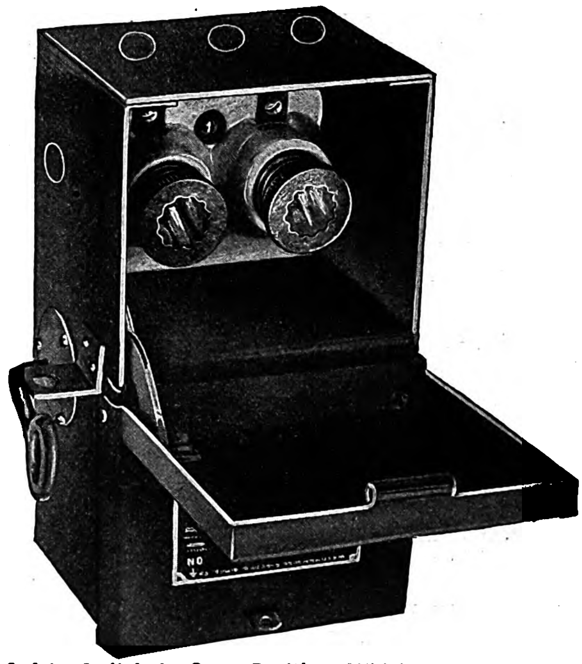
It is now becoming generally recognized that the unprotected knife switch is too dangerous to be used in places where it can be handled by careless and ignorant persons, especially in the home where it can be reached by children. The best modern wiring practice therefore demands the use of safety switches in such locations.

The new Westinghouse type WK-53 switch has been designed to meet this demand. It is perfectly safe to operate, the fuses can be renewed only when they are dead, unauthorized persons can not reach live parts, and the switch can be locked open if desired. At the same time its construction is simple and its cost very low. It is suplied in a 30-ampere, 125-volt size and is especially adapted for house-entrance service; but it can also be used to advantage in place of an open knife switch for any purpose within its capacity.

The switch, which is of knife type, is mounted together with two plug fuses on a porcelain base and is inclosed within a steel box. It is operated by a projecting handle and opens with a quick break, no matter how slowly the handle may be operated.

The cover of the box consists of two parts, hinged together. The upper part, which covers the knife switch, is held in place by screws. The lower part forms a door, which gives access to the fuses. It is, however, impossible to open this door unless the switch is in the off position when the fuses are dead; if the switch is closed when the door is open, the door closes also; and a barrier prevents access to the switch and terminals from the fuse compartment. Hence there is no possible way (short of damaging the switch) of getting a shock when renewing the fuses.

The upper part of the cover can be protected by a seal and the handle can be locked in the off position by a padlock. Unauthorized persons can therefore be prevented from getting at the live parts and also closing the switch. These features are valuable safeguards in any service, but appeal especially to central stations as they prevent theft of current.



Safety Switch in Open Position, Which Enables Access to Be Obtained to Fuse Compartment.

Lately Approved Appliances

The electrical fittings listed and described in this department have been approved by the Underwriters' Laboratories, Incorporated, after examination and tests conducted under standards of the National Electrical Code as recommended by the National Fire Protection Association.

Armored Cable.—Arrow Flexible Conduit Co., Inc., 212 Canal street, New York.
Marking: Letter "A" in circle stamped in armor at intervals of about 3 in.
Listed June 2, 1919.

Cabinets and Cutout Boxes, Sheet-Metal.—United Metal Box Co., 49 Sixth avenue, New York, N. Y.
Listed Sept. 10, 1919.

Connection Block.—Benjamin Electric Manufacturing Co., 120 South Sangamon street, Chicago.
Consisting of two or more terminal plates, each with two binding screws, mounted on base of insulating material. Designed for mounting in conduit box to facilitate making connections. "Benjamin," Catalog Nos. 6912 to 15 inclusive, 6936, 6937, 6952.
Listed Aug. 21, 1919.

Cutout Bases, Plug-Fuse. — The Gordon Electric Manufacturing Co., Waterville, Conn.
"Gordon," 0-30 amperes, 125 volts. Catalog Nos. 1935, 2135.
Listed Sept. 8, 1919.

Cutout Bases, Plug-Fuse.—Ward Electric Co., 1411 Walnut street, Philadelphia, Pa.
"Ward." 0-30 amperes, 125 volts, Catalog Nos. 1935, 2135, 2165, 2199, 2965, 8042.
Listed Aug. 29, 1919.

Dental Equipment Stand.—The S. S. White Dental Manufacturing Co., 211 South 12th street, Philadelphia, Pa.
Consisting of pedestal designed to stand by dentist's chair and upon which are mounted an extensive line of electric, gas, air and water attachments, suitable for use in performing a great variety of dental operations. Catalog No. 5.
Listed July 2, 1919.

Fixtures, Vaporproof.—The Adapti Co., 919-25 West street, Cleveland, Ohio.
"Adapti." Catalog Nos 9100, 9101, 9110-12 inclusive, 9120-22, 9130-32, 9140-42, 9150-52; 9200, 9201, 9210-12, 9220-22, 9230-32, 9240-42, 9250-52, 9500-02, 9510-12, 9520-22, 9530-32, 9540-42, 9550-52, 9600-02, 9610-12, 9620-22, 9630-32, 9640-42, 9650-52.
Listed Oct. 10, 1919.

Fuses, Cartridge.—Ward Electric Co., 1411 Walnut street, Philadelphia, Pa.
"Ward." Cartridge inclosed fuses. 0-600 amperes, 250 volts, 0-200 amperes, 600 volts.
Listed Aug. 29, 1919.

Fuses, Plug.—Whitman Electric Manufacturing Co., 352 South avenue, Whitman, Mass.
"Blue Ribbon." Edison plug fuses, 0-30 amperes, 125 volts.
Listed Sept. 6, 1919.

Ground Clamps.—Emil C. Zisterer, 4701 West 12th place, Cicero, Ill.
"Zisterer." Continuous copper strip for bonding and grounding pipes and conduits 2 in. size or less.
When distance between pipes and conduits is not so great as to require insulated connecting ground wire, continuous strip installation reduces number of joints and connections to minimum.
Listed Aug. 22, 1919.

Heating Appliances, Liquid.—Hot-Flo Faucet Corp., 1400 Broadway, New York.
Electric faucet, consisting of electric heater and switch combined with water faucet; switch spindle controls both electric current and water.
"Hot-Flo." 14 amperes, 125 volts; 7 amperes, 250 volts, a.c.
Listed Aug. 12, 1919.

Insulating Supports.—Line Material Co., South Milwaukee, Wis.
Stamped bases, or malleable-iron hooks or brackets, galvanized, to which petticoated porcelain insulators are secured.
Catalog Nos. 1818-G, 1919-G, 2001-G, 2051, 2201, 2231, 2261, 2324-G, 2332-G, 2341-G, 2352-G, 2355-G, 2411-G, 2413, 2417, 2421, 2423, 2433-G, 2473, 2681, 2951-G, 2959-G, 2961-G, 2969-G, 2973-G, 2977-G, 2989-G, 2995-G, 3205-G, 3219-CG, 3233-G, 3237-G, 3247-G, 3305-G, 3309-G, 3319-CG, 3323-G, 3333-G, 3337-G, 3347-G, 5050-G, 11529, 11538.
For low-potential conductors No. 8 B. & S. gauge or smaller, when installed in manner acceptable to inspection department having jurisdiction.
Listed July 15, 1919.

Outlet Bushings, Service-Entrance.—Cap-Swivel-Let Co., Warren, R. I.
"Johnson's." Porcelain fittings having separate openings for wires and secured in cast-iron caps attached by threaded swivel bushing to rigid conduit. ½-in. to 2-in. sizes included. Types AW, BW.F.
Listed Oct. 6, 1919.

Pump.—The Vaile-Kimes Co., 35 St. Clair street, Dayton, Ohio.
Electrically operated pump for domestic water supply automatically controlled by switches, pressure or float-operated.
"V-K." 250 volts or less, 1½ hp. or less. Fig. 120, sizes 0, 1; Fig. 130, sizes 3, 5, 7; Fig. 140, sizes 0, 1; Fig. 150, sizes 3, 5, 7; Fig. 173, size 203; Fig. 177; Fig. 178; Fig. 183; Fig. 185; Fig. 266, sizes J, K, L, M; Fig. 267, sizes E-2, E-4, F-4, F-6, F-8, G-8, G-10.
This rating is to be understood as indicating that in construction the electrical hazard has been reduced to an acceptable degree. It is not to be construed as approval of device for use in connection with automatic sprinkler or other fire-protective equipments, for which services their merits have not been investigated.
Listed Aug. 13, 1919.

Receptacle for Attachment Plugs, and Plug.—Oliver Electric & Manufacturing Co., 4221 Forest Park boulevard, St. Louis, Mo.
"Oliver." For use in series with switch and not for opening or closing circuit under load.
3-pole, 60 amperes, 550 volts. Type S.P.R.
Listed July 19, 1919.

Receptacles for Attachment Plugs, and Plugs.—Ward Electric Co., 1411 Walnut street, Philadelphia, Pa.
"Ward." 660 watts, 250 volts. Catalog Nos. 4000-01.
12 amperes, 250 volts. Catalog Nos. 4500-02 inclusive.
Listed Aug. 29, 1919.

Receptacles for Attachment Plugs.—John I. Paulding, Inc., New Bedford, Mass.
"Paulding." 660 watts, 250 volts. Catalog No. 8010.
Listed Sept. 22, 1919.

Receptacles for Attachment Plugs, and Plugs, Vaporproof.—The Adapti Co., 919-25 West street, Cleveland, Ohio.
"Adapti." Catalog Nos. 9410-12 inclusive, 9420-22, 9430-32, 9440-42, 9450-52.
Listed Oct. 10, 1919.

Receptacles, Medium-Base.—Kirkman Engineering Corp., 237 Lafayette street, New York, N. Y.
"Kirkman." Porcelain receptacles. Keyless. Catalog No. 50715.
Listed Sept. 5, 1919.

Rectifiers.—Mills Novelty Co., Jackson boulevard and Green street, Chicago.
Dynamotor type rectifiers for charging small-capacity storage batteries. A.c., 110 volts, 60 cycles. D.c., 15 volts, 18 amperes; 30 volts, 9 amperes; 45 volts, 5 amperes or 110 volts, 2 amperes.
Standard when dynamotor and its wiring up to storage battery are installed according to Class C specifi-

cations of National Electrical Code. Listed July 28, 1919.

Rectifier. — St. Louis Electrical Works, 4060 Forest Park boulevard, St. Louis, Mo.

Vibrating rectifier for charging small storage batteries from a.-c. supply lines. 110 volts, 60 cycles, a.c.; 6 volts, 6 amperes d. c. Type MU.

Vibrating contacts in operation are capable of producing arcs which may, under certain conditions, ignite flammable vapors. Devices having such contacts should preferably be placed outside rooms likely to contain such vapors, or if in such rooms, must be installed in accordance with requirements of inspection department having jurisdiction.

Listed Aug. 8, 1919.

Rosettes, Fused, Link Type.—John I. Paulding, New Bedford, Mass.

"Paulding." For use only in large mills in accordance with Rule 23d of the National Electrical Code. 2 amperes, 125 volts. Catalog No. 14203.

Listed Sept. 22, 1919.

Sewing-Machine Motor and Control Rheostat.—Hamilton-Beach Manufacturing Co., Racine, Wis.

Portable motor for operating domestic sewing machines together with foot-operated control rheostat, and separable attachment plug, separable cord connector and portable flexible cord for attachment to supply circuit. 115 volts, d.c. or a.c.

Listed July 18, 1919.

Signal Appliance, Miscellaneous.—Charles J. Dorrance, 5247 Ravenswood avenue, Chicago, Ill.

Device on principle of induction coil designed to take current from direct-current lighting circuit at 125 or 250 volts and to supply current at approximately 10 volts to signaling circuit. Primary wiring to be in accord with Class C requirements, National Electrical Code.

"Dorrance D. C. Voltage Reducer, Type D.C.-A."

Listed Oct. 1, 1919.

Signaling Systems.—The Holtzer-Cabot Electric Co., Roxbury, Boston, Mass.

"Plug Type Relay Unit System." Hospital signal system composed of push-button calling stations on flexible cords and signal lamps at calling stations, corridors and annunciators, together with buzzers for audible signals; a.c. or d.c., 125 volts or less.

Standard when all wiring is installed in accordance with Class C rules, National Electrical Code.

Listed Aug. 5, 1919.

Signs.—A. & W. Electric Sign Co., Prospect and West Third streets, Cleveland, Ohio.

Electrically illuminated display signs for general use.

Listed Aug. 2, 1919.

Sockets, Mogul-Base.—Benjamin Electric Manufacturing Co., 120 South Sangamon street, Chicago, Ill.

"Benjamin." Porcelain shell.

Keyless, socket extension. Catalog Nos. 4396, 4397.

Listed Aug. 22, 1919.

Stand for Flatiron.—Mrs. Catherine V. Wilson, 2591 Broadway, Toledo, Ohio.

"Wilson Iron Rest." Corrugated steel stand to be secured by screws to end of ironing board, for pressing irons consuming 660 watts or less.

Listed Sept. 17, 1919.

Sockets, Medium-Base. — Henry Cole & Co., 54 Old Colony avenue, Boston, Mass.

"Cole." Weatherproof sockets. Porcelain. Catalog No. 9366.

Listed Sept. 18, 1919.

Supports for Switch Boxes.—E. & B. Manufacturing Co., 965 Woodward avenue, Detroit, Mich.

"E. & B." Formed, sheet-steel supports in single and gang types having flanged edges for mounting on studs and notches for screws securing switch boxes.

Listed Sept. 11, 1919.

Switches, Inclosed.—Square D Co., Detroit, Mich.

"Square D." Two, three or four-pole knife switches and cutout bases for standard plug or cartridge inclosed fuses. Inclosed in metal cases and designed for manual operation without opening cases.

30 amperes, 250 volts or less. Catalog Nos. 57311, 78211, 78311, 96211, 96311, 97311.

Listed July 3, 1919.

Switches, Oil-Break.—Electric Service Corp., 511 Sutter street, San Francisco, Cal.

"Adler." Two or three-pole, oil-immersed switches designed for manual operation without opening case, provided with no-voltage release coils and in sizes up to and including 30 amperes with overload release.

440 volts or less, 100 amperes or less.

Listed July 8, 1919.

Switches, Knife. — Ward Electric Co., 1411 Walnut street, Philadelphia, Pa.

"Ward." 30 amperes, 125 volts. Catalog Nos. 801, 1000, 1001, 1002, 1003, 1004, 1005, 1006, 1007.

30 amperes, 250 volts. Catalog Nos. 802, 803, 2030, 2031.

Listed Aug. 29, 1919.

Switches, Miscellaneous — Oven-Door.—J. F. Hoenninger, Jr., 322-24 West King street, Lancaster, Pa.

Single-pole knife switch in cast-iron case with spring-actuated push rod arranged to engage with door of bake ovens to illuminate lamps in oven when door is open. For use on branch lighting circuits. 660 watts, 250 volts.

Listed Aug. 8, 1919.

Switches, Oil-Break.—W. E. Mushet Co., 502 Mission street, San Francisco, Calif.

"WEMCO." Three-pole, oil-immersed switches designed for manual operation without opening case, provided with no-voltage and overload release coils. 10 hp., 440 volts or less.

Listed Aug. 6, 1919.

Switches, Rotary Flush, Vapor-proof.—The Adapti Co., 919-25 West street, Cleveland, Ohio.

"Adapti." Vaporproof box complete with standard labeled snap switch.

Catalog Nos. 9300-02 inclusive, 9320-22, 9340-42, 9350-52.

Listed Oct. 10, 1919.

Switches, Surface. — The Chelten Electric Co., 4859-65 Stenton avenue, Philadelphia, Pa.

"Chelten." Single-pole. Catalog No. 1200.

Listed Sept. 10, 1919.

Transformers, Bell-Ringing.—Killark Electric Manufacturing Co., 3940 Easton avenue, St. Louis, Mo.

"Killark." Air-cooled transformers designed to supply current at following voltages: For use only in ringing bells or for similar signaling work when primary wiring is installed in accordance with Class C rules, National Electrical Code.

25 or 60 cycles, primary 110 or 220 volts, secondary 10 volts or 6, 12 and 18 volts.

Listed June 20, 1919.

Wire Connectors.—The French Manufacturing Co., Grandview avenue and Robbins street, Waterbury, Conn.

Copper lugs of stamped tubing for making electrical connection to wires and cables. Each lug is marked with equilateral triangle on top of barrel. 0-30, 31-60, 61-100, 101-200-ampere ratings.

Listed June 27, 1919.

Wire Connectors.—H. B. Sherman Manufacturing Co., Battle Creek, Mich.

Solderless splicing device, consisting of brass sleeve and brass clamping screws for tightening on conductors.

For use in joining wires No. 12 B. & S. gauge or smaller, where such joints are accessible for inspection at all times.

Laboratory tests indicate this connector will not hold more than two No. 12 B. & S. gauge conductors, more than three No. 14 B. & S. gauge conductors, nor conductors of different size at same end.

Note: Joint must be insulated as required for soldered joints.

Listed June 26, 1919.

Wire—Flexible Cord.—The Whitney Blake Co., New Haven, Conn.

Marking: One uncolored cotton thread running parallel with conductor between insulation and braid.

Listed July 18, 1919.

Wire — Flexible Cord. — Flexible Woven Cable Co., 170 Purchase street, Boston, Mass.

Marking: One red, one yellow and one green thread between outer covering and rubber jacket or one red and one green thread between braid and rubber insulation on each conductor.

Listed Aug. 13, 1919.

Wire, Portable Flexible Cord for Electric Heaters.—The Whitney Blake Co., New Haven, Conn.

Marking: One uncolored cotton thread running parallel between insulation and braid.

Tag on coil to read "National Electrical Code Standard."

Listed Aug. 6, 1919.

Trade Activities

Crystal Washing Machine Co. Holds Successful Convention —Doehler Die Casting Co. to Erect New Plant—Literature

Wellman-Seaver-Morgan Co., Cleveland, has issued Bulletin No. 38, dealing with its dock cranes installed at the U. S. Army Supply Base, Boston. An extensive description of these crane installations was given in ELECTRICAL REVIEW, Nov. 8.

American Machinery Equipment Co., Detroit, Mich., was recently organized as a clearing department for cranes, boilers, power plant equipment, new and second-hand machinery, etc., with headquarters at 1246 Penobscot building. The company's operations will cover the entire east and central western sections of the country with branch offices in all the largest cities, according to W. R. Gard, general manager.

Voss Brothers Manufacturing Co., Davenport, Iowa, manufacturer of hand and power washing machines, is erecting a new factory, which will be joined to the old building with a tunnel and an overhead bridge. The new building will be a four-story structure, 150x75 ft., and of brick and concrete construction. It will be modern in every respect and will be used for assembling a new type of machine which the company is manufacturing.

Edison Electric Appliance Co., Inc., 5660 West Taylor street, Chicago, has issued a handsome bulletin, introducing its new line of "Hotpoint" 1847 Rogers Brothers silver plated ware. It contains two full page illustrations of the silver plated tea set and percolating coffee urn set and gives some idea of the remarkable beauty of this electric hollow-ware which has been added to the Hotpoint line of appliances. It is of the Adam period style, artistically designed, and lends an atmosphere of wealth wherever seen.

Doehler Die Casting Co., manufacturer of die-castings in white metal, aluminum and brass alloys, and bronze back and aluminum back babbitt-lined bearings, with main office and eastern plant at Brooklyn, N. Y., and branch plant at Toledo, Ohio, has just closed the purchase of a seven-acre tract in Chicago, on which the company will erect a modern one-story concrete steel and brick structure for the manufacture of die castings and bearings, in order to respond to the increasingly large demand for its product. Contract for the new building has already been let and operation started. The building is to be completed and ready for occupancy and operation on or about Jan. 1, 1920. This enterprising concern, one of the world's largest manufacturers in its particular line, has been influenced in this move by a policy for which it has long been noted—service to its customers.

Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., has issued, effective Nov. 1, a new retail price list on electric ware, which includes iron, percolators, toasters, hot plates, chafing dish vessels, warming pads, luminous radiators, air heaters, etc.

Allis-Chalmers Manufacturing Co., Portland branch, has received an order from the Pelican Bay Lumber Co., Klamath Falls, Ore., for a 1000-kw. turbine. This unit will be complete with condenser, exciter and centrifugal injection pump. The machinery is for 480-volt, 60-cycle, 3-phase service, and has a capacity of 1500 amperes per terminal at full load.

American Wiremold Co., with general office and factory at Hartford, Conn., is sending out a new discount sheet (No. 5) to contractors, applying to doubling of all list prices published prior to Nov. 1. This action was taken in deference to the wishes of many thousand contractors, who are using Wiremold and have asked that the list prices of Wiremold and of Wiremold fittings be increased in order that they might have a basis for figuring wider margins of profit on this line of material which is meeting with increasing popularity.

McCarter & Cooper is the name of a new firm of consulting engineers formed by Robert D. McCarter and William L. Cooper, with offices at 165 Broadway, New York. Prior to 1902 Mr. McCarter was connected with the General Electric Co. in London as chief engineer and from that time until 1914 he maintained a consulting engineering office in London. He was also consulting engineer for all the European Westinghouse companies and president and managing director of the Russian Westinghouse Co., and in 1914 opened his office in New York. Mr. Cooper was for 15 years European manager and chief engineer for Robert W. Hunt & Co., prior to the establishment of his office in New York in 1917. The purchasing department of this firm will be located at 50 Church street.

Harvey Hubbell, Inc., Bridgeport, Conn., is sending out two new pieces of literature to the trade dealing with industrial illumination, and are a part of the extensive publicity campaign which the company is now conducting. One of these circulars illustrates and describes various types of Hubbell lamp guards, which protect lamps from breakage in shops or warehouses or wherever the lamp is exposed. Hubbell locking lamp guards are provided with lock and key and can be supplied to fit any type of socket. The other circular (No. 184) points out the essentials of efficient industrial lighting and the part that reflectors play in the distribution of light. Various types of reflectors with their respective distribution curves are illustrated, as is also a typical factory installation showing the type of reflector used and the effectiveness of this particular design. Both of these circulars, with any desired imprint and in any quantity, are offered gratis to the dealer of Hubbell electrical specialties for distribution to his customers.

Crystal Washing Machine Sales Convention.—That the electric washing machine has received the endorsement of the entire American household was borne out by the distributors and salesmen of the Crystal Washing Machine Co., who held their annual convention in Detroit, Mich., the week of Nov. 10-15. Among those who attended the convention aside from representatives from all parts of the country were Phillip R. Mallory, president of the Mallory Industries, Inc., manufacturer of household appliances, of which the Crystal company has just been made a subsidiary; Frank E. Seeley, vice-president in charge of production; C. A. Magee, vice-president in charge of sales, and F. C. Sebulske, secretary, who has been made general manager of the Crystal company and directed the convention program.

Many interesting facts were brought out at this convention, but probably the most striking was the remarkable growth of the electric washing machine industry, and the optimistic view held of the future was further evidenced by the demand of the distributors that the production figures for next year be set at 120,000 machines. These figures, Mr. Seeley said, would tax to the utmost the four large plants operated by the company throughout the country, but he lent assurance that material has already been purchased to exceed this demand. Mr. Mallory outlined the policies and activities of the company for the coming year, and laid great emphasis upon the coming year as a record breaker in the washing machine industry. Another important part of the convention was that brought out by Mr. Magee in his talk on territorial quotas, and a wider distribution of the washing machines. He pointed out that under the new distributing plans and with the co-operation of trade publication and newspaper advertising the company hoped to put the washing machine within the reach of every household, no matter how remote may be the section in which they live. To further the widespread plan of distributing the washing machine, Mr. Sebulske outlined the plan of dealer co-operation that this company plans to give every distributor and dealer.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Manchester, N. H.—Manchester Traction Light & Power Co. has completed arrangements for the issuance of notes for $1,750,000, the proceeds to be used for general business expansion.

Cambridge, Mass.—Palmer Electric Manufacturing Co. has started work on a plant, 50x200 ft.

Bridgeport, Conn.—United Illuminating Co. will erect a power house of 75,000-hp. capacity, generator house, boiler house, switchboard and screen house. The plant will be equipped with automatic stokers and ash removers.

Elmwood, Conn.—New Departure Manufacturing Co., Bristol, will erect a three and four-story reinforced concrete building. Extensive improvements in its plant at Bristol are also being considered. The work will take seven months and will involve an expenditure of several million dollars.

Bristol, Conn.—In connection with the construction of the proposed additions at the plant of the New Departure Manufacturing Co., to comprise four-story building, about 110x 220 ft.; one-story structure, 100x200 ft.; two-story transformer house, 41x 133 ft.; boiler plant, 45x58 ft.; machine shop, 70x263 ft.; administration building, printing plant, and auxiliary structures.

New Haven, Conn.—Seamless Rubber Co. has had plans prepared for the construction of a new power plant to be used in connection with the new plant of the company now in course of construction on Hallock avenue.

West Haven, Conn.—Kelly Tire & Rubber Co., 262 Chapel street, New Haven, is having preliminary plans prepared for the construction of a new three-story plant and one-story power house, about 75x260 ft., and 25x 260 ft., respectively, to be located at West Haven. The project is estimated to cost $500,000. Westcott & Mapes, Inc., 207 Orange street, New Haven, is architect for the company.

Providence, R. I.—Robbio Electric Co., 753 Eddy street, has filed notice of organization to engage in the production of electrical goods. Benjamin Robbio, 23 Barclay street, heads this company.

Brooklyn, N. Y.—Metropolitan Engineering Co., 1250 Atlantic avenue, manufacturer of protective devices, will erect a two-story plant addition, 100x148 ft.

Churchville, N. Y.—F. S. Tracy, electrical engineer, of Middleport, was retained to make an exact estimate of the cost of the installation of an electric lighting system for the village.

Endicott City, N. Y.—In connection with the construction of the proposed plant of the International Time Recording Co., North street, now under consideration, estimated to cost $150,000, considerable electrical equipment will be required.

Middleport, N. Y.—Niagara Sprayer Co., manufacturer of spraying machines, will build a one-story machine shop, works, power plant and chemical plant.

New York, N. Y.—Alberger Pump & Condenser Co., 140 Cedar street, has been reorganized with a capital of $499,250, to manufacture pumping equipment, condensers, etc.

New York, N. Y.—Ohio Utilities Co., 115 Broadway, a Delaware incorporation, has filed notice with the Secretary of State of an increase in its capitalization from $5,000,000 to $7,750,000, for general business expansion.

New York, N. Y.—New York Edison Co., Irving place and 15th street, has completed plans for the construction of a new three-story transformer station, about 42x75 ft., to be located at 421-23 East Sixth street. The structure will be of brick construction, and is estimated to cost $60,000.

New York, N. Y.—Vitreous Enameling & Stamping Co., 11 East 147th street, is having plans prepared for a one-story, 95x172 ft., plant.

Port Chester, N. Y.—P. R. Mallory, Inc., manufacturer of tungsten products, has awarded a contract to George Mertz & Sons, Port Chester, for the construction of the proposed two-story and basement plant, about 40x112 ft., to be used for increased capacity. The structure is estimated to cost $60,000.

Rochester, N. Y.—City has awarded a contract to W. F. Martens, 244 Cutler building, for the erection of a new one-story boiler plant and laundry building on Woodman road. The structure will be about 46x167 ft., and is estimated to cost $35,000.

Pulaski, N. Y.—In the early spring ornamental lights will be planned in the business section of the city. Address Frank L. Burdick, cashier of Pacific National Bank.

Annandale, N. J.—Plans are under consideration by borough officials for the installation of a new electric street-lighting system. It is understood that electric service will be furnished by the Jersey Electric Co., High Bridge.

Bloomingdale, N. J.—Borough Council is understood to be arranging plans for the installation of a new electric street-lighting system, service to be furnished by the municipal electric plant at Butler, N. J.

Hoboken, N. J.—Button Machinery Co. has filed plans for a three-story reinforced concrete plant at 401-15 11th street, to cost about $100,000. A boiler plant and other construction work will cost $70,000.

Newark, N. J.—Roth & Co. has had plans prepared for the construction of a large new cold storage plant to be located in Plane street, near Orange street. The structure will be two-story, about 60x150 ft., and will include a heating plant, refrigerating apparatus, electrically operated elevators, etc.

Nutley, N. J.—Board of commissioners is understood to be considering plans for the installation of a new street-lighting system on Park avenue, between Washington avenue and the Passaic river bridge.

Rosenhayn, N. J.—The committee is planning to secure electric lighting. Address Samuel Vinie.

Wharton, N. J.—New Jersey Power & Light Co. is arranging for the installation of new electrically operated pumping equipment on the Rockaway river to have a capacity of 500,000 gal. per day, to be used by the Borough of Wharton.

Whitehouse, N. J. — Readington township committee is considering plans for the installation of a new street-lighting system in the Whitehouse and East Whitehouse districts.

Wrightstown, N. J.—Hanover Water Co., which operates in Wrightstown and vicinity, has been ordered by the Board of Public Utility Commissioners to make extensive improvements in its plant, to provide increased and improved service. The proposed work includes the installation of new plant equipment.

Allentown, Pa.—Slate Belt Street Railway Co. is understood to be considering plans to increase its capital from $360,000 to $585,000, and the indebtedness of the company from $402,000 to $500,000. The company will also change its corporate name to the Slate Belt Transit Co.

Allentown, Pa.—A number of electric utility companies recently incorporated, are planning for extensive operations in this vicinity, including the production and distribution of electric energy for light and power service. These companies are Danville Borough Electric Co., East Chillisquaque Township Northumberland Electric Co., West Chillisquaque Township Northumberland Electric Co., Turbot Township Northumberland Electric Co., Milton Borough Electric Co., Rush Township Northumberland Electric Co., Mahoning Township Electric Co., Valley Township Montour Electric Co., and Liberty Township Montour Electric Co. H. R. Fehr, C. M. Walter (treasurer), and J. S. Wise, Jr., head the companies.

Bethlehem, Pa.—City council has passed a bill authorizing a bond issue for $80,000 to cover the cost of the installation of a new ornamental electric street-lighting system. It is proposed to commence the work at the earliest possible moment, and the city is arranging for the preparation of plans and specifications at once.

Chester, Pa.—Board of managers of Chester Hospital, 16th and Parker streets, has commenced work on the construction of the proposed three-story laundry building and boiler plant at the institution at Ninth and Halley streets. The work, including equipment installation, is estimated to cost about $300,000. The Ward Building Co., Crozer building, Chester, is the contractor.

Gettysburg, Pa.—A special election has been called by the Borough Council for the purpose of voting on the issuance of bonds for $20,000, the proceeds to be used for the construction of a new municipal electric light plant and the erection of the necessary lines for street-lighting purposes.

Marcus Hook, Pa.—Union Petroleum Co. is considering the construction of a new pumping plant in connection with its local government contracts, including the installation of new boilers and other equipment.

Philadelphia, Pa. — In connection with the construction of new extensions and additions to the Philadelphia Hospital for Contagious Diseases by the Department of Health and Charities, contract has been awarded to the Electro Construction Co., Commercial Trust building, for all electrical work, at $7125.

Pittsburgh, Pa.—General Electric Co. has completed negotiations for the purchase of a portion of the property of the Eiler Lumber & Mill Co., 23rd and Wharton streets, in the south side district, for a consideration of about $75,000. The property is about 120x214 ft., and it is understood that the company is arranging plans for the construction of a large new building, to be used in part for warehouse purposes.

Stroudsburg, Pa. — International Boiler Works has acquired a 40-acre tract of land on which it proposes to build a modern plant.

Tullytown, Pa.—Tullytown Electric Co., recently organized, is considering plans for the operation of a local electric light, heat and power plant. The company has made application at the state capitol for a charter of incorporation.

York Haven, Pa.—York Haven Power Co. is making rapid progress on the construction of an addition to its electric substation on South Wood street. It is understood that the company is planning to commence the installation of machinery and equipment immediately upon completion of construction work.

Baltimore, Md.—Consolidated Gas, Electric Light & Power Co. has completed arrangements for alterations and improvements in its building at Lexington and Liberty streets, to facilitate operations.

DATES AHEAD.

American Society of Mechanical Engineers. Annual meeting, New York City, Dec. 2-5. Secretary, Calvin W. Rice, 29 West 39th street, New York City.

Massachusetts State Association of Electrical Contractors and Dealers. Annual meeting, Worcester, Mass., Dec. 3. Headquarters, Bancroft Hotel. Secretary, J. E. Wilson, Boston.

American Institute of Chemical Engineers. Annual meeting, Savannah, Ga., Dec. 3-6. Secretary, J. C. Olsen, Brooklyn, N. Y.

Electric Power Club. Meeting, Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, Ohio.

American Electrochemical Society. Annual convention, Boston, Mass., April 7-10, 1920. Friday, April 9, joint session with American Institute of Electrical Engineers on "Electrically Produced Alloys." Secretary, Joseph W. Richards, Bethlehem, Pa.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

Winchester, Va.—Northern Virginia Power Co. is understood to be considering plans for the extension of its electric lighting system to Strasburg, Shenandoah county. The company was recently acquired by the Potomac Light & Power Co., Baltimore, Md.

Wilmington, N. C.—Notice has been filed with the Secretary of State by the Tidewater Power Co. of an increase in its capitalization of $2,600,000, to provide for general business expansion.

Greenville, S. C.—Thomas N. Walker Co. will establish electric lighting and power plant in connection with the development of Oakville, a residential suburb five miles from Greenville.

Greer, S. C.—The power house at plant of the Greer Water & Light Co. was destroyed by fire. C. C. McGowan, manager.

Chipley, Ga.—Plans are under consideration by the city officials for the construction of a new municipal electric light plant. S. A. Goodman is mayor.

Columbus, Ga.—In connection with the proposed additions to the plant of the Columbus Manufacturing Co., contracts for which have been awarded, estimated to cost, including equipment, $1,000,000, it is planned to install a total of about 1000 looms, to be operated by individual motor drive. Contract for electric motors for this purpose has been awarded to the General Electric Co.

Dawson, Ga.—A white way lighting system is proposed. The electric wires may be laid underground. Address mayor.

Talbotton, Ga.—City is having plans prepared for the construction of a new municipal power plant, including the establishment of an electric light system.

Tifton, Ga.—Southern Bell Telephone & Telegraph Co. will erect a new telephone exchange at a cost of $450,000. Chief engineer, Atlanta, Ga.

Jacksonville, Fla.—Additional improvements of municipal electric light plant are contemplated. John S. Bond, chairman of city commission.

Jacksonville, Fla.—Acceptance by the Navy Department of the offer of the city commission of Jacksonville of a tract of land and other facilities at the municipal docks and terminals for the erection of a high-powered radio station was announced in a letter to the commission from Secretary Daniels. Plans and specifications for the station will be prepared immediately.

NORTH CENTRAL STATES.

Akron, Ohio. — Ground has been broken for the erection of Plant No. 2 by the Firestone Tire & Rubber Co. The building will be three stories high and is designed to accommodate the electrical, machine, pipe, carpenter, pattern and tin shops. It will coordinate under one roof all the labor of this nature done in the various buildings of the tire factory. The structure will be modern in every respect and all mechanical equipment will be strictly up-to-date. Electric traveling cranes will be employed to carry heavy machinery. The cost of construction is said to exceed $400,000.

Dover, Ohio.—About $100,000 will be expended to improve the city power plant. W. H. Scheu, mayor.

Lima, Ohio.—Lake Erie & Western Co. will erect a power plant. Address Superintendent Peters.

Toledo, Ohio.—Toledo Railways & Light Co. has proposed to the city a $2,000,000 10-year street-lighting contract.

Auburn, Ind.—Auburn Water & Electric Light Co. will install a 480 hp. boiler, build a brick stack 135 ft. high, 6½ ft. in diameter at the top; equip the plant with an automatic coal conveyor; install an automatic underfeed stoker under three boilers and make other improvements. To this end the company has asked approval of the Indiana Public Service Commission for the issuance of $40,000 in bonds.

Decatur, Ind.—General Electric Co. has announced that it will erect a new branch factory in Decatur. The new plant will be a one-story building, 200x300 ft., brick and steel. It is planned to have the factory start operations March 1, 1920, and employment will be given to 500 persons. The new plant will have trackage connections with the Grand Rapids & Indiana railway.

Marquette, Mich.—Houghton County Electric Light Co. is making improvements in its lines from Laurium and Dollar Bay, at an estimated cost of $12,000. The installation of a substation at Lake Linden is also contemplated.

Chicago, Ill.—A. M. Castle & Co., 715 North Morgan street, have purchased property, 219x561 ft., at the northwest corner of Blackhawk street and Cherry avenue, on which they will erect a building with floor space of approximately 200,000 sq. ft.

Chicago, Ill.—Fairbanks, Morse & Co., manufacturers of electrical and railroad equipment, gasoline and oil engines, etc., will erect a big warehouse at 38th street and Loomis place, in the central manufacturing district. The lot has a frontage of 300 ft. and a depth of 150 ft. The building will be a three-story structure of brick and reinforced concrete construction, 150x 210 ft., and will cost about $315,000.

Chicago, Ill.—H. M. Byllesby & Co., public utility operators, plan immediate construction of three new power stations, one in southern Minnesota for the Northern States Power Co., one in western Oklahoma for the Oklahoma Gas & Electric Co., and one at Pueblo on the present power site of the Arkansas Valley Railway, Light & Power Co., with combined initial capacity of 33,500 hp. at an estimated cost of about $3,000,000. These and other projected improvements, including a new 40,000-hp. unit under construction at Minneapolis, will add 100,000 hp. to Byllesby properties during 1920.

East St. Louis, Ill.—The machine shops of the St. Louis, Troy & Eastern Railroad Co. have been destroyed by fire.

Evansville, Ind.—Schroeder Headlight & Generator Co. will erect a new addition to its plant.

Fort Wayne, Ind.—Fort Wayne Battery Manufacturing Co. will on Jan. 1, 1920, begin the manufacture of storage batteries for automobiles and lighting systems. The company is completing a two-story building, 54x 196 ft., and a boiler house, 50x57 ft. The company has taken options on several vacant lots surrounding the plant for future expansion. Among the directors are S. A. Lehman, J. C. Sherer and George Houser.

Indianapolis, Ind.—H. C. S. Motor Car Co. will erect two four-story factory buildings, brick and concrete, each building 80 by 205 ft.

Marion, Ind.—Board of education plans erection of $80,000 school building to replace one destroyed by fire Nov. 19.

Marion, Ind.—Marion Insulated Wire & Rubber Co. has increased its capital stock from $100,000 to $500,000.

Portland, Ind.—Jesse E. Poting has the contract to erect an electric light plant at a cost of $16,441.

East St. Louis, Ill.—Erco Amusement Co. will erect a fireproof theater, 120x120 ft., to cost $200,000.

Marseilles, Ill.—National Biscuit Co. will erect combination warehouse and manufacturing plant as addition to present mill buildings. The new structure will be an addition to the main plant and will occupy the site of the old paper mill which was destroyed by fire a few years ago.

Peoria, Ill.—Western Structural & Machine Works has taken over the plant and business of the J. C. Armstrong Machine Co. The company handles machine, pattern, tool and die work, power plant work, engine boring and rebuilding, and general machine work of all kinds.

Taylorville, Ill.—Taylorville Utility Co., dealer in light, heat and power, has increased its capital to $100,000. H. M. Hallock, president; Walter M. Provins, secretary.

Sorento, Ill.—The sum of $5000 in electric light bonds has been authorized. Address village clerk.

Urbana, Ill.—University of Illinois will install two new boilers, each of 500 hp., Jan. 1. This will increase the present capacity of 3000 hp. 50%.

Colfax, Wis.—Colfax Light & Power Co., Amery, Wis., will erect a power house and dam here. Work will start in the spring. Engineer J. C. Jacobson, 53 Metropolitan Bank building, Minneapolis, Minn.

Marinette, Wis.—Wisconsin Service Co. contemplates a reserve dam at High Falls on the Peshtigo river.

Rutland, Wis. (P. O. Stoughton)—East Rutland Electric Co. will construct a power plant to furnish power to the towns of Dunkirk and Rutland. Ole H. Eddingsaas, W. J. Richardson and Bennie Oxrude are interested.

Stanley, Wis.—A new line is to be constructed between Chippewa Falls and Stanley to carry the current from Wissota dam to the consumers along the Soo. The work will be completed by next May.

Sturgeon Bay, Wis.—High Falls Power Co. contemplates the erection of transmission lines from High Falls to Sturgeon Bay. J. C. Langemack, city clerk.

Tomah, Wis.—The local plant of the Wisconsin-Minnesota Light & Power Co. has been purchased by Messrs. Louis Barnes and Philip Bennett, who will continue its operation under the name of the Tomah Electric & Power Co.

Union Grove, Wis.—The trustees of Union Grove have granted permission to the Milwaukee Electric Railway & Light Co. to establish a new electric lighting system in that village.

Waupaca, Wis.—Waupaca Electric Service & Railway Co. will erect a new electric plant. Truman Hibbard, president.

Albert Lea, Minn.—Minnesota Gas & Electric Co. has purchased capital stock owned by G. C. Edwards, president of the H. L. Nichols Co., and contemplates furnishing electric energy to communities outside of Freeborn county. Improvements will be made at an estimated cost of $50,000.

Clearbrook, Minn. — Clearbrook Electric Co. will construct electric light plant and install white way. E. T. Evenson, village recorder.

Crosby, Minn.—The city contemplates the purchase of poles, wires, and other holdings of Cuyuna Range Power Co. H. L. Nicholson, village recorder.

Glyndon, Minn.—The village will install electric light plant and extend lines from Dilworth. R. S. Brown, village recorder.

Perley, Minn.—The city will erect an electric light plant. Engineer W. E. Skinner, 15 South 5th street, Minneapolis. B. I. Hoglun, clerk.

Clinton, Iowa.—Low Moore Light & Power Co. and Clinton, Davenport & Muscatine Interurban Co. have been granted franchise for constructing power, heat and light line from Shafton to Low Moore.

Dubuque, Iowa.—The building of the International Harvester Co. has been destroyed by fire with $260,000 loss.

Sioux City, Iowa.—Harger & Blish will erect factory building, 50x100 ft., to cost $80,000.

Kansas City, Mo. — Sherwin-Williams Co., Cleveland, Ohio, will build a $500,000 factory, comprising an initial unit equipped for the manufacture of paint.

Marceline, Mo.—The city contemplates bond issue for an electric light plant. Address mayor.

Memphis, Mo.—The city will vote Dec. 5 on $10,000 bonds for extending the electric light plant. Address the mayor.

St. Louis, Mo.—Emerson Electric Manufacturing Co. contemplates the erection of a large new factory building, immediately adjoining the present extensive plant, to provide adequate facilities for meeting the increased demand for its products. The plant with machinery and other equipment installed will cost approximately $750,000.

Spivey, Kans.—The sum of $10,000 in bonds have been voted to install an electric light plant. W. B. Rollins & Co., 209 Railway Exchange building, Kansas City, Mo., engineers.

Wichita, Kans. — Extensive improvements in the electric light and power system will be made. Bids are being received on new machinery and engines which are to be installed in the power and water plants.

Chancellor, S. D.—Plans are being made whereby power lines will be extended from the electric light and power plant at Hartford to Chancellor.

Yankton, S. D.—Yankton is enjoying such a substantial growth that the enlargement of the local light and power system has become necessary. Extensive improvements are planned. The company recently was reorganized, with ample capital to make the contemplated improvements. It is further planned to have the power plant of such capacity that power wires can be extended from Yankton to adjoining towns, so they can be provided with electricity for lighting and power purposes from the central plant here.

Ellendale, N. D.—Ellendale Electric Co. will enlarge its plant and install another engine. It also contemplates the erection of transmission lines to Menango and Fullerton.

Grand Forks, N. D.—The new state-owned elevator and flour mill to be located in Grand Forks will have a capacity of 3000 bbls. of flour per day. Standard Oil Co. has taken out permits for $250,000 worth of construction in Grand Forks covering a distributing station and office.

SOUTH CENTRAL STATES.

Hazard, Ky.—Hazard Coal Co. is planning for the immediate installation of new power plant equipment at its works, to cost about $10,000.

Hazard, Ky.—Kentucky & West Virginia Power Co., with headquarters at 30 Church street, New York, which recently filed articles of incorporation with a capital of $6,000,000, is understood to be arranging plans for the construction of a new addition to its local power plant for increased operations. F. R. Weller, Hibbs building, Washington, D. C., is consulting engineer; R. E. Breeb is president.

Mayking, Ky.—Pine Creek Coal Co. is arranging plans for the construction of a new power plant at its local coal mining properties, to provide for increased capacity.

Parsons, Ky.—Plans are being prepared by the Elkhorn By-Product Coal Co. for the installation of a quantity of new power equipment at its plant in the Fleming district.

Chattanooga, Tenn.—International Harvester Co., Chicago, plans to double the capacity of the plant of the Chattanooga Plow Co. by the erection of an addition to its main plant. Plans are also being made for a $10,000 building containing club rooms, cafeteria, locker rooms and gymnasium.

Sequatchee, Tenn.—Crossville will have electric lights, a company composed of M. F. Reed, J. S. Reed and B. A. Smith having been formed to install a plant. A franchise to use the streets for the erection of poles will be granted by the city.

Gadsden, Ala.—An election will be held Jan. 6 to vote on a $100,000 municipal light plant and $90,000 sanitary sewer bonds. Address mayor.

Rolling Rock, Miss.—City has approved a bond issue of $60,000 the proceeds to be used to cover the cost of the construction of a new municipal electric light and waterworks plant. Xavier A. Kramer, Magnolia, Miss., is consulting engineer.

Little Rock, Ark. — Little Rock Railway & Electric Co. will sell $376,500 bonds to finance extensive improvements in its plant, extend its electric transmission on lines and improve its service generally. Many improvements in the plant are contemplated, including a giant smokestack, new boilers and other machinery and will install fuel saving devices to cost $60,000, which will effect a large saving in fuel for the power plant. The company expects to extend its lines to North Little Rock which, in case of emergency, may be tied in with the lines of the Arkansas Light & Power Co.

Drumright, Okla.—The Drumright division of the Oklahoma Gas & Electric Co. has completed extension of its transmission lines to the No-co-Che lease of the Shaffer Oil & Refining Co. where a number of wells will be pumped electrically.

Miami, Okla.—A loss of $75,000 was sustained when fire visited the power plant of the Miami Traction Co.

Thomas, Okla.—Plans are being prepared by the city for improvements and alterations in the municipal electric light plant, including the installation of a new Diesel engine, for increased service.

Electra, Tex.—The city council has under consideration the construction of a municipal electric light and power plant for that city.

Lubbock, Tex.—City is having plans made for extensions in the municipal electric light system. It is proposed to issue bonds for $15,000 to cover the cost of work.

Snyder, Tex.—G. I. Wilcox of Snyder has sold the local electric light plant to Messrs. Yoder and McCormick of Crowell. The new owners will install new machinery and make other improvements to the plant.

WESTERN STATES.

Pueblo, Colo.—A new tract of 1000 acres of land north of Fowler, Colo., will be irrigated by electric power next year, if plans under way mature. This will give the Arkansas Valley Railway, Light & Power Co. an additional 150 hp. of irrigation business. The company's output is running 15% ahead of last year.

Boise, Ida.—Utah Power & Light Co. has filed application with the Public Utilities Commission for permission to extend its lines to Clifton, Oxford and Dayton, and neighboring districts, for the furnishing of electric energy for light and power service.

Everett, Wash.—Plans are under consideration for improvements in the electric street-lighting system, including the installation of a new cluster type lighting system in the downtown district.

Holson, Wash.—The city will estimate its own public utilities, particularly light and water.

Vancouver, Wash.—City council is understood to be considering plans for the installation of a new modern electric street-lighting system throughout the municipality.

Portland, Ore.—A new lighting system will be installed by Northwestern Electric Co. Estimated cost, $20,000 to $25,000.

Young's Bay, Ore.—Pacific Power & Light Co. has recently completed arrangements for the construction of a large new power and gas plant on local property acquired comprising approximately 15 acres. It is said that the proposed works will cost in excess of $750,000, including equipment installation.

Los Angeles, Cal.—Board of Public Works has taken bids for the immediate installation of the proposed new ornamental electric street-lighting system on Westmoreland avenue, to extend from Wilshire to Seventh street. Marbelite lighting standards will be utilized in connection with the work.

Orange, Cal.—City trustees have recently taken bids for the installation of a new ornamental electric street-lighting system on Chapman and Glassel streets, located in the business section of the city. The work is estimated to cost $15,000.

Richmond, Cal.—City council is having plans prepared for the immediate installation of a new ornamental electric street-lighting system throughout the business district of the municipality. Service will be furnished by the Western States Gas & Electric Co.

Richmond, Cal.—Pacific Sanitary Manufacturing Co. will shortly install an additional 50 hp. in motors, and the Metals Atomizing Co. (a new concern) will start operations with one 100-hp. unit. Both will be served by the Richmond division of the Western States Gas & Electric Co. The second named company will add other units later. A new oil tank company building at Point Orient will require 25 hp. in motors.

Rio Vista, Cal.—Great Western Power Co. is having plans prepared for the immediate construction of a new power line extending from the company's pumping works in Reclamation District 999 to the Elkhorn Slough section of the property of the Holland Land Co., a distance of about five miles.

San Francisco, Cal.—Great Western Power Co. has completed plans for the construction of a new power line to extend to Franklin, near Sacramento, for the furnishing of electric service, the proposed line to cover a distance of about 12 miles; it is estimated to cost approximately $20,000. In connection with this work, plans are being arranged for the construction of a new substation at Hood, Cal., at which point a power line of 22,000-volt capacity will also be constructed.

Vallejo, Cal.—Plans are being arranged by the United States government for the construction of a new radio station, to be located in the Mare Island district. The work includes the construction of three large radio towers, and is estimated to cost $150,000.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Telephone and Telegraph Apparatus (31,297).—A firm in Spain desires to secure the representation of a manufacturer of telephone and telegraph apparatus and supplies. It guarantees deposit on consignment of models manufactured in the United States. Quotations should be given c. i. f. Spanish ports, if possible, or f. o. b. New York. Correspondence should be in Spanish. References.

Electrically Operated Pianos (31,299). — Catalogs, quoting prices and terms of payment, of all kinds of musical instruments, and especially electric coin-operated pianos, are described by a firm in Norway. Reference.

Personals

M. S. Sloan Chairman Committee on Electrical Resources N.E.L.A.—F. R. Slater Resigns—S. A. Rhodes Promoted

J. F. CANFIELD, formerly auditor of the Ottumwa Railway & Light Co., Ottumwa, has been appointed auditor of the Union Light, Heat & Power Co., Fargo, N. D.

DON H. BLANKS has been appointed manager of railways for the Monongahela Valley Traction Co., at Fairmont, W. Va. He succeeds W. C. Callaghan, who resigned.

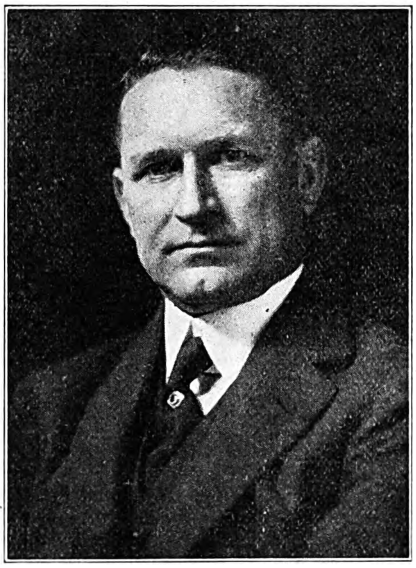
RALPH J. FOGG, who has been a member of the civil engineering department at Lehigh University during the last 11 years, has been appointed professor of civil engineering and head of the department. He takes the place vacated by Professor McKibben, who went to Union College at Schenectady.

R. F. PALMBLADE, general superintendent of the Jefferson City Bridge Transit Co., Jefferson City, Mo., will succeed Rufus W. Bailey as general superintendent of the Peoria Railway Co., Peoria, Ill. Mr. Palmblade is well acquainted with rolling stock, general equipment and conditions of operation of the Peoria Railway Co., as he was formerly operating engineer of that company.

W. L. R. EMMET, consulting engineer with the General Electric Co., Schenectady, N. Y., and one of the world's foremost experts on steam turbine design, delivered a paper on "Electric Propulsion of Ships" before the Society of Naval Architects and Marine Engineers at its twenty-seventh general meeting held in New York recently. He has made an extensive study of electric propulsion of ships and in co-operation with the Bureau of Steam Engineering, U. S. Navy, applied electric drive to the battleship *New Mexico*.

FRED R. SLATER has resigned as vice-president and general manager of the Texas Power & Light Co., Dallas, Tex., to take up another line of business and will remain in Dallas. Before joining the company about five years ago as general superintendent, Mr. Slater was engaged as an electrical and construction engineer in New York City. He was connected with William G. McAdoo in the building of the Hudson tubes under the East river. Mr. Slater is well known in the public utility field in the Southwest, and has been prominently identified with various organizations, having served as president of both the Southwestern Electrical and Gas Association and the Dallas Jovian League.

M. S. SLOAN, president of the Brooklyn Edison Co., Brooklyn, N. Y., has been appointed chairman of the recently organized Committee on Electrical Resources of the Nation, National Electric Light Association. Mr. Sloan is a graduate of the Alabama Polytechnic Institute and entered the utility business in 1906 with the Birmingham Railway, Light & Power Co., Birmingham, Ala. During the six years with which he was associated with the Birmingham utility, he rose from the position of chief engineer to assistant to the president, with supervision over all departments. In 1913 he left Birmingham for New Orleans, La., where he held the position of vice-president and general manager of the New Orleans Railway & Light Co. In the latter part of 1917 he became operating manager of the New York Edison Co. and on Aug. 1 of this year was elected to the presidency of the Brooklyn Edison Co., Inc.



M. S. Sloan.

Mr. Sloan is a firm believer in giving prompt and satisfactory service to the community and in effecting harmony and efficiency in all departments of his organization, so treating his employes as to make them happy and contented. It is his belief that in carrying out such a policy, he is performing the best and highest service to the stockholders of the company. His previous career has demonstrated that he has the strength and skill to accomplish such a program. Mr. Sloan is vice-president of the Association of Edison Illuminating Companies, treasurer of the Electrical Testing Laboratories and is identified with other organizations.

B. J. GRIGSBY, vice-president of the Anderson Electric Specialty Co., Chicago, is visiting London and Paris in connection with the distribution of the company's products in Great Britain and France. Mr. Grigsby is particularly acquainted with those markets, having been managing director of the Benjamin Electric, Ltd., in London, for nearly ten years, manufacturing electrical and automobile accessories.

CHARLES F. SCRIBNER, formerly industrial engineer with the Colt's Patent Fire Arms Manufacturing Co., Hartford, Conn., and more recently consulting engineer for L. V. Estes, Inc., Chicago, has become associated with the Business Service Corp. of America, Chicago, in the capacity of vice-president and chief engineer.

S. A. RHODES, acting chief engineer of the central group of Bell Telephone Companies, has been promoted to the position of chief engineer. Mr. Rhodes, who is an associate member of the American Institute of Electrical Engineers, was graduated from the Lehigh University in 1892. Shortly thereafter he established himself in Chicago, and his first association with active telephone work was on some inspections in connection with cable and conduit construction for the Chicago Telephone Co. He has ever since continued in the engineering department of the Chicago Telephone Co. and the engineering department of the central group of Bell Telephone Companies. About 1895, when the use of common-battery equipment was inaugurated, the Chicago company carried on considerable development work in connection with subscribers' station equipment and central office equipment for common-battery operation, and in this work Mr. Rhodes took a very active part. After the common-battery equipment became standardized, he became chiefly engaged in engineering in connection with outside plant and substation equipment. When the central group was formed in 1911 he continued work of a similar nature for the group under the title of material engineer. About this time the matter of providing adequate transmission over trunks and toll lines assumed much importance, and Mr. Rhodes was assigned transmission problems handled by the central engineering department, later being given the title of transmission engineer. In this capacity he continued until he became acting chief engineer of the central group in February of this year.

Obituary.

PERCY H. ASHMEAD, 52 years old, a consulting engineer, who was head of the Costa Rica-Nicaragua boundary dispute arbitration commission, died of pneumonia on Nov. 11 in New York. He was born in Philadelphia and was graduated from Lehigh University. He planned a railroad for the Chinese Government many years ago and also worked on the Madeira-Mamore railroad in Brazil. At one time Mr. Ashmead was in charge of the construction of railroads in the Philippine Islands, and for many years he was chief engineer of J. G. White & Co., of New York City. He was a major in charge of the supplies for the Engineer Corps at Washington during the war.

For the Readjustment Period—What?

Trade Advisors of Other Nations Coming to San Francisco

America's first world conference of American Foreign Traders, with special trade advisors from the Far East, Australasia, and South America, appointed by the various foreign governments, will be one of the important features of the Seventh National Trade Convention to be held at San Francisco, May 12-15, 1920, according to the preliminary plans of the Convention just announced at the Annual Meeting of the National Foreign Trade Council.

The bringing of special trade representatives from the foreign nations to San Francisco so that they may be consulted by American business men is something that should appeal to every manufacturer, merchant and trade organization in the country, says Secretary O. K. Davis, in commenting on this feature of the program. For the purpose of meeting these foreign trade advisors as well as the large number of Americans who are now doing business in foreign countries, who have been invited to attend, the Council is taking steps to have the San Francisco Convention one of the largest ever held in this country.

Chairman Frederick J. Koster, of the Pacific Coast Committee, announces that elaborate preparations for the Convention are being made on the Pacific Coast. The Seattle, Portland, San Francisco and Los Angeles Chambers of Commerce are co-operating in plans to make the journey to the Pacific Coast atttractive for those who attend the convention. Seattle is arranging an exhibition of products of the Far East, San Francisco an exhibition of Pacific Coast products, and Los Angeles an exhibition of the products of South America and Australasia.

Arrangements have been completed for two special steamers from the Far East and one from Valparaiso up the west coast of South America to bring the delegates to the Convention. A special steamer will be provided to take delegates from the East through the Panama Canal to San Francisco. This ship will sail from New York about April 20.

The Convention program will consider chiefly the effect upon American foreign trade of the fact that the United States has become a creditor nation during the war. The discussion at the Annual Meeting of the Foreign Trade Council showed that the members of the Council are giving careful study to the increase of imports that is bound to come to this country in satisfaction of the annual interest upon the huge loans that have been extended to Europe. This question will be threshed out from every angle at the San Francisco convention.

Extensive plans are under way for the entertainment of delegates to the convention and their families and in every way preparations are being made to care for the large attendance which is anticipated.

Special transcontinental trains are announced for the convenience of delegates in the United States. These trains will be made up of special cars from various cities, for reservations in which applications should be made to O. K. Davis, Secretary, National Foreign Trade Council, 1 Hanover Square, New York City.

C. A. TUPPER, President : International Trade Press, Inc., Chicago

Financial News

Warfare on Public Investors.

In a recent issue of Wall Street Journal there appears an article by William L. Ransom, former counsel for the Public Service Commission of the First District, New York, in which he discusses the essentials of a sound regulatory policy in respect to the investor. This is briefly quoted as follows:

"We have had in the United States nearly ten years of deliberate, well-planned warfare to intimidate investors from furnishing the needed new capital for railway and other public service projects. In some instances, this crusade has been the by-product of a narrow but zealous view of public rights as to franchise-holding companies, but it much more generally has been the work of men who believed that manifestations of extreme hostility to the owners of these enterprises would be so popular as to lead naturally to political preferment, and, in many instances, the campaign of terrorism and affrightment of investors has been inspired by those who realized that if private funds would not furnish the requisite capital for new construction and new financing, the treasury of government would of necessity be resorted to, and that the most effective step towards the governmental acquisition of all basic utilities would be to force existing properties into the bankruptcy court or upon the bargain counter.

"In the discussions which have taken place in the National Congress, and in much of the more recent discussion as to the plight of utilities in our states and cities, there has been discernible what may be termed a new realization of the relationship of the investor to the whole problem of the public service. If we are to avoid and withstand the wholesale socialization of the railway, light, heat, power and traction enterprises of the country, conditions must be restored which will attract private capital freely, normally and adequately, under proper safeguards and guarantees, again into this important field. Investors and the general public may well grasp the situation and join hands in dealing with it. The insidious campaign which has made private capital unwilling to risk further outlays in the railway and public utility field has had for its conscious objective the compelling of resort to governmental funds instead, and the clubbing of the present owners into willingness to sell outright on a bargain basis."

Thomas W. Hulme, vice-chairman of Railway President Committee on Valuation, speaking on relation of valuation to investment, said the courts have held true valuation is not original cost, but present value. The determining factors of present value are investments, cost of reproduction, condition of property and earning power. Even in rate decisions not merely physical value, but "going concern value," or good will have received consideration. These principles will be brought to the attention of the Interstate Commerce Commission in a conference to be held in January.

Cities Service Earnings Show Substantial Increase.

Earnings of Cities Service Co. for October, 1919, show a fair increase over the preceding month, indicating that the improvement in earnings noted in the September statement is still continuing. Gross earnings of Cities Service Co. for October, 1919, were larger by $37,756 than for September, while the amount available for payment of dividends on the preferred stock for the month increased $40,451. The balance available for reserves, dividends on the common stock and surplus for October showed a gain of $38,987 over the preceding month, and an increase of $195,820 over the balance for August, 1919.

In conformity with the policy announced in May, 1916, the directors at their November meeting increased the rate of stock dividends being paid on the common stock from 12% annually to 15% annually by declaring a monthly dividend of 1¼% on the common stock, payable in common stock at par on Feb. 1, 1920, to stock of record Jan. 15, 1920. The board also declared the regular monthly dividends, payable in cash, of one-half of 1% on the preferred stock and one-half of 1% on common stock, both payable Feb. 1, 1920, to stock of record Jan. 15, 1920.

In 1916 and 1917 Cities Service Co. paid 6% in stock dividends on the common stock, in 1918 9% was paid on the common stock in stock dividends, and the present rate of payment of these dividends is 12%. The directors at the meeting also approved the issue and sale of the $3,000,000 par value preference B shares recently offered to stockholders of Cities Service Co., which offering was heavily oversubscribed, and declared the initial monthly dividend on the 6% cumulative preference B shares of one-half of 1% payable Jan. 1, 1920, to shares of record Dec. 15, 1919.

Indiana Power Acquires Power & Water Company.

The Indiana Public Service Commission has granted permission to the Indiana Power Co. to issue bonds and stock to take over the property of the Indiana Power & Water Co. The commission authorized the company to sell at not less than 90% of par $750,000 of its first and refunding mortgage 25-year 6% bonds and $500,000 of its 7% cumulative preferred stock and to issue at not less than par $300,000 of its common stock, the proceeds to be used to cover the costs of extensions and betterments and property acquisitions; also to issue to its stockholders at par $150,000 of common stock to reimburse them for the loss of dividends incurred through increasing their equities in the property.

Dividends.

A quarterly dividend of $1.50 per share on preferred stock has been declared by the Connecticut Power Co., payable Dec. 1 to stock of record Nov. 20.

The American Power & Light Co. has declared a quarterly dividend of 1%, payable Dec. 1 to stock of record Nov. 21.

The Fairbanks-Morse Co. has declared a quarterly dividend of 1½% on preferred stock, payable Dec. 1 to stock of record Nov. 20.

Key West Electric Co. has declared a quarterly dividend of $1.50 on preferred stock, payable Dec. 1 to stock of record Nov. 18.

Northern Texas Electric Co. has declared a dividend of $2 per share, payable Dec. 1 to stockholders of record Nov. 21.

Wisconsin-Minnesota Light & Power Co. has declared a quarterly dividend of 1¾%, payable Dec. 1 to stock of record Nov. 20.

Eastern Wisconsin Electric Co. has declared a quarterly dividend of 1¾%, payable Dec. 1 to stock of record Nov. 20.

Marconi Co. of America has declared a dividend of 5%, payable Jan. 2 to stock of record Dec. 10.

Baton Rouge Electric Co. has declared a semi-annual dividend of $4 per share, also a semi-annual dividend of $3 per share on preferred stock, both payable Dec. 1 to stock of record Nov. 25.

Canadian General Electric Co. has declared a quarterly dividend of 2%, payable Jan. 2 to stock of record Dec. 11.

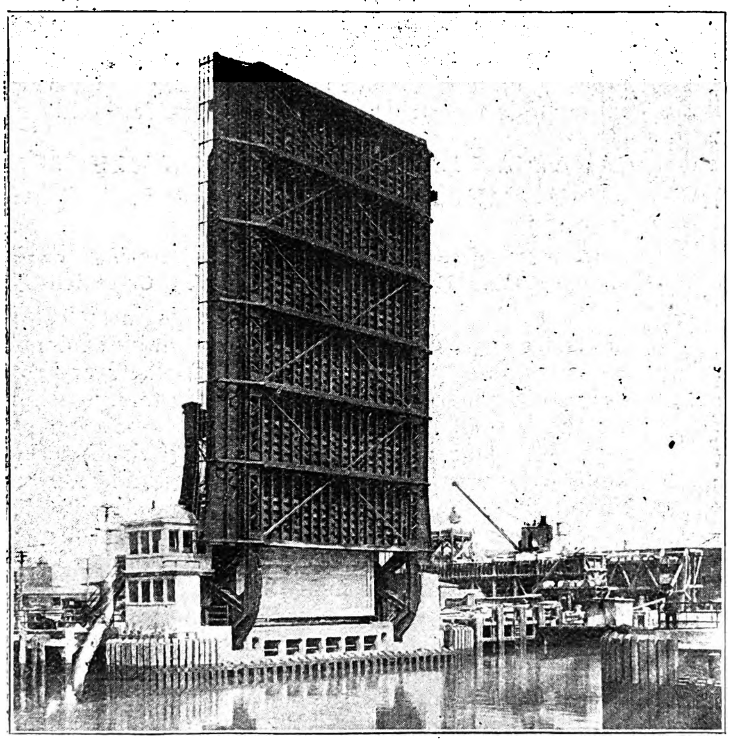
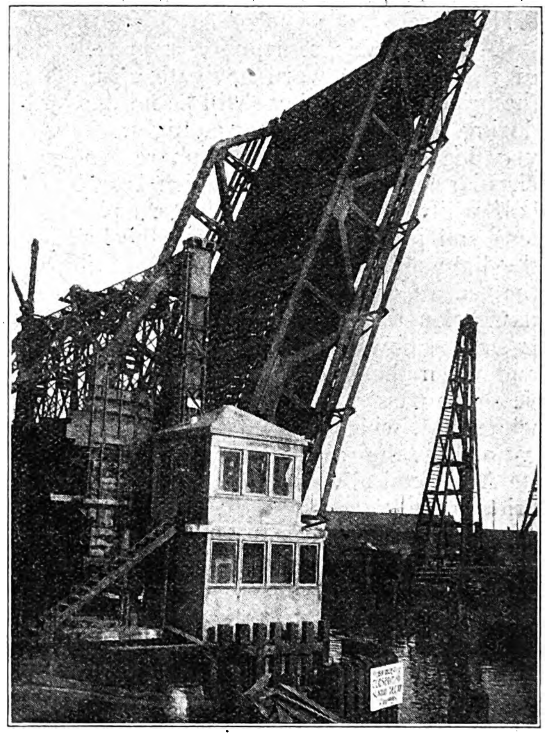
WITH WHICH IS CONSOLIDATED WESTERN ELECTRICIAN AND ELECTROCRAFT

VOL. 75—No. 23. CHICAGO, SATURDAY, DECEMBER 6, 1919. PAGE 933.



San Francisco Single-Leaf Lift Bridge Raised to Its Highest Position—Entire Operation of Bridge Is by Electrical Apparatus, Most of Which Is Automatic.



Electrically Operated Lift Bridge During Construction—View of Tower Which Contains Control and Motive Equipment.

An Electrically Operated Bridge in San Francisco

Features of Motive, Control and Safety Electrical Equipment Installed on Novel Single-Leaf Lift Bridge in Golden Gate City

THERE are three drawbridges operated by the city of San Francisco, the electrical installations for all of which were designed by the engineers of the Department of Public Works of that city. The most novel of these bridges is that at Fourth street.

The bridge in question is of single-leaf construction, with a span of 94 feet. It is counterweighted on the north side with a 700-ton overhead concrete weight spanning the roadway, the weight of the bridge being slightly overcome by the weight of the concrete.

The bridge is raised and lowered by two 25-hp. electric motors, series wound, with reversing controller and magnetic brake lock, the latter being operated by a 0.2-hp. motor.

The switchboard and all controls are housed in an observation tower with glass sides, enabling the operator to obtain an unobstructed view of the river in all directions as well as a view of Fourth street. The switchboard is equipped for the control of lock motors, lift motor and brakes, gates, alarm auxiliary lights, and also with the necessary voltmeters and ammeters.

When the bridge is about to be raised, an alarm bell is sounded at both ends of the bridge to warn all vehicles and pedestrians. The safety gates are then lowered and the bridge unlocked. It is impossible to unlock the bridge until both safety gates have been lowered. It is also impossible to start the motors that raise the bridge until the safety gates are properly lowered and the bridge unlocked. Energy for operating the motors that raise and lower the gates on the south side of the river is carried over a cable that is carried on the bridge, and the instant the bridge starts to raise the contact is broken, so that it is impossible to raise the south safety gates until the bridge is again lowered.

When the bridge is raised to a nearly upright position, the upward movement is automatically stopped, a short-circuiting device shutting off the motor and applying the brakes. By means of hand control of the motors and brakes provision is made to raise the bridge still farther to enable vessels of extraordinary large sails to pass. On lowering the bridge it is automatically stopped just before reaching the final resting position, and it is then necessary for the operator to take charge of the controller and complete the lowering of the bridge. After the bridge has been lowered into its final position and then locked, a contact is made which permits the raising of the safety gates.

In the tower there are tell-tale lights which tell the position of the bridge, such as locked, open, bridge nearly raised, bridge fully raised, bridge nearly closed, bridge free.

An automatic semaphore is placed on both sides of the bridge to warn navigation of the position of the bridge, so that there will be no danger of collision during foggy weather or at night. This is operated very ingeniously. The semaphore consists of a semicircular lens, one-half of which is red and the other half white, and an electric lantern placed back of the lens and pivoted so that when the bridge is lowered the light shines through the red section of the lens; the red, of course, being the danger sign, indicates to navigation that the way is not clear. As the bridge is started upward the position of the lantern changes and when the bridge is raised sufficient to permit a vessel to pass the lantern is in a position back of the white lens, which gives a white light informing navigation that the way is clear.

An electrically operated bell is installed at all three bridges, and is connected with the central fire alarm station in Jefferson Park. When a fire is in a locality that will necessitate the fire department apparatus using any of the bridges a warning is sent out from the central fire alarm station by means of these bells. If a bridge is open it is closed as soon as possible, and if it is in a lowered position it is not raised under any consideration until after all fire department equipment has passed over the bridge.

NEW ZEALAND GOVERNMENT PURCHASES HYDROELECTRIC PLANT.

Another Plant Added to the Government System Which in Few Years Will Cover Both Islands.

The New Zealand Government has purchased the Horahora hydroelectric system from the Waihi Gold Mining Co. for $1,034,131, with the view of distributing electricity to the company's properties, other industrial enterprises, and homes in the Auckland province south of Auckland, New Zealand.

The Horahora electric power works, situated on the Waikato river a few miles beyond Cambridge, were erected by the Waihi Gold Mining Co. a few years ago at an expense of about $1,000,000. The present plant is capable of developing 9000 hp., and with the addition of two units at a cost of about $250,000, which it is expected will be constructed, soon will total 12,000 hp. for the hydroelectric works. The maximum demand of the Waihi company is 4000 hp., thus leaving 8000 available for distribution in the Waikato and adjacent districts as far north as Auckland, a distance of over 100 miles.

It may be a few years before the city of Auckland receives much power from Horahora, but with the construction of the additional two units it is estimated that 5000 or 6000 hp. would be available for that city. The present consumption in Auckland is between 12,000 and 13,000 hp., and whatever is obtained from Horahora will be in addition to the two local generating plants now operating in that city. The cost of the electricity from this plant is not fully determined, but it probably will be the same as that from the Lake Coleridge government plant in the South Island.

Horahora is only one step in the general hydroelectric development plan for New Zealand, and in the course of a few years the proposed Arapuni plant will be erected, which will be the main supply for the North Island, with several generators capable of producing 13,000 hp. each. In the face of the present critical coal shortage and the unpromising outlook for the future supplies of coal in New Zealand, it looks as though the hydroelectric developments in general will make great strides during the next few years.

CANADIAN EXPRESS RATES ON ELECTRIC INCANDESCENT LAMPS.

Protest by Manufacturers' Association Against Excessively High Rates Not Warranted by Conditions.

As the law in Canada now stands incandescent lamps are carried by the express companies at double first-class rates. The Canadian Manufacturers' Association, acting on behalf of the importers, is asking for the normal first-class rate. The association has recently submitted evidence showing that electric lamps were carried in the United States and from the United States into Canada at the first-class rate. It was further shown that 22% of the metal-filament bulbs and 70% of the carbon-filament bulbs exported from the United States in 1918 came to Canada.

The attitude of the express companies was that incandescent lamps were very bulky and light in proportion to other goods, the result being that cars were often loaded with electric bulbs to the exclusion of more profitable goods. To the contention of the importers that lighter articles, such as musical instruments, wicker furniture, tins, and wire goods, were carried at normal rates, the companies replied that these articles were not sent in such large quantities.

No decision was given by the board at the time of the hearing, and importers state that no judgment has yet been received by them as to the attitude of the board in the matter. The claim of the importer is that the only justification the express companies would have for charging such a rate would be the percentage of breakages being very high, and this was not shown by the companies in the case which they presented to the board.

COPPER PRODUCTION MORE THAN DOUBLED.

During the past four years the cost of producing copper has more than doubled, according to reports of producers. They show that the cost per pound in 1915 varied from 6 to 10 cents, while in 1919 this cost varied from 12 to 22 cents. Costs today are calculated on a somewhat different basis than in 1915 in that formerly no charge was made for depletion, and credits were allowed for gold and silver recoveries not now so treated; but these two items do not affect the comparison by more than 1 cent per pound.

Recent set-backs in the copper market have been due to the failure of export demand to materialize as expected. War-devastated Europe was counted on to absorb enormous tonnages of American copper in reconstruction, but to date foreign purchases have been small and until credits to foreign customers are forthcoming it is stated that it is needless to look for a correction of present conditions.

Central-Station Rates in Theory and Practice

Twenty-second Article—Importance of Accuracy of Rates—Inaccurate Rates Reduce the Profit and Impair the Service—Growth and Scope of Public Utility Regulation by Commissions

By H. E. EISENMENGER

This series of articles, of which this is the twenty-second, was begun in the issue of July 12. The first seven articles constituted Part I and dealt with the cost of electric service. Part II contained six articles on the policies governing selection of a rate system. Part III included six articles describing the various systems of rates in common use. Two articles formed Part IV on rate analysis. The present article includes Part V and the first portion of Part VI, the remaining portions of which will be continued in the last three articles of the series.

PART V—ACCURACY OF RATES.

SECTION 171. We have seen that, regardless of whether we make the prices on the basis of the cost-of-service principle or the maximum-earnings principle or the value-of-service principle, there are always certain prices for every particle or for every class of service. These prices vary with the class of service according to the variation of the cost and, except in case of the cost-of-service principle, according to the variation of the profit.

Referring to the system of graphical rate representation explained in the preceding Sections (164-170) we can say that the *cost* of the various consumers (at least within one certain class of service) is roughly a Doherty plane. If the percentage of profit were to be constant for all sizes of customers this would result in another Doherty plane for the *prices* (rates) which is everywhere higher than the cost plane by just that percentage.

According to Sections 97-99 it will be of advantage for the producers as well as for the consuming public if the small consumers and the large ones get prices which are based on smaller profits than those charged to the consumers of medium size. Then the price (rate) surface will become curved, with the convex side pointing upwards.

We cannot follow this ideal surface exactly by the rate schedule, in the first place because we do not know the surface exactly and secondly because we do not want the rate system to become too complicated. The surfaces of most rate systems show a more or less close approximation to this vault-like curvature of the ideal surface by a substitution of a combination of planes in lieu of the curved surface. We see this approximation to the curvature for instance in the Wright demand rates, especially in those with a greater number of blocks, and still better in the double-block Hopkinson rate. (For photographs and drawings of models of this system, see H. E. Eisenmenger, "Space Representation of Central-Station Rates," *Electrical World,* Nov. 4, 1911, Figs. 13 and 14.)

The very fact that we have only an approximation to the ideal rate surface implies that we have certain inaccuracies of the rate. The rate will be just at its ideal or theoretical value at certain points of the bottom plane, that is for certain combinations of demand and energy consumption, but it will be higher than it ought to be at other points, and again lower at others. The smaller these inaccuracies are (with reasonable simplicity of the rate schedule) the better for the consumer and the producer.

172. The reason why every inaccuracy of rates is of disadvantage to both the consumer and the producer is this: Suppose certain customers (to be called Class A) are charged more than what is intended and would be theoretically correct, that is, more than what is to the best interest of all parties concerned (see Part II, Section 78 *et seq.,* "The Value-of-Service Principle"); other customers (Class B) are charged less than their proper amounts. The result will be that some of the customers of Class A will drop out or change the character of the service they require, in such a manner that they become Class B customers or approach to Class B customers. An inaccuracy of rates has therefore the following effect: Whatever class (or classes) of customers or service is affected in such a way by the inaccuracy that its rates and therefore its profitableness is reduced below the theoretical and intended amount, it will always be just that class which is increased in number and volume, and conversely just that class whose profitableness would be increased by the inaccuracy will—at least partly—disappear. Therefore every inaccuracy of the rate will of necessity reduce the profits and thus create a tendency towards raising the prices.

173. A separate and frequent case of rate inaccuracy is the case where one or two of the three charges (customer, demand, energy) are left out. In fact, as has been shown (Section 10) even rates which embody all three charges are necessarily inaccurate because an accurate rate would require an indefinite number of charges.

If, for instance, we suppress the demand charge (as in pure meter rates) the customers will get the use of the demand for nothing and consequently they will not care how large their demand is; they will be wasteful with their demand, so to speak. A customer using, for instance, 50 kw-hr. per month under a pure meter rate will have a larger maximum demand than a customer using 50 kw-hr. under a rate system where a charge is made for the demand. The consequence will be a smaller load-factor. For a given kilowatt-hour consumption the central station has to keep in readiness a large generating capacity, etc., which reacts unfavorably on the cost and therefore on the price per kilowatt-hour.

On the other hand, if no energy charge is made (flat demand rate) the customers will be careful to keep down their maximum demand, or its rating-equivalent, respectively (capacity connected or connected load). In any case they will be far less careful about their number of kilowatt-hours (burning hours) than under a system of charging which makes a charge for every additional kilowatt-hour actually consumed. The only check which remains against absolute extravagance (outside of a feeling of fairness towards the central station on the part of a portion of the customers) is the cost of lamp renewals where these must be borne by the customer. The result will be that the load-factor of customers with a flat demand rate will be large.[1] A superficial observer who has accustomed himself to think in terms of average cost per kilowatt-hour may consider this an advantage because he knows that a large load-factor results in a low cost per kilowatt-hour. It must not be forgotten, however, that just in this case (flat demand rate) the central station is not paid for the additional kilowatt-hours furnished. The element that builds up the revenue is in this case exclusively the maximum demand and the larger the load-factor is for a given maximum demand the larger is the energy consumption for which the central station has to provide without getting any return.

Again, taking the case where the customer charge (and its substitute, the minimum charge) is left out of the rate schedule, this means that the very small customers will pay less than it costs to serve them; they can be carried only at a loss and, on the other hand, we have to give them service if they demand it. A customer charge or a minimum charge will either keep these unprofitable customers away or else raise their bills high enough so that they are turned into profitable customers. We can, in case of a suppression of the customer charge, not say that the *individual* customer is wasting anything, as in the case of the pure meter rate and of the flat demand rate, but the general average of the customers is wasteful, so to speak, without the customer cost, inasmuch as the small customers (whose customer cost would be a large percentage of their total cost) are unduly attracted.

It is always the element which is offered gratuitously or excessively cheaply with which the customer will be extravagant and in this manner the public service company will suffer damage from an inaccuracy of the rates and as the losses must, at least to a certain degree, ultimately be paid out of the customers' pockets the customers will suffer also.

174. It must not be overlooked, however, that the inaccuracies of the rate weigh differently in different places of the bottom plane. For illustration, if we have a residence rate it is necessary that it be accurate for small consumers but it does not matter if there is even a large inaccuracy for a residential customer of, say, 10 kw. demand and of some 2000 kw-hr. energy consumption per month because there will be very few, if any, residential customers who have a demand of that size and certainly none with a load-factor of that magnitude. A retail power rate, on the other hand, must be accurate for just that type of customers and its accuracy for the very small customers is not of such importance.

Fig. 23 shows a model constructed by the author several years ago in the course of an investigation of the rates of a company operating in a large city on the Pacific Coast. This model refers to the distribution of the residential customers of that company with reference to the size of the customers. The two horizontal axes of this model are kilowatts and kilowatt-hours, the same as in the rate models, but the vertical dimension is used for stepping off the number of residential customers. The ground plane (bottom plane) has been divided into squares (or rectangles) by using certain steps for the kilowatts as well as for the kilowatt-hours and then the number of residential customers to be found in each square in the territory of the company has been stepped off as vertical ordinate. The model shows that in one of the "squares" the number of customers in existence is very much larger than in any other square and it further shows that practically all residential customers are crowded together—so to speak—in a very few, perhaps six, of the squares so that anything outside of these six squares is of little or no importance and the accuracy of the rate outside of these six squares is of no great consequence. A similar model has also been constructed, showing in the same manner the income from the various sizes of customers instead of their numbers in each group. The shape of this model which has a still greater bearing on the accuracy of the rates is, of course, in general similar to the one shown in Fig. 18 except that the maximum is moved a little further away from the origin.

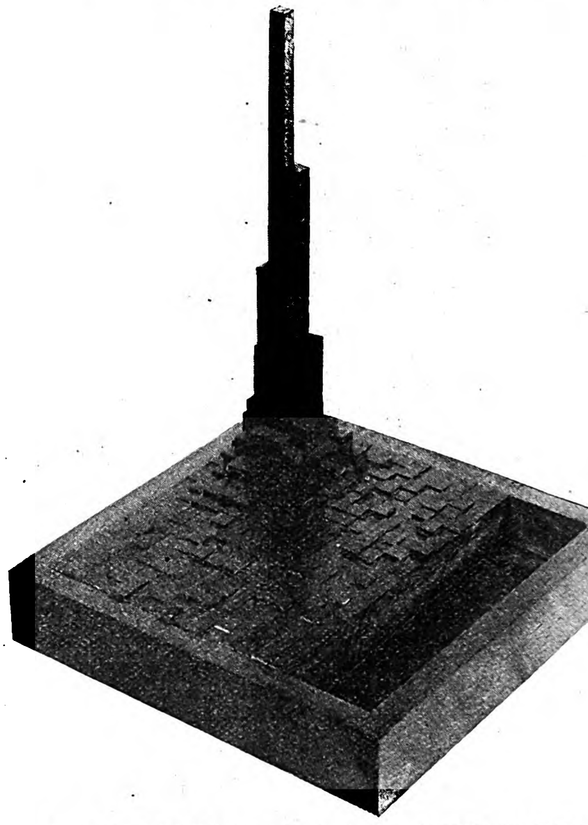


Fig. 23.—Distribution of Consumers of Different Sizes.

[1]According to the information obtained by S. E. Doane and the author in Milan, Italy, it has been found in that city by using check meters that the average load-factor for small flat-rate customers was 2270 hours per year. The demand charge must therefore be large enough to cover the cost of this waste of kilowatt-hours, but as the increment energy cost per kilowatt-hour is very small the large reduction in the customer cost (see Section 128) and the other advantages make this system economical in spite of the waste of kilowatt-hours.

PART VI—PUBLIC UTILITIES AND PUBLIC REGULATION.

CONTRIBUTED BY S. F. WALKER,
Formerly Associate Editor of Rate Research.

I. PUBLIC UTILITIES AND THE PUBLIC INTEREST.

WHAT ARE PUBLIC UTILITIES?

There is no generally accepted or legal definition of a public utility, or, looking at it another way, there is no generally accepted authority showing just what business enterprises may be brought into the program of public utility regulation and what industries may not be subjected to public service regulation as it has been set up in the various states.

In practically all of the state laws, public utilities have been defined by enumeration, the law stating, for example, that railways, electric, gas, telephone and water companies are to be subject to the regulatory powers vested in the commission. The policy of state regulation of public utilities has had a rapid extension. It has gone from state to state until every state, except Delaware, has some form of a railroad or public utility commission, and in various states the law has been amended year after year to include additional business enterprises. The question is, just where must this extension stop because the remaining unregulated businesses are not public utilities or are not subject to public regulation.

Franchise Companies.—Some authorities have held that public utilities are those companies which hold franchises to use the public streets. But regulation has gone beyond that limit.

Noncompetitive Enterprises.—Franchise companies were protected from competition, more or less. At least the field was not easily accessible to every one willing to come in and compete for business. On this basis some authorities have said that public utilities were subject to regulation because competition did not regulate their rates. But there are many monopolistic enterprises able to nullify the effect of competition in naming their prices that are not thought of in the same breath with public utilities. And, on the other hand, competition is a factor, often a ruling factor, in the rates of public utilities. There have been rate wars between public utilities that have driven rates lower than any commission would feel justified in imposing upon the companies, and it has often been one of the first tasks of a commission to bring such rate wars to a close and raise the rates to enable the companies to operate properly. The public utility rates are also affected by competition with other products. For example, electric companies are in competition with gas companies and with private plants for certain classes of service.

Commissions that have adhered strictly to the cost-of-service theory and have recorded their disapproval of "value of service" and "what the traffic will bear" methods, have often encountered situations where the theory cannot be followed, but where the rates for certain classes of the service are determined by the competition of other sources of fuel, light, power or whatever it may be.

Public Interest.—Taking refuge in a broader definition, public utilities are those companies whose business is clothed with a public interest.

The principle of public regulation was applied in early times to innkeepers, ferries, turnpikes, blacksmiths, and surgeons, because public welfare at that time was dependent upon obtaining these services at reasonable rates. This power to regulate in the interest of the public is held to be one of the inherent powers of the state, so much so in fact that the states cannot bargain this power away. It has been held that contracts, special charters and franchises granted a company or institution cannot debar the state from later imposing regulations contrary to the terms of such special grant, if it is in the interest of the public so to do.

EXTENSION OF PUBLIC REGULATION.

The state of Massachusetts established a Railroad Commission as early as 1869, and before 1890 there were railroad commissions in California, New York, and Iowa. The Interstate Commerce Commission was established in 1887.

Commission control of public utilities as it is known today may be said to have started with the Wisconsin and New York laws passed in 1907. Wisconsin established its Railroad Commission in 1905, and extended its power by the public utilities act of 1907. The New York law passed in the same year provided similar regulations of public utilities and other states have followed rapidly, keeping in general to the regulation of electric, gas, water, telephone, street railway, railroad, telegraph, and express companies, until the idea of public utility has been associated with these industries in a peculiar degree.

These industries might well ask, "Why is it so particular with us?" The business of furnishing food and clothing is certainly "clothed with public interest," and in fact, during the war period especially, has been subjected to regulation by administrative commissions in the interest of the public.

Commission regulation is not limited to natural monopolies and companies holding franchises, but may be extended at any time to such industries as public interest may dictate. There is no legal holding to the contrary.

In Oklahoma the Corporation Commission, provided for in the constitution of that state, was given general powers of regulation over all industries clothed with a public interest.

The provision of the Oklahoma constitution and the statute laws of that state relating to the establishment of the Corporation Commission and defining the powers of that body, while mentioning particularly railroad and transmission companies, include the following section going beyond any attempt at enumeration of public utilities subject to regulation.

Chapter 38, Article I, Section 13, Oklahoma Statute Law (1908): "Inevitable monopolies declared subject to price regulation by the state. Whenever any business, by reason of its nature, extent, or the existence of a virtual monopoly therein, is such that the public must use the same, or its services, or the consideration by it given or taken or offered or the commodities bought or sold therein are offered or taken by purchase in such manner as to make it of public consequence or to affect the community at large as to supply, demand or price or rate thereof, or said business is conducted in violation of the first section of this act (restricting combination in form of trust or conspiracy in restraint of trade or commerce within the state), said business is a public utility and subject to be controlled by the State, by the Corporation Commission or by an action in any district court of the State, as to all of its practices, prices, rates and charges. And it is hereby declared to be the duty of any person, firm or corporation engaged in any public business to render its services and offer its commodities, or either, upon reasonable terms without discrimination and adequately to the needs of the public considering the facilities of said business."

An enumeration of industries in the different state laws has led to a more artificial idea of public utility regulation. While in one city or town the people are in need of having their electric company or street-railway company regulated, perhaps in other towns the people are more in need of having a meat market, a grocery, a warehouse, stockyard or perhaps even the dentist, the doctor or the lawyer regulated than the so-called public utilities.

Sometimes the commission regulation planned for companies known as natural monopolies has been extended to other classes of business under the same law—warehouses and cotton gins, for example, while other methods of regulation have appeared as anti-trust laws, food and drug acts, and special laws regulating the rates of insurance companies.

Just what the future limits of public utility regulation by commission will be cannot be foretold, but the tendency appears to be toward extension of the regulatory policy rather than toward restriction.

PURPOSE OF REGULATION.

The main purpose of regulation may be briefly stated as the securing of adequate service at reasonable rates, without unjust discrimination in either the furnishing of service or in the rates charged.

Proper regulation is concerned with the protection of the company, on the one hand, as well as the protection of the public, on the other.

Service.—The commission may determine what extensions and improvements in service are required to serve the best interests of the public and is given the power to order such extensions and improvements where the company has failed to make them of its own initiative.

However, the company is protected from unreasonable demands which would increase the investment in its property out of proportion to the public benefit secured.

The protection of the company against unreasonable service demands to the benefit of the general public has been most marked during the period of the war. Service improvements have been postponed, further extensions discontinued, requirements lightened, all at a time when the high cost of materials and labor would have imposed a high investment as a permanent burden upon the utility service.

Rates.—The public is entitled to service at reasonable rates, and the utility is entitled to a fair return on its investment and to compensation for good management. Rate regulation is only one of the phases of regulation, although it has been given the first place in public attention. Poor service at low rates may not be as good a bargain for the public as good service at high rates. The rates must be such as to afford proper inducement to capital and managing ability and to secure the benefits of new inventions and improvements in the industries concerned.

Rate Reductions.—The introduction of regulation was followed by a period of rate reductions. The public expected this of the commissions established. There were many factors making it possible, perhaps, for the various utilities regulated to withstand these rate reductions without harm. Under regulation the rights and duties of these companies were more clearly defined, thus giving them a more stable position. The stocks and bonds of the companies issued under commission approval had a ready market. The experimental period of development was over and the companies were entering upon a period of regular development. The companies were in many instances freed from losses from free service and discriminatory rates held over from the days of bargaining. And finally, a most important factor, rate reductions brought increases in business.

Increasing Rates.—During the period of rising prices, under war conditions, the commissions have found it necessary to grant increases in public utility rates. While there have been disappointments and delays in granting what companies have considered justifiable increases in some cases, it is undoubtedly true that increases in the emergency were secured more generally under commission regulation than could have been secured by bargaining with local authorities.

Reasonable Rates.—It is the duty of a commission to determine reasonable rates—not just nonconfiscatory rates. The courts had the power to prevent the exaction of a confiscatory rate, but the commission must go further and prescribe reasonable rates affording a fair profit to the company above all legitimate expenses of operation.

(To be continued.)

NEW SOURCE OF ALUMINUM.

Metallic aluminum can be obtained by electrolytic methods from its oxide; the oxide, however, must be free from iron and silica. The ore most commonly used is bauxite, after it has been purified by the costly Baeyer process. There being no bauxite in Norway, Prof. V. M. Goldschmidt, of the Mineralogical Institute, Christiania, in 1917, conceived the idea of using Labrador stone as a source of aluminum. By Goldschmidt's process, the Labrador stone is extracted from the plagioclase felspar by means of 30% nitric acid (the first raw product of the electrical air industry). The silica and the greater portion of the iron minerals remain insoluble, while aluminum, calcium and sodium go into solution, together with a little iron. After removal of this iron the solution is evaporated down to dryness, and the residue heated to a certain temperature at which the aluminum salt alone is decomposed, the nitric acid driven off being collected as a valuable concentrate. By washing with water the nitrates of calcium and sodium are removed, to be recovered and used in agriculture, whilst the aluminum remains. Since there are abundant supplies of the white, marble-like rock or plagioclase felspar, containing about 30% aluminum, in the southwestern part of Norway, this process seems full of promise for that country.

EFFECT OF AUTOMOBILES ON STREET-RAILWAY REVENUES.

A committee of the Massachusetts Legislature, which made a study of the street-car situation, has estimated that private automobiles, exclusive of "jitneys," reduced the income of the traction lines in that state 12%, and that, if this reduction were applied to the whole country in proportion to population, the total reduction in street-car earnings would amount to about $70,000,000 per year.

Electric Automechanical Handling of Freight Shipments

How Electrical Equipment Can and Is Already Solving the Freight Terminal Problem — The Gattie System in London—Cincinnati's Experience—Paper Before New York Railroad Club

By ZENAS W. CARTER

Secretary-Manager, The Material Handling Machinery Manufacturers' Association

THE railroads are to go back into private hands. The first problem executives and managing heads of all departments of railroading must face and work to solve is that of costs—both costs for materials and costs for manual service. The second problem is labor shortage. The third problem is lack of equipment. The fourth problem is condition of equipment. And last, but not least, is attitude and productiveness of the entire personnel from the section hand to the directing chief.

Unfortunately, under government ownership and especially on account of the war reaction which is influencing men so strangely, there has been little serious attempt on the part of the operating and working forces to keep down costs.

Further, man-power shortage is the natural result of the war. This same cause may be given as the reason for lack of railroad equipment and condition of equipment.

Depreciation in productiveness is partly psychological and partly the result of the sudden increase in the distribution and rotation of money among the masses. Rotation of money tends to develop a sense of luxuriousness which directly results in a slackening of effort.

Knowing the problem and the factors of the problem is half the solution, however, and the real work for the railroad executive is the application of methods which will change the factors into a co-ordinated unit.

It is possible, therefore, to visualize electric automechanical freight handling as a very important method which may be used to change the factors of high costs, labor shortage, lack of equipment, etc. We may even conceive that used thus, electricity may be the colloidal to improve both the attitude of the individual toward his labor and to increase his productiveness.

To visualize this it is only necessary to consider the changes electricity has already made in our daily life. And to make the application specific, as it relates to the use of electricity in new ways in railroad progress, it is only necessary to check over the present activity at some few points.

Proposed Central Freight Station for London Using the Gattie System.

For instance, few men in this country, even in the railroad lists, are familiar with the fact that the British Government is right now considering very seriously the elimination of every one of the 74 freight yards and stations in the city of London.

The idea is to combine the entire interchange of all freight, both carload and l.c.l. into one immense central freight station and distributing point. This would be absolutely impossible without electricity as the all-powerful, infinitely flexible force with which to operate.

When such an idea is even mentioned the average man simply must smile to himself and look to assure himself the man who makes the statement is not a victim of shell shock.

Nevertheless, this scheme, known as the "Gattie System," has received the consideration of the governmental and financial and business interests and is not at all an impractical proposition. Mr. Gattie has worked out every detail from planning an immense depressed area of 30 acres to be known as the "Crypt" to the detail of the floor sections and stalls on each of the planned nine stories of a gigantic 15-acre freight station. The "Crypt" will be used for all incoming trains and in making up trains to travel over all lines radiating in and out of London.

Of course the use of gondola cars in England—much smaller cars than in America—has made his plan workable, and he is to utilize the flexibility of electricity throughout to operate 196 powerful overhead electric traveling cranes, supplemented by a system of conveyors, the entire plant being planned to handle heavy loads in bulk. The cranes will lift uniform containers bodily from the platform of a car on the London & Northwestern, say, and take it over and place it on the platform of a car on the Great Eastern. This will eliminate the present need for that car to pass through dozens of switches and suffer from four to ten days' delay in its transfer across London.

In the handling of l.c.l. freight the containers are lifted bodily and taken to one of the four distributing floors. All goods, as they term freight in England, will then be handled from these central distributing floors to every part of that tremendous station by electrically operated conveying systems, escalators, elevators, chutes and electric trucks and trailers. Each lot goes from the central distributing floors directly to stalls where are particular containers for each railroad station or group of small stations.

These containers filled with goods for one particular town will be lifted bodily from the car platforms by local cranes when the train reaches that town. The car platform, then empty, may be at once utilized for a local container which has been previously loaded at that station just as we now load a boxcar with l.c.l., and the local traveling crane will place the container on the empty car platform and the train may then proceed towards its destination.

It will take just a little reflection to completely bring to your mind's view just what is necessary in the way of electric automechanical freight-handling equipment to completely handle a system of this kind.

Certain it is, however, that it is all possible through the use of electrically operated shuttle cars, electric traveling cranes, electrically operated conveyors of both the overhead trolley and the belt and apron and gravity types, and automatic elevators, and electric trucks and trailers.

The result of using such a system will be great economy, the release of the great spaces now used for yards and switch storage tracks and freight stations and it is figured that the value of the 74 stations will be much greater than the entire cost of the proposed gigantic central station.

This would also solve much of the problem of reducing freight-handling costs, labor shortage and equipment shortage. In addition, the psychological effect upon groups of men operating machinery under sanitary and healthful conditions in all kinds of weather, and with a minimum of physical effort, is certain to be such as to change their very attitude toward this work, while the synchronization of the whole would automatically speed up the productivity of each worker.

What is still more important, it would tend to give both regularity of hours of toil and continuity of employment, with a resultant uplift in the mental caliber of the men employed which would be incalculable.

Terminal System to Be Used in Cincinnati.

And just to prove that electricity right here in the United States is going to help solve the coming problem of the railroad executives and managers and employes of the railroads in the United States, all the railroads of Cincinnati, O., have made arrangements with a private operating company for the installation of a patented system of terminal operation.

This company has almost completed all the installation of the electrically operated machinery necessary to carry out its method of handling l.c.l. freight at Cincinnati, and it is my opinion this, or a similar system, is going to revolutionize the transfer-point interchange of l.c.l. freight all over the United States.

Starting from the results which will accrue at Cincinnati and working back to the principles of operation, the facts seem almost as revolutionary at first as the "Gattie System" will be in England.

For instance, this Cincinnati plan to handle freight by automechanical methods, using electric and gas motor trucks and machines instead of steam coal, switch engines, engine and switch train crews, and switches, is estimated to release 66,000 freight cars previously used exclusively in "spotting," transfer, trap or ferry service in the Cincinnati terminal territory.

There are problems one, two, three and four met in a way which at first tends to stagger even our American imagination. Cost is reduced, equipment both released and saved from deterioration, and labor shortage overcome.

But that is only part of the saving. The complete motorization of Cincinnati l.c.l. will save the railroads entering that city just about 300,000 switch cut movements per year and also will extend existing terminal facilities over 30% and make a reduction of 25 cents per ton in handling costs—all at the insignificant cost to the railroads of approximately $150,000.

Furthermore, to date over 140,000 tons of general classification merchandise freight have been moved without a single loss or damage claim resulting, and the current movement of all connecting line and substation freight has been greatly facilitated. Thus electricity functions tremendously as a force to help overcome these five problems of railroad management at Cincinnati.

The detail of the operation at Cincinnati is not a new untried scheme, as it has been under practical every-day test for almost two years between main and substations of the "big Four" railroad. The actual figures resulting from the tests were used in making the estimates for the complete plants now being installed.

Details of the Equipment and Method of Operation.

The system is a combination of motor truck, overhead electric traveling cranes and uniform containers, with which will ultimately be combined many forms of mechanical handling machinery, such as industrial electric trucks, stacking and tiering machines, portable conveyors and other electrically operated devices which reduce physical labor and tend to improve the morale of the men who serve in the handling of freight.

It is the combination which is the essential element of saving, as all of these devices and machines are now daily reducing manufacturing costs in most of our American industries and most of them will soon be in service at terminal and transfer points handling ocean and river cargoes as well as freight.

The handling of l.c.l. interchange at Cincinnati is as follows, bearing in mind that at the present time the railroads are not making any attempt at store-door delivery, although this also is undoubtedly going to be the outgrowth of the use of this system. At Cincinnati only railroad freight is being handled.

The cars are spotted alongside the freight station in the usual manner. Doors are opened and hand trucks or electric trucks receive the goods in the usual manner. They are then conveyed to the uniform containers and packed into the container identically as you pack a freight car.

These containers are placed in rows in the freight station, each container being plainly marked for one of the seven railroads entering Cincinnati. The containers are wood and steel boxes, 17½ ft. long, 8 ft. wide, 7 ft. high, and are usually loaded not to exceed 4 tons. The containers each have wide side doors and wide end doors so they may be easily loaded with miscellaneous freight of all kinds. Also each container (at least most of them) is fitted with large substantial casters so that it may be rolled across the station floor or rolled along the platform alongside a car.

When the container is filled or loaded it is lifted by a traveling electric crane, swung from its position and transported by the crane to the point where a motor truck chassis stands ready to receive the container as the complete body of the motor truck. Clamps are set and tightened, and the motor truck dashes off to the station of the railroad over which the goods in that particular container are routed.

At some stations the traveling crane delivers the container to the motor truck sidewise and at others the delivery to the chassis is endwise. In most cases where endwise delivery is made, and in cases where crane operation is not necessary on account of the few containers per day to be handled, the containers are set on a type of skid, which is just high enough and wide enough between its supports to permit the truck chassis to be backed underneath the container, and the lifting and lowering is then done through the use of electrically driven chain hoists. Where this latter method is in use, the skids are in bays extending into the station shed.

When the truck reaches the destined station, the traveling crane immediately relieves the chassis of the container and then places a return container on the chassis, effecting a minimum of delay for the motor truck. A central dispatcher handles the operation of all of the motor trucks, insuring their operation for a maximum percentage of the day.

The electric traveling crane of course carries the container with its load to the point nearest the spotted car of the connecting line and it is unloaded direct from the container into the car of the connecting line; or, if the goods in the container are for various small stations along the line, they are placed in proper cars in the usual manner, remaining in the container until cars are spotted for that particular freight division on which the station is located.

It is entirely practicable to haul the containers about by means of a winch or an electric tractor truck although they are not yet equipped for movement by electric tractor.

Of course, it is but a step from the development of this system into an electrically operated unit for the complete system of freight service, including delivery and receipt of freight from store door, which will be a very simple step ahead—involving merely the use of the same type of trucks and containers for the door-to-door service as is now employed in the inter-railroad service.

It is almost necessary for similar plans to be put into use throughout the country in order to meet the demands of the economic situation of costs, manual service need and equipment shortage.

Because of this engineers and railroad operatives are making exhaustive studies of these different machines and their co-ordination into handling systems.

With its adoption will also come a fuller appreciation by the railroads of the value of all types of mechanical handling machinery. In our manufacturing plants, men are given the benefit of every conceivable type of machine or device which will save physical effort and conserve time and energy, or speed up production, but as yet little use has been made of these electrically operated machines in freight and ocean cargo handling.

An automobile plant is equipped with numerous systems of conveyors, cranes, etc., all electrically operated. And in all large plants coal is handled by crane, belt conveyor or trolley with grab bucket, oftentimes without manual labor service from coal car to furnace grate bars, and even the ashes are automechanically carried to refuse piles.

Endless instances of the use of mechanical handling machines could be given where savings have resulted sufficient to pay for equipment in one or two months after installation, and it is logical to believe that the very first moves on the part of the actual owners of the railroads after Jan. 1 will be to purchase and install electric automechanical handling machinery of many kinds.

VALUE OF ELECTRIC COAL CUTTERS IN MINING.

British Mining Electrical Engineer Explains How They Can Increase Output of Collieries.

The use of electric coal cutters in collieries as a means of securing efficiency of production came in for consideration in the address of E. P. Hollis delivered at Birmingham, England, in November to members of a branch of the Association of Mining Electrical Engineers. He said that the electric coal cutter had won its spurs and was a most potent factor for increasing production; in fact, it was now realized that it was the only method of getting maximum production contingent, of course, upon the circumstances being favorable for its use. The introduction of a few of these machines in a casual way had to be guarded against very strongly, as it was not a proper test of their effect upon production.

Maximum production could only be obtained by machine mining on an intensive scale and that did not mean merely putting a few coal cutters into a mine. It meant very much more than that. If the maximum output was to be obtained from a mine it was necessary to provide for a mining scheme with the application of a maximum number of machines and after that to see that the hoisting plant was large enough to handle the output expeditiously, and that the various tunnels and passages about the mine were never congested. It is also necessary to see that the best hoisting and haulage systems available were installed. Properly equipped repair shops for all kinds of machinery must be provided. There must be sufficient spare units and it is necessary to standardize the plant throughout. More particularly was it necessary to make sure that adequate protection against breakdown was provided so that it was never possible for a section of the mine to be shut down through a breakdown of the plant serving it.

The care with which the plant in the mine was attended had also a bearing upon production. If through inefficient or inadequate care the plant broke down, the whole working of the mine might be disorganized, the scheme put out of gear, and in consequence there would likely be a big slump in output which could not be made up for a considerable period. That would be avoided if the authorities put in properly skilled attendants.

There was no industry into which the same degree of skill in electrical engineering was put as in the mining industry. Mr. Hollis said that from his own knowledge he was quite certain that the mining electrical engineer was not sufficiently consulted and therefore did not apply himself as closely as he might to the problems of production. If it were known to the mining electrical engineer that his experience was valued, and if it were appreciated that he could give most valuable advice and that his experience fitted him for grappling with the problems involved in increasing production, then he would be given incentive to apply his knowledge intensively to increasing production.

BRITISH MARKET FOR ELECTRIC WASHING MACHINES.

From investigation it is evident that the sale of imported electric washing machines for domestic use in Great Britain is confined to two or three large firms. The sale so far is not extensive and the prices are in the neighborhood of $200 to $250. In the opinion of several of the large distributors of electric power in the London area, there should be a considerable market for these machines in England, provided a machine could be offered at a price which would bring it within the reach of the average middle-class householder, who would be the type of citizen to whom the machine would most readily appeal. The servant problem and high laundry prices greatly assist in the demand for such labor-saving devices.

Co-operation of Central Station and Lumber Mills

Mill Refuse Utilized to Good Advantage Through Co-operative Arrangement in Three Cities in Gray's Harbor District of Washington — Steam and Electric Drive in Typical Mills and Shops

By W. A. SCOTT

THE three small cities of Aberdeen, Hoquiam and Cosmopolis on Grays Harbor, Wash., have become important centers of lumber manufacturing and other industries subsidiary thereto. In the operation of saw mills, planing and shingle mills, stave and box factories, machine shops and fish-packing plants in these communities there is a considerable consumption of power. Steam is the basic power, and this will continue to be so indefinitely by reason of the abundance of lumber-mill refuse available for fuel. While a number of mills are operated from steam-driven lineshafts, several others are operated either partly or entirely by electric motors. In the latter cases the electrical energy is produced by steam-driven generators, there being no hydroelectric power produced on Grays Harbor. In developing this energy there has been worked out an interesting case of co-operation between the central-station and lumber-mill interests.

Demands for electric power are increasing, and of all the electrical energy produced by the central-station company and at the lumber mills there appears to be practically no surplus. Among the mills in which direct steam drive is applied there is undoubtedly a tendency to change to electric power except for certain purposes. As the lumber demands are becoming heavy, and as the mills are running well up to capacity, the situation would seem to invite an increase in the production of electric power, and there are indications that some new generating equipment will be installed in 1920.

Central-Station and Street-Railway Service Co-operating with the Lumber Mills.

The Grays Harbor Railway & Light Co., of Aberdeen, Wash., is the public utility concern that serves light, power and local passenger transportation in these harbor towns. Its central generating station is situated about half way between Aberdeen and Hoquiam, which are about six miles apart. Its power plant equipment has a present capacity of 2400 kw. The steam plant comprises four Babcock & Wilcox boilers of 400 hp. each, which require about 35 cords per day of "hog" or lumber-refuse fuel, procured from the mill of Wilson Bros., in Aberdeen. A supply of 700 cords of this kind of fuel is kept on hand. To prepare this fuel requires the operation of a "hog" machine by a 125-hp. motor.

In the generating room there are two 1000-kw., 3-phase, 2300-volt turbogenerators operating at 3600 r. p. m., and another similar unit of the capacity of 400 kw. In addition to the above, there are two rotary converters of 500 kw. and 300 kw., for producing the 550-volt direct-current energy required for the company's street-car system. These cars are operated between Aberdeen and Hoquiam, and between Aberdeen and Cosmopolis.

The power company's output of electrical energy is considerably augmented by a co-operative arrangement that it has with the Anderson & Middleton Lumber Co., of Aberdeen. There is installed in the mill of this lumber company a General Electric 1000-kw. turbogenerator, belonging to the power company, but which is operated by the lumber concern. The output of this generator is divided, Anderson & Middleton commonly using about 300 kw., and 700 kw. is tied in on the power company's system.

Further, the power company also buys about 700 to 1000 kw. of surplus power produced in the mill of the Grays Harbor Lumber Co. at Hoquiam. Thus, the public utility concern, counting what is generated in its own plant and that which is secured from the lumber mills, is able to deliver nearly 4500 kw. of power for its own use and to its customers. It has 5714 light consumers in the towns on the harbor, and 190 power customers. In meeting these demands, the company serves energy at voltages of 2300, 440, 220 and 110, as single, two and three phase. Practically no direct-current power is required except for operating the street cars.

The important economic aspect of the situation is that waste fuel at the lumber mills is being converted into electrical energy, and that development along this line may be carried to the point of producing as much power as may be needed for all purposes.

Installations in Typical Lumber Mills.

The Grays Harbor Lumber Co., operating a large lumber mill at Hoquiam, uses both steam and electric drive, and has a surplus of 1000 kw. of electric power which is sold. The boiler capacity of this plant is rated at 1050 hp. Steam is required for the dry kilns, and for operating the log carriage, and some other machines, besides for driving the generators. Even though an abundance of electric power is available in this mill, it is stated that for a few machines steam has superior adaptability. The plant is equipped with three steam-turbine-driven generators as follows: A Westinghouse 1000-kw., and a General Electric 750-kw., both equipped with Wheeler surface condensers; also, a General Electric 500-kw. generator, equipped with a Worthington barometric condenser. The first two are 2300-volt units, the third producing current at 440 volts.

All motors of 50 hp. and higher are operated at 2300 volts, those below 50 hp. being operated at 440 volts. The 440-volt bus and the 2300-volt bus are tied together through three 200-kv-a. General Electric transformers. In the connected motor load of about 2000 hp. in this mill there are the usual features of power transmission. The 11-ft. single-cut headsaw is driven at 10,000 ft. per min. by a 300-hp., 2300-volt, wound-rotor motor, of a speed of 600 r. p. m.; this is a belt drive on 13-ft. centers. The 14 by 72-in. Allis edger is operated by a direct-connected 400-hp. squirrel-cage motor, at 900 r. p. m. The trimmer, of 22 saws, is driven by a direct-coupled 100-hp. motor, at 600 r. p. m. Each of the three resaws is belt-connected to a motor.

In the planing mill there are five planers, including matchers and sizers, each machine being direct-connected to a motor of 50 to 75 hp. The refuse from the planing mill is handled by two motor-driven fans—a double 55-in. and a single 70-in. unit.

This lumber company supplies the city of Hoquiam with the electric power necessary to operate its pumping plant for delivering water to the city reservoir.

The Anderson & Middleton lumber mill at Aberdeen, which has a combination of steam and electric drive, is one of the plants in which electric energy may be greatly increased. There are here four Stirling boilers of a capacity of 2000 hp. The operation in this plant of a 1000-kw. generator, belonging to the Grays Harbor Railway & Light Co., has already been explained above. It was a case of installing the generator at a plant where the boiler fuel was produced. The electric drives in this mill are applied to the log-haul, resaws, planing-mill machines, two 84-in. refuse fans, circulation and hot-well pumps, and all conveyors and elevators. The transformer equipment consists of two 185-kv-a. transformers and two of 37½-kv-a., by which 2300-volt, three-phase energy is transformed to 480 volts, for the 440-volt motors; also one 25-kv-a. and two 10-kv-a. to step down to 110 volts for plant and yard lighting. The motor capacity in the plant amounts to 810 hp.

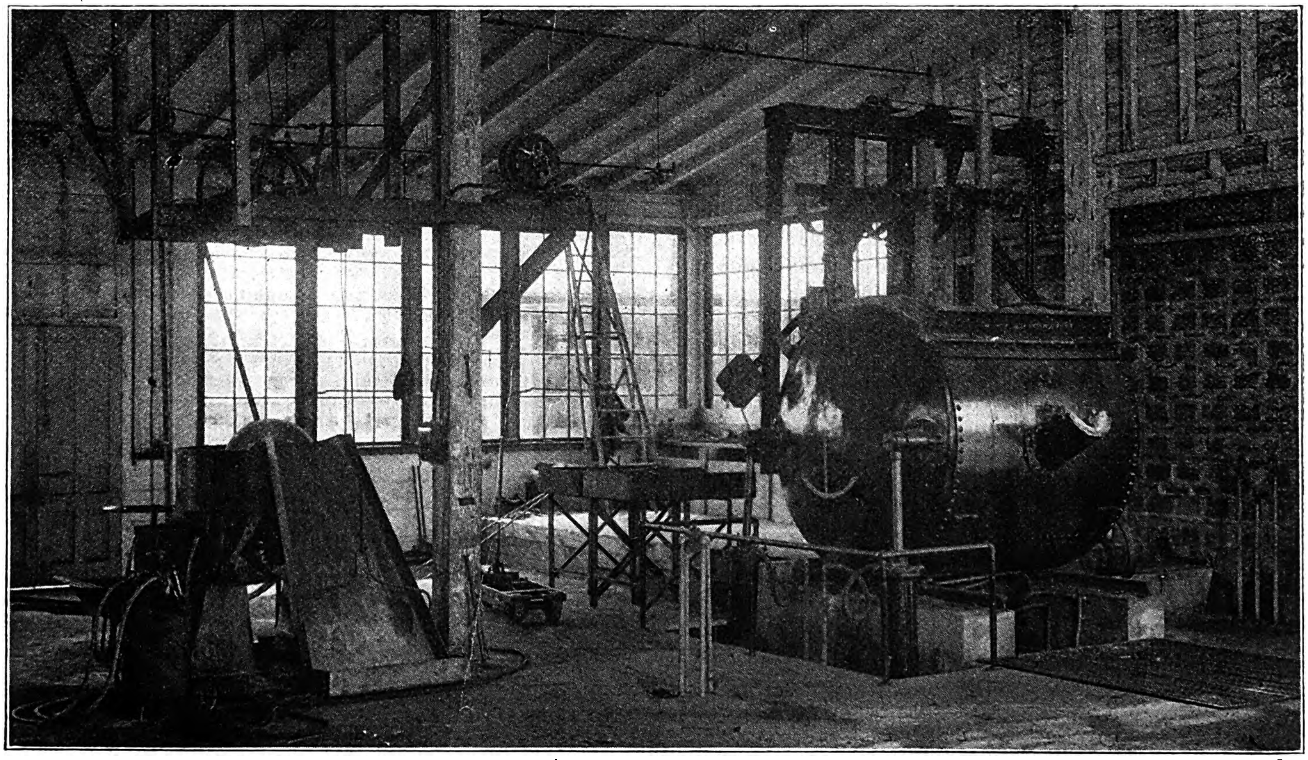
Steam drive is by means of a 24 by 48-in. Hamilton Corliss twin engine, connected to a main 350-ft. lineshaft by a 52-in. three-ply, waterproof leather belt, 110 ft. long. The 11-ft. bandsaw, with a 30-in. pulley, is driven from the main lineshaft through a Graton & Knight, two-ply, 26-in. leather belt, 90 ft. long, in which there is application of the plan of reverse drive. The bandsaw has a speed of about 10,000 ft. per min. The two "hog" machines, having a combined capacity of 60 cords of "hog" fuel per hour, are also driven from the main lineshaft through leather belts having a speed of 8200 ft. per min. The edgers and trimmer saws are also engine-driven through belt connection with the main lineshaft. It is understood that the Anderson & Middleton Lumber Co. has plans for installing a 1500-kv-a. generating unit, whereby practically the entire mill may be electrically operated.

The Grays Harbor Commercial Co., operating a plant at Cosmopolis, has a 750-kw. generating unit, and contemplates the early installation of another unit of like capacity to meet its power requirements. This company manufactures wood staves for pipe, silos and tanks, and makes boxes. It appears to have sufficient boiler capacity to furnish steam for the proposed new unit.

Bay City Lumber Co., of Aberdeen, and other concerns in this locality operate good-sized mills in which the principal drives are steam, but the facts above given serve to show the methods which are typical in this district. Storage-battery trucks and Ross Lumber carriers, also operated by storage batteries, are much used in the mill yards of this region.

The Lamb Machine Co., one of the electric-power customers of the district, operates a shop and foundry at Hoquiam for the manufacture of logging equipment and tools. A new feature in its foundry is a Greene 2-ton electric furnace, used for making steel castings, mostly from open-hearth steel. An accompanying illustration shows this furnace installed, ready for use.

The Northwest Electric & Water Works Co. operates a 500-kw. steam-electric plant at Montesano, and two small hydroelectric units, whereby light and power consumers at Montesano and Elma and vicinities are served.



A 2-ton Greene Electric Furnace for Making Steel Castings in Foundry of Lamb Machine Co., at Hoquiam, Wash.

Proposed Changes in Part II, National Electrical Safety Code

Principal Changes Proposed by Bureau of Standards in the Rules for Construction of Overhead Lines

MUCH controversy has been indulged in for several years and has now been revived with vigor respecting the rules governing the construction of overhead and underground lines that constitute Part II of the National Electrical Safety Code issued by the Bureau of Standards. When given their widest publicity in the 1916 edition of the Code they were declared by many central-station interests to be impracticable because they set standards that were too high and that would involve a prohibitive expense in execution. Other objections were also made. Much more objection was raised to Part II than to all other parts of the Code put together and the overhead line rules have remained the principal bone of contention respecting the Safety Code as a whole.

Since the 1916 edition of the Code is entirely exhausted, the Bureau of Standards has deemed it advisable to revise various parts of the Code before its republication. The revision of Part III, rules for utilization equipment, was completed some time ago; revision of Part I, rules for construction of central stations, substations and the like, was also completed a few months ago. It is not proposed to make any revision (other than correction of errors) of Part IV, rules for operation of generating stations and substations, before the next edition appears. This leaves the revision of Part II as the chief matter delaying the new edition of the Code and, as this third edition is clamorously being called for, the Bureau is anxious to complete the new Part II before the close of the year, if possible.

On account of the great interest taken in the revision of Part II, the short time in which it should be done, and the limited number of copies of the proposed changes available for general distribution, we give below an abstract of the principal changes in the first portion of Part II as suggested by the Bureau after extended investigation of the conditions existing and of the problems involved in complying with the standards of construction called for. The principal changes in the remainder of Part II will be given in our next issue.

A radical revision has been made in the arrangement of the rules in Part II with the belief that the new arrangement will facilitate the use of the rules and will be found much more satisfactory than that of the old edition. The proper requirements for rules 242*b* and 244 are still being studied by the Bureau and it will issue a special communication on these points later. One of the important proposals for change has to do with the voltage classification of supply lines crossing over signal lines as affecting the grade of construction required. A discussion of the reasons for this change will be appended at the end of the list, which gives the principal changes only, as the complete list includes a multitude of minor changes in phraseology, etc., that would be too voluminous for the space available. Where a rule is changed as to position as well as radically regarding text, the old rule number is given in parentheses. New rules are similarly indicated.

Principal Changes in Section 20 (Scope of Rules and General Requirements) and Section 21 (General Rules for Pole Lines).

Rule 203.—Minimum Requirements.—(Added paragraph.)—These minimum values are exceeded in much existing construction; service requirements frequently call for stronger supports and higher factors of safety than the minimum requirements of these rules.

210. Compliance with Other Rules and Special Precautions.—(New.)

(a) Other Rules.—The rules of this section apply to all supply lines, whether or not they are required by Section 23 to have a definite grade of construction. The additional requirements for supply lines in those situations which are required to have a definite grade of construction, A, B or C, will be found in Sections 25, 26 and 27.

The clearances and separations of conductors, climbing space, vertical wiring on poles and clearances from other structures shall comply with the requirements of Section 22.

(b) Special Precautions.—Where conductors are attached to structures other than those used solely or principally for supporting lines, all rules shall be complied with insofar as they apply, and such additional precautions as may be necessary shall be taken to avoid injury to such structures or to the persons using them. The supporting of conductors on trees and roofs should in general be avoided.

217. Strength of Poles and Crossarms.

(a) Poles.—Poles used for lines for which no designated grade is required shall be of such initial size, and so guyed or braced where necessary to safely withstand the loads to which they may be subjected, including linemen working on them.

(b) Crossarm Bracing.—(231*e*.)—Crossarms shall be securely supported, by bracing if necessary, so as to safely support loads to which they may be subjected in use, including linemen working on them. Any crossarm or buckarm, except the top one, shall be capable of supporting a vertical load of 225 lbs. at either extremity in addition to the weight of the conductors.

218. Conductors—Material and Minimum Sizes.

(b) Minimum Sizes.—(221*a* and *b*.)—Supply conductors in urban districts shall not be smaller than listed in the following table:

TABLE 1.—MINIMUM SIZES OF SUPPLY CONDUCTORS (URBAN DISTRICTS).

Soft copper	No. 6
Hard or medium drawn copper	No. 8
Steel	No. 9

Stranded Aluminum:	Spans 150 ft. or less	Spans over 150 ft.
Not reinforced	No. 1 A. W. G.	No. 0 A. W. G.
Steel reinforced	No. 6 A. W. G.	No. 4 A. W. G.

It is recommended that, except as modified in Rule 268, these minimum sizes for copper and steel be not used in spans longer than 150 ft. for heavy-loading districts.

219. Minimum Sizes and Sags of Service Leads.

(a) Above 750 Volts.—(273*c*.)—Supply service leads of over 750 volts to ground shall comply, as to sizes and sags, with the requirements for supply line conductors of the same voltage.

(b) Below 750 Volts.—(273*d*.)—Supply service leads of 750 volts or less in spans not exceeding 150 ft. shall be not smaller than the sizes listed in the table below. Such leads shall have sags not less than 12 ins. for spans 100 ft. or less, 18 ins. for spans up to 125 ft., and 27 ins. for spans up to 150 ft.

TABLE 2.—MINIMUM SIZES OF SERVICE LEADS BELOW 750 VOLTS.

Situation.	Spans 150 ft. or less.
Alone	No. 10 if soft copper
Concerned with signal lines	No. 12 if hard copper
Over supply lines less than 750 volts	No. 12 if steel

Over trolley less than 750 volts .... Over any trolley in rural districts ...... Over supply lines of 750 to 7500 volts... Over supply lines more than 7500 volts in rural districts	No. 8 if soft copper; No. 10 if hard copper; No. 12 if steel
Over trolley more than 750 volts in urban districts .... Over supply lines more than 7500 volts in urban districts	No. 6 if soft copper; No. 8 if hard copper; No. 9 if steel

= Grade C requirements.

Supply-service leads of 750 volts or less in spans exceeding 150 ft. shall be not smaller than required for grade C in Table 10, Rule 246, and shall have sags not less than required for grade C in the sag tables of Appendix A.

Principal Changes in Section 22—Clearances and Separation of Wires.

220. Clearances of Conductors and Wires at Crossings.—(After table of clearances from ground or rails; new.)—For signal conductors along roads where the location of the pole relative to fences, ditches, embankments, etc., is such that the ground under the line will never be traveled except by pedestrians, the clearance above ground may be reduced to 10 ft.

For trolley contact conductors above 1500 volts to ground this clearance shall be increased by 2 ft.

Signal conductors below 150 volts to ground need have only 10 ft. clearance. Supply or other wires (except trolley contact wires) if below 150 volts to ground need not have more than 10 ft. clearance at entrance to buildings.

Where with guys crossing streets or alleys the section of the guy concerned is effectively insulated from the highest voltage to which it is exposed, up to 7500 volts, this value may be decreased, in urban districts, to 16 ft. at the side of the traveled way.

Increased Clearances—[3]—(265*c*).—Where the lowest supply conductor at a crossing over track rails is supported by suspension insulators, the initial clearances shall be sufficient to prevent the minimum clearances over rails given in Table 3 from being reduced more than 10% through the breaking of a conductor in either adjoining span.

222. Required Line-Conductor Clearances and Separations at the Supports.—(242.)

(*a*) *Line-Conductor Separations According to the Sags Concerned.*—The separation, at the supports, of the conductors of the same or different circuits of grades A, B, or C, shall in no case be less than the values given by the following tables, at 60 deg. F. without wind. The requirements of Rule 221 apply if they give a greater separation than this rule.

Separation in Inches Required for Line Conductors Smaller than No. 2 A. W. G.

(Formula: Separation = 0.2 in. per kv. + $6\sqrt{S/3 - 8}$, where *S* is the apparent sag in *inches* of the conductor having the greater sag, and the resultant separation is in inches.)

(See exception under Table 5, note *d.*)

TABLE 6.

Voltage.	Sag in Inches 36	48	72	96	120	180	240
750	12.0	17.0	24.0	29	34	43	51
2200	12.5	17.5	24.5	30	35	44	52
6600	13.5	18.5	25.5	31	36	45	53
22000	16.5	21.5	28.5	34	39	48	55
44000	21.0	26.0	33.0	38	43	53	60
66000	25.0	30.0	37.0	43	47	57	64

Separation in Inches Required for Line Conductors, No. 2 A. W. G. or Larger.

(Formula: Separation = 0.2 in. per kv. + $7\sqrt{S/12}$, where *S* is the apparent sag in *inches* of the conductor having the greater sag, and the resultant separation is in inches.)

(See exception under Table 5, note *d.*)

TABLE 7.

Voltage.	Sag in Inches 36	48	72	96	120	180	240
750	12.0	14.0	17.0	20	22	27	31
2200	12.5	14.5	17.5	21	23	28	32
6600	13.5	15.5	18.5	21	24	29	33
22000	16.5	18.5	21.5	24	27	32	36
44000	21.0	23.0	26.0	29	31	36	40
66000	25.5	27.0	30.5	33	36	41	45

For other voltages, separations may be calculated by formulae.

226. Clearances of Vertical and Lateral Conductors.—(246.)

(*c*) *Vertical Supply Conductors Through Signal Circuits on Poles Used Jointly by Supply and Signal Circuits.*—(New.)—Vertical supply conductors which run through a space occupied by signal circuits shall be inclosed from a point 4 ft. above the highest signal conductor or equipment, if the supply wire is below 7500 volts, or from a point 6 ft. above the highest signal conductor or equipment, if the supply wire is 7500 volts or over, to the ground in insulating conduit or mounted on pins and insulators as provided in (*e*) below.

Vertical supply-circuit ground wires which run through the space occupied by signal circuits shall be inclosed in wood or other insulating conduit from a point not less than 4 ft. above the highest signal conductor or equipment to the ground, except that within 8 ft. of the ground suitable mechanical protection as required by (*g*) below may be used.

227. Clearances of Conductors of One Line from Poles of Another Line.—(245*a*.)

Where conductors of one line are carried within 6 ft. from a supporting structure of a second line, and are not attached thereto, the clearance between the conductors of the first line and any part of the supporting structure of the second line, shall, if practicable, be not less than 3 ft. at 60 deg. F. and no wind. In no case should this clearance be less than the values required by Rules 221 and 222 for separation between similar conductors on the same support, increased by 1 in. for each 2 ft. of the distance from the supporting structure of the second line to the nearest supporting structure of the first line. The climbing space on the structure of the second line shall in no case be reduced by a conductor of the first line.

Principal Changes in Section 23—Classification of Circuits According to the Grade of Construction Required.

230. Required Grades of Overhead Line Construction, and Arrangement of Levels.—(210.)

(*d*) *Limitation of Joint Use.*—(New.)—The joint use of poles by signal lines and supply lines above 7500 volts is not recommended except where it is physically or economically impracticable to separate the lines sufficiently to avoid conflicts.

Between 5000 and 7500 volts conditions in particular cases will determine whether or not joint use of poles is desirable. (See Rule 213 for equivalent lower voltages in grounded circuits.)

231. Supply Lines in Urban Districts (See Rule 251).

(*a*) *Grade B.*—(217.)—Supply lines over 7500 volts in urban districts, unless in cable having permanently grounded continuous metal sheath or armor and installed in compliance with Rule 274, shall comply with the requirements of grade B.

Supply lines of any voltage carried above lines over 7500 volts, unless the lower lines are in cable having permanently grounded continuous metal sheath or armor and installed in compliance with Rule 274, shall comply with the requirements of grade B.

(*b*) *Grade C.*—(New.)—Supply lines above 7500 volts in urban districts if in cable having permanently grounded continuous metal sheath or armor and installed in compliance with Rule 274, shall comply with the requirements of grade C.

(Old No. 218 revised.)—Supply lines between 750 and 7500 volts in urban districts, unless in cable having permanently grounded continuous metal sheath or armor and installed in compliance with Rule 274, shall comply with the requirements of grade C.

Supply lines below 750 volts in urban districts, when carried above lines of between 750 and 7500 volts, shall comply with the requirements of Grade C, except when the lower line is in cable having permanently grounded continuous metal sheath or armor and is installed in compliance with Rules 274*c*, *d*, *e*, *f*.

Exceptions: Lines covered under (*a*) and (*b*) above, when on fenced rights-of-way, need not comply with the above requirements except where crossing over, conflicting with, or higher on joint poles with the conductors of other lines.

Constant-current circuits are included in (*a*) and (*b*) above, the voltage being the nominal full-load voltage.

(*c*) *No Grade.*—(New.)—Supply lines between 750 and 7500 volts in urban districts, if in cable having permanently grounded continuous metal sheath or armor and installed in compliance with Rules 274*c*, *d*, *e*, *f*, need comply only with the general requirements of Sections 20, 21 and 22.

(Old 271*a* revised.)—Supply lines below 750 volts in urban districts, where alone, or where concerned only with signal lines, or only with supply lines below 750 volts, or both, need comply only with the general requirements of Sections 20, 21 and 22.

232. Supply Lines in Rural Districts (See Rule 252).

(*a*) *Grade C.*—(219.)—When either of two supply lines in rural districts, one above 7500 volts and the other below 750 volts, crosses, conflicts with, or has common poles with the other, the upper one shall comply with the requirements of grade C, unless the line of higher voltage is in cable having permanently grounded continuous metal sheath or armor and is installed in compliance with Rules 274*c, d, e, f*.

(*b*) *Service Crossings.*— * * * Constant-current circuits are included in (*a*) and (*b*) above, the voltage being the nominal full-load voltage.

(*c*) *No Grade.*—(272*b*.)—Supply lines above 7500 volts in rural districts, where alone, or where concerned only with supply lines above 750 volts, need comply only with the general requirements of Sections 20, 21 and 22.

Supply lines below 7500 volts in rural districts, except as covered in (*a*) above, need comply only with the general requirements of Sections 20, 21 and 22.

233. Supply Lines Crossing Over Railways. (See Section 26.)

(*e*) *Street-Railway Crossings.*—Supply lines crossing over street railways on traveled portions of highways need conform only to general requirements, but when carried over trolley contact conductors shall have the same grade of construction as where crossing over supply lines of equal voltage (See Rules 231 and 232).

234. Supply Lines in Crossings, Conflicts, and Joint Use of Poles with Signal Lines. (See Section 27.)—(214.)

(*a*) *Grade A.*—Constant-potential alternating-current supply lines of over 7500 volts between conductors (or 4400 volts to neutral or ground), or constant-current circuits exceeding 10 amperes, or direct-current grounded trolley circuits of over 750 volts to ground, where at higher levels and crossing over, conflicting with, or having joint poles with telephone, telegraph, or other signal lines shall comply with the construction requirements of grade A, except as noted below.

(*b*) *Grade B.*—(215*a*.)—Constant-potential alternating-current supply lines of between 5000 and 7500 volts between conductors (or between 2900 and 4400 volts to neutral or ground), or constant-current circuits of between 7.5 and 10 amperes, where at higher levels and crossing over, conflicting with, or having joint poles with telephone, telegraph, or other signal lines, shall comply with the construction requirements of grade B.

(*c*) *Grade C.*—(216*a*.)—Constant-potential alternating-current supply lines between 750 and 5000 volts between conductors (or between 440 and 2900 volts to neutral or ground), and constant-current circuits not exceeding 7.5 amperes, where at higher levels and crossing over, conflicting with, or having joint poles with signal lines, shall comply with the construction requirements of grade C.

Where the supply lines over 5000 volts are in cable having permanently grounded continuous metal sheath or armor and are installed in compliance with Rule 274, grade C may be used for the supply line.

It is not intended that the requirements of (*a*), (*b*) and (*c*) above shall apply to supply lines at higher levels than signal lines, where over individual twisted-pair drop wires only, or where over other unimportant circuits only, if equally effective protection is secured by other methods of construction.

(*d*) *Double Crossing.*—(New.)—Where a line crosses in one span over two other lines, the strength of construction shall not be less than would be required if either of the two lower lines crossed the other.

For example, if a 2300-volt line crosses in the same span over a signal line and a direct-current trolley line over 750 volts, the 2300-volt line would be required to comply with grade A construction at the crossing. This is a double crossing and introduces a greater hazard than where the upper supply line crosses the signal line only.

(*e*) *Inverted Levels.*—Signal lines carried at higher levels than direct-current grounded trolley circuits of over 750 volts to ground in crossings, conflicts, or joint use of poles, shall comply with grade A construction, so far as mechanical strength is concerned. Signal lines carried over trolley contact conductors below 750 volts to ground shall comply with the requirements of grade C, as to conductor sizes and sags, with exceptions as noted in Rule 285.

In other situations, signal lines carried at higher levels than supply lines in crossings, conflicts, or joint use of poles, shall comply with the grade of construction required for the supply lines by (*a*), (*b*), or (*c*) above if in the reversed position, so far as mechanical strength is concerned, except as smaller wire sizes are permitted by Rule 285 for grade C signal lines.

235. Signal Lines Crossing over Railways. (See Section 28.)—(213.)

(*b*) *Grade E.*—Signal lines carried over tracks included in the following list shall conform to the requirements of grade E:

(1) Spurs not exceeding two tracks in the same span.

(2) Branches on which no regular schedule of operation is maintained.

(3) Narrow-gage tracks or other tracks on which standard rolling stock can not, for physical reasons, be operated.

(4) Tracks used only temporarily for construction or similar purposes for a period not exceeding one year.

(5) Tracks not operated as a public utility, such as industrial railways used in logging, mining, etc.

(*e*) *Street Railways.*—Signal lines carried over street railways not having overhead trolley contact conductors, need comply only with the general requirements for signal lines alone. (See Rule 288 and Sections 21 and 22.)

(*d*) *Trolleys.*—Where signal lines cross over trolley contact conductors, below 750 volts to ground, they shall comply with the requirements of Rule 285 as to conductor sizes and sags. For trolley contact conductors above 750 volts to ground, the requirements for crossing over supply lines must be met; namely, grade A for direct-current trolley lines, and grade A, B or C for alternating-current trolley lines, depending upon the voltage.

(*e*) *Signal Lines Classed as Supply Lines.*—Signal lines which are classed as supply lines (see def. 4), shall, where crossing over railways, comply with the construction requirements of Rule 233. (See Rule 289.)

Principal Changes in Section 24—Specifications for Supply Lines of Grades A, B and C.

241. Loads Assumed in Determining Stresses in Conductors.—(222.)

(*a*) *Assumed Loading of Wires.*— * * * The minimum temperature shall be assumed as 0 deg. F. for heavy-loading districts, 15 deg. F. for medium-loading districts and 30 deg. F. for light-loading districts.

Heavy loading for conductors consists of a horizontal wind pressure of 8 lbs. per sq. ft. of projected area and ½ in. of ice. Since the stress in the conductor does not in general exceed one-half the breaking strength for grades A and B, and 60% for grade C, this corresponds to a factor of safety of 2 for grade A and B and 1⅔ for grade C, based upon an 8-lb. wind and the ultimate strength of the conductor. Owing to the elongation of the conductor when stressed beyond the elastic limit, with the resulting increase of sag and decrease of tension, there is usually a greater factor of safety than 2 under normal conditions.

(*b*) *Loading Map.*— * * * (230*c*).—The localities in the different groups are classed according to the relative prevalence of high wind velocity and thickness of ice which accumulates on wires, light loading being in general for places where little if any ice ever accumulates on wires.

(*c*) *Modification of Loading.*— * * * (New.)—In case a state is redistricted by state administrative authority, so as to meet local weather conditions better than the map of Appendix A, a grade of loading above heavy may be used, if necessary, to meet such local conditions.

243. Strength of Steel Poles and Towers and Other Metal Supports.—(234*a*.)

(*a*) *Loads and Limiting Stresses.*— * * * (New.)—Guys are made of various grades of steel wire, the lowest grade generally having a strength of about 60,000 lbs. per sq. in., while the highest grade has a strength of 180,000 lbs. or more per sq. in.

For transverse strength in grade A construction heavy loading consists of a horizontal wind pressure of 12 lbs. per sq. ft. of projected area and ½ in. of ice. Since the stress in the steel does not exceed one-half the ultimate strength under these conditions, this is equivalent to a factor of safety of 3, based on an 8-lb. wind pressure and the ultimate strength of the steel.

245. Strength of Crossarms and Conductor Fastenings.—(231.)

(*a*) Crossarms of Selected Yellow Pine or Fir.*

	For grades A and B.	For grade C.†
2 or 4 Pin.	3 × 4 in.	2¾ × 3¾ in.
6 or 8 Pin.	3¼ × 4¼ in.	3 × 4 in.

(*b*) *Crossarm Strength.*—Crossarms for construction of grades A, B or C shall, when installed, withstand the vertical loads specified in Rule 222 without the stress under these loads exceeding 50% of the assumed ultimate strength of the material. They shall also withstand any unbalanced longitudinal stresses to which they are exposed with a limit of unbalanced tension where conductor pulls are normally balanced, of 700 lbs. at the outer pin.

246. Conductors—Material, Minimum Sizes and Sags.

(*b*) *Minimum Sizes.*—(221*b*.)—Supply wires shall not be smaller than indicated in the following table, except that longer spans may be used with any listed conductor size if the separations and clearances given in Section 22 and the sags given in Appendix A are correspondingly increased.

*If of other material they shall have at least equal strength.

†Grade C signal line crossarms may be 2¾ by 3¾ ins. for 6 pins, and 3 by 4 ins. for 10 pins.

TABLE 10.—MINIMUM ALLOWABLE CONDUCTOR SIZES.

		Without steel reinforcement	
All	A, B & C	1	0
		with steel reinforcement	
All	A, B & C	6	4

Note—For sizes and material requirements of supply service leads see Rule 219.

Lightning-protection wires shall be regarded, in respect to size, material and stringing requirements, as supply conductors with which they are associated.

247. Line Insulators for Grades A and B.

(*b*) *Strain Insulators.*—(254*b*.)—Where strain insulators are used they shall be capable of withstanding without puncture under the normal mechanical stress at least as high a voltage as other insulators on the same line.

(*c*) *Insulators at Grounded Structures.*—Wherever wood pins and crossarms or other ungrounded supports are used within five spans of a crossing span with line conductors there attached to grounded metal pins, grounded crossarms, steel bridges, steel towers or other grounded structures the insulators at the grounded supports shall be capable of withstanding without flashover a voltage 50% higher than those used at adjacent ungrounded supports.

Where the supporting structures for the crossing span are the same as for other parts of the line, the insulators used may also be the same.

The above may be met, by installing insulators within five spans which will withstand a flashover voltage of only two-thirds the voltage which those at the grounded structure will stand, provided the other requirements of this rule are still met.

248. Special Transverse Strength Requirements.

(*a*) *Alternate Construction in Special Cases* (3).—(233*c*.)—The entire section between the transversely strong structures shall comply with the highest grade of construction concerned in the given section, except as to the transverse strength of the intermediate poles or towers.

(*b*) *Strength of Crossarms and Pins.*—(233*b*.)—The crossarms, insulator pins and conductor fastenings connected to the structure at each end of the transversely weak section shall be such as to withstand, under the conditions of loading prescribed in Rule 241 an unbalanced load equivalent to the combined pull in the direction of the transversely weak section of all the conductors supported up to 10,000 pounds for grade C, plus one-half the excess for grade A, or plus one-fourth the excess for grade B.

249. Longitudinal Strength Requirements for Sections of Grades A and B Construction in Certain Special Cases.

(*c*) *Methods of Providing Strength.*—(266*c*.)—The requirements of (*a*) are usually met by placing supporting structures of the required longitudinal strength at either end of the higher grade section of the line.

Where this is impracticable the supporting structures of the required longitudinal strength may be located one or more span lengths away from the section of higher grade, within 500 ft. on either side and with not more than 800 ft. between the longitudinally strong structures, provided such structures and the line between them meet the requirements, as to transverse strength and stringing of conductors, of the highest grade occurring in the section, and provided that the line between the longitudinally strong structures is approximately straight or suitably guyed.

PRINCIPAL CHANGES IN SECTION 25—REQUIREMENTS FOR SUPPLY LINES, INCLUDING ELECTRIC RAILWAY FEEDERS.

250. Compliance with Other Rules.

(*a*) *Grade A, B or C Construction.*—(New.)—In addition to complying with the requirements of Sections 21 and 22, the requirements of this section shall be met by all supply lines in urban and rural districts where a definite grade of construction (A, B or C) is required by Section 23, except in the important cases of crossings over railways or signal lines and the joint use of poles, which are covered by Sections 26 and 27.

(*b*) *Special Strength.*—(New.)—Special longitudinal strength requirements are made in Rule 249 for crossings of supply lines below 7500 volts over supply lines above 7500 volts.

(*c*) *Dead Ends.*—(274*b*.)—Where supply lines over 7500 volts in urban districts come to dead ends or to changes in line direction (even where no crossing exists) the end shall have construction complying with the longitudinal strength requirements of Rule 249.

(*d*) *Clearances.*—(New.)—For clearances of conductors and wires above roadways, railways, and footways, and from other conductors and wires, see rules 220*a* and *b*, 257, and 258.

251. Supply Lines in Urban Districts.

(*a*) *Below 750 Volts.*—(271*a*.)—Supply lines below 750 volts in urban districts, where alone, or where crossing over, conflicting with, or where higher on common poles with, other supply lines below 750 volts need only comply with the general requirements of Sections 20, 21 and 22.

(New.)—If the lower supply lines have a voltage over 750 volts and are not in cable having permanently grounded continuous metal sheath or armor and installed in compliance with Rules 274*c, d, e, f,* both lines shall comply with the requirements of grade C; if over 7500 volts and not in such cable, both lines shall comply with the requirements of grade B.

(*b*) *Between 750 and 7500 Volts.*—(271*b*.)—Supply lines between 750 and 7500 volts in urban districts, where alone, or where crossing over, or conflicting with, or where higher on common poles with, other supply lines not over 7500 volts shall comply with the construction requirements of grade C, as given in Section 24, unless the supply lines are in cable having permanently grounded continuous metal sheath or armor and are installed in compliance with Rules 274*c, d, e, f,* in which case no grade is required.

If the lower supply lines have a voltage over 7500 and are not in such cable, both shall comply with the construction requirements of grade B.

(*c*) *Over 7500 Volts.*—(271*c*.)—Supply lines over 7500 volts in urban districts where alone, or on the same poles with other supply lines of any voltage, or crossing or conflicting with such lines, shall comply with the construction requirements of grade B, except as covered in the next paragraph.

Such lines, if in cable having permanently grounded continuous metal sheath or armor and installed in compliance with Rule 274, need only comply with the construction requirements of grade C.

252. Supply Lines in Rural Districts.

(*a*) *No Grade.*—(272*a, b*.)—Where supply lines of any voltage in rural districts are not concerned with crossings of railways or signal lines, or conflicts or joint use of poles with signal lines, no grade of construction is required for conductors or supports, except as noted in (*b*) below. Such lines are subject only to Rule 246 for conductor materials, and to Sections 20, 21 and 22 for isolation, guarding, clearances, and pole arrangement.

(*b*) *Grade C.*—(272*c*.)—When either of two supply lines in rural districts, one above 7500 volts and the other below 750 volts, crosses, conflicts with, or has common poles with the other, the upper one shall be of grade C, unless the line of higher voltage is in cable having permanently grounded continuous metal sheath or armor and is installed in compliance with Rules 274*c, d, e, f.*

256.—Electric Railway Construction.

(*d*) *Strength of Construction in Urban Districts Generally.*—(276*h*.)—Trolley contact conductors, feeders, and their supports, in urban districts, shall comply with the strength requirements for supply lines of equal voltage. Direct-current circuits of over 750 volts to ground where at higher levels and crossing over, conflicting with, or higher than and having joint poles with, signal lines shall comply with the requirements of grade A (see notes under Rule 234 for special cases).

257. Wire Clearances Above Railways, Roadways, and Footways.—(276*j*.)

(2) Above streets or alleys, roadways, or footways, including track rails of railways where brakemen are not permitted on top of cars, the trolley contact conductors, when not over 1500 volts to ground, shall have a minimum clearance of 16 ft., and when above 1500 volts to ground shall have a minimum clearance of 18 ft.

This clearance is the minimum clear height in the middle of the contact conductor span. The point of support at the pole structure should be not less than 2 ft. higher, thus allowing for maximum sag in span wire and trolley contact conductor at 60 deg. F.

PRINCIPAL CHANGES IN SECTION 26—CROSSINGS OF SUPPLY LINES OVER RAILWAYS.

260. Grades of Construction.—(261*a*.)

Overhead supply lines (or signal lines which have taken on the character of supply lines) crossing over railways shall comply with the construction requirements of grade A, except when over sidings, spurs, branches, or other minor tracks only, in which case they shall comply with the construction requirements of grade B. (See Rule 233 for full statement.)

265. Increase of Clearance in Special Cases.

(*d*) *Increases Cumulative.*—(New.)—The above increases are cumulative when more than one applies.

PRINCIPAL CHANGES IN SECTION 27—SUPPLY LINES OVER SIGNAL LINES AND JOINT USE OF POLES.

270. Special Requirements and Compliance with Other Rules.

(*a*) *Grade of Construction.*—(268*a*.)—Overhead supply lines crossing over signal lines under the circumstances noted in Rule 234 shall comply with grades of construction A, B or C, as noted in the rule referred to.

(*f*) *Clearance Increases.*—(268*f*, *g*, *h*.)—The increases of clearances for longer spans, higher voltages, and for suspension insulators, shall be as given in Rule 220*b*.

(*g*) *Special Requirements.*—(268*i*, *j*, *k*.)—Special longitudinal strength requirements are given in Rule 249.

Requirements for protection against conductor breakage are given in Rule 266.

272. Joint Use of Poles by Signal and Supply Lines—Supply Lines Above Signal Lines.

(*a*) *Avoidance of Conflict.*— * * * —(New.)—The joint use of poles by signal lines and supply lines above 7500 volts between conductors (or 4400 volts to neutral or ground) is not recommended, except where it is impracticable to separate the lines sufficiently to avoid conflicts.

Between 5000 and 7500 volts between conductors (or between 2900 and 4400 volts to neutral or ground) conditions in particular cases will determine whether or not the joint use of poles is desirable.

The general requirements of Sections 20, 21 and 22 shall be complied with, except as modified in the following paragraphs.

(*b*) *Strength of Poles.*—(286*a*.)—Poles used jointly by supply lines and signal lines with the supply lines above shall have the highest grade of construction specified in Rule 234 according to the voltage and character of the various lines carried by the pole.

Where the signal lines are used exclusively in the operation of supply lines the pole strength need not be that required above, but the lines shall occupy the same relative positions noted under (*f*) below.

(*e*) *Longitudinal Stresses.*—(286*a*6.)—In calculating the longitudinal stresses upon jointly used poles complying with grade A or B construction requirements where crossing over railways or over signal lines (where these crossings would of themselves require compliance with grade A or B construction of the crossover span to meet the special longitudinal requirements at such points the tension in the signal conductors may be considered as limited to one-half their breaking strength provided they are smaller than No. 8 Stl.W.G. if of iron or No. 6 A.W.G. if copper, regardless of how small the initial sags of the signal conductors at 60 deg. F.

273. The Joint Use of Poles by Signal and Supply Lines—Signal Lines Above Supply Lines.

(This relation of levels is not in general desirable, and should be avoided where practicable.)

(*a*) *Strength Requirements.*—(287.)—Poles or towers used jointly by signal and supply lines, with the signal lines above the supply lines, shall comply with the requirements and rules referred to in Rule 272 as well as those in this rule.

(*b*) *No Reduction.*—The grade of construction A or B where required for the signal lines, includes the size, material, and sag of conductors as well as the strength of structures required for supply lines of the same grade by Section 24 with no reduction in transverse strength requirements such as is permitted by Rule 272*d* where supply lines are above signal lines.

(*c*) *Grade C Signal Conductors.*—(221*e*.)—Signal conductors which are required to comply with grade C construction may be smaller than Grade C supply conductors but not smaller than given in the following table:

TABLE 12.
(221 *e* revised.)

Span Length and Sag.	Material.	Sizes.
Spans not over 100 ft. with sags not less than 12 ins., and spans over 100 ft. but not over 125 ft. with sags not less than 15 ins.	Hard copper Steel	10 12
Spans over 125 ft. but not over 150 ft. with sags not less than 18 ins.	Hard copper Steel	9 11
Spans over 150 ft. with sags of Grade C supply conductors or more, as given in Appendix A.	Hard copper Steel	Sizes of Grade C supply conductors as given in Rule 246.

Paragraph 272*d* does not apply to such conductors.

274. Joint Use of Poles by Cabled Supply Lines and Signal Lines.—(New.)

(*a*) *Requirements When Cable Is Unsheathed.*—Poles used jointly by signal lines and cabled supply lines not having permanently grounded continuous metal sheath or armor shall meet all the requirements for poles used jointly by open supply and signal lines given in Rule 272.

(*b*) *Strength of Poles When Cable Is Sheathed.*—Cabled supply lines having permanently grounded continuous metal sheath or armor shall be installed in compliance with (*c*), (*d*), (*e*) and (*f*) below. When the voltage of the cabled supply lines is over 750 the poles shall meet the strength requirements of grade C as given in Section 24.

(*c*) *Messengers.*—Messengers shall be stranded and of galvanized or copper-covered steel with strengths and sags as specified in Rule 280, or if of other sizes shall not be stressed beyond half their ultimate strength when the cable and messenger are coated with ½ in. of ice and subjected to a transverse wind pressure of 8 lbs. per sq. ft. of projected area.

(*d*) *Grounding of Cable Sheath.*—Each section of cable between splices shall be suitably and permanently bonded to the messenger wire at not less than two places. The messenger wire shall be grounded at the ends of the line and at intermediate points not exceeding 800 ft. apart. (See Section 9 for method.)

(*e*) *Splices.*—Splices in the cable shall be so made that their insulation is not materially weaker than the remainder of the cable. The sheath or armor at the splice shall be made electrically continuous.

(*f*) *Insulation.*—The conductors of the cable shall be so insulated as to withstand a factory potential test of at least twice the operating voltage at operating frequency applied continuously for 5 minutes between conductors and between any conductor and the sheath or armor.

275. Special Crossing Construction.

(*b*) *Cradles.*—(New.)—Cradles are not recommended. It is believed better to build the supply line strong enough to withstand extreme conditions than to build a cradle of sufficient strength to catch and hold the supply line if it falls.

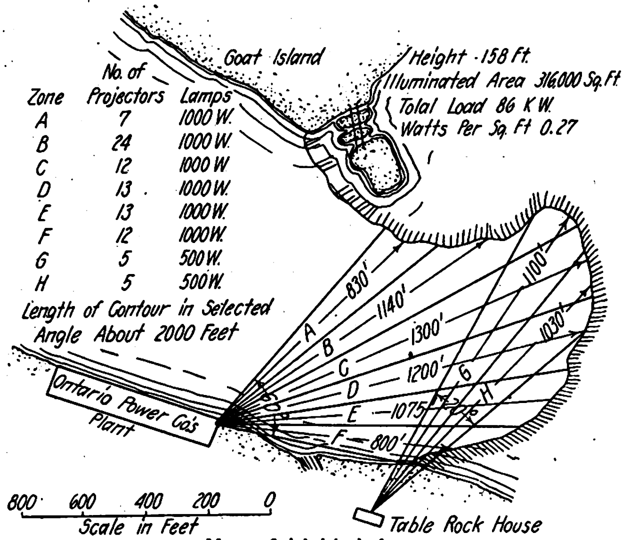
(To be concluded in the next issue.)

FLOOD LIGHTING OF CANADIAN FALLS AT NIAGARA.

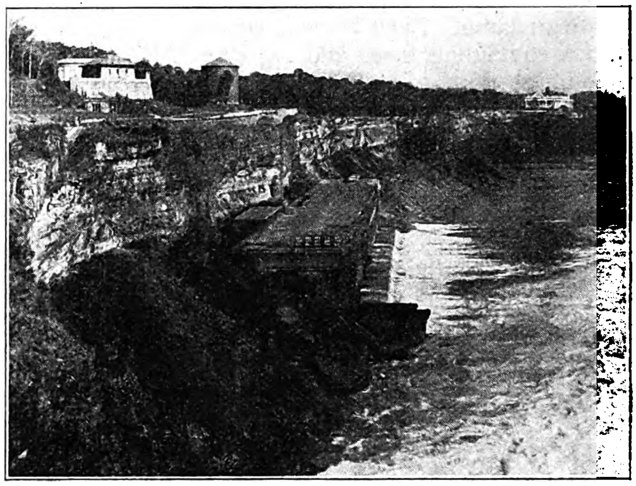
Remarkable Effects Secured by Use of 91 Projectors—Prince of Wales Lights Installation for First Time.

Lifting himself by his boot straps is something man has yet to accomplish. But he has by his ingenuity enabled the Horseshoe Falls at Niagara to illuminate themselves. It amounts to that. Because the force of water that goes tumbling over the falls supplies the power utilized in generating the electrical energy which, through the medium of 91 projecting lamps, of a total load of 86 kw., makes the view of the falls by night more awesome even than it is by day.

The Prince of Wales it was who supplied the final touch that made the lighting of the falls an accomplished fact. On the evening of Oct. 18, while a visitor at the home of Dr. Harry Grant, park commis-



Map of Lighted Area.



Battery of Projectors on Roof.

sioner of Queen Victoria Park, the Prince pushed the button that made the view of the falls by night more fascinating even than it is by day.

The illustrations convey only so much of the witchery of the view of the electrically lighted falls as can be caught by the unimaginative camera. One must visit the falls to secure the full effect. Then one becomes an active advocate of the policy of flood lighting all show places.

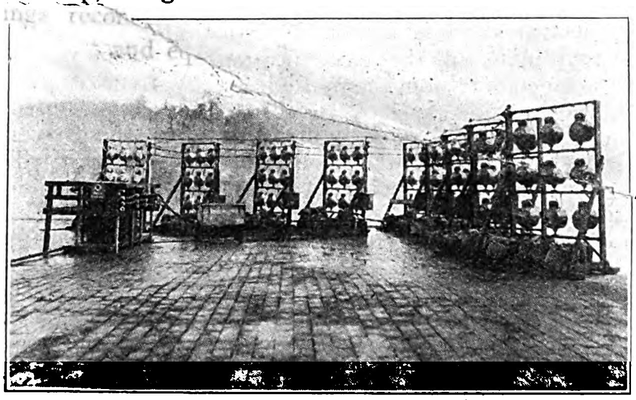
The lighting is by means of a main and a secondary battery of projectors, located with careful regard for all essential considerations. The plan of illumination installation shows the location of the main battery on the corner of the roof of the Ontario Power Co.'s plant, and of the secondary battery on the roof of Table Rock House. From the location of the main battery light can be directed to all parts of the falls, with the unique advantage also that the apparatus makes no bid for the attention of sightseers during the daytime. It does not intrude upon their gaze; only those having a special purpose will spy out its location. Another advantage of that location is that it is adjacent to an ample source of power. But there is one disadvantage necessitating the installing of the secondary battery on Table Rock House and which results from the occasional rising clouds of spray. When the spray is up it is impossible to see from the roof of the power house the crest of the falls near the apex of the horseshoe. This necessitated the installing of the secondary battery of ten 500-watt short-focus projectors on Table Rock House.

The distances, as will be seen by an inspection of the map, are greater than occur with the usual flood-lighting problem. The height of the falls is 158 ft. And at the longer distances the diameter of the beams is greater than is necessary to cover the face of the falls. Where this occurs the top of the beams are directed to the crest, while the diffused light from the main projectors is depended upon to illuminate the waters at the base of the falls.

No attempt has been made to penetrate the rising spray with artificial light, because even though this were done the view of the falls would still be obstructed by the spray itself. Better results have been attained by lighting up the falls by means of the secondary battery on Table Rock House from which a splendid view is had. It was found too, in the final adjustment of the beams, that more of the contour of the falls towards Goat Island could be illuminated than is shown in the map and each zone was spread out slightly to accomplish this end.

The installation was designed and erected by the engineers of the Hydro-Electric Power Commission of Ontario, and George Beattie, of the Electric Shop, Toronto, Ont., co-operated with the Commission and supplied the reflectors. Long-focus projectors, utilizing the regular type of gas-filled lamps, comprise the main battery. These were selected because such lamps are more readily obtainable, and also because it was not thought necessary to utilize high beam concentration. The areas to be lighted are large and they are both vertical and horizontal. And as all the light below the rim of the falls illuminates interesting surfaces there is little or none of it that can be deemed wasted.

The main battery is divided into nine banks of nine



Rear View of Projectors.

Niagara's Horseshoe Falls Floodlighted.

units each, and each of the 81 projectors contains one 1000-watt lamp. Each bank is equipped with a service box containing fuses and switch and is a complete three-phase unit in itself. And all service boxes are protected from spray to tight fitting wooden housings. Flexible conduits connect the subfeeders to the projector sockets. The conduits are securely fastened at each end so that any accumulation of ice will not impose a strain on the wires. Three 30-kw. transformers, located close to the projectors, are connected to the 2200-volt buses in the power house by lead-covered cable in conduit. Weatherproof cable is used for low-tension feeders.

PROSPECTS OF RAILROAD ELECTRIFICATION IN AMERICA AND ABROAD.

General Survey of Conditions Indicates That Extensive Electrification Will Be Brought About During Next Decade.

By F. H. Shepard,

Director of Heavy Traction, Westinghouse Electric & Manufacturing Co.

The world-wide shortage of coal during the great war and the present coal tieup in this country have emphasized more clearly the necessity of fuel economy in industry, while the present general shortage of labor and the certainty of its continuing scarcity throughout the reconstruction period forms another most serious problem. But fortunately we have at our disposal a means that will greatly assist in alleviating both of these conditions, namely, electrification.

The use of electricity in industry saves both fuel and labor. This fact is recognized throughout the world today, and in order to secure these advantages, practically all of the nations are now considering plans for the electric generation of power. In England, Belgium and France, among other countries, these plans are being prepared by official commissions so that a tremendous activity in electrical power development may be expected with the stabilization following the advent of peace. In all cases the ideal in view is a broad one: To use electricity for all possible power purposes, including railroad operation.

The operation of the railroads will naturally form an important part of any program of general electrification, for in almost every country the railroads form one of the largest users of fuel and labor. Nor are the advantages obtained from railroad electrification limited solely to economy in fuel consumption and the more effective use of labor. Among others, the following can be mentioned:

1. Greater speed of movement for the heaviest trains, due to the fact that electric locomotives can be made much more powerful than the largest steam locomotives.
2. Greater nicety of control.
3. Increased traffic capacity of existing tracks, terminals, grades, tunnels and other points of traffic restriction, because when electricity is used, heavier trains can be operated at higher speeds and less time is consumed at terminals and in yards.
4. Operation where the use of steam is [illegible] or objectionable, as in long tunnels.
5. Independence of weather conditions, since the electric locomotive is not affected by cold weather.
6. More reliable operation, as proved by the statistics of all existing electrifications.
7. More effective use of all rolling stock, due to more expeditious movement of traffic.

These are some of the advantages that are now being obtained from the mere substitution of the electric locomotive for the steam locomotive, but they by no means tell the whole story.

Since the United States has an abundance of coal, railroad electrification here has been determined solely by local conditions. Passenger terminal problems caused the electrification of the New York Central at New York and the Pennsylvania at New York and Philadelphia. The limitations of the steam locomotive determined the electrification of the Baltimore tunnel on the Baltimore & Ohio, the Cascade tunnel on the Great Northern, the St. Clair tunnel on the Grand Trunk, the Hoosac tunnel on the Boston & Maine and the Detroit River tunnel on the Michigan Central. Examples of electrified railroads with freight as well as passenger service are the Norfolk & Western, the Chicago, Milwaukee & St. Paul and the New York, New Haven & Hartford.

While the other electrifications are successful and interesting, the last three are more properly representative of general railroad electrification. The Norfolk & Western is an example of electrification under the heaviest conditions of freight traffic on a mountain grade. The Chicago, Milwaukee & St. Paul has in operation the longest continuous mileage in the world and when completed will cross five mountain ranges. The New York, New Haven & Hartford has a very large movement of both freight and passenger traffic. All three installations are successful and profitable and, when financial conditions are stabilized and the American railroad question settled, it is expected that all three of these systems will extend their electrified service.

In addition there are sections of railroads about the country where the present congestion of traffic or the availability of water power warrants the early adoption of electric power. These possibilities alone promise under normal conditions of finance (as no engineering problems now remain to be solved) extensive activity in the electrification of railroads for many years to come.

Differing from America, European and South American countries, with the exception of England alone, lack an adequate supply of fuel, but many of them, including Norway, Sweden, Switzerland, Italy, Spain and Brazil, have large amounts of water power while France has a moderate amount. These resources combined with the high cost of fuel make extensive railroad electrification in these countries inevitable sooner or later.

The neutral countries will probably be the first to undertake this work, Switzerland having a program covering a term of years well established, while both Norway and Sweden are giving active consideration to definite projects. In England a considerable [illegible] of electrification is in contemplation [illegible] general plan for the electrification [illegible] country. A French commission [illegible] government and railroad engineers, [illegible] visited the United States in order [illegible] thoroughly familiarize themselves with [illegible] practice. The Italian Government will [illegible] its definite program as soon as financial conditions permit. An official Belgian commission is already planning to rehabilitate with electric power at least a portion of the railroads destroyed by the Germans. In Spain, Brazil and South Africa as well railroad electrification is under active consideration.

It is evident, therefore, that the next decade will see a large amount of railroad electrification in almost every quarter of the world.

Editorial Comment

The Coal Issue and Ultimate Issue

FOR MORE than thirty-five days the bituminous coal miners have been on strike. The rate of coal production throughout the country is about 35 per cent of normal. Only because of vast stores of coal in storage have the nation's industries and our national life been able to continue their usual course and each hour brings nearer the time when the supply of coal on hand will be consumed.

In recommending a wage increase of 14 per cent, Dr. Garfield stated that such a wage increase could be awarded the miners without increasing the cost of coal to the public. But this was not his only recommendation. He asked that the miners return to work while a Federal investigation of the entire coal industry be taken up. His wage increase of 14 per cent was not final; it was but temporary. Dr. Garfield's finding was not offered as the permanent solution to the problem, but merely as a palliative that would enable the nation's coal to be mined pro tem, until such time as a thorough investigation would enable a solution at onc equitable and wise to be formulated upon actual facts.

But the miners refused to work. Instead they decided to fight. Apparently they are out for all they can get, regardless of how gotten, or how the nation may meet their demands, or the hardship and suffering capitulation to their demands entails. In this crisis the American people are showing admirable *sang-froid,* typical of our best traditions. Hardship is, however, already being suffered by many, and culmination of the deadlock is not yet in sight. But America must keep her sang-froid, and become cold, if necessary, for a little while, for the issue before the nation will decide who it is that rules the nation.

The miners have thrown down the gauntlet, determined to fight our government for their demands. The issue is thus no longer whether miners are justified in obtaining more money, shorter hours, steadier employment or better working conditions, for Dr. Garfield has promised to determine these things, and on the findings recommend not "what the traffic will bear" but a just and equitable award. The issue between America and the miners now is whether America is to be ruled by those elected by the people to govern them or whether a certain class, representing a very small minority of the people, shall dictate terms and force its will upon the nation regardless of our government and any other element of society.

The issue before us is plain. The immediate issue is whether this country shall be coerced, domineered and browbeaten by a few wilful men who attempt to dictate to a hundred million free people that half a million may obtain their own ends. This is the issue every true American faces today. It is an issue that can no longer be side-stepped. It is an issue that must no longer be shirked by anyone an American in fact as well as name.

We must now decide whether our present form of government shall stand, or whether we shall capitulate to the ultimatum of the self-appointed few to force their will upon us, by ruthless methods, and thus create a precedent that may ultimately result in the overthrow of our present form of government.

Sentiment Versus Logic in the Electrical Christmas Appeal

ALL DECISIONS in life are either the result of sentiment or of logic. Everyone prides himself in being logical in all his decisions, yet in reality most decisions in life are the result of sentiment.

There was only one nation that went into the recent war for purely logical reasons. It was Germany. America went into the war for a sentimental reason—"To make the world safe for democracy." Cool-blooded logic on the part of Germany failed to win the war.

Let us now consider why the middle class of today—largely composed of the former poorer classes—are buying higher priced goods. It isn't because of logic, for logic shows that they should be contented with the class of goods they were accustomed to before, or merely a slightly better grade, as labor cannot logically hope for the present high wage scales to continue. These people, and most people, buy the higher grades of goods, labor-saving devices, electrical table utensils, near luxuries and luxuries for but one reason—sentiment—in the form of pride, love for one's wife, love for the home, the desire for an element of refinement, etc.

They are not interested so much in how much it costs to make coffee in an electric percolator nor its cost, if apparently within the range of their pocketbooks, but in the air of refinement it will give the home, how well it will look on the table and how much it will please the housewife.

Similarly in the case of washing machines and vacuum cleaners. Bridget, who married the milkman, is now on easy street. For sentimental reasons both she and her husband want the washtub and the broom forgotten. Similarly Bridget's former mistress for sentimental reasons wouldn't think of using Bridget's old washtub and broom. It is beneath her dignity to use or handle such things. Logic shows that if the hands are toughened and muscles strengthened this is good from a physical point of view. But neither

Bridget nor her former mistress nor the husbands of either are really logical. For sentimental reasons all prefer the modern labor-saving devices.

Too many advertisements overlook the power of sentiment, yet the good salesman recognizes sentiment as one of the most potent factors in a sale. In the first place, he does all he can to cause his prospect to take a fancy to him, then he learns his hobbies and tries to talk about them, whether the hobby be golf, dogs or baseball, and finally ends the interview with a little selling talk and an order. This isn't, of course, how all sales are made but it is the easiest and quickest way of making a sale.

In advertising, as well as in selling, sentiment must be taken into consideration. Sometimes it should be subordinated to logic. In other cases logic should be subordinated to it. Sentiment has been too far subordinated in much electrical advertising. A common percolator on the stove will make as good coffee as an electric one on the table—but it doesn't make the same sentimental appeal as does an electric one.

Christmas is a sentimental period. The emotion, the desire to give and to please hold sway often to the extent of one spending much more than he can logically afford to spend on presents.

Let sentiment play a part in your Christmas advertising and selling. Appeal to the sentiments of love of wife, of mother, of home and to the sentiments of pride, of desire for refinement, for progress, etc. What more striking appeal could be made at Christmas time than that used by a well-known central station, "Do you love her?" A man does not seek to please his wife or any one else as a rule for logical reasons but for sentimental reasons.

Oil as a Peak-Load and Emergency Fuel

CONSIDERABLE has been said of late regarding the relative values of oil and coal as fuel. The oil men have been very active in furthering the use of oil for industrial and domestic purposes ever since coal became a high-priced commodity and sometimes a scarce one. How does the use of oil fuel in any way affect central stations located in territory where neither gaseous nor liquid fuel are obtainable without considerable transport, in fact in the coal zones?

What are the advantages of oil over solid fuel? The calorific value of oil is about 35% higher per pound than coal; for a given storage space about 50% more heat value can be stored as oil than as coal. Oil is more easily handled than coal, dust and ashes are absent, resulting in lower investment in equipment and smaller labor costs. As to combustion, oil enables fires to be lighted instantly, and instantly shut down, smoke is practically eliminated and combustion may be made more nearly perfect with less trouble than when burning coal. Control of combustion, hence more constant steam pressure and efficiency, are easier when consuming liquid fuel than solid fuel in the lump state. These advantages are very real ones, and yet even when considered upon a basis of investment cost and cost per thermal unit, oil fuel cannot threaten the use of coal with many central stations, because there are other factors involved.

However, while the probability of fuel oil usurping coal must continue to be the exception rather than the rule it would seem that there exists an application for fuel oil among the central stations that might be a very promising one for the oil salesmen to take up. That application is for emergency and peak-load service. Used in this way, primarily, oil fuel would affect considerable fuel saving since banked fires and large stand-by losses would be much reduced, emergency starting would be much more rapidly attained, and the capacity of existing equipment could be considerably augmented.

It is not proposed that oil-burning furnaces and boiler should be available, awaiting the peak demand or the emergency to arise. But we do believe that the use of oil under double-fired boilers so that the oil might be turned to supplement the coal firing whenever needed, would add immensely to the flexibility of operation, likewise the economy. With many, it may be said most, installations, it is the rate of coal burning that limits the capacity of a unit rather than the ability to evaporate water. The addition of oil burners to one or more existing stoker installations would extend this limitation. When the peak load abated or the emergency passed, the oil would be turned off and its consumption immediately cease.

Underfeed stokers are able to bring a boiler up to high rates of steaming in very short time, and sufficiently quickly for central-station purposes and the welfare of the furnace lining, hence the even better performance of oil fuel in this respect is of limited capitalization. But it is the ability to reduce to an absolute minimum the consumption of coal for banked fires and similar stand-by service, that oil fuel offers advantages. Moreover, the use of oil burners in addition to stokers extends the limits constituted by ability to consume coal, hence increases the steam generating capacity of existing equipment while also adding to the flexibility and economy of the plant as a whole.

The above generalities have been dwelt upon in the idea that there may be an application of fuel oil in many a central station if employed as above, whereas if not so used there is no application. By this we mean that central stations located within reasonable distance of sources of coal will find coal their chief source of combustible for many a year to come. It is beneficial that they should, for fuel oil is being used at a rapid rate and there are many instances where exists little choice other than fuel oil. Most central stations are best able to burn coal efficiently, and therefore should stick to the use of coal. Leave the oil for the steamships, the battleships and the plants where coal cannot be readily obtained. But use it when its use is indicated or promising.

Current Events

Light and Power Curtailment Necessiated by Coal Shortage—Water-Power Development for California and Alaska

PUBLIC UTILITIES AFFECTED BY COAL-SAVING PLANS.

Drastic Measures Enforced by Federal Fuel Administration in Effort to Economize on Coal Used by Central Stations.

With the settlement of the strike of the bituminous coal miners remaining indefinite and with the depletion of stocks of coal held in storage by central stations, the situation became such this week that the Federal Fuel Administration issued an order to the effect that in the release of coal to public utilities the latter shall, in furnishing power to manufacturing plants which purchase power produced by use of coal, curtail service to place such plants in the same situation as if they were using coal. This order affects all central stations throughout the United States and as a result unnecessary expenditure of coal has been curtailed also by dimming street lights, cutting off electric signs, show-window lights, etc.

The situation in eastern states has not become alarming, as far as the central stations are concerned, because of large storage of bituminous coal and of the availability of anthracite coal. There are numerous hydroelectric plants in New England and other eastern states which are able to supply much of the demand for power in industrial centers.

However, in middle western states, especially in the northern part, the situation is becoming acute. The public utilities in Chicago and other middle western cities have but a few weeks' supply. Furthermore, if the coal strike should be settled at once it would be several weeks before the fuel shortage could be relieved by fresh deliveries. Because of these conditions drastic measures were deemed necessary by the Illinois State Public Utilities Commission, and as a result it issued the following order to all public utilities subject to its jurisdiction:

"To immediately cease furnishing service for all unnecessary interior and exterior illumination, including signs, display lights and show windows.

"To permit service to shops, industries, business establishments and warehouses (except cold storage) for but 6½ hours per day; provided, where there is continuous operation such service must be discontinued for two working days each week.

"To permit service to retail stores in the central district of Chicago from 11 o'clock a.m. to 5 o'clock p.m. only, and in the outlying districts from 10 o'clock a.m. to 6 o'clock p.m., and until 9 o'clock p.m. on Saturdays.

"To permit service to offices, banks and other places of business, including office buildings, from 9 o'clock a.m. to 3:30 o'clock p.m. each day.

"To permit service to theaters and similar places of amusement for six performances each week, one in the afternoon and five in the evening, without restriction upon motion picture houses."

The Commission earnestly urged upon the public the necessity of co-operating in every way possible to make this order effective, and expressly urges upon domestic consumers of electricity the importance of reducing their consumption of the same to the very lowest point possible, lest there be none for their necessities within a very short time.

Representatives of the Fuel Administration in Chicago ordered the Commonwealth Edison Co. and the Sanitary District of Chicago to cease supplying energy to nonessentials, and the Sanitary District, which operates a hydroelectric plant, was ordered to deliver to the Edison company any surplus power gained by the restrictions on supply of energy to nonessential industries.

The coming of cold weather has reduced the output of hydroelectric plants in north central states, and this, coupled with the fact that very little coal is being moved by the railroads and only a small percentage of that released to the public utilities, makes the situation alarming for central-station companies. Unless the strike is settled soon, even more drastic measures concerning the generation and distribution of electrical energy probably will be taken.

A. I. E. E. MEETING TO BE HELD AT CHICAGO JAN. 9.

Electrical Distribution for Street Lighting to Be Considered in Three Papers.

A national meeting of the American Institute of Electrical Engineers has been arranged for Jan. 9, 1920, at Chicago. The general subject of this meeting is to be "Electrical Distribution for Street-Lighting Purposes." There will be two sessions, afternoon and evening. The morning of Jan. 9 will be devoted to registration, getting together, Board of Directors and committee meetings of various kinds, the Western Society of Engineers' rooms in the Monadnock Block being the headquarters.

The first session will be at 2 p. m., at which the following papers will be presented:

"Series Systems of Distribution for Street Lighting," by W. P. Hurley, of the Westinghouse Electric & Manufacturing Co.

"Multiple Systems of Distribution for Street Lighting," by Ward Harrison, of National Lamp Works of General Electric Co.

At 6 p. m. there will be an informal dinner at the City Club.

At 7:30 p. m. the evening session at the City Club will be opened by an address by Dr. Charles P. Steinmetz on "Constant Potential-Series Distribution for Street Lighting." After this address an extended discussion of this subject is being arranged. As a number of modifications of the old series and multiple systems of distribution have been devised recently for meeting the changed conditions brought about by the new types of street-lighting lamps, it is anticipated that this discussion will bring out much of interest.

The Chicago Section of the Illuminating Engineering Society and the Electrical Section of the Western Society of Engineers will join in this meeting. Local arrangements for this meeting are in charge of J. R. Cravath, of Fowle & Cravath, Monadnock Block, Chicago.

N. E. L. A. COMMITTEES ON WATER POWER AND CO-OPERATION.

Strong and Influential Personnel of These Committees and Outline of Their Work.

President R. H. Ballard of the National Electric Light Association announces that the Committee on Water Power Development under the chairmanship of Franklin T. Griffith, president of the Portland Railway, Light & Power Co., Portland, Ore., will include the following personnel:

William A. Brackenridge, president, Southern California Edison Co., Los Angeles; John A. Britton, vice-president and general manager, Pacific Gas & Electric Co., San Francisco; H. T. Edgar, president, Mississippi River Power Co., Keokuk, Iowa; G. C. Egbert, consulting engineer, Niagara Falls Power Co., Niagara, N. Y.; Mortimer Fleishchhacker, president, Great Western Power Co., San Francisco; H. I. Harriman, president, New England Power Co., Boston, Mass.; D. L. Huntington, president, Washington Water Power Co., Spokane, Wash.; H. F. Jackson, president, Sierra & San Francisco Power Co., San Francisco; Frank M. Kerr, vice-president and general manager, Montana Power Co., Butte, Mont.; W. S. Lee, chief engineer, Southern Power Co., Charlotte, N. C.; A. W. Leonard, president, Puget Sound Traction, Light & Power Co., Seattle, Wash.; J. D. McKee, vice-president, California-Oregon Power Co., San Francisco; G. W. Talbot, president; Pacific Power & Light Co., Portland, Ore.; A. B. West, vice-president and general manager, Southern Sierras Power Co., Riverside, Cal.; A. G. Wishon, vice-president and general manager, San Joaquin Light & Power Co., Fresno, Cal.

A complete investigation of the water-power resources of the country, both developed and undeveloped, will be undertaken by this committee. The great aid to national industrial and agricultural development that will result from commercial and economic use of the nation's natural resources in water supply will be fully set forth for the benefit of the industry at large, bankers and investors. A study will be made respecting the practical application of pending national legislation on the subject and of the economic advantages to be obtained through a more general interconnection of water-power systems.

President Ballard also announces that the following is the personnel of the Committee on Co-operation in the Industry:

Chairman, Lee H. Newbert, Pacific Gas & Electric Co., San Francisco; vice-chairman, Robert Sibley, editor, *Journal of Electricity,* San Francisco; John J. Gibson, Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa.; D. R. Bullen, General Electric Co., Schenectady, N. Y.; S. M. Seelman, Jr., Brooklyn Edison Co., Brooklyn, N. Y.; R. S. Hale, Boston Edison Co., Boston, Mass.; William Creighton Peet, Peet & Powers, New York City; Frank Price, Pettingill-Andrews Co., Boston, Mass.

This committee is formed to investigate generally conditions throughout the country, and particularly within geographic sections, in regard to the matter of general co-operation in the industry, and will be prepared to make a report and some general recommendations at one of the sessions of the annual convention to be held in Pasadena, May 18 to 21, 1920.

INDUSTRIAL ECONOMICS DISCUSSED AT CHICAGO MEETING.

Chicago Sections of A. I. E. E., A. S. M. E., I. E. S., and Electrical Section of W. S. E. Hold Joint Meeting.

Three papers dealing with various phases of industrial economics were presented at a largely attended meeting of the Chicago Sections of the American Institute of Electrical Engineers, the American Society of Mechanical Engineers and Illuminating Engineering Society with the Electrical Section, Western Society of Engineers, held in Chicago on Nov. 24.

Edwin D. Tillson, testing engineer, Commonwealth Edison Co., took as his subject, "Reaction of Labor to Intensive Lighting." The progress of good factory lighting has been comparatively slow, although if plant owners realized what high financial returns the investment in this line brings they would quickly insist on it. Chicago tests on the productive value of intensive factory lighting showed returns of up to 700% on the investment involved. Many installations of such lighting have been made under the guidance of the Edison company's engineers; in these the intensity has been increased all the way from 3 or 4 up to 50 times the original intensity. Such installations have been carefully designed on basic data and principles derived from numerous tests and well known authorities, and after a detailed survey of the premises has been made. Tests of productive value of lighting are very difficult to make, but two schemes have been proposed by the Lighting Sales Bureau of the National Electric Light Association whereby fairly reliable data on this point will be obtained under varied conditions.

Higher intensity is not the only desirable feature of a good factory lighting system; much more uniform light distribution and absence of dense shadows are of almost equal importance. Under drop-cord lighting now slowly becoming obsolete the workman had a very small brightly lighted area surrounded by a wall of deep darkness that acted like a physical obstruction to his effective and efficient work, and that led to many accidents. Removal of this wall of darkness by provision of good general lighting has a very remarkable effect in making the workman more alert and attentive and much more efficient in every way. By means of a cleverly contrived working model of a factory, Mr. Tillson showed the difference in illumination and in shadows of drop-cord lighting and two systems of general lighting having average intensities of 4 and 12 ft-cdls. on the working plane.

George H. Jones, power engineer, Commonwealth Edison Co., read a paper on "Central-Station Power as a Means of Effecting Economies and Increasing Production." He showed that it is now, especially in view of the coal situation, just as necessary to conserve our resources and eliminate waste as it was during the war. In doing this electric power is a vital factor in many ways as was so effectively demonstrated in the war. Valuable economies result from the logical machinery arrangement and freedom from much shafting and belting permissible when electric power is used for machine drive, and yet these are not its most important advantages when the power is supplied from a central-station system. During the war we submitted gladly to lighting and heating restrictions in the effort to conserve fuel, but the saving thus effected was small in comparison with that resulting from replacing isolated plants with central-station service.

The marked economies of central-station power supply were strikingly shown in a number of curves, the first showing that the annual output of the Edison company in kilowatt-hours has increased several times as fast as the investment in its entire system, also much faster than the total number of its employes; other curves showed the marked reduction in coal consumption per kilowatt-hour generated by the company and the decreased rates for power, both being due to the much higher efficiency of generation in very large, modern power stations. Mr. Jones cited by contrast the very low economy of the average isolated plant; even well operated and maintained plants of this type often use 10 to 12 lbs. of coal per kw-hr., which is almost a criminal waste of fuel. During the summer the Edison company took over the supply of electric power to ten such isolated plants, enabling their steam equipment to be shut down with a saving per season of some 13,000 tons of coal or enough to supply the entire neighboring city of Evanston for about 15 months.

Harold Almert, consulting engineer, Chicago, presented the third paper, which dealt with the "Personal Efficiency of the Employe." He called attention to the heavy exodus of alien workmen going back to native lands. This and the dearth of immigration for many years have depleted our labor supply very seriously. If we are to get the same output from the remaining workmen we should have increased efficiency from each one of them. During the war the idea of service to the nation spurred everyone on. Now, on the contrary, the spirit of service seems to have vanished and instead we see nearly everyone trying to work less and yet get more pay. Increase in the standard of living is desirable, but it must be kept in bounds to prevent further excessive increases in the costs of commodities.

Mr. Almert cited public utility service as having increased in price probably less than nearly all other services or commodities. And yet analysis of the labor costs of public utilities shows a decided slackening of effort on the part of employes since signing of the armistice. During the present year not only have the wages of such employes gone up, but the time necessary to complete a unit quantity of work has increased, in many cases over double that during the war. Figures were given on the setting of telephone poles, installing telephones, erecting gas holders, etc., which verified this evident decreased efficiency of the employe and which is largely to blame for our increased costs. It is well to provide machinery, power and lighting to increase the efficiency of the plant, that is, the output per employe, but the personal efficiency of the employe must not be allowed to drop further to offset these other gains. Mr. Almert thought that if the workmen were left free from false leadership and agitators, they would return to war-time efficiency. Meantime the employers must make a closer study of human nature, make better selection of his employes and try to stimulate interest in their work by means of profit sharing or other methods that impress on them their obligation to co-operate in meeting the wants of the community.

SOUTHERN CALIFORNIA EDISON CO. TO SPEND $41,800,000 ON WATER POWERS.

Will Build New and Extend Present Hydroelectric Plants Within Next Four Years, Thus Conserving About 2,560,000 Barrels of Oil Annually.

The Southern California Edison Co., with headquarters in Los Angeles, has been authorized by the Railroad Commission of California to sell $7,500,000 of 6% 25-year bonds. Of this amount all but $1,843,000 is to be used to carry out part of the company's construction program, which calls for an expenditure in the next four years, for new water-power plants and extensions, of $41,800,000. The balance is to be used to meet notes issued in connection with construction work now under way. The company has issued a statement to the effect that the proposed new water-power plants will produce electrical energy that would require the burning of 2,560,000 bbls. of oil a year if generated by steam. The statement further declares that approximately one-half of the new power will be needed for electric pumping plants for the irrigation of lands in southern California, the number of acres being estimated at 370,000. In a supplemental order issued by the Commission the Edison company has been granted authority to exchange $1,970,000 of its 1915 debentures at par for $1,970,000 of series of 1919 bonds at 97.

WIRE CONTROL COSTS GOVERNMENT FOURTEEN MILLION DOLLARS.

Deficit Between Net Earnings and Guarantees Was More Than 20% During Government Operation.

War-time operation of telephone and telegraph systems of the country cost the Federal Government $14,418,237, according to the report of Postmaster General Burleson transmitted to Congress on Nov. 13 by the President. The sum represents the difference between the net earnings of the companies and the compensation guaranteed by the Government. Figures showing the result of the operation of the cable companies, which were under Federal control during six months, were not included in the report because reports from these companies had not been received when the postmaster general made his report.

Total net earnings of the telephone and telegraph lines during Federal control were reported at $70,387,532, while the compensation assured was $83,055,769. The total deficit included an estimated $3,000,000 for settlement of future claims. Small independent companies operated by the Government reported a surplus of $57,428.

HYDROELECTRIC DEVELOPMENT PROJECTED IN ALASKA.

Nonfreezing Mountain Springs to Furnish Power for Operation of Gold Dredges at Nome.

Plans, tentatively outlined two years ago, for the development of hydroelectric power on the north slope of the Sawtooth mountain range, on Seward Peninsula, Alaska, apparently are being completed for

New York men who are interested in the project. The source of water for power is in springs on the mountainside which do not freeze in winter. In this flow there is a fall of about 700 ft. This water runs into the Kuzitrin river, the latter into Salt lake, which has an outlet into Clarence bay.

It is understood that two 5000-hp. generators, as the initial units, may be installed in 1920, and that the project contemplates other similar-sized units. The first installation, it is reported, will require a 56-in. pressure pipe two miles in length, and a transmission line to Nome, a distance of about 80 miles. The principal market for power is for the operation of gold dredges on the Nome tundra and elsewhere on Seward Peninsula, concerning which plans on a large scale are being considered.

PACIFIC GAS AND ELECTRIC TO TAKE OVER ANOTHER UTILITY.

Proposes to Operate Sierra & San Francisco Power Co.'s Plant and Transmission Line for 15 Years.

The Pacific Gas & Electric Co. has completed a preliminary agreement with the Sierra & San Francisco Power Co. to lease and operate all the properties of that company for 15 years. Application being made to the California Railroad Commission for permission to complete the agreement, according to a statement made by John A. Britton, vice-president and general manager of the Pacific Gas & Electric Co. The principal properties and power house of the Sierra & San Francisco company are in Tuolumne county, and it owns a transmission line to San Francisco, where it supplies the United Railroads and Universal Electric & Gas Co. with power. The company also owns a distribution system in the San Joaquin valley and operates in Stanislaus and Calaveras counties. The proposed lease will enlarge the facilities and equipment of the Pacific Gas & Electric Co. Should the Railroad Commission rule favorably on the matter, the Pacific Gas & Electric Co. will, it is stated, make improvements that the Sierra & San Francisco Power Co. has had under consideration and probably will also make some extensions.

DEVELOPMENT OF ELECTRICAL SIGNALING DURING THE WAR.

Dr. Jewett Reviews Progress in Communication and Signaling—Address Before Seattle Section, A. I. E. E.

Dr. F. B. Jewett, chief engineer of the Western Electric Co., made the principal address at a well attended meeting of the Seattle Section of the American Institute of Electrical Engineers at Seattle, Wash., on the evening of Nov. 17. His address related to the development of means of communication for the army and navy during the war, in which special attention was given to use of the telephone at the battlefront, radiotelephony and radiotelegraphy for both army and navy. He illustrated and described submarine detectors and instruments for sound ranging of big guns. He also explained the apparatus developed whereby pilots on several airplanes had successfully communicated with each other and with stations on the ground. This had proved a success in cases where visual signaling was impossible. He exhibited numerous lantern slides and motion pictures of the highest interest.

During the war Dr. Jewett was a lieutenant colonel of the Signal Corps, and had a directing hand in developing radiotelephony to its acknowledged efficiency in military and naval service.

AUTOMATIC TELEPHONES FOR NEW YORK CITY.

The New York Telephone Co. has announced that following exhaustive experiments it has developed a machine switching central office system that has proved so satisfactory in a number of practical trials as to warrant its use in several places within its territory.

Installations are now being made in Dunkirk, Ithaca and Geneva and the work is expected to be completed about the first of the year. In New York City it is planned to place this apparatus in the three new exchanges, but none of these installations can be completed, according to present estimates, much before the end of 1920. The latter changes are expected to help meet the abnormal demand for telephone service in that city.

The new system has been so carefully worked out and the means of co-ordinating it with the other types of switchboards have been so perfected that the different types of equipment will interconnect without difficulty. In fact, a subscriber connected with one of the new switchboards will not need to know whether the called party is connected to a machine switching or a manually operated switchboard and vice versa.

N. E. L. A. COMMITTEE TO COMPILE FACTS ON LINE DEVICES.

The Overhead Systems Committee of the National Electric Light Association is planning in its 1920 report to bring to the attention of the industry any new devices that, in the committee's opinion, would be useful in line construction or line maintenance work. In order to make the report as useful as possible, the committee would be glad to get into touch with any manufacturers making such tools or devices for use in overhead line work.

It is not the committee's plan to include in its report anything whatever regarding the various lines of standard fixtures that are on the market, but to call attention to special articles that might prove of particular value to operating companies.

Any data regarding such items should be sent to W. K. Vanderpoel, chairman of the Overhead Systems Committee, 80 Park place, Newark, N. J.

N. E. L. A. COMMITTEE MEETINGS SCHEDULED.

The following National Electric Light Association committee meetings have been scheduled during the month of December: Committee on Inductive Interference and Committee on Overhead Systems, Denver, Colo., Dec. 1-3; Committee on Meters, Ft. Wayne, Ind., Dec. 2; Committee on Membership and Committee on Credits and Collections, 29 W. 39th street, New York City, Dec. 3; Executive Committee, 29 W. 39th street, New York City, Dec. 4; Committee on Prime Movers, Pittsburgh, Dec. 8; Committee on Bonus Systems, 29 W. 39th street, New York City, Dec. 10; Committee on Underground Systems, Detroit, either Dec. 15 or 17.

Commercial Practice

Customers Buy Central-Station Stock—Sterilizing Instruments with Electric Heat—Campaign for Window Lighting

CENTRAL STATIONS SELL STOCK TO CUSTOMERS AND EMPLOYES.

Blocks of Stock Offered to Customers and Employes by Commonwealth Edison Co. and Public Service Co. of Northern Illinois.

With a view to increasing the number of local stockholders the Commonwealth Edison Co., Chicago, offered during November a block of 5000 shares of its stock to customers and employes.

The stock was offered at $112.50 (which was a little above the market price), on installment terms, with the initial payment of $5 per share, and subsequent payments of $5 per month per share. Thus the total payments cover a period of 22 months, the payment for the last month being $2.50. The company issued to each customer or employe signing an application and making the required initial payment a stock purchase receipt which contained the terms and conditions of the contract by which the company sold the stock and which provided for indorsement of the payment of the various installments due from the purchaser. When all installments are paid the purchaser will receive a stock certificate for the number of shares covered by the receipt, the stock not being new but that which has been validly issued and reacquired by the company.

So long as no default is made in the payment of any of the installments when due, the purchaser will be credited with any dividends paid on the stock and will be charged with simple interest at the rate of 6% on each installment from date of purchase to the date of payment of such installment. As the dividends have been and will likely be more than 6% they probably will more than offset the interest charge. In case any purchaser fails to pay any of the installments when due, it is provided that the receipts evidencing payment of prior installments will become void and that the purchaser will lose all interest in the amounts paid by him, but he will be entitled to receive an amount equal to the sum for which his stock purchase receipt could have sold upon the market on the day of his default.

Notice of the sale of the stock, which is regarded as a choice investment, was sent out in circular form to the customers of the company. Sales teams were organized among the employes of the company, ten-men teams under the leadership of appointed captains being assigned to each of the 35 wards in the city. A commission of $1 per share was offered to the salesmen for selling the stock, the work being done on their spare time. Rivalry between the different teams was engendered by the offer of cash prizes ranging from $75 for the winning team down to $5 for the fifteenth.

The original offer of 5000 shares was extended, the sales of the 385 salesmen totaling 8747 shares. These were sold to 3714 persons, a maximum of 5 shares to a person being set. The winning team sold 697 shares, while the highest individual sale was 186 shares. The sale was limited to a three-day period, and the returns showed very satisfactory results.

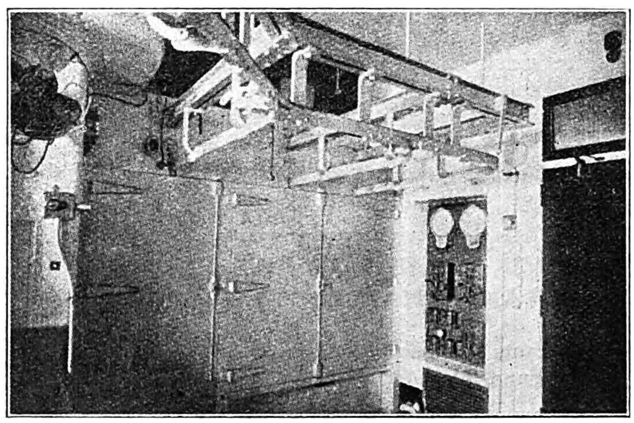
Following the sale of Commonwealth Edison Co. stock comes the announcement that the Public Service Co. of Northern Illinois will offer a block of stock for sale to its customers and employes. The terms, conditions and methods of sale will be somewhat similar to these outlined above, and it is expected that the sale will result in the addition of a large number of stockholders who are customers of the company.

ELECTRIC HEAT EFFICIENT IN STERILIZING INSTRUMENTS.

Gas Oven Supplanted by Electric Oven, Which Proves Superiority in Economy, Efficiency and Simplicity of Operation.

Besides furnishing electrical energy for power, heat and light, central-station companies have taken upon themselves the duty of investigating and becoming familiar with the thousand and one uses in which electricity has been found economical, efficient and satisfactory.

A noteworthy case of this kind was brought to light by the Boston Edison Co. in connection with the Forsyth Dental Hospital, Boston. This institution treats daily the teeth of some 300 to 400 children.



Electric Oven for Sterilizing Dental Instruments.

In a hospital, sterilization is the watchword and as a result it is necessary to properly sterilize 300 to 400 sets of instruments each day, or practically 21,000 separate instruments. For this purpose a gas-heated oven was originally installed. It was successful insofar as it performed its functions after a fashion, but it proved expensive to operate and hard to maintain temperature control. It also generated moisture which coated the instruments with rust, rendering them useless. If the temperature went above a certain point, which it often did, owing to the failure of the controlling apparatus, the intense heat "drew" the temper, also rendering the instruments useless. After destroying several thousand sets, it was suggested that the ovens be electrically equipped.

The ovens are now electrically heated, automatically controlled, and perform the sterilization perfectly at a cost of about $48 per month for energy.

The ovens have attracted widespread attention from physicians, hospital authorities and the electrical fraternity, and further application of this method is contemplated in other institutions.

CAMPAIGN BRINGS OUT ADVANTAGES OF GOOD WINDOW LIGHTING.

Contractors and Dealers of Rochester, N. Y., Co-operate with Central Station in Campaign for Better Lighting of Window Displays in That City.

The industrial department of the Rochester (N. Y.) Railway & Light Co. is conducting an organized campaign for better show window lighting among the merchants of Rochester. A survey showed that approximately 80% of the window displays in the city were poorly lighted. In order to spread the idea of good lighting the central-station company, in co-operation with the Rochester Electrical Contractors and Dealers Association, decided upon definite plans under which to work.

A list of merchants having poorly lighted window displays was compiled, and circular letters were sent to all on the list inviting them to call and inspect some examples of modern show window lighting prepared by the Rochester Railway & Light Co. These consisted of exhibits of colored fabrics, loaned by one of the department stores, one exhibit being correctly illuminated with modern methods and the other incorrectly illuminated by old methods. At the same time advertisements in the daily papers were used to interest the prospects and other merchants who were not on the list.

Salesmen used arguments to the effect that store managers were slow to realize that $15 a month spent for electricity in maintaining good lighting in their window space meant an increase from 50 to 200% in their sales; also that the public was becoming familiar with well lighted window displays and that merchants should not neglect the opportunity of showing their goods to the best advantage.

PRESENT VALUATION HELD MORE IMPORTANT THAN ONE BEFORE WAR.

Court Grants Injunction Against a Fare Increase on Ground That It Was Not High Enough to Cover Increasing Costs.

Valuation of public utility properties for rate-making purposes cannot be estimated, fairly, on the basis of original costs in a before-the-war period, said the Federal Court of Appeals in a recent case in Kansas City, Mo. Three judges passed on the question. The decision was in the application of the Joplin & Pittsburg Railway Co., for an injunction to prevent the enforcement of the Missouri Public Service Commission's order increasing the passenger-mile rate from 1.93 cents to 2.12 cents. The court held that it could enjoin such increase if it did not go far enough to allow the company a remunerative return. It held that such increased rate was not remunerative, and set a rate of 2.5 cents as a maximum that the company could charge pending further adjustment by the state commission. The court had reviewed the valuation figures as prepared by the commission, and the figures presented by the company. It declared that apparently the commission had laid too much emphasis on the cost of the property before the war, when the railroad was completed. "It cannot be said," the court declared, "that the present period of high prices is so temporary or abnormal that it may practically be disregarded in arriving at the value of the complainant's properties. No one can say what degree of depression may ultimately come, but it is reasonably certain that the cost of the properties now under consideration will never again approximate figures prevailing in the years before the World War."

LOW COST OF ELECTRICITY SHOWN BY FIGURES FROM LOUISVILLE.

The relative cheapness of electric service in households is shown in a striking way in a tabulation recently prepared by Robert Montgomery, commercial manager of the Louisville Gas & Electric Co. Mr. Montgomery shows that it is possible for a five-room cottage to obtain electric service for about one-third the cost of that of 19 years ago, and at a much lower price than before the war. The basis upon which the comparisons are made is a monthly consumption of 50 kilowatt-hours either in a five-room cottage or apartment.

As the Louisville company has an optional rate calling for a price of but 3 cents a kilowatt-hour for all energy in excess of 6 kilowatt-hours per room per month, it is possible to obtain the 50-kilowatt-hours for $2.88. On the ordinary residence rate the monthly bill would be $3.80, compared with $5 in 1910, $8.34 in 1905 and $10 in 1900.

PITTSBURGH COMPANY SETS NEW HOUSE-WIRING RECORD.

Early in the current year the Duquesne Light Co., Pittsburgh, set out to secure 5000 contracts for the wiring of old houses during the twelve-month period. This seemed rather a high mark to strive for, and the progress of the campaign was watched closely by others in the industry, particularly managers of central-station commercial departments. As month after month went by, reports showed that the company was exceeding its quota. The latest information is that on Nov. 10 a total of 4794 contracts for wiring old houses had been secured, and indications pointed to the fact that close to 6000 contracts would be signed before the end of the year.

The campaign is a record-breaking one, and shows emphatically the possibilities that exist in the house-wiring field.

CAMPAIGN FOR PORCH LIGHTING.

The Puget Sound Traction, Light & Power Co. has inaugurated a campaign for the purpose of inducing customers in residential districts to install porch lights for all-night service. The idea behind the campaign is that wholesale use of porch lights will provide protection against burglaries as well as enhance the effectiveness of the street lighting, making the streets of Seattle safer for pedestrians as well as vehicles.

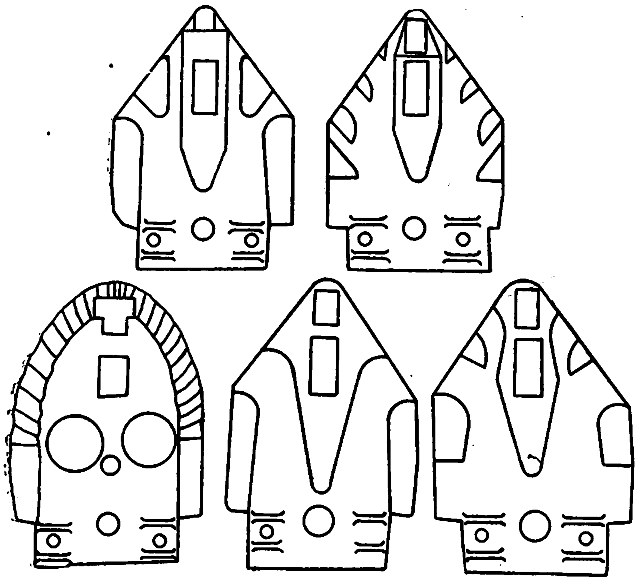
Operating Practice

Influence of Tuyeres Upon Combustion Efficiency—Instrument "Service"—Factors Affecting Underground Cables

INFLUENCE OF CHOICE OF TUYERE UPON STOKER EFFICIENCY.

Interesting Data Obtained by Detroit Edison Co. Clue to Higher Furnace Efficiency and Over-all Economy.

During the year 1918 a decided drop in operating efficiency was found to have occurred at the Delray station of the Detroit Edison Co., part of this decrease being chargeable to the boiler room. Previously, some modifications had been made in some of the stokers, and it was suggested by Mr. Stark of the Delray station that these changes might be responsible for the drop in efficiency. The modifications that had been made to the stokers, of the underfeed type, consisted in changing the type of tuyere originally used by the stoker manufacturer for one designed by the Detroit Edison Co. Several different designs had been evolved by the company, but because of changing personnel due to the war, complete tests were not run and the new tuyere designs were adopted before determining their efficiency as compared with that of the original tuyeres. It was thought that these might be the cause of less efficient stoker performance.



Different Types of Tuyeres Experimented Upon by Detroit Edison Co.

The original underfeed stokers installed at Delray were Taylors, the tuyeres for which have a front nose of solid cast iron. This nose burns in course of time, and to overcome this a tuyere was designed in 1913 that had the same cross section (5.5 sq. ins.) for the flow of air through it as the Taylor, but so divided that half the air passed through the nose and half through the sides instead of entirely through the sides as was the case with the original Taylor tuyere. This tuyere was called the Delray tuyere. Later on, the Conners Creek tuyere was designed for about 9 sq. ins. of air passages which consisted of eight holes spaced around the tuyere.

The accompanying illustration shows various tuyeres used by the Detroit Edison Co. with its underfeed stokers. The tuyere which has since been found the most efficient, after extensive furnace and boiler tests, is the Taylor tuyere and the one originally furnished with the Taylor stoker. It is the one in the center of the bottom row. The top left-hand tuyere is the Delray type, that on the top right-hand side being the Conners Creek tuyere. The bottom left-hand tuyere is of a well-known make, while the one shown on the right-hand side at the bottom is another tuyere experimented with. The above information was presented by J. P. Considine, Detroit Edison Co., in the October issue of the *Synchroscope*.

COMMON SENSE A FACTOR IN MAINTENANCE OF INSTRUMENTS.

Example of Misuse of Recording Instruments Shows Difficulties of Manufacturers in Maintenance.

It is often stated that "service" after a sale of equipment may mean that the manufacturer is called upon on frequent occasions to repair or maintain some piece of apparatus damaged through misuse or abuse and not through ordinary wear and tear. This form of "service" is a very expensive one for the manufacturers, for which they receive neither credit nor reward of any kind, but instead usually much complaint.

In one case that occurred quite recently in a very large power plant where the personnel had both quality and quantity a large number of recording thermometers had been installed. There were so many of these instruments in use, that it was one man's job to go round daily and wind them up. The time taken for this operation, plus the foot-pounds required to wind the clock mechanism, suggested a time and energy-saving method.

One of the keys for winding the clock had the handle cut off and the shank was then fitted to a brace. The attendant was then able to quickly and easily wind up the clocks. Unfortunately, with the brace, because of the leverage obtained, it was very easy to overwind the clocks, and many springs were broken from this cause. At first, the manufacturer replaced the springs, but as spring failures became quite frequent, broke incessantly, investigation was started to determine the cause, and, of course, a complaint was lodged by the manufacturer with the user as to the manner of winding the clocks. As soon as the brace method of winding was discontinued, the clock springs ceased to break.

This incident has been mentioned to emphasize the fact that the responsibility for using commonsense and discretion rests with the purchaser of equipment for no instrument can be made absolutely foolproof.

PAPER-INSULATED CABLE PROPERTIES.

Considerations Involving Safety of Operation and Life of Underground Lead-Covered Conductors.

Paper-insulated, lead-covered, underground conductors are employed to a greater extent than conductors insulated with varnished cambric or vulcanized rubber.

Impregnated paper will stand higher operating temperature with a lower rate of deterioration than rubber or varnished cambric. It has high dielectric strength and when properly made has reasonable temperature variation curves for insulation and dielectric loss. It has the lowest cost of the three.

Its greatest drawback is its tendency to absorb moisture, requiring a waterproof outer jacket and the careful sealing of ends. It is also the least flexible of the three insulations. It follows that its life and rate of deterioration are really entirely the rate applying to its outer jacket.

As to form of conductor, on account of the saving in material and space, the semi-sector shaped conductor will undoubtedly become standard for all 3-conductor cables with paper insulation larger than No. 1/0. Limiting the over-all diameter to about 3 ins. and limiting the smallest cable by one giving a tension of about 90 volts per mi. at the surface conductor, the present range available is shown in Table 1.

Three-Phase, Paper-Insulated, Lead-Covered Cables.
Y-Connected Neutral-Grounded Circuits.

Working pressure, a-c, r.m.s. Volts.	Insulation on each, ins.	Belt.	Small.	Large.	5-minute test between conductors, volts.	5-minute test to earth, volts.
30,000	11/32	11/64	3/0	3/0	75,000	45,000
25,000	9/32	9/64	1/0	250,000	62,500	37,500
15,000	11/64	5.5/64	2	650,000	37,500	22,500
10,000	4/32	2/32	7	750,000	25,000	15,000

It is self-evident that in selecting the working pressure of a system, the size of the distribution feeders in kilowatt capacity is a most important factor.

The smallest 30,000-volt cable is good for at least 8000 kw. at 100% power-factor under ordinary conditions. It would appear, therefore, that plants with a probable 25,000-kw. maximum output are not justified, except by requirements of interconnection, in going to 30,000 volts unless its feeders are of extraordinary length.

Table 1 refers to cables for Y-connected grounded neutral circuits and some of the reasons for excluding the consideration of the open-delta connection are outlined below:

(1) Maximum kilowatt capacity in given duct with grounded Y.

(2) Minimum cable cost for given kilowatt capacity. If a 3-conductor No. 4/0 15,000-volt cable, 6/32 by 6/32 in. paper cost $1, a 3-conductor No. 4/0 15,000-volt cable, 6/32 by 3/32 in. paper would cost 90 cents.

A comparison of change of voltage and connection:

3-conductor, 500,000 cir. mil.—15,000-volt delta, 325 amp., 8400 kv-a.—about 8 watts per duct-foot loss. Cost, $1.

3-conductor, 350,000 cir. mil.—25,000-volt "Y," 250 amp., 11,000 kv-a.—about 7 watts per duct-foot loss. Cost, 88 cents.

Increased capacity 30%
Decreased investment 12%
Decreased transmission loss... 12½%

As to operating, many companies have changed from open delta to improve operation. Almost none have taken the reverse step.

Tests made seem to show that where no voltage stress is present, a temperature of 85° C. does not produce any appreciable deterioration in properly made paper cables in one year. Temperatures of 100° C. maintained for two months produced less than 10% reduction in tensile strength of the paper. These results, of course, apply only to the particular paper and saturating compound used and are not universally true but they indicate what can be done.

If cable insulation were perfect the charging current would have zero power-factor. In practice the power-factor varies from 2 to 6% at 25° C. and from 18 to 50% at 100° C., tests being at operating voltage and 60 cycles. This energy must all go towards heating the cable and when a point is reached where the sum of C^2R loss and the dielectric loss exceeds the amount of energy which can be dissipated, a burn-out must and does result. This is why cable manufacturers object to operating temperatures of 100° C. for short periods and 85° C. continuously.

It follows, therefore, that every size of every make of cable of each voltage rating has a definite safe operating current and temperature under a given set of conditions. It is not possible for a manufacturer to state either the current or the temperature because he does not know the rate at which the cable can dissipate its heat, due to losses at all points of its length. Cases have been recorded of a 12,000-volt line operating at 11 watts C^2R loss per duct-foot, for periods of 12 hours or more daily and this represents an extreme condition without artificial cooling. Probably 8 watts on 13,200 volts and 7 watts C^2R on 25,000 volts are nearer general safe practice. There is, of course, a variation with the season; one company rating cables in conduit with air in the open at 30° F. at approximately double the rating with temperature at 100° F. Another large company increases the winter load over summer load 25%.

With reference to the so-called dielectric losses in three-phase cables, that is, the loss due to the pressure stress in the insulating material independent of the current carried. This loss varies with the frequency, with the square of the voltage (unless insulation is over-stressed), and with the temperature. Power-factor of the charging current varies in the same way and the figures given below outline a very good cable and a very poor one, at 60 cycles, 14,000 volts.

	Good cable.		Poor cable.	
Temperature.	Power-factor.	Watts loss per duct-foot.	Power-factor.	Watts loss per duct-foot.
20° C.	1%	.05	10%	.5
40° C.	7%	.15	20%	1.0
60° C.	10%	.30	35%	2.5
80° C.	15%	.50	59%	6.0
100° C.	20%	.70	73%	13.0

The poor cable had been in use six years. The watts, of course, will vary with the size of the cable while the power-factor does not increase with the size of conductor. Therefore, even with the best cable allowance must be made for this dielectric loss. The above are excerpts from a paper on "High-Tension Cables," presented by Wallace S. Clark before the New England Section, N. E. L. A.

Contracting-Construction

Repair of Large Alternator—Platform for Overhead Motor —Motor Maintenance Cost Form—Convenient Fuse Rack

REPAIR OF ALTERNATOR HAS INTERESTING FEATURES.

Customer's Specifications Make Difficult Work for Contractor in Reinsulating Stator Coils of Big Alternating-Current Generator.

Instead of giving the customer what he wants, most American business concerns would rather give him the kind of goods and service they think is best for him. This sort of policy has lost a great deal of foreign business for American exporters, and at the same time it has lost business in this country for concerns whose policies are not flexible enough to allow them to place their reliance on the judgment of the buyer.

This fact holds true, in many instances, for the electrical contractor. Of course, there are occasions when the customer is in error to his own detriment, and in order to properly serve him it is necessary for the electrical contractor to offer advice from his experience. But there are times when the customer is right.

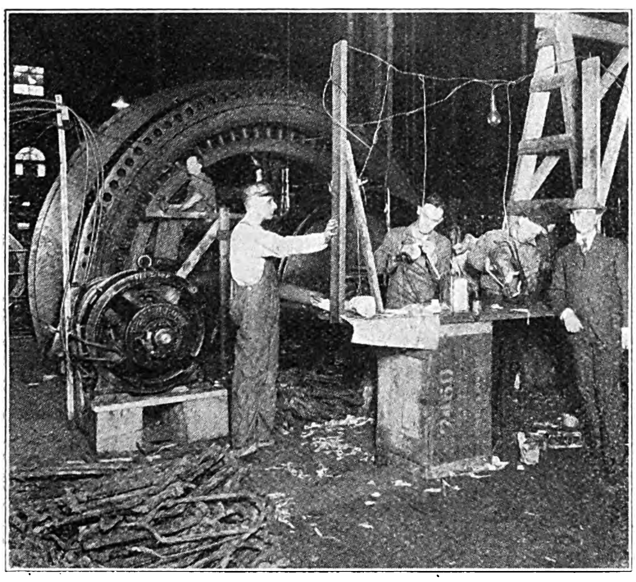
An illustration of this point is given in the case of the repair of an a-c. generator in the power plant of Morris & Co., Chicago. The machine in question is a 600-kv-a., 440-volt, 60-cycle, three-phase, engine-type Bullock alternator that has been in service about 18 years. The insulation on the stator coils began to deteriorate and this fall the company decided that it was necessary to repair the machine, reinsulating the stator coils. However, the demand for power nearly equals the capacity of the generating equipment in the plant, and precautions had to be taken so that only one generating unit was out of commission at a time. Accordingly, repairs to the alternator were a matter of speed. Furthermore, the company stipulated that the repairs should be made in the power house and that parts could not be taken to the contractor's shop to be repaired. The reason for this was that the company was afraid that a strike might occur when parts were out of the power house and that such an occurrence might prevent the return of the parts and would endanger the capacity of the plant, especially if one of the other units should fail.

In spite of these stipulations, the work of repairing the alternator was undertaken by the Electric Service Construction Co., Chicago. The stator has 72 poles, made up of 288 coils of ¾-in. by 1/16-in. form-wound copper. These were all removed and found to be insulated with a wrap of linen tape varnished, then a wrap of oiled linen tape, a sleeve of mica, a wrap of linen tape and finally a covering of fish-paper. The coils were soaked in a vat of hot water and lime, the old insulation scraped off and the copper cleaned and wiped.

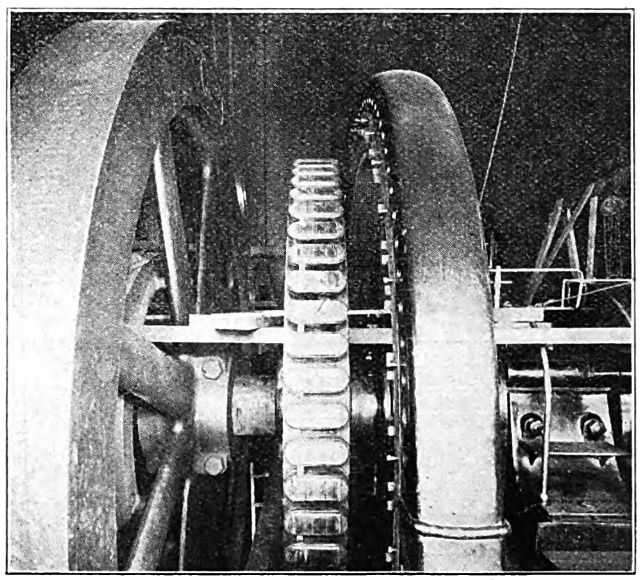
The coils were wrapped with linen tape, double lapped, and after being dipped in Sterling varnish were placed in a baking oven for 16 hours. Two layers of double-lapped oiled linen tape were then placed on each coil, followed by a wrap of double-lapped linen tape and a sleeve of fish-paper. The coils were then put back into place on the stator frame and the connections soldered in.

Two shifts of 5 men, each working 8 hours, accomplished the work of repairing the alternator in 24 days, which was deemed very satisfactory, considering the amount and nature of the repairs made.

After the repairs were completed the machine was tested at 2300 volts for grounds and then run with 600 kv-a. load for 10 hours without appreciable temperature rise.



Improvised Work Bench Used by Contractor in Reinsulating Stator Coils of Alternator.

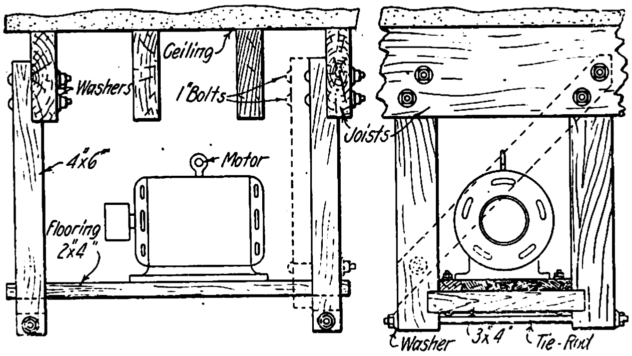


Rotor of 600-kv-a. Alternator Shifted to One Side to Permit Repair of Stator Coils.

CONSTRUCTION OF AN OVERHEAD PLATFORM FOR MOTORS.

By L. M. Harrison.

When floor space is at a premium it may be desirable to mount electric motors on platforms suspended from ceilings instead of supporting them on the floor. In the accompanying illustration are shown the details of a satisfactory support for motors of capacities up to about 30 hp.



Construction of Wooden Motor Platform for Overhead Installation.

Four 4 by 6 timbers bolted to the floor joists sustain the floor of the support. To these vertical pieces are clamped two 3 by 4 cross timbers, which act as beams to which the 2 by 4 tongue-and-groove flooring is spiked. A 1-in. tie rod binds together the lower ends of the verticals. Where the side pull is great to insure against shifting, diagonal pieces, as shown by the dotted lines, may be used to prevent lateral displacement.

CONCISE FORM FOR KEEPING MAINTENANCE COST RECORDS.

Those responsible for the upkeep and maintenance of electrical equipment often desire accurate data to determine just what each appliance costs in upkeep, labor and spare parts. It is necessary to keep proper records to obtain this information, and for this purpose Mr. Bower, chief electrician of the Berwick (Pa.) plant of the American Car & Foundry Co., has originated a form which is noteworthy because it can be kept up easily and at the same time give essential maintenance costs.

The accompanying illustration shows the form and in this particular instance is applied to data on maintenance costs of a motor, although it is suitable for practically any type of electrical apparatus on which such costs are desired.

MOTOR FORM

TYPE	SERIAL NO	R P M	FIRM	H P	MOTOR NO

Form for Keeping Records of Maintenance Costs of Motors and Other Electrical Apparatus.

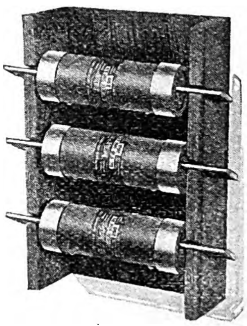
ELECTRICIAN'S LICENSE LAW DISCUSSED.

At a meeting of the Massachusetts State Association of Electrical Contractors and Dealers, held Nov. 20 at Boston, F. A. Williams, clerk of the State Board of Examiners of Electricians, read a paper on the license law passed in Massachusetts in 1915, giving facts and figures regarding the law from its inception up to the present time.

Since that time 3912 examinations have been made, or an average of about 100 a month. The last six months the average examinations were 114, while the month of November will probably show 250 examinations. There are at present about 8000 journeymen electricians licensed and 700 masters. Since 1915 there have been 3000 licenses lapsed, a large majority of these were journeymen. Mr. Williams told of many cases where men were arrested for disobeying the law and spoke of the proposed legislation to more fully fortify the law. He requested the co-operation of the contractors in the coming proposed legislation.

FUSE RACK SAVES TIME.

Maximum production is what is demanded of manufacturers these days, and when production depends on electric motive power, any device that will help shorten the time of stoppages has merit. In order to avoid delay as much as possible extra fuses should be kept handy near every motor.



Handy Rack for Extra Fuses.

A convenient and practical method is to build a wooden rack like that shown in the accompanying illustration. It should be installed near the motor and accommodate an extra set of fuses, of correct rating, so they will be available immediately a fuse is blown.

NEW YORK CONTRACTORS AND DEALERS HOLD MEETING.

The regular semiannual meeting of the Metropolitan District Association of Electrical Contractors and Dealers was held in New York Nov. 24. In addition to reports of officers covering the activities of the association for the current fiscal year, the report of the secretary covered the work of the license board and the elimination of special permits. Addresses were delivered by W. L. Goodwin and Samuel A. Chase.

New Appliances

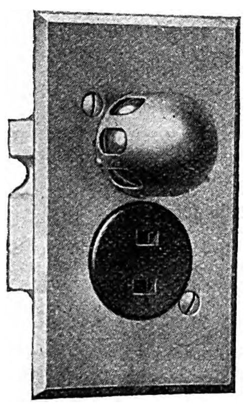
Compact Wall Receptacle and Pilot Light—Double Toggle Switch for Automobiles—Magnetically Operated Oil Switch

Combination Receptacle and Warning Light for Single Switch Box.

It is a recommendation of the National Electrical Code that in connection with smoothing irons, sadirons and other heating devices intended to be applied to combustible articles, there should be a warning signal to indicate that the current is flowing. Compliance with this recommendation has been rather slow because of the nature of the fittings available for the purpose. These were expensive in first cost and were also expensive to install because of their size, some of them requiring a two-gang box, but most of them a three-gang box.

The Bryant Electric Co., Bridgeport, Conn., just placed on the market a device which is a combination of its standard Spartan flush receptacle and warning light. The two are combined in a single porcelain which can be installed in a single switch box. The Spartan receptacle will receive any of the numerous Spartan and other standard parallel-bladed caps. The 2-cp., 125-volt candelabra-base warning lamp, which is connected in parallel with the receptacle, is protected from mechanical injury by a perforated brass cage. When occasion requires, the lamp can be renewed by removing the faceplate of the device. The connections in the receptacle are such that the lamp automatically lights up when the attachment-plug cap is inserted, thus doing away with the necessity of a snap switch which is frequently a component part of devices designed for the purpose.

The use of a device of this kind is not only advisable from the fire-prevention

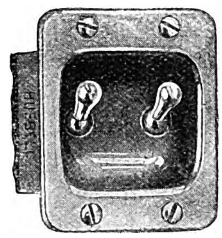


Combined Wall Receptacle and Pilot Lamp for Flatiron and Similar Outlets.

standpoint but also from the standpoint of economy in connection with the less hazardous but widely used domestic appliances, such as percolators, toasters, chafing dishes, curling irons, etc., since it tends to diminish the unintentional and undiscovered consumption of current. All internal connections are made complete at the factory so that the device can be substituted for any receptacle at present installed by simply attaching the line wires to the two terminals that are provided. The new device is designated by catalog No. 121.

Two-Gang Toggle Switch for Automobiles.

Harvey Hubbell, Inc., Bridgeport, Conn., has just brought out a new type of two-gang switch for automobile use generally, but perhaps more especially adapted for closed-car interiors. It is in the popular toggle pattern and so designed that the handles are countersunk



New Toggle Switch for Automobiles—Handles Countersunk in Recesses.

in gracefully curved recesses which add materially to its artistic appearance. Several of the leading automobile manufacturers have already adopted this switch for their car bodies. This new type will be listed as the No. 8022 switch.

Oil-Immersed Switch Operated by Clapper-Type Magnet.

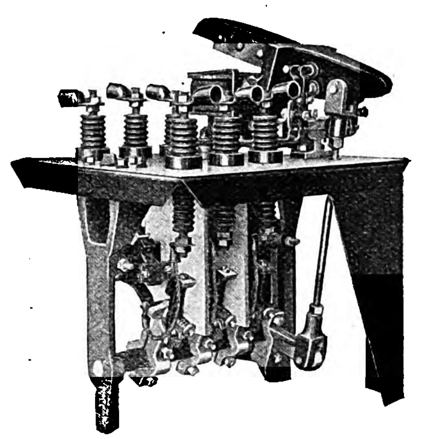
Magnetically operated main-line switches on alternating-current light and power circuits are at times slow and unreliable in closing when a solenoid and plunger must be depended upon for their operation. If the plunger is slightly out of adjustment its movement becomes jerky and noisy, its sealing pull is diminished, and it does not seat properly.

The Cutler-Hammer Manufacturing Co., Milwaukee, Wis., has developed a new oil-immersed magnetic contactor, operated by a clapper-type magnet, which makes possible a more rigid mechanical structure and greater reliability in operation than is obtained in contactors of the solenoid and plunger type. This contactor has a capacity of 100 amperes at 2200 volts, and is particularly desirable as a main-line switch for an automatic 2200-volt motor starter, or for the remote control of any 2200-volt light or power circuit. It is built with three poles, unless used with an auto-transformer starter when five poles are provided.

The frame of the contactor, which is of heavy sheet iron, is arranged for wall or switchboard mounting, and carries two cast-iron supports with two insulated shafts carrying the contacts. The copper leaf brush contacts are saved from all wear due to breaking the circuit because auxiliary arcing contacts are provided for this purpose. Leads from the contacts connect with suitable terminals extending through high-tension insulators mounted on the top of the frame. The armature is firmly pivoted to the frame, and is connected by a rod to an arm of the shaft carrying the moving contacts. The attraction of the armature against the face of the magnet rotates the shaft and closes the switch, which is normally held open by the weight of the moving parts.

A good head of oil is maintained over the contacts by providing a sheet-metal tank of ample capacity, and as the contacts are situated above the operating shaft they are away from any sediment which might accumulate in the bottom of the tank. The arc is broken at the contacts in a horizontal direction and therefore rises to the point of rupture without burning other parts. Transite shields prevent arcing across adjacent poles.

This new oil-immersed switch may be arranged to have two contactors act as a reversing switch, in which case they are mounted side by side, so when one switch is closed the nose



Oil Tank Removed, Showing Contacts and Arcing Shields—By Breaking in a Horizontal Plane the Arcs Do Not Damage Other Parts.

on the armature interferes with the movement of the armature of the other contactor, thereby preventing the closing of the other switch, which would short-circuit the line.

Trade Activities

Booth Electric Furnace Establishes District Offices—Wodack Electric Tool Organized—Literature Distributed

Westinghouse, Church, Kerr & Co., Inc., New York City, has issued an illustrated folder which has for its subject "Shops." It contains a brief discussion of shops, a list of organizations for whom the company has designed and built shops, and views of several shops that it has built. The organizations for which the shops have been built include manufacturers, automobile companies, steel and iron companies, and railroads.

Trumbull Electric Manufacturing Co., Plainville, Conn., is sending out a new eight-page pamphlet on "Circle T" externally operated entrance switches and meter protective trim. It illustrates and describes in a brief and comprehensive manner two and three-pole switches with fusible top and bottom, for use either with or without meter trim. Meter trim knockouts and back plates for use with externally operated entrance switches are also illustrated and briefly described.

Harvey Hubbell, Inc., Bridgeport, Conn., is sending out a new illustrated circular on the Hubbell current tap No. 6700, showing the convenience offered to users of electrical current by this device, whether in the home, office or factory. Another circular which the company is distributing illustrates and briefly describes Hubbell multiple plugs, which increase facilities for making current connections and are a further incentive to greater use of a wider variety of devices.

Bacharach Industrial Instrument Co., Pittsburgh, Pa., manufacturer of precision instruments, is making distribution of two new pamphlets dealing with its products. Pamphlet P discusses Pitot tubes and orifices for measuring the flow of gases in connection with hydro-flow meters, and summarizes the extensive experiences of the Bacharach company in this field. Pamphlet F is devoted to Bacharach "Easy Read" pressure volume indicator for the control of air delivery to cupolas. This instrument consists of a Pitot tube installed in the blastpipe and connected to the pressure and volume indicator. The accuracy of this device is unquestioned and it is suitable for either permanent installations or testing purposes.

Wodack Electric Tool Corp., 23-27 South Jefferson street, Chicago, has recently been organized by Oscar P. Wodack to manufacture portable electric drills, grinders, hammers, etc. It succeeds the Electric Tool Repair & Maintenance Co., which has for the past 3 years been engaged in the repair and rebuilding of electric tools of all kinds. Mr. Wodack, who is president and treasurer of the new organization, recently resigned as district manager in Chicago of the James Clark Jr., Electric Co., with which he has been affiliated for 12 years. A. K. Wodack is vice-president of the company, and Albert T. Lochner, secretary and superintendent.

Delta Electric Engineering Co., Philadelphia, has undergone a change in ownership, having recently been purchased by George B. McClennen, P. J. McBride and Andrew I. Mehan, who have changed its name to the Delta Equipment Co. and will maintain headquarters at 140-142 North Third street. Mr. McClennen was for 7 years identified with the machine tool department of Frank Toomey, Inc., Philadelphia, and resigned recently, as did Mr. McBride, who in the same period was in the steam and electrical department of the same concern.

Nichols Electric Co., 123-124 North Kenton street, Dayton, O., has recently been incorporated under the laws of Ohio with a capitalization of $30,000, to conduct a wholesale electrical supply business. It now represents the following companies: J. H. Parker & Son, Bryant Electric Co., Ivanhoe-Regent Works, Detroit Insulated Wire Co., Bryan-Marsh Co., Monarch Electric & Wire Co., National Metal Molding Co., Barkelew Electric Manufacturing Co., Chicago Fuse Co., and the Square D Co. M. W. Nichols is president and treasurer of the company; G. D. Carver, vice-president, and N. J. Meyers, secretary, all of who were formerly connected with the William Hall Electric Co., Dayton.

Booth Electric Furnace Co., Chicago, whose incorporation was announced in these columns a few weeks ago, has opened up the following district offices in connection with the sale of electric furnaces for melting steel, iron, and non-ferrous metals. For New York and New England, Edward B. Stott & Co., Flatiron building, New York City, with E. F. Tweedy, secretary of the company, directly in charge; for eastern Pennsylvania, New Jersey, Maryland, Delaware and southern Atlantic Coast states, Northern Engineering Co., 308 Chestnut street, Philadelphia, with F. W. Doran in charge; for northeastern Ohio, western Pennsylvania and western New York state, Charles L. Foster, formerly sales manager of the Electric Furnace Co., Alliance, Ohio, with offices at 879 The Arcade, Cleveland, O. In connection with these district offices a complete staff of engineers and metallurgists will be maintained so that the needs of customers can be promptly met and adequately taken care of. Further announcements will be made of the opening of other district offices, arrangements for which are being completed.

Cutler-Hammer Manufacturing Co., Milwaukee, Wis., is now distributing a new 4-page, 2-color folder which illustrates the distinctive features of the new swivel attachment plug recently developed by the company. This consists primarily of an inner member on which an outer member revolves, the inner member having openings for the conductor. Numerous illustrations in this folder portray the novel construction and the simple operations necessary for wiring. It is shown how the component parts of the new plug are permanently fastened together when manufactured, insuring them against becoming disassembled, separated or lost in shipment or distribution. Delay and losses due to a difference in the number of component parts in the electric appliance manufacturer's stock are thus avoided. Illustrations also show the time-saving methods of attaching to cords. Space is provided on the folder for the dealer's or jobber's imprint.

International Trade Commission Visits Westinghouse Works.—The International Trade Commission, which has been touring the United States for the purpose of studying our methods and to work out plans whereby trade conditions between their countries and ours might be improved, made a special visit to the works of the Westinghouse Electric & Manufacturing Co. at East Pittsburgh, Pa., in course of their tour of inspection. This commission consists of prominent manufacturers, bankers and merchants as well as professional and representative business men of France, Italy, Belgium and Great Britain. Probably the most interesting member of the Commission was Monsieur Schneider who is known as the steel king of Paris. Dr. Schneider is head of the firm of Schneider & Cie of Creusot, France. This firm was largely responsible for the manufacture of the 75 mm. guns used very effectively by the Allies against the Boches. In view of the fact that this company probably supplied the American Army in France with all of its small artillery and a large part of its heavy artillery, while many American companies were shipping shells to France to be used in this gun, it seemed of special significance that Monsieur Schneider should visit our American industries. After completing the tour through the plant the party proceeded to the University of Pittsburgh where the degree of Doctor of Science was conferred upon Monsieur Schneider by the university.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Orange, Mass.—Fire which caused a loss of $100 000 at the car barns and terminal of the Orange & Athol Street Railway Co., recently destroyed a large quantity of electrical equipment. It is understood that the company is considering plans for immediate rebuilding.

Bridgeport, Conn.—United Illuminating Co., furnishing light and power service to New Haven, Bridgeport, and other nearby municipalities, has completed negotiations for the purchase of the property formerly held by the Farist Steel Corp., comprising about 8 acres of land, to be used as a site for the construction of a large new power station. It is said that the proposed plant, which will have a capacity of about 75,000 hp. for initial operations, will be one of the largest works in this section of New England.

Bridgeport, Conn.—In connection with the construction of the proposed new addition to the local plant of the Singer Sewing Machine Co. on Waterview avenue, plans have been prepared for the erection of a new pumping building at the works.

Hartford, Conn.—Hartford Electric Light Co. has had plans prepared for the construction of a new one-story brick and concrete building at its plant at 1040 Windsor avenue, to cost about $40,000. Contract for erection has been awarded to the J. H. Grozier Co., 721 Main street.

Bath, N. Y.—Bids will be received Dec. 10 for the recent issue of village bonds authorized at a special election. The issue is for $35,000 to pay for the enlargement of the municipal electric light and power plant.

Binghamton, N. Y.—Kroehler Manufacturing Co. has had plans prepared for a power house, 1-story, 34x 100 ft.

Binghamton, N. Y.—George Q. Moon & Co. have awarded a contract to the Binghamton Light, Heat & Power Co. for furnishing additional electric energy for the operation of their plant. An increase of about 75 hp. is required by the company.

Binghamton, N. Y.—Binghamton Light, Heat & Power Co. has completed arrangements for the furnishing of electrical energy to the Metropolitan Construction Co.

Churchville, N. Y.—Plans are under consideration by the borough officials for the installation of a new electric light and power plant for municipal service. The work will include an underground conduit system and is estimated to cost $25,000.

Endicott, N. Y.—Endicott Johnson Corp. is considering plans for the construction of a new power plant at its works.

Medina, N. Y.—Western New York Utilities Co., Inc., has filed application with the Public Service Commission for approval of a franchise granted by Clarendon officials, and permission to construct the necessary power lines for the furnishing of electric energy for light and power service. It is proposed to have this work completed by July 1.

Newport, N. Y.—Application has been filed with the Public Service Commission by the Newport Electric Light & Power Co. for permission to construct and operate a transmission system to extend from Newport to the plant of the Middletown Light Co., a distance of about 4½ miles.

New York, N. Y.—Henry L. Doherty & Co., 60 Wall street, will erect a new building on Battery place, occupying the block from Greenwich to Washington streets.

Rochester, N. Y.—Bastian Brothers Co., Clinton avenue, will erect a power house.

Rochester, N. Y.—New York State Railways Co. has arranged for the construction of a new freight terminal in the vicinity of its State street car barns, with proposed plant to include electrically operated facilities for freight handling, loading, etc.

Rochester, N. Y.—Rapid progress is being made on the installation of a new street-lighting system in the new extension of Melville road, extending beyond Culver road.

Annandale, N. J.—Plans are being arranged by prominent local interests for the formation of a new company to be known as the Annandale Light & Power Co. It is proposed to construct and operate a local electric system, electric energy to be purchased from the plant at High Bridge.

Butler, N. J.—Borough Council is completing plans for an extension of the municipal electric lighting system through Wanaque avenue, Bloomingdale district. It is understood that plans are also under consideration for an extension of the system in Larry avenue in the same section.

Newark, N. J.—Kaltenbach & Stevens, Inc., Bigelow street and Sherman avenue, has filed plans for the erection of a new boiler and plant and engine room, about 46x57 ft., at its plant. It is also planned to erect a garage building at the works the additions being estimated to cost $35,000.

Newark, N. J.—United Electric Specialty Co. has filed notice of organization to operate at 30 Clinton street to deal in electric supplies. Frederick A. Schiller, 117 Rose Terrace, heads the company.

Newark, N. J.—P. Ballantine & Sons will erect a 71x80-ft. power house. Plans provide for the installation of 4 500-hp. boilers and additional space for four similar power units.

Newark, N. J.—A factory building to cost about $45,000 will be erected by Blanchard & Co. The structure will be 2 story, 50x100 ft.

Trenton, N. J.—Plans are under consideration by the city commission for the installation of oil-burning equipment at the municipal waterworks station to replace the present apparatus at the works designed to utilize coal for fuel. It is said that the present coal situation has been a prominent factor in forwarding these plans.

Trenton, N. J.—City commission is making rapid progress on extensive alterations and improvements in the municipal electric police and fire alarm signal systems. It is understood that plans are being arranged for the installation of underground conduits to replace the present overhead wires. Electric energy for operation is furnished by the Public Service Electric Co.

Trenton, N. J.—Freeman Electric Co. has had plans prepared for the erection of a new extension, one-story, to be located on Walnut avenue.

Wildwood, N. J.—City commissioners have authorized a bond issue of $20,000, the proceeds to be used for improvements in the municipal waterworks plant, to increase the present capacity.

Allentown, Pa.—Lehigh Valley Light & Power Co. is making rapid progress on the installation of new generating equipment of increased capacity at its local power plant.

Allentown, Pa.—In connection with the expansion plant of the Steward Auto Co., 13th and Turner streets, operating a large automobile repair works, plans have been prepared for the installation of complete modern machinery, to be operated by individual motor drive. Electrically operated welding apparatus will also be installed as well as auxiliary equipment.

Catasauqua, Pa.—Borough council has approved a new ordinance providing for a new electric lighting system. The ordinance will be submitted to the Public Service Commission at once for approval.

Clearfield, Pa.—Penn Public Service Co. has inaugurated construction work on the proposed power station to be located in the vicinity of Seward, and to be used for the furnishing of electric service for light and power purposes to 5 counties in the Johnstown district. The proposed works are estimated to cost $3,000,000.

Erie, Pa.—The city will appropriate $75,000 for a system for electric lighting. Address Theodore Eickhorn, superintendent.

Harrisburg, Pa.—Philadelphia Suburban Gas & Electric Co. has been ordered by the Public Service Commission to make extensions to its mains in Springfield township, Delaware county, for extensions in its service.

Macungie, Pa.—Macungie Electric Light, Heat & Power Co. is making rapid progress on the extension of its system at East Macungie, to provide for increased service.

Philadelphia, Pa.—Penn Central Light & Power Co. has recently been awarded a contract by the Borough council, Carrolltown, Cambria county, for furnishing electric service for the operation of the municipal electric street-lighting system for a period of 5 years.

Philadelphia, Pa.—General Carbonic Co. has awarded a contract to M. H. McCloskey, Jr., 1620 Thompson street, for the erection of a new one-story brick power plant, about 30x93 ft., to be located at 838-44 North 3d street. The structure is estimated to cost about $10,000. Contract has also been awarded to the same contractor by the company for the erection of a new two-story brick assembly plant and administration building, about 48 x90 ft.; and 1-story brick garage building, about 27x30 ft.

Philadelphia, Pa.—United States Government, Frankford Arsenal, Captain Hugh Lumsden in charge, has awarded a contract to M. H. McCloskey, Jr., 1620 Thompson street, for the construction of a new addition to the power plant at the Frankford Arsenal. Alterations and improvements will also be made in the existing structure, the entire work being estimated to cost $60,000.

Pittsburgh, Pa.—Plans are under consideration by the McClintic-Marshall Co. for the complete electrification of its plant at Leetsdale, definite details of which have not as yet been arranged. The company has also completed negotiations for the purchase of property aggregating about 100 acres of land in the vicinity of Leetsdale, to be used for its future expansion plans, for a consideration of about $300,000.

Seward, Pa.—Pennsylvania Public Service Co., Pittsburgh, has broken ground for a power plant to cost about $3,000,000, and which will supply current in Westmoreland, Indiana, Jefferson, Clearfield and Center counties. The first unit of the plant will be ready for operation next year.

Washington, D. C.—Fire recently damaged the conduit system in the electric substation of the Potomac Electric Power Co. at 14th and C streets. The company will commence repairs at once.

Greensboro, N. C.—Guilford Lumber Manufacturing Co. is considering plans for the installation of new engine equipment at its plant. William B. Mendenhall is secretary and treasurer.

Atlanta, Ga.—M. C. Kizer, a realty man, is considering ways and means for extending the white way system on Peachtree street and Ponce de Leon avenue.

Spring Creek, Ga.—Bainbridge Power Co., recently organized with a capital of $100,000, is arranging for the construction of a large new hydroelectric power plant and dam in the Spring Creek district, to cost in excess of $75,000. The plans of the company include the construction of a new transmission system and the installation of necessary machinery and equipment, to cost over $50,000. Contract for construction has been awarded to E. O'Brien, New Orleans, La. E. J. Perry, Bainbridge, Ga., is secretary and treasurer of the company.

DATES AHEAD.

Electric Power Club. Meeting. Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, O.

American Electrochemical Society. Annual convention, Boston, Mass., April 7-10, 1920. Friday, April 9, joint session with American Institute of Electrical Engineers on "Electrically Produced Alloys." Secretary, Joseph W. Richards, Bethlehem, Pa.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

NORTH CENTRAL STATES.

Ada, Ohio.—Ada Water & Light Co. will expend $15,000 for improving its plant. Address city clerk.

Bangor, Mich.—Benton Harbor & St. Joseph Railway & Light Co. has purchased from the village of Bangor the municipal light and power plant. The local company has obtained a 30-year franchise to furnish electricity to Bangor consumers. The plant has been in operation 18 years, but the high cost of coal, together with the need for repairs, which the village was unable to make, compelled the council to dispose of it.

Jamestown, Mich.—The village has decided to install an electric light plant. The plant will have a capacity of 500 lights, together with 4 or 5 street lamps.

Auburn, Ind.—Auburn Water & Electric Light Co. will file petition for authority to issue $40,000 in bonds for improvements.

Creagerstown, Ind.—Town Council has recently completed work on the installation of a new electric street-lighting system. Power is furnished by the Hagerstown & Frederick Railway Co., Hagerstown.

Bloomington, Ill.—Petitions are being made to light 12 blocks of city street with cluster lights. Address S. Rosenbluth, promoter.

Chicago, Ill.—Old Colony Life Insurance Co. will erect a 15-story building, 50x165 ft., to cost $1,000,000. The new building, together with the remodeled Lombard Hotel into a 15-story structure, will make an L shaped building of uniform height and design with over 170,000 sq. ft. of rentable space. The new structure will be called Jackson-Quincy-Wells building.

Chicago, Ill.—A 6-story factory building will be erected by the Chicago Addressing Co. and will involve an expenditure of about $200,000. Construction work will begin in the spring.

Chicago, Ill.—M. Born & Co., 540 South Wells street, will erect a 12-story building to cost approximately $600,000, to adjoin its present plant. The total floor space of the combined buildings will be 138,000 sq. ft.

Chicago, Ill.—Industrial Engineers have leased the entire sixth floor of the Trustees' building, 63 East Adams street, for a term of 7 years. The floor will be used as a general office by the engineering company.

Chicago, Ill.—Construction work has begun on the new plant of the Walker Vehicle Co., 531 West 39th street. The building will be 1-story and provide about 100,000 sq. ft. of floor space.

Galesburg, Ill.—Ornamental street lights will be installed on North Chambers, Willard, Bateman and East Losey streets.

Harvey, Ill.—The new welded high pressure gas line built by the Public Service Co. of Northern Illinois between the Blue Island Gas Works and Harvey was connected up to the system last month. The line will have the effect of greatly improving conditions in the district.

Rock Island, Ill.—Property owners in the vicinity of 9½ and 10th avenues on 31st street have petitioned the council to place electric lights. Address Commissioner Frank Wich, department of streets and public improvements.

Springfield, Ill.—A new lighting system for Williams place will be installed at a cost of $3812. Address City Engineer Wade Seeley.

Urbana, Ill.—Board of local improvements has ordered the installation of an ornamental lighting system on West Elm street, to cost $3160.

Antigo, Wis.—Antigo Tractor Co., recently organized, will erect a machine shop and assembling plant to cost $150,000.

Ashland, Wis.—Ashland Light & Power Co. contemplates a lighting plant at Junction.

Monroe, Wis.—Monroe Electric Co. will build an addition to its power plant. L. A. Turner, general manager.

Duluth, Minn.—Minnesota Steel Co. plans to spend about $5,000,000 for the erection of additional units to its plant. The projects include the conversion of a rail mill into a continuous billet mill, the construction of a rod mill, a wire nail mill, and a new residence section at Morgan Park to house employes. The housing project is estimated to cost $2,000,000 alone.

Faribault, Minn.—Northern States Power Co. (Faribault division) has received an order for an additional 150 hp. in motors to be installed in the addition being made to the Zumbrota Clay Manufacturing Co.'s plant.

Minneapolis, Minn. — During the week ended Nov. 14 the sales department of the Minneapolis General Electric Co. (Northern States Power Co.) secured 328 new electric light and power customers with 192 kw. of lighting and 256 hp. in motors. The sale of electric household appliances continues very good. New business connected to the company's lines shows a gain of 223 customers with 224 kw. of lighting and 20 hp. in motors. Output of electric energy was 37.8% greater than during the corresponding week last year.

St. Paul, Minn.—Northern States Power Co. has accepted a contract covering the electric requirements of a new bakery being established by the Zinsmaster Baking Co.

Buck Grove, Ia.—City has signed contract between Denison and Buck Grove for electric current to be furnished from Denison by December.

Clinton, Ia.—Clinton Street Railway Co. contemplates constructing a line to South Clinton. A. L. Schuyler, attorney for county.

Dubuque, Ia.—Eastern Iowa Electric Co. of Dubuque contemplates extension of transmission lines from Peosta to points in Vernon, Prairie Creek, Whitewater and New Wine townships.

Massena, Ia.—City contemplates the construction of municipal electric light plant. C. W. Stoker, village clerk.

Minerva, Ia.—Minerva Electric Co. will construct transmission lines along public highways in Marietta township. W. F. Goecke, president.

West Liberty, Ia.—Town will hold an election to vote $38,000 bond issue for a municipal electric light plant. Irwin Atkins, town clerk.

Bertrand, Mo.—Electric power and current will be furnished within a short time by the Missouri Public Utilities Co. from Charleston.

Abilene, Kan.—Election will be held Dec. 13 to vote $450,000 in bonds for the purpose of building a pipeline connection to Lake Abilene.

Canton, Kan.—Election will be held Dec. 8 to vote $37,000 in bonds for erecting and equipping a waterworks plant and $18,000 in bonds for erecting buildings or additions thereto and purchase of machinery, equipment and for the purchase of pole lines for producing and transmitting electric current.

Geneseo, Kan.—Bonds will be voted in the near future for the erection of an electric power plant or to build a transmission line from the United Water, Gas & Electric Co. at Hutchinson. Estimates on the latter have been furnished and bonds to the amount of $25,000 will probably be voted.

Girard, Kan.—The city commissioners passed an ordinance authorizing the issuance of $40,300 in water and light bonds to cover the cost of purchasing and installing new oil engines and other equipment at the light plant. Two 200-hp. Fairbanks-Morse oil engines will be installed with built-in generators.

Hugoton, Kan.—Election to vote bonds for the installation of a city water and light plant carried. The bonds have been sold, but the contract has not been let for the plant. The site is not yet selected.

Hutchinson, Kan.—Plans are being made for the enlargement of the plant of the United Water, Gas & Electric Co. at Hutchinson, because of the increased demand from surrounding towns.

Lenexa, Kan.—The proposition of building a power plant is being discussed. The plant will be built in the near future unless it is found advisable to connect with the high power line to Olathe by the Kansas City Light & Power Co. which is under construction.

Little River, Kan.—Election to vote $30,000 in bonds for the improvement of the electric light system, carried. A high-tension transmission line is to be constructed to connect with wires of the United Water, Gas & Electric Co. at Lyons.

Lyndon, Kan.—A special bond election is contemplated in the near future to vote bonds for improving the electric system.

Olathe, Kan.—Olathe Electric Light & Power Co. has perfected arrangements by which it is to receive high-voltage current from Kansas City. A new substation will be erected for its reception.

Palmer, Kan.—Election will be held Dec. 22 to vote $21,000 for a new waterworks system, work including complete new plant pipe lines and stand pipe. W. B. Rollins, 209 Railway Exchange building, Kansas City, Mo., engineer. E. H. Hornbustel, city clerk.

Solomon, Kan.—A special election is to be called in the near future to vote $75,000 in bonds to install a system of waterworks.

Spivey, Kan.—A $10,000 bond election for the purchase of 1 30-hp. oil engine and storage battery, carried. Mattie Friend, city clerk.

St. Francis, Kan.—Election to vote $55,000 in bonds for the erection of a new electric light plant building and equipment for same, carried.

Mitchell, S. D.—Dakota Central Telephone Co. will build additions and install 200 telephones. B. J. Savis, engineer.

SOUTH CENTRAL STATES.

Hazard, Ky.—Kentucky & West Virginia Power Co. has had plans prepared for extensive improvements and extensions at its plant, including the installation of new equipment. It is proposed to install 2 new 833-hp. boilers, equipped with underfeed stokers; 3000-kw. turbine, with surface condenser, and auxiliary apparatus. The plans of the company also include extensions to the boiler plant.

Louisville, Ky.—The commercial department of the Louisville Gas & Electric Co. during the week ended Nov. 18 secured 96 new electric light and power customers with 41 kw. of lighting and 77 hp. in motors, and accepted contracts for wiring 39 already built houses. New business connected by the company shows an increase of 74 customers with 38 kw. of lighting and 27 hp. in motors. Electric energy output was 23.1% greater than during the corresponding week last year.

Pikeville, Ky.—Kentucky & West Virginia Power Co. is having plans prepared for the installation of a new electric substation on the Big Sandy river, of 10,000-kv-a., step-down type; and extensions in its 88,000-volt transmission line and 44,000-volt distributing system for increased service for local and nearby coal mining operations.

Monroe, La.—Election to vote $450,000 in bonds for an electric light plant, carried. Bonds will be sold about Jan. 20. P. A. Poag, city clerk.

Claremore, Okla. — Representatives of the Charles Page interests are contemplating erecting a high-tension transmission line from Sand Springs to Claremore for commercial purposes.

Enid, Okla.—The local distribution system at Bison will be completed within a week or two, with the exception of the substation. Work on the Garber-Covington transmission line will be started soon, most of the material having already been received.

Grandfield, Okla.—City has approved the issuance of bonds for $75,000, the proceeds to be used for improvements and extensions in the municipal electric light and waterworks systems.

Minco, Okla.—Bonds to the extent of $11,000 which were recently voted have been approved and the money will be expended immediately for the improvement of the light and water system. New machinery is to be installed at the light plant and extensions made on the water mains.

Oklahoma City, Okla.—New business secured by the Oklahoma Gas & Electric Co. includes contracts covering an initial installation of 400 hp. in motors for operating casinghead gasoline plants near Beggs, Okla.

Perry, Okla.—City council has completed arrangements for improvements in the municipal electric-light and water systems. The plans include the installation of 2 new oil-engine generating units, switchboard, and auxiliary apparatus. Black & Veatch, Kansas City, Mo., are engineers.

Sulphur, Okla.—Plans are being made for a white way on the main street.

Thomas, Okla.—City contemplates the installation of 90-hp. Diesel engine to improve electric light to furnish power for 18-hour service. Address mayor.

Wilson, Okla.—Plans are in progress for the installation of 2 200-hp. boilers, also a 200-hp. engine. J.

W. Ryder, 614 C street, N. W. Ardmore, Okla., engineer.

Fort Worth, Tex.—Fire originating in the boiler plant of the Farmers' Gin Co., Roanoke, near Fort Worth, recently damaged the plant to the extent of $25,000.

Marlin, Tex.—Work on the new electric light and power plant will begin not later than Jan. 1, 1920. Contracts for material have been let.

Normangee, Tex.—W. L. Martin has purchased the electric light plant together with the water works plant from H. E. Shaw, at a consideration of $10,000.

Olden, Tex.—A telephone exchange building and an electric street lighting system are under consideration. Address mayor.

WESTERN STATES.

Sandpoint, Ida.—The city has renewed for two years its street lighting contract with the Mountain States Power Co.

Cordova, Alaska.—Alaska Public Utilities Co., which produces electricity by water power and a Diesel engine, has a new generator on the ground for the driving of which additional Diesel engines will be provided.

Centralia, Wash.—Surveying the ground and laying out the site preparatory to the erection of the steam plant of the Sherman County Light & Power Co. is under way, same to cost about $150,000. Machinery which was formerly intended for a steam plant at Lewiston, Ida., is on hand.

Everett, Wash.—Eclipse lumber mill, now operating under steam power, is to be completely equipped for electric drive. A new building is to be erected to house machinery for finishing operations, electrical equipment for which will be installed.

Molson, Wash.—This city is considering the matter of establishing its own utilities, particularly light and water.

Seattle, Wash.—Contract for furnishing 3 5000-kv-a. transformers at $222.50, for use at Cedar Falls extensions of the city light plant, has been awarded to Allis-Chalmers Manufacturing Co.

Seattle, Wash.—Saxe & Hussey have opened an electrical appliance store, and contemplate serving the local trade and engaging in export business with oriental countries.

Seattle, Wash.—J. D. Ross, superintendent of the lighting department, has requested that $500,000 of utility bonds be sold as soon as possible to provide funds for financing extension of the light plant imperatively needed, while waiting, pending decision of the supreme court as to validity of a $1,755,000 bond issue.

Seattle, Wash.—NePage McKenney & Co., electrical engineers, contractors and manufacturers, are installing electrical equipment for lights and power in the Mallory apartments, at 47th street and 14th avenue, North East, and installing electrical equipment in the new store building of John Graham at Second avenue and Pine street. They have completed installation of the electrical equipment at the schools in Bremerton and Charleston, Wash., and in the Togo Hotel at Bremerton. They are installing electrical equipment in the infirmary building and in an addition to the female ward Northern State Hospital at Sedro Woolley, Washington, and have practically completed work in the new high school at Hamilton, Wash. They are now installing stage lighting, border lights, foot lights, strip lights, announcement letters and dimmers in the Liberty theater at Wenatchee, Wash.

Vancouver, Wash.—Petitions have been circulated in the business district asking that cluster lights be installed on both Main and Washington streets.

Roseburg, Ore.—The proposal to issue bonds in the sum of $500,000 for constructing a municipal light and water plant will probably be decided at the coming special election.

Eureka, Cal.—An order has just been placed by an electrical dealer in Ferndale for 69 single-phase motors to be used for operating milking machines to be served with power by extensions now being made by Western States Gas & Electric Co.

Los Angeles, Cal.—San Joaquin Light & Power Co. is now erecting a 40,000-hp. plant. A still larger plant is now being contemplated which will generate 300,000 hp. It will be located on the north fork of the Kings river canyon and will be one of the largest power plants in the country. Construction on this plant will not start for a number of years. The first steps toward the erecting of the power house will be the building of a first-class road along the banks of the Kings river to the site. This it is understood will entail an expenditure of $250,000. W. G. Kerchoff, president.

Salinas, Cal.—Mayor George A. Daugherty has appointed a committee to co-operate with the city council in investigating the taking over of local gas, water and electrical service system, now owned and operated by the Coast Valleys Gas & Electric Co., or installing new plants in case the Coast Valley's interest cannot be acquired at a satisfactory figure. A public utility expert from Los Angeles has been engaged to make an inventory of the Coast Valleys' properties as a basis for negotiations.

CANADA.

Almonte, Ont.—The council plans to remodel its power plant and to purchase a new generator. Chairman of Commission, Mayor McDowall.

Jarvis, Ont.—Estimates will be secured at once on the cost of installing a hydroelectric street lighting and power distribution system. Clerk C. S. McCarter.

Toronto, Ont. — Canadian Allis-Chalmers, Ltd., is erecting a new 1-story plant, 65x150 ft. for the purpose of electrogalvanizing and enameling electric conduit. Electric monorail cranes will operate over the pickling and plating tanks. Three plating dynamos, each of 5000 amperes and other modern equipment will be installed. In addition to equipment used in zinc plating, baking furnaces and appliances for black enameling of conduit in all sizes will be installed. About 12,000,000 ft. of conduit per year will be produced.

PROPOSALS

Wireless Station.—Bids will be received until June 30, 1920, by Ministerio de Fomento de los Estadoa Unidos de Venezuela for the construction and installation of a new wireless station and system to be located in the vicinity of Caracas.

Electric Light Plant.—Bids will be received until March 15, 1920, by the Port Commission, Port Commission Offices, Santiago, Chile, for the installation of an electric lighting and motive power plant for the furnishing of service for the port of Valparaiso.

Electrical Equipment.—Until Dec. 10, bids will be received by the Secretary of the Board of Commissioners, 509 District building, Washington, D. C., for electrical equipment, including switchboard installation at the Central High School, as well as machine shop equipment.

Electric Work.—Bids will be opened in the office of the supervising architect, Treasury Department, Washington, D. C., at 3 p. m., Dec. 23, for furnishing materials for the construction of an extension to the Animal House for the Hygienic Laboratory, United States Public Health Service, Washington, D. C., including materials for concrete, reinforced concrete, stone, brick, miscellaneous iron and steel work, composition roofing, sheet metal work, lumber, millwork, electric work, hardware, etc., in accordance with drawings, specifications and bills of quantities attached thereto, copies of which may be obtained at this office, in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

FOREIGN TRADE

[*Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.*]

Engineering Materials (31,312).—A civil and mechanical engineering firm in India desires to represent manufacturers and exporters for the introduction into India of American machinery, and engineering and structural materials. Quotations should be given c. i. f. ports of India. References.

Electrical Apparatus (31,345).—A manufacturer in Spain desires to secure an agency for the sale of motors and dynamos, electric heating apparatus, electrical conductors, electric lamps of ½ and 1-watt (tools) insulated and enameled copper wire on bobbins and resistance wires. Correspondence should be in Spanish. References.

Personals

J. W. Carpenter Appointed Vice-President of Texas Power —H. B. Joyce Joins United Electric Light & Power Co.

A. P. HARRIS, manager of the Hickman plant of the Kentucky Light & Power Co., Fulton, Ky., has resigned to enter the service of the Edwardsville (Ill.) Water Co.

THOMAS E. DEMPSEY has resigned as chairman of the Illinois Public Utilities Commission and is succeeded by James H. Wilkerson, a member of the commission and formerly United States district attorney in Chicago.

E. H. SNIFFEN, manager of the power department of the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa., recently tendered an interesting address on "The Steam Turbine" at a meeting of the Duquesne Light Co. Section of the National Electric Light Association in the auditorium of the Chamber of Commerce building.

J. C. GRINDELL, formerly with the Wagner Electric Co., is now district manager for St. Louis Electrical Works at 1427 L. C. Smith building, Seattle, having charge of sales in Washington, Oregon and in the Orient. He recently sold between 40 and 50 motors to the Aladdin Co., which is establishing a factory in Portland, Ore.

CARROLL G. BROWN, for 4 years professor of electrical engineering at Cornell University and more recently connected with the testing department of the General Electric Co., has accepted a position on the faculty of the School of Engineering of Milwaukee. He was also connected with the American Telephone & Telegraph Co. and conducted the research department of the Rochester Railway & Light Co.

J. W. CARPENTER, manager of the Dallas Power & Light Co., Dallas, Tex., has been appointed vice-president and general manager of the Texas Power & Light Co., succeeding Fred R. Slater, resigned. Mr. Carpenter began work in the electrical field as a day laborer and by his efforts and industry steadily advanced to high executive positions. After taking a course in electrical engineering, Mr. Carpenter was employed in some of the large electrical machinery factories. He was for some time connected with the Northern Ohio Traction Co. as construction engineer, resigning this position to take over the management of the Corsicana Gas & Electrical Co., Corsicana, Tex. He later became president of the company and at the same time was president and general manager of the Athens Electric Light & Power Co. and other smaller companies. He resigned these connections about two years ago to accept the position of manager of the Dallas company, from which he has just been promoted. Mr. Carpenter has been identified with the electric utility business for the last 18 years and is well known in business, social and civic affairs of Dallas. He is president of the Dallas Jovian League and is a member of various other organizations.

W. D. BAKER, assistant division superintendent of Division "K" of the Public Service Co. of Northern Illinois, has resigned and is succeeded by E. S. Looker.

R. W. SUTHERLAND, secretary of the Splitdorf Electrical Co., Newark, N. J., has been elected general manager of the company to succeed C. W. Curtiss, recently resigned. Mr. Sutherland will also continue in the capacity of secretary.

JAMES H. WILKERSON, former United States District Attorney, has been appointed chairman of the Illinois Public Utilities Commission by Governor Frank O. Lowden to succeed Thomas E. Dempsey, of East St. Louis, Ill., who has resigned. Mr. Wilkerson has been a member of the commission for a number of months, succeeding Fred E. Sterling, who was elected state treasurer of Illinois at the last election. Mr. Wilkerson has been a prominent attorney in Chicago and has served as United States district attorney in that city.

RALPH NEUMULLER, formerly assistant advertising manager of the New York Edison Co. and general manager of the Electric Publications Syndicate, has been appointed advertising manager of the United Electric Light & Power Co., New York. During the war, Mr. Neumuller was a member of the 326th Infantry, 82nd Division, which saw considerable action in France. The division had the distinction of remaining in continuous offensive action for a longer period without relief, during the Meuse-Argonne operations, than any other unit in the American Expeditionary Forces. Following the armistice, Mr. Neumuller was assigned to G-5 (Athletics), Paris, where he was placed in charge of Ceremonies and Parades during the Inter-Allied games at the Pershing Stadium.

MATHEW RUTHERFORD BIDDELL has been appointed assistant professor of aeronautic engineering and assistant director of the Engineering Experiment Station of the University of Illinois, Urbana, Ill., effective Jan. 1. He will be a member of the staff of the mechanical engineering faculty. His specialty in experimental work will be in studies of aeroplane crankshafts and other parts of planes which have been subject to breaks and defects. Professor Biddell has been until recently chief engineer for the Canadian Aeroplanes, Ltd., of Canada, and had previously served that company as chief draftsman and later as testing engineer. In the latter position he tested all materials which entered into the construction of planes built by the company. From June, 1915, to Dec., 1916, he was chief draftsman for the Curtiss Aeroplane & Motors Co., Ltd., of Canada. He was graduated from the School of Applied Science and Engineering of the University of Toronto in 1906 with the degree of Bachelor of Applied Science. He received both preliminary and final honors.

MAJ. H. B. JOYCE, recently discharged from military service, has been appointed manager of the power bureau of the United Electric Light & Power Co., New York. Commissioned a captain in the Quartermaster Corps, and assigned to Chief Construction Division on Aug. 13, 1918, he was immediately placed in charge of the operation of all refrigerating equipment under the jurisdiction of that division handled by the maintenance and repair branch. In November, 1918, Mr. Joyce was placed in charge of the section of the maintenance and repair branch handling the operation and maintenance of all electric generation, distribution and its utilization; heating equipment and its operation and maintenance, and refrigerating equipment together with its operation and maintenance which were under the jurisdiction of the Construction Division. These utilities were in some 370 odd separate and distinct locations scattered throughout the United States and dependencies. The approval of technical terms and conditions in all service contracts for the supply of electricity, heat, gas, refrigeration, etc., were also handled in this section. Promoted to Major on May 28, 1919, he continued in the same work. On July 1, 1919, Mr. Joyce was placed in charge of the operating section of the Engineering Division. He handled all engineering necessary for the operation and maintenance of utilities including that necessary in connection with the repairs to buildings, roads, water and sewer systems, purification plants, etc., under the jurisdiction of the Construction Division, in all camps, cantonments, base hospitals, storage depots, port terminals and regular army posts throughout the United States and its dependencies.

Obituary.

JAMES B. MCCARTHY, of Detroit, Mich., who for many years has been special representative of the National Metal Molding Co., was killed on his farm near Detroit last week. At the time of going to press no details are available regarding the circumstances. Mr. McCarthy was publisher of *Electrocraft*, which paper was absorbed by the ELECTRICAL REVIEW AND WESTERN ELECTRICIAN in December, 1911. He was connected with the Electrical Review Publishing Co. for several years after this as assistant general manager. Later he joined the National Metal Molding So. and during his connection with that firm assigned to it many valuable patents on brackets and other construction devices.

Financial News

Montana Power Pays Dividend.

Montana Power Co. declared regular quarterly dividend of ¾% on the common stock and 1¾% on the preferred. Both dividends payable Jan. 2 to stock of record Dec. 13. Action of the directors of Montana Power Co. in declaring a 75-cent dividend on the common stock, the same as last quarter, definitely disposes of the unfounded rumors that the company would omit the disbursement of the junior issue this quarter. Referring to this matter, following the meeting of the board, an official of the company stated that these rumors had no foundation, as directors had never contemplated passing the common stock dividend.

While earnings statement for the third quarter of this year did not show up as well as 1918, this has been due primarily to extremely poor business conditions throughout Montana, brought about by a severe drought. Conditions the first part of the final quarter have shown improvement which is expected to be reflected in earnings.

The Montana Power Co. for the 9 months to Sept. 30 showed earnings available for dividends on the preferred and common stocks of $1,901,031. Deducting preferred dividends for this period amounting to $509,250, left a balance of $1,391,781 available for common stock dividends or $3.20 a share. This is at an annual rate of $4.25 a share compared with $5 87 a share actually earned for the fiscal year 1918.

Emerson Electric Stock Offered.

Caldwell & Co., St. Louis, are offering $1,000,000 7% cumulative preferred stock of the Emerson Electric Manufacturing Co., at 97½ and accrued dividend to yield about 7.18%. The proceeds of this issue will be used for the construction of a new factory building immediately adjoining its plant and provide additional working capital. The demand for the company's products is increasing rapidly, and the company is unable to handle all business offered it with present facilities. Upon completion of the new factory building, the sound valuation of plant and equipment will be equal to approximately 143% of the present issue of $1,000,000 preferred stock. In addition, net quick assets on Sept. 30, 1919, after giving effect to present financing were equal to over 130% of the par value of the preferred stock, thus giving the company net tangible assets equal to over 273% of the preferred stock.

The net earnings of the company after taxes, depreciation, etc., available for dividends in the four years ended Sept. 30, 1919, averaged $247,887.80 per year, equivalent to over three and one-half times the annual dividend requirements on the $1,000,000 7% cumulative preferred stock. Net earnings after taxes, depreciation, etc., for the year ended Sept. 30, 1919, were $281,498.37, equivalent to over four times the annual dividend requirements on preferred stock.

Niagara & Erie Power Bonds Authorized.

Public Service Commission has granted permission to the Buffalo & Lake Erie Traction Co. and its receiver to sell, assign and transfer to the Niagara & Erie Power Co., Buffalo, certain of the special franchises granted the company by the municipalities of Dunkirk, Silver Creek, Angola, and Brocton under which the company's transmission system between Athol Springs and West Portland exists. The Niagara & Erie Power Co. at the same time is authorized to issue bonds for $225,000 and common stock for $44,500, the proceeds to be used for the purchase of this transmission line. The commission has also authorized the Niagara, Lockport & Ontario Power Co. to issue bonds for $101,000 and first preferred stock for $28,600, the proceeds to be used for the purchase of 480 shares of the common stock of the Niagara & Erie Power Co. held by the receiver of the Buffalo & Lake Erie Traction Co.

Kansas City Capital Increase.

The Kansas City Light & Power Co. has filed a statement with the secretary of state increasing its capital stock to $20,000,000. This sum the company was authorized to issue by the state public service commission some time ago. The incorporation fee paid by the company to the secretary of state was $10,001.25.

The commission has also authorized the company to issue $717,000 of new securities. It is said that the company will apply to the commission for additional authority to increase the issue of its securities.

Gas & Electric Securities to Declare Monthly Dividends.

Gas & Electric Securities Co., which financed the organization of the Cities Service Co., has declared a dividend of 3%, payable Dec. 1 in common stock at par to common stockholders of record Nov. 15. Announcement is also made that the company intends to declare monthly dividends in common stock at par at the rate of ½ of 1% on the first day of each month in 1920 to stock of record the 15th of the preceding month, these dividends being in addition to the regular cash dividends of ½ of 1% being paid monthly at present.

It is understood that the board of directors of Gas & Electric Securities Co. has adopted a dividend policy for the common stock of regular dividends, payable in common stock at par, in addition to the regular monthly cash dividends, this policy providing for the payment of the 3% dividend on Dec. 1, with 6% in stock dividends in 1920, payable monthly at the rate of ½ of 1% a month, with an increase in this stock dividend each year thereafter of 3% so long as earnings of the company are sufficient to justify the payment of such stock dividends. A similar policy is now being carried out respecting the common stock of Cities Service Co.

Commonwealth Power Earnings Compare Favorably.

During the last three months of 1918 earnings of Commonwealth Power, Railway & Light Co. and subsidiaries were adversely affected by the influenza epidemic. The statement for October, 1918, showed a deficit of $48,082 after fixed charges, which compares with a surplus of $218,878 earned during October, 1919.

Surplus after charges for 12 months ended Oct. 31, 1919, amounts to $2,185,058, equal to $12.23 on $17,953,000 of 6% cumulative preferred stock. Preferred dividends in cash were discontinued with the last payment in 1917. Since then regular quarterly dividends have been paid in 6% interest-bearing scrip maturing six years from date of issuance. After allowing for deduction of 6% on the preferred, the latest 12 months' earnings show $5.96 earned on $18,585,900 of common stock.

Earnings of Commonwealth Power, Railway & Light Co., and subsidiaries, for October, 10 and 12 months ended Oct. 31, compare as follows:

	1919.	1918.
October gross	$2,289,807	$1,799,628
Net earnings	913,113	600,587
Surplus after charges	218,878	*48,082
Balance, after preferred dividend	129,113	*137,847
10 months' gross	20,929,618	17,715,992
Net earnings	8,586,629	6,720,818
Surplus after charges	1,777,246	543,091
Balance, after preferred dividend	879,596	*354,558
12 months' gross	25,131,687	21,534,193
Net earnings	10,365,843	8,300,450
Surplus after charges	2,185,058	916,994
Balance, after preferred dividend	1,107,878	*160,185

*Deficit.

Surplus after charges, as shown is available for dividends, replacements and depreciation. Fixed charges include dividends on outstanding preferred stock of constituent companies in addition to taxes and interest.

American Capital to Finance Italian Electric Trust.

The long protracted negotiations under the minister of transport have resulted in the formation of a joint Italo-American combine, with a capital of 800,000,000 lire (at normal rates, $150,000,000) for electrification of the state railways of Italy and for the utilization of water power in the Trentino and other parts of Italy. All of the plant will be supplied by America.

Marconi Deal Ratified.

At a special meeting the stockholders of Marconi Co. of America voted in favor of the absorption of the company by the Radio Corp. of America. The General Electric Co., which is backing the Radio corporation, is to contribute $2,500,000, part of which will be used to acquire American Marconi shares held by the British Marconi Co.

The new company is to have a capital of 5,000,000 shares of 7% preferred stock, $5 par, and 5,000,000 shares of common stock of no par value, of which the General Electric Co. will receive 135,174 shares of preferred stock and 2,000,000 common. American Marconi stockholders are to have the privilege of exchanging their holdings, par for par, for Radio preferred and in addition to receive Radio common shares equal to number of Marconi shares held.

Detroit Edison Increases Stock.

At a special meeting of Detroit Edison Co. held last Monday, stockholders approved an increase in the authorized capital stock from $35,000,000 to $60,000,000, and authorized the issue of an additional $10,000,000 face value of debentures. The board of directors was also authorized to issue and dispose of the additional stock and bonds, at such time and in such manner as they by resolution prescribe and to confer conversion privileges on the holders of the debts or obligations evidenced by the debentures.

During October, the maximum load on the company's plants ranged between 15 and 20% above the maximum of the war period, and the 24-hour output of current was largely in excess of the wartime figures, notwithstanding the cessation of night shifts and of Sunday work which were required last year by the war necessities of the Government.

Hurley Machine Sales Show Big Gain.

At a special meeting of the board of directors of the Hurley Machine Co. an initial quarterly dividend of $1 a share on the new no par value common stock was declared, payable Jan. 5, to stockholders of record as at Dec. 10.

The rate indicates a considerable increase of that paid on the old common. The quarterly dividend paid Oct. 1 was at the rate of 8% per annum on the old shares, which were of a par value of $100, and which has now been exchanged for the new shares on the basis of seven new shares for one of old. The dividend declared therefore is equivalent to an annual rate of 28% on the old stock.

The report made to the board showed the net sales of the company for the 11 months ended Nov. 28, 1919, to be $5,072,281, as compared with the first 11 months of 1918 of $2,553,577, or an increase of $2,518,709. The sales for the 3 months ended Nov. 28, 1919, were $1,884,974, as compared with the same 3 months of 1918, which were $978,884. This increase, it is stated, is not due to higher selling prices, but to enlarged quantities.

Dividends.

General Electric Co. has declared a dividend of $2 per share, payable in cash on Jan. 15, 1920, to stockholders of record Dec. 6; also a dividend of 2% has been declared, payable in stock of the company at par on Jan. 15, 1920, to stockholders of record Dec. 6. Stockholders will be paid the cash value of fractional shares aris-

For the Readjustment Period—What?

LX.

BRAVO DUNEDIN!

Under this heading the "Electrical Review" of London prints an item as follows:

"We are indebted to a New Zealand correspondent for a copy of a local newspaper dated July 30th, reporting the proceedings at the Dunedin City Council when it was resolved to give preference to a British tender for electrical plant over an American tender which was £800 less. The Council, says the report, decided to accept the tender of the British Westinghouse Co. for a synchronous motor for Half-Way Bush, although the American General Electric Co.'s tender was £3,258, as against the British firm's £4,070, and the latter required a longer term for delivery.

"Councillor Shacklock, in introducing the matter, said that at the last meeting of the Council the matter of accepting a tender for the motor had been held over for further information by cablegram. This had been received and the engineer recommended that the tender of the British Westinghouse Co. be accepted. The purpose of recommending this tender was to obtain a motor of English manufacture. An American machine could be obtained for £800 less and delivery got in five months, whereas the British machine could not be delivered for nine months. The delay might involve some restriction on the users of electric power. He would move that the tender of the British Westinghouse Co. be accepted, provided delivery be given in nine months.

"Councillor Sincock asked would the Westinghouse machine be a more durable machine and what loss was involved to the small users (at present restricted) in the fact that the machine would not get here for nine months. Unless there was some defect in the American machine, he felt inclined to adhere to their original idea of getting the American machine, which could be secured quicker.

"Councillor Clark said he was surprised to hear Councillor Sincock. He hoped the Council would not go beyond the Empire because a little inconvenience or money was involved.

"Councillor Shacklock, in reply, said the British Westinghouse machine was quite satisfactory. The department would do its best to meet the demands of the consumers without restrictions, and if such were necessary it would be only in the depth of winter. The tender was accepted."

This item of news reflects very clearly the prevailing tendency of Great Britain, her dominions and her colonies to do their trading within the Empire itself. American manufacturers can most profitably concentrate on other countries—particularly non-European—for export business. For the present, however, domestic trade should be our chief, although by no means our only, concern.

C. A. TUPPER, Chicago.
President International Trade Press, Inc.

ing out of such stock dividend, based upon the market price of the stock on Dec. 6, except as to those who request script certificates for fractions.

The Chicago Telephone Co. has declared a quarterly dividend of 2%, payable Dec. 31, to stockholders of record Dec. 30.

The Montana Power Co. has declared a dividend of ¾ of 1% on common stock and a quarterly dividend of 1¾%, both payable Jan. 2, 1920, to stockholders of record of Dec. 13, 1919.

Water Works earn.	$ 5,011,316	$ 4,973,352
West Penn. Rys.	10,362,483	8,601,358
Total gross earn.	$15,373,799	$13,574,750
Net earnings	1,263,953	1,396,258
Surplus after charges	435,110	585,185

GREAT WESTERN POWER.

Earnings of the Great Western Power System for October and 12 months ended Oct. 31, compare as follows:

	1919.	1918.
October gross	$ 420,450	$ 401,070
Net after taxes	245,339	240,651
Surplus after charges	55,658	69,093
12 months' gross	5,224,303	4,515,249
Net after taxes	3,055,230	2,588,380
Surplus after charges	929,350	762,592

MASSACHUSETTS LIGHTING COMPANIES.

The gas and electric light companies owned by the Massachusetts Lighting Companies report aggregate sales of gas and electricity, excluding inter-company items, as follows:

	1919.	1918.
October net	$ 161,666	$ 138,849
4 months' net	621,389	557,823

COLUMBIA GAS & ELECTRIC CO.

Consolidated earnings statement of Columbia Gas & Electric Co. and subsidiaries, compares as follows.

	1919.	1918.
October gross	$ 939,757	$ 856,709
Net after taxes	426,686	386,530
Surplus after charges	192,034	197,085
10 months' gross	9,525,602	9,353,690
Net after taxes	4,641,886	4,647,649
Surplus after charges	2,427,708	2,715,252

Paducah Electric Bonds Offered.

An offering of first mortgage 6% five-year gold bonds of the Paducah Electric Co. is being made by Powell, Garard & Co., Chicago. They are selling at 95.75 and interest and yield over 7%. The properties owned and controlled by the company include an electric station, with a rated capacity of 2440 hp.; gas works, with a daily generating capacity of 490,000 cu. ft.; electric and gas distributing systems, reaching all of the desirable portions of the city; steam heating mains, serving the central business district; 17 miles of standard gauge street railways, and 75 acres of valuable real estate and miscellaneous buildings. The present depreciated value of properties, exclusive of any allowance for franchises and going value, is conservatively estimated at $1,315,202, or 117% in excess of first mortgage bonds now outstanding.

The consolidated statement of operation of the company and its subsidiary and predecessor companies for years ended Sept. 30, 1917, to 1919, is as follows:

	1917.	1918.	1919.
Gross earnings	$304,588.70	$313,570.38	$390,642.92
Operating expenses, including taxes and maintenance charges	228,803.44	231,114.38	278,655.80
Net earnings	$ 75,785.36	$ 82,456.00	$111,987.12
Annual interest requirement on $236,400 5% and $368,100 6% first mortgage (this issue) bonds			33,906.00
Balance			$ 78,081.12

Electrical Review

Vol. 75. No. 24. CHICAGO, DECEMBER 13, 1919 Three Dollars a Year

Electrical Review
WITH WHICH IS CONSOLIDATED WESTERN ELECTRICIAN AND ELECTROCRAFT

VOL. 75—No. 24. CHICAGO, SATURDAY, DECEMBER 13, 1919. PAGE 973.

The Coal Situation—An Editorial

WHILE advices from Indianapolis and Washington indicate an early resumption of bituminous coal mining in all fields, the country is still suffering under the most stringent and far-reaching fuel restrictions in its history. Particularly in Chicago and in the Middle West has the need for unprecedented curtailment been necessary. Many factories are closed and all others are working on a part-time basis. Stores are only open between the hours of 12 noon and 6 p. m. and street and interurban railway service has been reduced to a minimum entirely inadequate for the needs. And as this issue of ELECTRICAL REVIEW goes to press orders are being sent out for still further curtailment in every direction.

Every restricting order is being met in a splendid spirit of Americanism. No one questions the justice or authority of the steps that are being taken but all are willing and anxious to co-operate for the common good.

Naturally, our own publishing facilities have been seriously curtailed; hence this issue of considerably fewer pages than usual. With publishers already facing a critical shortage of paper and with the fuel restrictions that have now come to pass, the outlook is anything but favorable. However, we bespeak the patience and co-operation of our readers in this crisis. Nothing will be left undone to continue on the best basis possible with hopes for the early return to normal conditions.

The central stations, being the largest consumers of coal next to the railroads, naturally were most affected by the strike. The National Electric Light Association's committee, headed by John W. Lieb, which did such notable work during the war, was again called into service to assist utilities in getting coal supplies, and while this committee has done its utmost, the Federal Railroad and Fuel Administrations either have underrated the coal needs of the Central West or have been unable to supply fuel from other sources.

The situation in Chicago and vicinity became so critical as the result that a committee of five leading business men with Samuel Insull, president of the Commonwealth Edison Co., Chicago, chairman, appealed to the Illinois Public Utilities Commission to reduce the loads on utilities. Plans which were ultimately adopted provided for spreading out the load to get greater diversity-factor, cut the peak load and improve load-factor so as to dispense with as much reserve capacity, banked fires, etc., as possible. According to Mr. Insull, the Commonwealth Edison Co., as the result of the restrictions enforced, had cut down its peak load 34% and on Dec. 6 had reduced its output over 25%. Similar conditions obtained in other communities where like restrictions were enforced.

It is undeniable that the coal reserve maintained by utilities generally has virtually saved the nation, yet many central stations had smaller stocks of coal on hand this year than in previous years. High prices and a feeling that peace had settled conditions are probably responsible for this. Steadier work is one of the conditions which are due to the miners in mere justice. The central stations are one of the largest consumers of coal. If they buy more coal during the summer or off months, they will be enabled to maintain larger reserves, probably obtain a better unit price and enable the miners to obtain steadier work.

At present we do not feel that the miners deserve very well of the country after the manner in which they, or their leaders, issued an ultimatum of complete capitulation to their demands or annihilation. However, the coal problem will be settled only when settled right. This means among the first things that the miners must be offered continuous employment. Summer buying by all central stations, and thereby the maintenance of larger coal reserves than usual to guard against unforeseen contingencies, is necessary.

Collective bargaining is recognized. This means that until some way can be evolved for other methods of settlement, the country is at the mercy of such bodies of men controlling the key industries as coal and transportation. The steel strike affected the country but little. The coal strike has paralyzed a large section of the country, and we are not yet out of the dilemma. A protracted strike of the railroad men might work even greater havoc.

Industry seems to be in a bellicose state. There is increasing ill-feeling between the unionized and the nonunionized workers, not civil war, but a feeling by the latter that they are being exploited by the former. There is not peace between the employer and the employe, a condition often incorrectly spoken of as war between capital and labor.

The sum total of these things is that the central stations must lay in larger stores of coal in future, for recent events have taught the value of the coal pile.

Central-Station Rates in Theory and Practice

Twenty-third Article — Public Utility Regulation by State Commissions—Organization and Procedure of Commissions—Scope of Their Powers as to Rates, Service, Capitalization, Etc.

By H. E. EISENMENGER

This is the twenty-third article of this series which began in the issue of July 12. Part I consisted of seven articles on the cost of electric service. Part II included six articles on the principles governing selection of a rate system. The six articles in Part III dealt with the various rate systems in use. Two articles constituted Part IV on rate analysis. Last week's article included Part V on accuracy of rates and began Part VI, which is continued in the present and will be concluded in the two remaining articles of the series.

PART VI—PUBLIC UTILITIES AND PUBLIC REGULATION—(Continued).

CONTRIBUTED BY S. F. WALKER,
Formerly Associate Editor of Rate Research.

II. REGULATION BY COMMISSION.

UTILITY COMMISSIONS MUST BE DISINTERESTED AND UNBIASED ADMINISTRATIVE BODIES.

COMMISSIONS are not courts of punishment, but are administrative bodies intimately related to many phases of the utility business. A commission should not usurp the position of management in determining the development and operation of a utility, but as an administrative body, act in a corrective and advisory capacity. The underlying authority for the regulatory powers vested in commissions is the common-law principle that all business affected with a public interest is subject to public regulation.

Unbiased Judgment versus Home Rule.—The difficulty in regulation of public utilities by local franchises was that the municipality was a party to the contract and at the same time acted as the regulatory body. Therefore, free service to the municipality was exacted of the companies, heavy paving requirements, special taxes, unprofitable extensions and other unjustifiable burdens were placed upon the companies to their detriment and also to the detriment of the general public served by the utilities.

A statewide interest as against the companies operated in several states, such as railroad companies, natural-gas companies, or interstate power companies, may affect the judgment of the state commission to shade the findings in favor of a low rate for service within the state.

In order to secure an unbiased point of view the regulating body must be the agent of a larger unit than that affected by the regulation. State commissions pass upon the rights and privileges of the city and the local companies; the Interstate Commerce Commission deals with matters affecting the often conflicting interests of different sections of the United States.

In the future certain public utilities may outgrow the limits of state commissions and provision may be made for the delegation of matters affecting interstate operation of power-transmission companies, natural-gas companies and similar industries to an interstate or national commission.

Another consideration which favors regulation by state commission rather than by the municipality is that men with the desired education and training, capable of exercising the broad administrative powers affecting various industries, cannot readily be secured for local commissions. Furthermore, extensive investigations are often called for in determining proper standards of service, in adopting a policy of rate making or in deciding the advisability of adopting new inventions and improvements in operating conditions, which investigations can be conducted by the state body for the benefit of the industry in the entire state. The necessary equipment, such as meter-testing equipment is not often available to the local body, but may be acquired by the state commission for use throughout the state, or the state commission may use certain equipment jointly with other state departments or the state university.

Special Laws.—Prior to the establishment of commissions, special laws had been passed in some states, fixing a rate or standard of service for individual companies or for the railroads, gas, electric or other public utilities throughout the state.

This sort of regulation is too haphazard and limited in scope. Furthermore, it has the objection obtaining in the case of regulation by local franchise, that of inflexibility. The rate or service requirement, if reasonable when the special law or franchise became effective, may not continue reasonable and suitable to developments throughout the term of the franchise or the period during which the law remains in effect.

After the establishment of commission regulation there should be no occasion justifying the passage of a special law of this kind; and the special laws already passed should be nullified to give the commission entire freedom to make changes when they are found to be justified, the special rates and regulations to remain in effect only until reasonable rates and regulations can be determined by the commission.

COMMISSION ORGANIZATION.

The majority of the state laws provide for three members on a commission, but there are commissions of four, five and seven members. The majority of the laws also provide for appointment of the commission by the governor, by and with the consent of the senate. In some of the laws, provision is made for the election of the commissioners by the people, but the appointive commission has grown in favor, and this plan is adopted in the laws most recently enacted.

Term of Office.—The different state laws provide for a term of office for the commissioners varying from two to ten years, but the term most common is that of six years.

The body is given a greater degree of stability by providing for the expiration of the term of but one commissioner at a time, and there are many instances where men, who have proved their special adaptability for the work, have been returned for successive terms to the best interest of the regulatory system. There is an unwritten obligation that the governor maintain a commission divided as to party affiliations so that it may act entirely in a nonpartisan manner.

Qualifications.—In practically all of the laws, men appointed or elected to commissions are not to have any direct or indirect pecuniary interest in the industries to be regulated, and the requirement is often exacted that the members and employes of the commission are not to engage in any other business or hold any other political office.

The training of the men eligible to the office of commissioner is specified in some of the laws, while in others certain standards have been established by precedent. The men making up a commission should have different qualifications and training. For example one member may be a lawyer, and associated with him may be a business man familiar with railroad and public utility problems, an engineer of broad training and a man familiar with the financial and economic aspect of the regulated industries.

Provision is often made in the law for a secretary or clerk of the commission and for a special attorney.

The Staff of the Commission.—There is a commission staff, the members of which are appointed by the commission, to supplement the work of the commissioners, make investigations of operating conditions, make appraisals, compile data for submission to the commission, and conduct investigations in the field. The staff usually is organized by departments; the engineering department, accounting and statistical departments, and the tariff or rate departments. These are in turn subdivided. The engineering department, for example, is made up of subdivisions presided over by a railroad engineer, electrical engineer, gas engineer and experts in whatever line is included in the commission's jurisdiction.

COMMISSION PROCEDURE.

The commissions are in practically every case free to adopt their own rules and practice of procedure in making investigations and in conducting formal hearings.

The commission need not wait for the presenting of a formal case. Some of the most valuable work of commissions has not been recorded in formal opinions and cases. Especially is this true in the case of small companies who have been required to keep proper accounts, directed to make improvements in operating machinery, and advised in the development of their business under a favorable rate system.

Informal Cases.—A great part of the complaints made to the state commission are handled informally by correspondence and by visits of some member of the commission's staff.

Formal Cases.—Generally speaking, the less like a court the sittings of the commission in formal cases are the better the results. Matters may be brought up which are outside of the original case presented on complaint, petition or application. The scope of the case may be broadened to include parties other than those bringing the case to the commission and the final order of the commission is not necessarily limited to the initial proceedings but may present a full and complete disposition of all matters brought up during the progress of the case. For example, complaint against a rate charged one individual for electric power service may result in a change in schedule for all classes of service by the company involved.

The commission is given power to require the furnishing of records and data considered necessary to the case and has power to summon witnesses similar to the powers of a court in that respect.

Review by Court.—The judgment of the commission as to the proper findings in a case is practically paramount. The commission's decision may be taken to court for review, but the judgment of the court may not be substituted for that of the commission. If the court finds that the commission has exceeded its powers or made a decision contrary to law and fact, the case must be remanded to the commission for modification in accordance with the court's finding. If new and additional evidence is introduced when the case is presented to the court, the case is returned to the commission for consideration of the new evidence.

The finding of the commission is *prima facie* reasonable, and the burden is upon those carrying the case to the court to prove that the commission's finding is otherwise.

SCOPE OF REGULATION.

Without taking up separately the regulation provided for in the different states, it may be said that commission regulation of public utilities includes regulation of rates, service, accounting practice, the issue of securities, and the valuation of public utility properties.

Rates.—In a few of the state laws the commission is given the power to fix maximum rates only, and in Ohio the rates are in the first instance fixed by municipal ordinance subject in all cases to appeal to the state commission. In the large majority of states, however, the commission is charged with the duty of determining reasonable rates, and may order changes in individual rates or may prescribe entire new schedules. In about half of the states where the commission is given the more complete jurisdiction over rates, the rates of municipal utilities are exempt from regulation.

Provision is made for the commission to make valuations and obtain whatever data it may consider necessary to the determination of proper rates.

Rates Fixed by Contract.—When the utility services were first established, the utility companies were left free to make what agreement they could to gain permission to operate and to induce the customers to take the service. Many promises were made to individuals and to communities naming rates for the service, and these promises were often embodied in special contracts between the company and the customers. With the establishment of regulation, the interesting question arose as to whether or not the company should be permitted or required to carry out these original agreements. It has been generally established that these special contracts must be abolished as constituting unjust discrimination, and the reasonable rates adopted by the commission should be generally applied to all customers regardless of whether these special agreements called for a higher rate or a more advantageous rate to the customer than those found by the commission to be reasonable.

Franchise Rates.—Likewise rates fixed by franchise have been changed after investigation by commission. The franchise rates are binding upon the company only until modified by the commission.

Such orders of the commission have been upheld in cases of review by the courts upon the general ground that the state's power to regulate in cases affected with public interest cannot be bargained away by such special agreements.

Increases above rates fixed by franchise are allowed as well as decreases in such rates, since this is only just to the company, and rate increases may be as much in public interest as rate decreases.

Publicity in Rates.—All rate schedules are to be filed with the commission and all changes in such schedules are to be filed prior to their going into effect. Duplicate schedules and rate changes are to be filed in a place and manner readily accessible to the public. Such provisions securing publicity of rates are made in the interest of elimination of discrimination.

Different rates may be prescribed for different classes of service, but all customers whose service comes under a certain class are entitled to the same rates, rules and regulations.

Modification in rates.—Rates once determined by the commission may be reviewed at any time, either on the commission's own motion or upon complaint of either the company or the customer.

Emergency Rates.—Flexibility of rate regulation was secured by special provision in some of the laws permitting the commission to fix rates in an emergency without recourse to the extended investigation made in usual cases and the advance notice to the public of the proposed increase. Emergency increases have been resorted to in many cases under such provisions to meet the unprecedented increase in operating costs attendant upon war conditions.

Service.—The regulation of the service of public utilities is one of the most important branches of regulation.

Standards of Service.—In the case of gas and electric services, commissions have quite generally worked out statewide standards of service, covering, in the case of electric companies, such matters as accuracy of meters, meter tests, voltage regulation, variations in frequency; and in the case of gas companies, meter accuracy, heating value and illuminating value of gas, tests for purity of product and maintenance of uniform pressure. In some states following the establishment of such rules, regular inspections are made by the engineers in the gas and electric departments of the commission and the companies are required to keep operating records affording a check upon their operation under the standards set by the commission.

Other rules have been adopted covering the method and manner of construction of electric transmission lines, crossing of power lines, street car and railroad crossings, prescribing the intervals of service on car lines and frequency of car stops, regulating telephone and water service and many other matters affecting the safety and adequacy of service in these various utilities

Extension of Service.—The commission has power to determine what extensions of service are necessary, and when the cost of such extensions should be borne by the company. In some cases the commission has required extensions to be made only upon condition that part or all of the cost be borne by the customers to be served from the extension or only upon such customers guaranteeing a specified return upon the company's investment in the extension.

Joint Service.—The supervision of service covers the rendering of joint service by utility companies. The companies may be required to co-operate in rendering joint service to the public and the compensation for such service may be divided between the companies on a basis determined by the commission.

Refusal of Service.—Public utilities cannot arbitrarily refuse to serve certain customers, but must render service without discrimination. If an application for service is refused by a company it must be in accordance with rules on file with the commission and meeting with its approval. Upon complaint of the applicant to the commission, a determination will be made as to whether or not service should be given in that particular case.

Abandonment of Service.—A utility once having undertaken a service to the public, cannot abandon that service without approval by the commission after proper cause has been shown.

Neither can public utilities change hands by transfer or lease without commission approval; and reorganization and mergers are also made under commission supervision, the theory being that the public is an interested party to all such proceedings to the extent of determining that no unnecessary financial burdens are placed on the public service and that those acquiring control of the property are competent to conduct it in such manner as to afford adequate service to the public.

Accounting.—Commissions have been given the power to establish uniform systems of accounts for all utilities subject to regulation and to require regular company reports.

The information thus on file in the commission's office is of use in capitalization and rate cases and, being uniform, these accounts afford valuable sources of comparisons between operating companies. Complete accounting records for a number of years may afford a better basis for rate making than a valuation prepared for the immediate purpose at great expenditure of time and labor. Such data have been used in regular rate cases as well as in many of the recent emergency increase cases.

Issue of Securities.—The public utility laws vest in the commission power to regulate capitalization, varying from a general provision stating that no public utility should issue securities without the commission's approval, to an elaboration of the commission's power until regulation affords a practical guarantee that there is a property value upon which the company is entitled to a return for all securities issued.

The continued regulation of capital expenditures by the same body regulating rates makes it possible to use the capitalization as a rate base. The company is assured before making an expenditure that it will meet the commission's approval and that it is such that it should be allowed to earn a return upon the amount expended. In the past, companies have made expenditures which have not been justified by future developments. Extensions have been made which never have been profitable and perhaps never will be, and plants have been enlarged to an extent not justified by the later growth of the town. But if these expenditures had been approved by a commission, the judgment of the company at the time having appeared reasonable to the commission, there would be less opportunity to penalize the company in a future rate case on the ground that poor judgment had been shown in the expenditures which proved to be unnecessarily high.

Valuations.—Appraisals of public utility property may be made by the commission in capitalization and rate cases. In most laws where valuations are mentioned it is left optional with the commission to determine what and when valuations will be made. In one or two laws where it was made mandatory upon the commission to value all public utility property it was found to be practically impossible to determine a basis for such general valuations and it proved to be an unjustifiable burden and expense upon the commission and the utilities.

In some of the states, the staff of engineers organized by the commission has made property valuations for purposes of taxation.

Valuation, especially as concerned in rate cases, is later treated at length in the last two articles of this series as the subject most closely related to the discussion of rates.

Protection From Competition.—The companies most generally subjected to regulation are those in which competition increases the cost of service and is otherwise undesirable. Electric, gas, telephone, water and railway companies are called natural monopolies, because it is possible to have competition only at the expense of running duplicate systems of wires, mains and tracks through the city's streets, as well as maintaining greater plant capacities than otherwise necessary. Regulation by competition is secured by duplication of expenses in other industries, but the objections to duplication in the case of natural monopolies are more obvious. There is absolutely no excuse for duplication of expense under commission regulation.

Before the establishment of commission regulation, municipalities often followed the policy of granting franchises to as many companies as applied, thinking to secure the benefit of low prices during the rate war which invariably followed the establishment of duplicate properties, but the resulting waste, unwise expenditure, and failure to earn an adequate return resulted in the elimination of the weaker competitors or led to a general price agreement, and the price of the service had to be high enough to retrieve the losses during the rate war. Measures to prevent this state of affairs under regulation have been incorporated in many of the state laws. Companies desiring to establish new plants or established companies desiring to extend their service into new fields are required to first obtain a certificate of convenience and necessity from the regulating commission; and practically without exception the disadvantages of duplication have been recognized by the commission and the certificate of convenience and necessity has been withheld when the territory in question is already served by another company.

With one company in the field, if the service is inadequate the commission may order it improved, and if the rates are unreasonable new rates may be prescribed by the commission, leaving no excuse for resorting to the old unsatisfactory method of regulation by competition.

The greater stability given investment in a public utility under protection from competition makes it just that much easier to secure necessary capital for the development of these utilities and is reflected in a lower cost of capital. This protection should be against the establishment of municipal utilities as well as private utilities.

Municipal Utilities.—In about half of the states having regulation of utilities, municipal utilities are subject to the same regulation as private companies under the law. Regulation of the municipal utilities in these states has shown that they are greatly in need of revision of their accounting practice (in many cases the utility accounts are confused with the other municipal accounts until it is impossible to tell what the costs of the utility service are), revision of rates to eliminate discriminations and to afford a proper system for developing the business, and supervision of operation requiring improvements in equipment and operating conditions.

Only in those states placing municipal and private utilities upon the same basis can fair comparisons be made between municipal and private ownership and operation of utilities.

Indeterminate Permit.—In the case of the short-term franchise, capital is secured under the uncertainty as to what will happen when the franchise expires. Capital is under the practical necessity of getting what compensation it can within the term designated in the franchise, often at the expense of quality of the service rendered and upkeep of its property.

Bargaining for renewal of the franchise is often drawn out over a period of years and is a disturbing factor in local politics and company enterprise.

Under proper state regulation there appears to be no reason for continuing the term franchise. Grants to operate indefinitely do not prejudice public welfare as long as regulation requires adequate service at reasonable rates with power to enforce all reasonable requirements in public interest.

In Massachusetts the term franchise was abandoned for what were termed "grants of location," which were in fact franchises granted for an indefinite period during good behavior. Indeterminate-franchise forms have been adopted by the Federal Government: for example, franchises granted by Congress to public service companies operating in the District of Columbia, Porto Rico and the Philippine Islands. The indeterminate-permit provision was written into the Wisconsin law and has proved satisfactory to the companies and the public. In that state all franchises were arbitrarily made indeterminate by law in 1911. Indiana adopted the indeterminate-permit provision, leaving the acceptance of the indeterminate permit optional with the utilities. Commissioners in both states have publicly pointed out the advantages of the indeterminate permit.

Holding Companies.—Under proper regulation, all possible benefits to be derived from the organization of public utility holding companies may be secured without fear of the abuse of their power as against public interest.

Among the advantages to be gained from the holding company is the aid in securing capital for the further development of the subsidiary properties, in securing managing ability to advise in the development of the local enterprises, in building up better accounting practice and in the furnishing of legal and engineering advice from a central office. The expense of furnishing such services is shared by all the subsidiaries, and the pooling of the various risks and hazards makes it easier to secure necessary capital through the central holding company than by the local companies at a similar expenditure of time and money.

With the financial transactions subject to commission regulation, the accounts of the local companies open to public inspection, the service and rates regulated by the commission, the public interest is protected in the cases where holding companies are involved the same as in any other instances.

Consolidation.—Similarly, combinations of public utilities under regulation are not against public welfare. In fact, combination of business under these conditions is attended with the benefits of economic operation without fear of monopolistic power to be used against the public. The consolidations are under commission supervision as to capitalization, reliability of parties and similar matters of public interest; and after the consolidation has been effected regulation is still just as efficient, not being dependent upon the maintenance of competition. The consolidation of electric utilities, for example, results in more economical operation because the load is more uniform and the reserve maintained at one consolidated plant is not as great as the sum of the reserves necessary in separate plants. The desirability of effecting this saving in electric utility operation has been most marked under the shortage of coal and other war conditions.

The Massachusetts Gas and Electric Commissioners in their thirty-third annual report included in their recommendations for legislation the following request for an extension of their powers to make it possible to order consolidations that would be in public interest:

"Considerable progress has been made by the companies in tying together the electric generating stations, but in a great national emergency a matter so vital to the public interest should not rest entirely on the initiative of the companies. What has been said of power plants applies with equal force to gas works. With a view to prevent unnecessary duplication of investment and to conserve natural fuel resources, the Board recommends that it be given authority, after proper proceedings, to require the physical connection of power stations and gas works, the supply of gas or electric energy to other companies and municipal lighting plants, and the shutting down of such power plants and gas works as may be unnecessary, upon such terms and for such periods as may be just and reasonable, and to exercise the right of eminent domain wherever essential to this end."

Such a law was passed by the Legislature in accordance with the Board's suggestion as Chapter 152 of the General Acts of the year 1918.

Interconnection of electric systems, the pooling of electric power, and its distribution under the direction of a power administrator were secured in other states by the co-operation of the companies and under the direction of the state commissions and the Federal authorities, the aim being to overcome the shortage of power, eliminate wherever possible its uneconomical generation and assure the furnishing of adequate power for the essential industries.

(To be continued.)

STORAGE-BATTERY LOCOMOTIVES IN MINES DISPLACE TROLLEYS.

Examples of Efficient Use of Battery Locomotives in Idaho Mine and of Battery Lumber Carriers in Washington Lumber Mills.

It is of interest to make note of the tendency in coal and metal mines to use storage-battery locomotives instead of those equipped for trolley lines for underground and yard haulage. Some good examples of this means of ore transportation may be observed in numerous deep mines in the West.

The two illustrations presented herewith are from photographs taken on the deep levels in the Bunker Hill & Sullivan lead-silver mine at Kellogg, Idaho. Fig. 1 shows a battery-charging station on the 1100-ft. level, where Edison storage-battery cells are being charged for a Jeffrey 2½-ton locomotive. In Fig. 2

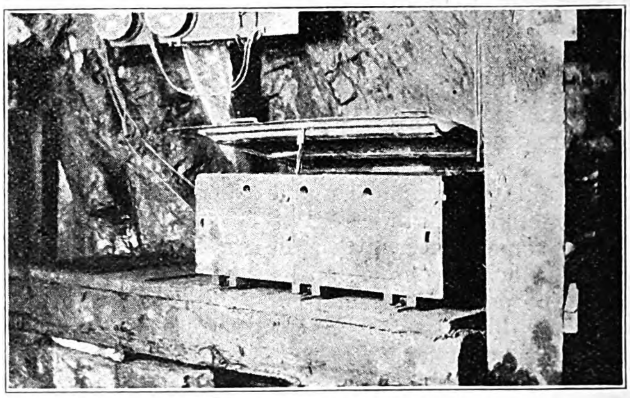

Fig. 1.—Simple Charging Station in Deep Mine for Charging Storage Batteries for Mining Locomotives.

is shown a charging and watering station on the 1300-ft. level of that mine, where a General Electric 3½-ton locomotive with Edison batteries is being charged.

In operating under this system, one favorable feature is that the batteries may be charged at times of the off-peak load, and of course the elimination of trolley wires counts for greater safety and economy of installation and maintenance costs. The number of loaded mine cars that may be pulled by a storage-battery locomotive of a given capacity depends, as in other cases, upon the condition and grade of the tracks and weight of ore per cubic yard. Some mine haulage locomotives having storage-battery equipment have as great as 9 tons capacity. Six or seven locomotives of

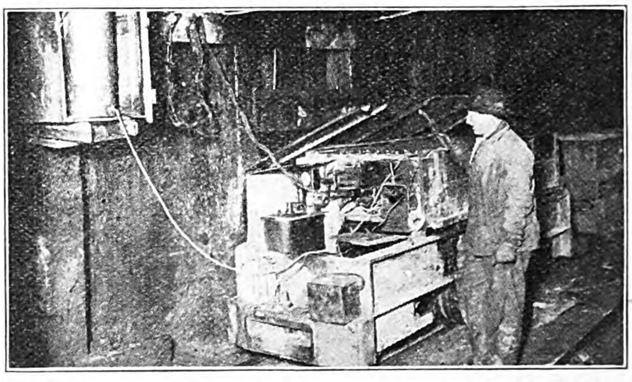

Fig. 2.—Charging and Watering Station on 13th Level of an Idaho Mine—A 3½-ton Battery Locomotive Is Being Charged.

this class, of various makes and capacities, are used in the Bunker Hill & Sullivan mine.

A similar tendency to use battery tractive equipment is observed in looking over the lumber mills of the Pacific Northwest. For instance, in the Grays Harbor region in the state of Washington there are 14 Foss electric lumber carriers, operated by storage batteries, in use. Many of these are equipped with Edison cells, giving each carrier a storage capacity of 18 kw-hrs.

Interesting Examples of Graphic Meter Records

What Graphic Records Signify—Superiority of Graphics Over Other Forms — Typical Instances of Graphics

GRAPHICS visualize a fact. Columns of figures may state a fact; but it takes a curve, a graph or a diagram to interpret the figures, to bring home just what the figures signify. Graphics tell the tale.

Electricity often offers the most convenient and often the most accurate method of measuring energy, speed, temperature and motion. And it is the recording instrument that enables the metering to be visualized by graphic registration. It has often been said that the electrical graphic recording instrument is the efficiency engineer of the industrial plant, because it shows what is being done, what conditions change, when they change and enable the cause of the change to be discovered.

In some instances it is practically out of the question to make a determination unless the electrical measuring instrument—and almost invariably this means the graphic recording instrument—is employed. For example, it would be very difficult, extremely laborious and quite costly to determine unless electrically just at what rate the output of a machine shop drops off as the lunch hour aproaches, whether work is resumed promptly when the whistle blows again, and whether the individual machines are kept busily employed until the time to stop arrives. The electric recording graphic meter shows just what happens, every instant of the time, when machines are started and stopped, when a machine runs idle for a bluff, when a machinist takes a light cut instead of a heavy one, and so forth. In the steel mill, the graphic instrument accomplishes the same purpose, it visualizes conditions, shows when something happens, shows the effect of changed operating conditions, indicates what ought to be done.

The applications of the graphic meter, for measuring current, voltage, energy, power-factor, speed, temperature and so on are endless. Not long ago in these columns it was shown where an industrial plant had been able by the use of a graphic wattmeter to purchase additional power from the central station instead of building additional plant of its own by simply modifying slightly the method of operating A few days ago an instance came to our knowledge where by the use of a recording ammeter, it had been possible to redesign a large machine in a steel mill and thereby brought about considerable operating economy. Such instances are legion.

The pictorial history of a heat in an electric furnace melting steel is shown in Fig. 1. The furnace is of the Heroult arc type, and takes a charge of 3000 lbs. of steel for producing nickel steel. The charge was fed to the furnace without preheating. At the start, the power taken by the furnace is small, but as the resistance of the furnace circuit constituted by the steel decreases as the electrodes heat up and the charge consolidates the current increases until stable conditions are obtained. The excessive variations are due to individual pieces of metal falling between the electrodes and causing what is in effect a short circuit. These short circuits are, of course, only temporary and result from movement of metal under the heavy current rush across it. The gradual lowering of current toward the end of the run was for the special treatment given the nickel-steel.

In following the records of a graphic meter in connection with electric furnaces, it is possible to know almost exactly when the heat will be ready for pouring, when various constituents should be added, as zinc to the brass furnace, and so forth.

Figs. 2 and 3 show respectively the load curves of two metal-working plants engaged in automobile finished parts production, the former working upon the day system, the latter on the bonus system. In most metal-working plants the power input varies with the output in finished parts. Fig. 2 shows that

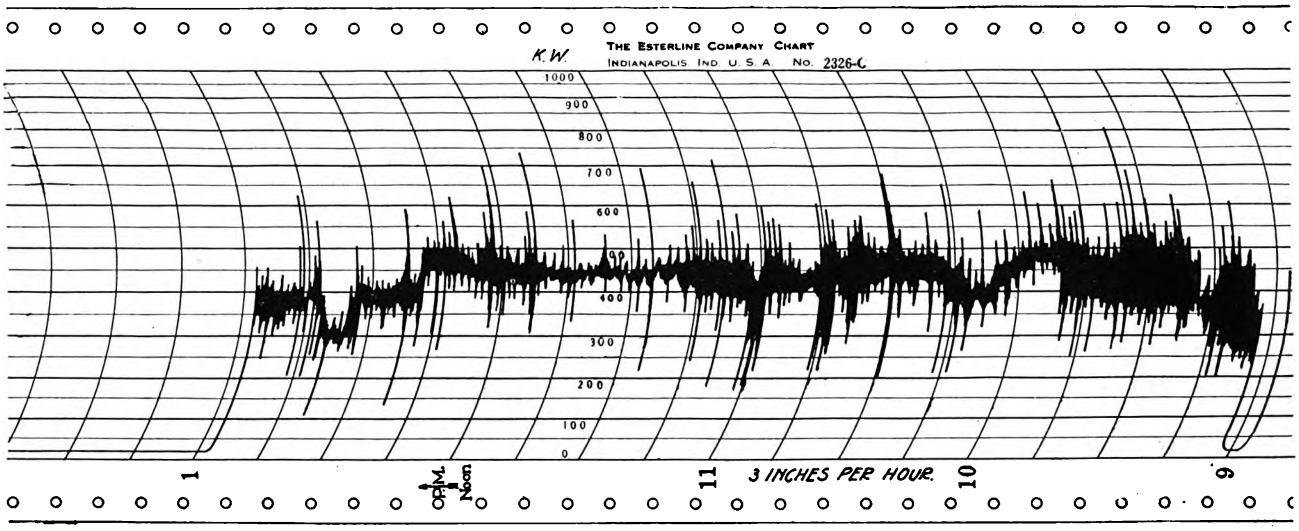

Fig. 1.

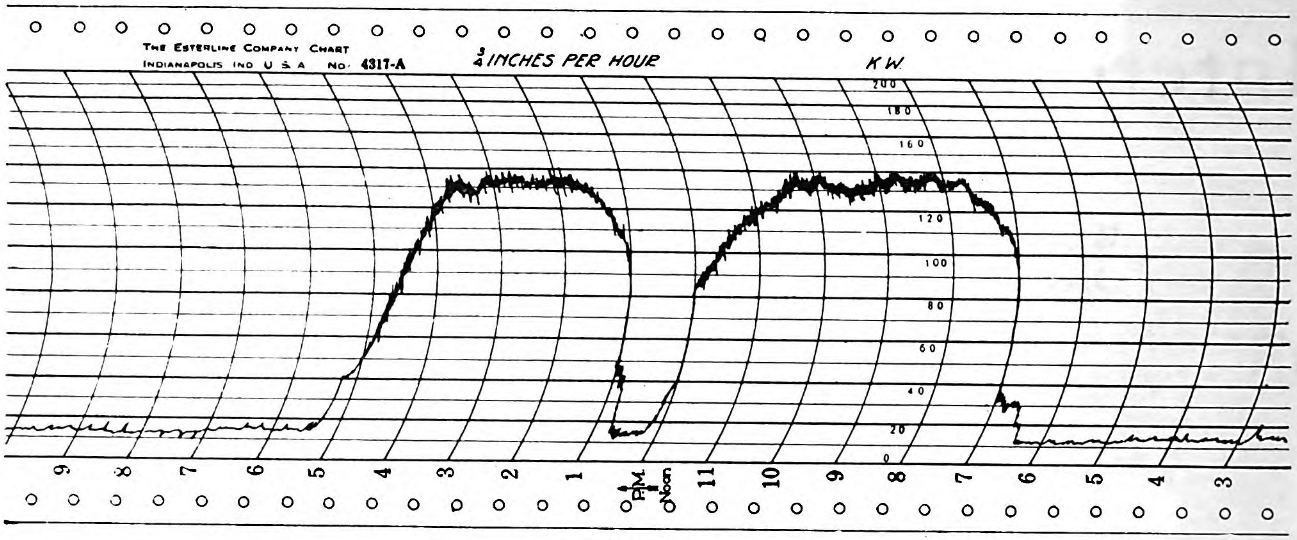

Fig. 2.

it took 45 minutes for the men to get the production up to normal in the morning and that the noon hour was anticipated by approximately 1½ hrs. probably given over to washing hands, preparing lunch, buying from peddlers, etc. Forty-five minutes were required too for the men to get production up to normal after the noon recess and then falling off commenced to occur about 1½ hours before quitting time.

In contrast is Fig. 3, which shows the load curve in a similar plant, but with the workers paid on the bonus system. Here the production commences directly the whistle blows and the rate of production is maintained right up to the noon hour. Work starts immediately when the lunch hour is over, with production slightly lower during the afternoon (chargeable to human fatigue rather than slackening such as is prone to occur when there is no special incentive to maintain the pace) and continues steadily without let-up till quitting time. These two records, when properly interpreted and studied, might result in a saving of many thousands of dollars to a concern paying its workers according to time instead of according to production.

Power-factor is the ban of many a central-station company. It interferes with voltage regulation; it limits the current-carrying capacity of generator fields, of underground and overhead lines and makes itself objectionable in many other ways. The graphic record of power-factor as obtained by one central station shows in an illuminating manner the value of the graphic recording meter for making surveys and getting to the root of a problem. Low power-factor was existent and a synchronous condenser was installed in one of the customers' plants to remedy conditions.

The size and necessity for a synchronous condenser were determined by surveys with graphic recording instruments, and these were later used to determine the correctness of the diagnosis and degree of solution. The record covers the period from 4:45 a. m. to 9:30 a. m. The power-factor is about 85% during the night, rising to 87% as the morning lighting load comes on. At 6:30 a. m. it begins to drop rapidly as induction motors are started and reaches 57% at 7:00 a. m., and would probably range about 60% throughout the day if no corrective apparatus were used. At 7:05 the synchronous machine is started, which, when the field is properly adjusted, maintains a power-factor of about 95% throughout the day. These facts are well visualized in the record shown on page 981, Fig. 4.

The electric elevator is overcoming competition with elevators of the hydraulic type in the large cities where high water pressure is available. They are without competition in the smaller cities where the

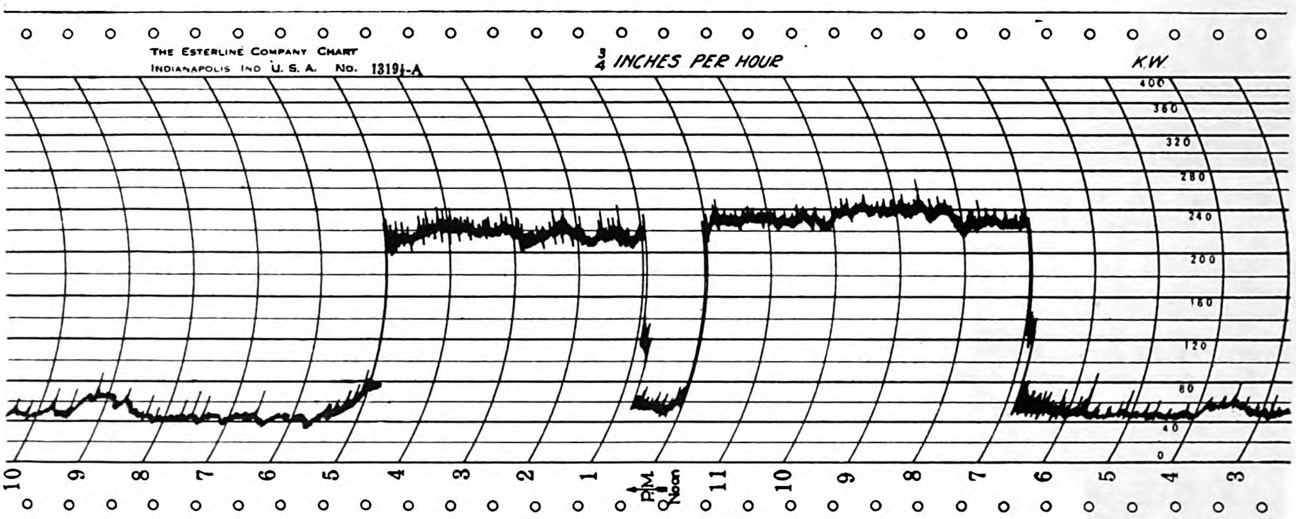

Fig. 3.

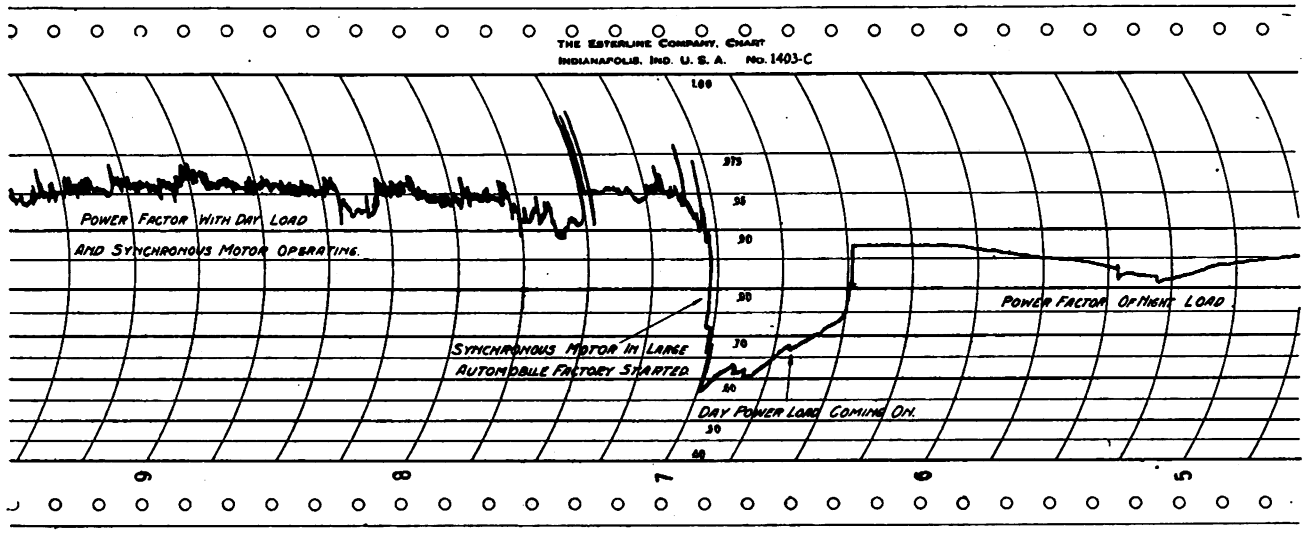

Fig. 4.

hydraulic elevator is not utilized. The amount of weight used for the counterweight is an important factor in operating economy and starting demand and this factor becomes of great importance where a number of elevators are used and where power is purchased upon a basis of kilowatt-hours consumed and kilovolt-amperes or kilowatts demand.

The graphic record shown in Fig. 5 shows the performance of an electric passenger elevator operated by a 25-hp., 220-volt, 60-r.p.m. direct-current motor. This elevator was tested running light, and the effect of the counterweight is clearly shown, the power requirements when running down being considerably greater than the power required to raise the cage. The operation of the automatic controlling equipment as well as the regeneration when braking is clearly shown. Records of this kind are useful to determine the condition of the elevator equipment, the handling by the operator and to secure data necessary for the correct scheduling of the cars.

The graphic records shown have been presented as being merely typical of what the electric graphic recording instrument enables to be done.

Similar applications could be discussed to much greater length. Sufficient has been said, however, to emphasize once more the value of the recording graphic instrument.

CREDITABLE PERFORMANCE OF STAND-BY STORAGE BATTERY.

A 150-cell, 1000-kw. storage battery installed in Station 6, Rochester Railway & Light Co., in 1905, has just been taken out of service to be sold as junk, it having completed its term of useful life of fourteen years since installed in 1905 by the Electric Storage Battery Co.

The function of the battery was to maintain continuity of service of the company's Edison system during such times of accidental interruption which would otherwise have occurred. A further use was to help out generating apparatus, transforming apparatus and underground lines, during periods of peak and excessive load. During its lifetime of fourteen years the battery furnished 1,844,803 kw-hrs., every one of which served a very useful purpose and often prevented a serious predicament from arising.

It might be pointed out that central stations are now recognizing that a storage battery is too valuable to be used for assisting over the peak load except under exceptional circumstances. When used for standby service only, which is the condition existing invariably today, a battery should have a life exceeding the one mentioned above, namely fourteen years. Obviously such an investment is a sound one.

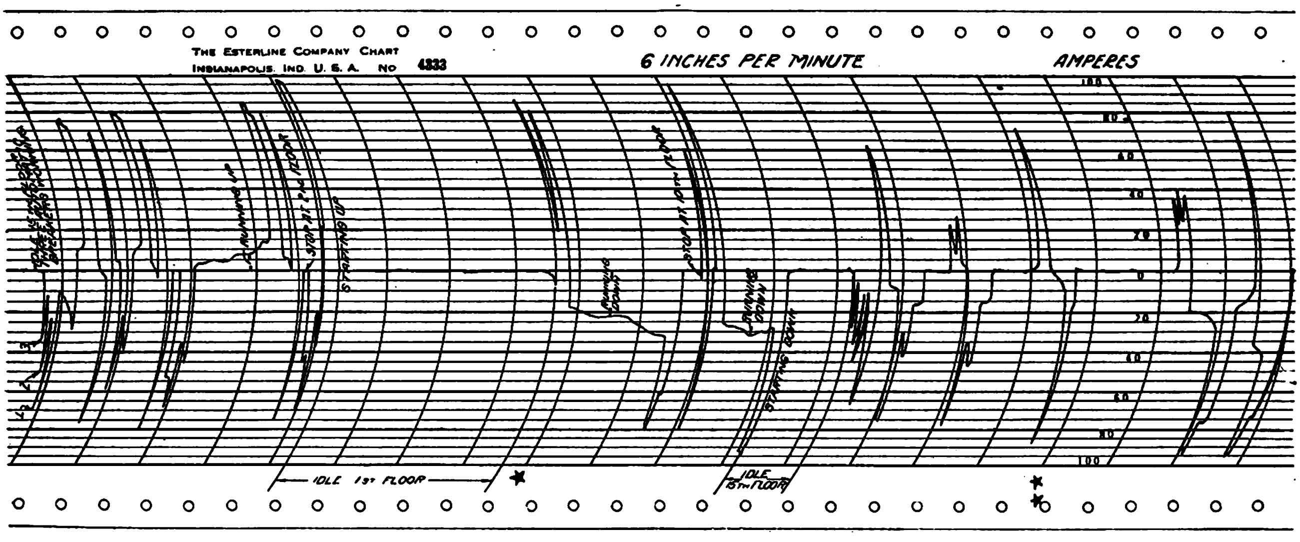

Fig. 5.

Proposed Changes in Part II, National Electrical Safety Code

Text of Proposed Revision of Section 28 and Comment on Voltage Classification Prepared by Bureau of Standards

CONSIDERABLE interest has been aroused among our readers by the compilation of the principal changes proposed in Sections 20 to 27 of Part II, National Electrical Safety Code, which was published in our issue of last week. In order to understand the significance of the proposed changes readily, a copy of the 1916 edition of the Safety Code should be available for comparison.

Such a comparison shows that rearrangement of the order of the rules has been carried out very extensively; this at first is confusing, but the old numbers of the rules given in the parentheses are a useful guide. The Bureau of Standards has prepared a table of contents of Part II, giving both old and new numbers. This gives a comprehensive view of the grouping of the rules in the present draft and will facilitate finding the location of any specific rule of the old edition. In contrast to the general opinion, some of the proposed rules are more lenient than the old ones.

On account of the numerous changes made in Section 28, the proposed complete revised text of it is given below, following generally the method used last week in presenting the principal changes in Sections 20 to 27, inclusive. In Section 29, on the contrary, only one minor change is proposed, so this section is omitted.

A discussion of the new voltage classification proposed is appended. This was prepared by Dr. E. B. Rosa, chief physicist of the Bureau of Standards, and explains why this classification is to be changed and how it will affect different types of circuits. Supplementing Part II in the new edition of the Code will be much similar explanatory matter making clear the reasons for many of the rules and interpreting them where there is possibility for not grasping their real significance.

The Bureau courts comments and constructive criticisms of the proposed changes before these are formally adopted. Such suggestions and comments should reach the Bureau of Standards, Washington, D. C., before Dec. 26 if possible so as not to delay the new edition of the Safety Code.

PROPOSED REVISED DRAFT OF SECTION 28—SIGNAL LINES AT CROSSINGS AND USED ALONE.

280. *Loading and Guying for Grade D.*

(*a*) *Conditions Determining Grade.*—(Revised.)—Signal lines crossing over railways, except in the cases mentioned in Rule 235 (*b*), (*c*), (*d*), (*e*), are classed as grade D and shall have construction in accordance with the following requirements. Where also crossing over supply lines (or signal lines having the character of supply lines) in the same span the construction required shall comply either with grade D, grade E (Rule 284), or grade A or B, according to the voltage of the supply line (see Section 23).

Signal lines crossing over the supply lines covered in Rule 234, and also crossing over railways in the same span, should comply with grade D or E requirements for supporting structures; but grade C requirements apply to conductor sizes and sags in such cases. (See Rule 241.)

(*b*) *Transverse Guying.*—(New.)—The poles supporting the crossing span shall be side-guyed or braced to withstand the transverse load put upon them in accordance with the conditions specified in the two following paragraphs, except that, if the poles are of such strength that the material will not be stressed beyond one-half its ultimate strength when the poles have deteriorated to 50% of their original strength, the guys or braces may be omitted. The guys shall be considered as taking, in the direction in which they act, the horizontal component of the entire load, the poles, acting as struts, resisting the vertical component. The calculated stresses in the guys shall not exceed one-half of the ultimate strength of the material.

(*c*) *Heavy Transverse Loading.*—(New.)—In regions of heavy loading the assumed horizontal wind pressure at right angles to the direction of the line upon the poles and conductors shall be taken as 8 lbs. per sq. ft. of projected area on cylindrical surfaces. The pressure shall be computed upon the poles without ice covering, while the conductors shall be assumed to be covered with a layer of ice one-half inch in radial thickness. In computing the transverse pressure on conductors the actual number of conductors shall be used up to 10. For larger number of wires only two-thirds of the total number shall be counted, with a minimum of 10.

(*d*) *Medium and Light Loading.*—(New.)—In regions of medium loading the transverse wind pressure shall be taken as two-thirds that for heavy loading. In regions of light loading the transverse wind pressure shall be taken as four-ninths that for heavy loading. (See (*h*) below as to three loading districts.)

(From 280*c*.)—In calculating transverse load, a cable with its supporting messenger shall be considered equivalent to the number of open wires obtained by multiplying the diameter of the cable in inches by three.

(*e*) *Longitudinal Guying.*—(New.)—The poles supporting the crossing span shall be head-guyed away from the crossing so as to withstand the load specified in the two following paragraphs, except that, where there are not more than two wires in a crossing span and the poles are not required by (*b*) to have side guys, the head guys may be omitted, if the poles are of such strength that the material will not be stressed beyond its ultimate strength when the poles have deteriorated to 50% of their original strength. The guys shall be considered as taking, in the direction in which they act, the horizontal component of the entire load, the poles, acting as struts, resisting the vertical component. The calculated stresses in the guys shall not exceed the ultimate strength of the material.

(*f*) *Heavy Longitudinal Loading.*—(New.)—In regions of heavy loading the longitudinal load shall be assumed equivalent to an unbalanced pull in the direction of the crossing of all the conductors or wires supported, the pull of each conductor or wire being taken as one-half its ultimate strength. In any case where the total pull exceeds 10,000 lbs. the load shall be taken as 10,000 lbs. plus one-quarter the excess above 10,000 lbs.

(*g*) *Medium and Light Loading.*—(New.)—In regions of medium loading the longitudinal load shall be taken as two-thirds that for heavy loading. In regions of light loading the longitudinal load shall be taken as four-ninths that for heavy loading.

For head guying cables are not included in the count of wires since the messenger serves as a head guy.

(*h*) *Three Loading Districts.*—(New.)—Three districts have been outlined in which heavy, medium and light loading, respectively, are considered to be justified by weather reports as to wind and ice and by local experience of the utilities using overhead lines. A map of the United States showing the territory falling into each class of loading is given in Appendix A.

(*i*) *Combined Effect of Ice and Wind.*—(New.)—The localities in the different groups are classified according to the relative prevalence of high wind velocity and thickness of ice which accumulates on the wires, light loading being in general for places where little if any ice ever accumulates on wire. If high wind velocities are frequent in a given place the loading for that place may be classed as heavy even though ice does not accumulate to any greater extent than at some other place having less severe winds which has been classed as a medium-loading district.

(*j*) *Modification of Loading Areas.*—(New.)—In the absence of any action by the administrative authority fixing the loadings for any given jurisdiction the classification of loadings shown on the map in Appendix A shall be considered to apply unless the party or parties responsible for the lines concerned assume some modification of the same, based upon local experience or weather records, or both. These modifications shall be subject to review by the administrative authority.

In case a state is redistricted by state administrative authority, so as to meet local weather conditions better than the map of Appendix A, a grade of loading above heavy may be used, if necessary to meet such local conditions.

(*k*) *Guy Leads.*—(280 *f.*)—Guy anchors shall, where possible, be located so that the horizontal distance from the ground line of the pole to the guy or guy rod will be not less than the height above ground of the attachment of the guy to the poles for head guys, and not less than one-third that height for side guys. The guys shall be attached as near to the center of the load as practicable. The guys and anchors shall be maintained so that the guys are kept taut and serve the purpose for which they are intended.

281. Poles, Crossarms and Wires for Grade D.

(*a*) *Size of Pole and Setting.*—(280 *d.*)—Wood poles supporting the crossing span shall be of selected timber, sound and reasonably straight. Poles shall have dimensions not smaller than the values given in the tables of Appendix B when carrying the numbers of wires there designated.

(New.)—The minimum dimensions given in the table of Appendix B correspond to poles designated by the wire-owning companies as class C, where less than 20 wires are carried; class B, where 20 to 40 wires are carried; class A, where more than 40 wires are carried.

(New.)—Poles shall be set to such a depth and in such a manner and back filling shall be tamped so thoroughly that the applied load will break the pole before the butt is pulled loose in its setting.

A table of recommended depths of setting is given in Appendix B.

(*b*) *Crossarms.*—(280 *h.*)—Wood crossarms supporting the crossing span shall be of yellow pine, fir or other suitable timber and shall have a minimum section of 2¾ by ¾ ins. for 6-ft. arms or shorter and 3 by 4 ins. for arms longer than 6 ft. Galvanized or painted iron or steel crossarms of equal strength may be used.

In rural districts in arid regions where the practice has been established by using 2¾ by 3¾-in. arms in 8 and 10-pin lengths, this practice may be continued where conductors are not larger than No. 10.

Crossarms and insulators shall be double on the crossing poles. The crossarms shall be held together with properly fitted spacing blocks or bolts placed immediately adjoining the outside pins and shall not support more than 10 conductors. Brackets or racks may be used only if used in duplicate or otherwise designed so as to afford two points of support for each conductor, except that for supporting twisted-pair wires, a single metal bracket, designed to safely withstand the full dead-end pull of the wires, may be used.

(*c*) *Pins, Insulators and Tie Wires.*—(280 *i.*)—Insulator pins shall be of steel, wrought iron, malleable cast iron, or locust or equivalent wood. Wood pins shall be sound and straight-grained with a minimum diameter of shank of 1¼ ins. and a maximum length of 8¾ ins. Steel or iron pins shall have a minimum diameter of shank of ½ in. and a maximum length of 9¼ ins.

(280 *j.*)—Each insulator shall be of such pattern, design and material that when mounted it will withstand, without injury and without being pulled off the pin, the ultimate strength of the conductor attached to the insulator. The conductors shall be securely tied to each supporting insulator.

(*d*) *Conductors.*—(280 *k.*)—Conductors shall be of hard-drawn copper, copper-covered steel, galvanized steel or other hard-drawn, corrosion-resisting metal, provided, however, that galvanized steel shall not be used in localities where excessive corrosion would result.

The minimum allowable sizes for conductors of the crossing span are given in the following table:

TABLE 13.—MINIMUM WIRE SIZES FOR GRADE D.

Conductor.	Spans 125 ft. or less.	Spans over 125 ft. up to 150 ft.
Hard-drawn copper	No. 10 A. W. G.	No. 9 A. W. G.
Galvanized steel	No. 10 Stl. W. G.	No. 8 Stl. W. G.
Galvanized steel in rural districts of arid regions	No. 12 Stl. W. G.	No. 8 Stl. W. G.
Steel-reinforced aluminum	No. 6 A. W. G.	No. 6 A. W. G.

If spans in excess of 150 ft. are necessary, the size of conductors specified above shall be increased.

Conductors of material other than the above shall be of such size and so erected as to have a mechanical strength not less than that of the sizes of copper conductors given above.

(280 *l.*)—The use of twisted-paid wires without a supporting messenger shall be eliminated as far as practicable. In no case shall this kind of wire be used in spans longer than 100 ft. without a supporting messenger. Each wire of a twisted pair not supported by a messenger shall be tinned hard-drawn copper not smaller than No. 14, or tinned copper-covered steel not smaller than No. 17.

Conductors of the crossing span shall be strung with sags not less than shown in the following table:

TABLE 14.—SAGS OF HARD-DRAWN BARE COPPER WIRE OR STEEL.

Length of span.	Sag in inches At 20° F.	At 60° F.	At 100° F.
No. 10 or larger—			
80 ft.	2½	4½	8½
90 ft.	3½	5½	10
100 ft.	4½	7	12
110 ft.	5½	8½	14
120 ft.	6½	10	16
No. 9 or larger—			
130 ft.	9	12	21
140 ft.	10	15	22
150 ft.	12	18	25

(*e*) *Messengers.*—(280 *n.*)—The following table gives the minimum sizes of galvanized steel strand messenger cable to be used for supporting different sizes of cable:

TABLE 15.—MINIMUM SIZES OF MESSENGER CABLE.

Size of cable in weight per foot.	Messenger cable (nominal ultimate tensile strength).
Less than 2.25 lbs.	6,000 lbs.
2.25 to 4.5 lbs.	10,000 lbs.
Over 4.5 and under 7.25 lbs.	16,000 lbs.

For spans exceeding 150 ft. or for heavier cables a proportionately larger messenger cable or other proportionately stronger means of support shall be used.

Multiple-wire cables and their messengers shall be suspended with a normal sag at 60 deg. F. not less than given in the following table:

TABLE 16.—MINIMUM SAGS OF MESSENGER CABLES.

Length of span.	Sag.
80 ft.	11 in.
90 ft.	13 in.
100 ft.	17 in.
110 ft.	20 in.
120 ft.	24 in.
130 ft.	28 in.
140 ft.	33 in.
150 ft.	37 in.

282. Signal-Line Clearances.

(*a*) *Clearances from Ground.*—(280 *c.*)—The clear space between the lowest signal conductor, guy or messenger and the heads of rails shall, at 60 deg. F. with no wind, be in general not less than 27 ft.

When the signal conductors are paralleled on the same highway by a trolley contact conductor at a lower level, the clearance of the signal conductors from the rail may be reduced to 25 ft.

When signal conductors cross tracks not carrying traffic which involves brakemen riding on top of standard freight cars, the above clearance may be reduced to 18 ft.

When spans exceed 150 ft. in length, additional clearance must be provided as given by Rule 220 *a*.

(*b*) *Clearances from Other Wires.*—(280 *c.*)—The clear space between the lowest signal conductor, guy or messenger and the highest wire of a similar nature paralleling the track shall be not less than 2 ft. where the span is 100 ft. or less. For longer spans and for crossings over supply wires, the requirements of Rule 220 *b* must be met.

The vertical clearance between conductors supported on the same pole or structure and at different levels shall in no case be less than 12 ins. and preferably 24 ins. (see also Rule 223).

(*c*) *Pole Clearances.*—(280 *a.*)—Unless physical conditions or municipal requirements prevent, the side clearance of poles shall be not less than 12 ft. from the nearest track rail, except at sidings where clearance of not less than 7 ft. may be allowed. Where conductors of one pole line cross over or under conductors of the second line there shall, if practicable, be not less than 3 ft. clearance between the conductors of the first line and any pole or tower of the second line, unless the conductors are attached thereto.

283. Relation of Crossing Span to Line.

(*a*) *Span Length.*—(280 *a.*)—Poles should, where practicable, be so located that crossing and adjacent spans are in a straight line and free from exposure to overhanging or closely adjacent trees or inflammable material or structures. (See Rule 211 for requirements as to location of poles.)

(280 *b*.)—The crossing span shall be as short as practicable, and in general shall not be longer than the normal span of the line. No crossing span should exceed 125 ft. in length if this can be avoided.

(*b*) *Vertical Displacement of Crossing Span.*—(*New.*)—The vertical distance from the top crossarm of a crossing pole to a straight line connecting the top crossarms of the next adjacent poles on either side of this crossing pole shall not exceed the values given in the following table:

Average length of span in feet.	Allowable vertical distance in feet.
Under 100	4
100 to 130	5
Over 130	6

(*c*) *Guying in Special Cases.*—(280 *g*.)—Where on account of physical conditions it is impracticable to guy or brace the crossing poles as specified in (*b*) and (*c*) the requirements there given may be met by head guying and side guying the line as near as practicable to the crossing, but at a distance not exceeding 500 ft. from the nearest crossing pole, provided that the line is approximately straight and that a cable of strength equivalent to that of the head guy is run between the two guyed poles, being attached to the guyed poles at the point at which the head guys are attached, this cable being securely attached to every pole between the guyed poles.

Where the poles supporting the crossing span are not in line with the poles in the adjoining spans, additional guying shall be placed to take care of the increased stress.

(*d*) *Inspection.*—(*New.*)—All parts of the supporting structures of the crossing span shall be examined annually by the owner and all defective parts shall be promptly restored to a safe condition.

284. Signal Lines Crossing Over Minor Tracks—Grade E.

(*a*) *Grade.*—(281.)—Signal lines crossing above minor tracks (as described in Rule 235 *b*) shall conform to the requirements for grade E. These requirements differ from those of grade D only in the respects specified in (*b*), (*c*) and (*d*) below.

(*b*) *Transverse and Longitudinal Strength.*—(New.)—The transverse and longitudinal strength of crossing supports of grade E construction shall be equivalent to two-thirds of that required for grade D construction by Rule 280.

(*c*) *Size of Pole.*—(281 *a*.)—Poles shall have dimensions not smaller than the values given in the tables of Appendix B when carrying the numbers of wires there designated.

The minimum dimensions given in the tables of Appendix B correspond to poles designated by the wire-owning companies as class C where not more than 40 wires are carried; class B where more than 40 wires are carried.

(*d*) *Conductors.*—(281 *d*.)—The minimum allowable sizes for conductors of the crossing span shall be as follows:

TABLE 17.—MINIMUM WIRE SIZES FOR GRADE E.

Conductor.	Spans 125 ft. or less.	Spans over 125 ft. up to 150 ft.
Hard-drawn copper in heavy loading districts	No. 10 A. W. G.	No. 10 A. W. G.
Hard-drawn copper in medium and light-loading districts	No. 12 A. W. G.	No. 10 A. W. G.
Galvanized steel	No. 12 Stl. W. G.	No. 10 Stl. W. G.
Steel-reinforced aluminum	No. 6 A. W. G.	No. 6 A. W. G.

If spans in excess of 150 ft. are necessary the size of conductors specified above shall be increased.

Conductors of material other than the above shall be of such size and so erected as to have a mechanical strength not less than that of the sizes of copper conductors given above.

The use of twisted-pair wires without supporting messenger shall be confined to spans not exceeding 125 ft.

285. Minimum Sizes of Grade C Signal Conductors.

(New.)—Signal conductors which are required to comply with grade C construction may be smaller than grade C supply conductors but not smaller than given in the following table:

TABLE 18.

Span length and sag.	Material.	Size.
Spans not over 100 ft. with sags not less than 12 ins., and spans over 100 ft. but not over 125 ft. with sags not less than 15 ins.	Hard copper. Steel.	10 A. W. G. 12 Stl. W. G.
Spans over 125 ft. but not over 150 ft. with sags not less than 18 ins.	Hard copper. Steel.	9 A. W. G. 11 Stl. W. G.
Spans over 150 ft. with sags of grade C supply conductors or more, as given in Appendix A.	Hard copper. Steel.	Sizes of grade C supply conductors as given in Rule 246.

Paragraph 272 *d* does not apply to such conductors.

286. Signal Lines Crossing Over Trolley Contact Conductors.

(*a*) *Not Exceeding 750 Volts.*—(282 *a*.)—(1) Signal lines, except twisted-pair conductors [see (2)] and fire-alarm conductors [see (3)], carried over trolley contact conductors below 750 volts shall have conductor sizes as specified for grade C in Rule 246 and sags as specified for grade C in Appendix A; except that for crossings where grades D or E are not required, for spans not exceeding 100 ft., No. 12 hard-drawn copper or steel is permitted with a sag of not less than 12 ins., for spans between 100 and 125 ft. No. 10 is permitted with a sag not less than 15 ins., and for spans between 125 and 150 ft. No. 9 is permitted with a sag not less than 18 ins.

Where the signal lines concerned cross over railways under circumstances requiring grade D or E construction for signal lines, the requirement of the above rule applies as to size and sag of conductors, while grade D or E applies to the supporting structures.

(2) Twisted-pair conductors, unsupported by messengers, shall not be used in spans over 100 ft., if carried over trolley contact conductors below 750 volts, unless each wire is hard-drawn copper not less than No. 14 or copper-covered steel not less than No. 17.

(3) Fire-alarm conductors shall in no case be smaller than required for grade C signal lines by Rule 285.

(4) The clearance of signal lines above contact conductors crossed over shall be in accordance with the values given in the table of Rule 220 *b*.

(*b*) *Exceeding 750 Volts.*—(282 *b*.)—(1) For signal lines carried over trolley contact conductors above 750 volts to ground see Rule 233.

(2) Twisted-pair conductors may be used under the restrictions given in (*a*) (2) above, but if in A or B construction, they shall have sags not less than those required by Appendix A for No. 8 hard-drawn copper, and where supported by a messenger, the messenger shall have the sags required in Rule 281 *e*. Where supply-line voltage exceeds 7500 volts the twisted pair shall always be supported by a messenger.

(3) The clearances of signal lines above the contact conductors crossed over shall be in accordance with the values given in the table of Rule 220 *b*.

287. Signal Lines Crossing Over or Conflicting With Supply Lines Above 750 Volts (Not Recommended Except Over Trolley Feeders).

(*a*) *Strength of Construction.*—(283 *a*.)—Overhead signal lines crossing over supply lines under the circumstances noted in Rule 233 *e* shall comply with the construction requirements of grade A, B or C as required in that rule. (See Rule 289 for signal lines used in the operation of supply lines.)

(*b*) *Compliance With Other Rules.*—(283 *b*.)—Where signal lines crossing over supply lines are required to comply with grade A, B or C construction, they shall comply as to conductor sizes, materials and sags and as to materials and strength of supporting structures and attachments with Section 24; as to separation and clearances of conductors and wires of the signal lines themselves with the requirements of Section 22; as to guys and their insulators with the requirements of Rules 212 and 213, and in general with the requirements of Sections 20 and 21.

(*c*) *Where Concerned Also With Railways.*—(283 *c*.)—Where the signal lines referred to in (*a*) above are required to comply with grade C construction and also cross over railways under circumstances calling for compliance with grade D or E construction requirements for the signal lines, the requirement for grade C construction may be waived as to strength of supports, being replaced by those of grades D or E, but grade C requirements apply as to size and sag of conductor. (See Rule 285.)

(*d*) *Pole Clearance.*—(283 *d*.)—The pole or tower structures of each line concerned in the crossover shall have clearances from the conductors of the other line as required by Rule 221 or 227, whichever applies.

(*e*) *Wire Clearance Above Supply Lines.*—(283 *e*.)—The clear space between the lowest overhead signal-line conductor (or guy, messenger or span wire) crossing over any supply line conductor or guy, span or messenger wire* shall not be less than given below, at 60 deg. F. with no wind

*Except for crossings between conductors and guy, messenger or span wires on the same pole, for which see Rule 220b.

where the upper conductor or wire has fixed supports, and the sum of the distances from the point of intersection to the nearest supporting structure of each span does not exceed 100 ft.

	Feet.
Signal lines above supply conductors below 7500 volts....	4
Above supply conductors 7500 to 50,000 volts...........	6
Above supply service conductors........................	2
Above supply guy, messenger, and span wires............	2
Guy, span and messenger wires above supply conductors below 750 volts..	2
Above supply conductors 750 to 7500 volts...............	4
Above supply conductors 7500 to 50,000 volts............	6

(*f*) *Clearance Increases.*—(Replacing 283 *f* and *g.*)—Clearance increases for long spans and high voltages are given in Rule 220 *b*.

(*g*) *Falling Trees.*—(283 *h.*)—The crossing span and the next adjoining spans, so far as practicable, shall be kept free from overhanging or decayed trees, which might fall into the line. (See also Rules 209 and 220 *d.*)

(*h.*) *Special Longitudinal Requirements.*—(283 *i.*)—For special requirements for longitudinal strength of crossover supports of signal lines crossing over supply lines, where compliance with grade A or B is required for the signal lines, see Rule 249.

(*i*) *Special Short-Span Crossovers.*—(283 *j.*)—For special short-span crossing construction, see Rule 275.

(*j*) *Guys.*—(283 *k.*)—Guys may be used to meet the strength requirements of Section 24 and where used they and their insulators and guards shall conform to Rules 212 and 213

(*k*) *Signal Lines Conflicting With Supply Lines.*—(284 *a.*)—Where signal lines are at higher levels and conflict with supply lines the requirements of (*a*) and (*b*) above apply in general to the conflicting signal lines just as they apply where the signal lines cross over the same supply lines.

Clearances from the poles and conductors of a second line are given in Rule 227.

Requirements for guys are given in Rule 212.

288. *Signal Lines Alone (or Concerned Only With Other Signal Lines).*

(*a*) *Fire-Alarm Lines.*—Conductors used for fire-alarm circuits shall comply with the requirements of Rule 285 for grade C signal lines.

Where carried at higher levels than supply conductors in crossings, conflicts or common use of poles, they shall comply with grade A, B or C construction requirements according to Rule 233 *e*.

(*b*) *Other Signal Lines.*—Conductors for signal lines other than fire-alarm lines, unless crossing at higher levels or conflicting with, or on the same poles above supply (or trolley) lines, need not comply with any requirements as to size, material or sag.

(*c*) *Supporting Structures for Signal Lines.*—The poles used for other signal lines, unless exposed to supply (or trolley) lines by crossing above, conflicting with, or being carried above the supply lines on the same poles, need not comply with any requirements as to strength and material except that poles and crossarms shall be of such initial size and so guyed or braced where necessary as to safely withstand the vertical loads to which they may be subjected, including linemen working on them.

In other respects all signal-line supports shall comply with the general requirements of Sections 20 and 21 covering traffic guards, pole clearances, guys and other matters.

(*d*) *Clearances Above Ground* (see also Rule 220 a.)—Signal conductors alone and their guys, span wires and messengers shall have clearances above streets, highways, alleys or generally accessible spaces across or along (and above) which the former pass, not less than the following at 60 deg. F., with no wind, when the spans do not exceed 150 ft.

Signal lines, or guy, span or messenger wires:	Feet.
Above streets and other traveled roadways............	18
Along roads in rural districts...........................	15
Crossing above spaces or ways accessible only to pedestrians	10
Above roadways to residence garages....................	10

The clearances do not apply to guys not carried over roadways, or to guys along one side of a street or alley, unless over driveways. For guys on private right-of-way, or parallel to sidewalk curbs, when not passing over pathways or roadways, no clearance is required; and if passing over only pathways the clearance may be reduced to 8 ft.

For signal-line spans over 150 ft. these clearances shall be increased at the rate of 1 in. for each 10 ft. excess.

(*e*) *Clearances From Other Signal Lines.* (*See also Rule* 220 *b.*)—Signal conductors and their guy, span or messenger lines concerned in crossings, conflicts or common use of poles with other signal lines only shall have a minimum of 2 ft. clearance from those of other lines.

Except for fire-alarm lines this may be reduced where desired, unless one set of conductors is for public use and the other is used in the operation of supply lines.

(*f*) *Grounding, Isolation or Protection.*—Signal lines, including fire-alarm lines, if at any point in their course exposed by supply (or trolley) lines over 400 volts to ground, shall be protected at each station for public use by one of the methods specified in Part III, Section 39. These lines shall elsewhere be isolated by elevation or otherwise guarded so as to be inaccessible to the public.

Signal lines used in the operation of supply lines shall be at all points isolated by elevation or otherwise guarded so as to be inaccessible to the public.

Metal-sheathed cables and messengers shall be isolated or grounded in conformity with the general requirements of Section 20.

289. *Signal Lines Used Exclusively in the Operation of Supply Lines.*

(*a*) *Under Other Lines.*—(210 *c* and 288 *g.*)—Such signal lines when (1) crossed over by, or (2) having conflicting with them, or (3) on common poles and below, high-voltage direct-current trolley circuits or other supply lines in the operation of which they are used, may be considered and run as ordinary signal lines if (1) the signal lines do not cross over or conflict with, and are not on common poles with and higher than other lines or equipment, and (2) the signal lines and connected equipment are adequately guarded and accessible only to authorized persons, and (3) the precautions of Sections 39 and 54 have been taken.

The supply lines concerned above are not required by the conditions described to comply with the requirements of Sections 25 and 27 as to strength of construction, but the conductors shall be not smaller than permitted by Rule 286.

(*b*) *Over Other Lines.*—(210 *c* and 288 *g.*)—Such signal lines, if crossing over, conflicting with or higher on common poles with other lines or equipment shall comply with all the requirements for the highest voltage supply lines not over 7500 volts with which the signal lines may come in contact, except as to wire sizes for grade C, for which see Rule 285. If, however, the signal lines are protected by fuseless lightning arresters, drainage coils, or other suitable protective devices to prevent the signal-line voltage from normally exceeding 400 volts to ground, they may be run as ordinary signal lines. The method used shall be consistently adhered to throughout the extent of the signal system.

Discussion on Voltage Classification for Power Lines Over Signal Lines.

The grade of construction required for supply lines where crossing over signal lines is given in Rule 214 of the present edition of the National Electrical Safety Code as follows:

Constant-potential alternating-current supply lines of over 7500 volts are placed in grade A; between 5000 and 7500 volts they are placed in grade B; between 750 and 5000 volts they are placed in grade C. Direct-current grounded trolley circuits of over 750 volts are classed in grade A, but other direct-current circuits do not require a definite grade unless they are constant-current circuits. Such circuits are classed according to the value of the current.

Where the crossing of the supply line is over individual twisted-pair drop wires only, or over other unimportant circuits only, the above grading does not apply if effective protection is otherwise secured. Grade B may be submitted for grade A whenever the signal line is restricted to four wires used mainly for local exchange service, where it carries only subscribers' loops or where it carries only two unimportant commercial telegraph wires.

According to definition 6 the voltage stated above means the highest effective voltage between the conductors of the circuit. When one circuit is directly connected to another circuit of high voltage, both are considered as of the higher voltage unless the circuit of lower voltage is permanently grounded.

Examples.—Except for the cases of unimportant wires noted above, the interpretation of these rules in special instances is as follows: An 11,000-volt, three-phase circuit calls for grade A construction in all cases. If it is star-connected and a single-phase tap of approximately 6600 volts between one phase wire and neutral is run off from this system, this tap would call for grade A construction if ungrounded, but for grade B construction if the neutral wire were grounded. A 6000-volt single-phase circuit run directly from a single-phase transformer or a generator would call for grade B construction whether grounded or not grounded. The same would be true of a three-phase circuit with 6600 volts between the line wires whether delta or star-connected and whether grounded or ungrounded.

Revised Rule.—Telephone engineers claim that the hazard occasioned by the contact of supply wires with telephone conductors is dependent upon the voltage of the supply wires to ground and that, wherever grounded circuits are considered, the grade of construction required should consequently be based upon the voltage to ground rather than upon the voltage between the separate wires of the circuit. This claim appears to be substantiated by the operating experience of telephone companies and is in accord with the means utilized to protect telephone equipment and persons handling it from supply-line voltage which may be superposed upon the line wire.

It has consequently been proposed to change the wording of present Rule 214 so that the grade of construction required for a supply line crossing over or in conflict with a signal line will be expressed in the following manner.

"Constant-potential alternating-current supply lines of over 7500 volts between conductors or 4400 volts to neutral or ground * * * crossing over, conflicting with or having common poles with signal lines, shall comply with the construction requirements of grade A."

Similarly 2900 volts to ground would be stated as the equivalent of 5000 volts between wires, and 440 volts to ground would be stated as the equivalent of 750 volts between wires, in classifying the supply lines as to grade of construction required.

Effect of This Change.—By referring again to particular cases, it will be seen that the change in classification will make a difference when applied to single-phase grounded circuits. For instance, an independent single-phase 6600-volt circuit if ungrounded would still require grade B construction, but if grounded on one side it would now require grade A construction. This is true also if it is derived from a three-phase star-connected 11,000-volt circuit with neutral grounded. A 6600-volt single-phase circuit derived from a delta-connected three-phase 6600-volt circuit and representing one phase of the same would require grade B as before, but if one wire of the delta three-phase line should be grounded the grade of construction is raised to grade A. In practice high-voltage delta-connected circuits are seldom grounded so that such a case is of little practical importance. For ungrounded circuits the requirements would remain as heretofore.

For star-connected grounded circuits the grade of construction required remains as before where all three-line wires are involved, but it is raised for a single-phase tap from such a grounded circuit. This is the particular instance which requires most serious consideration because it will most frequently arise. The hazard which such a circuit presents to a signal line with which in case of failure it may become crossed is regarded to be the same as in the case of a failure of the entire three-phase line from which it is derived, and it consequently seems reasonable to make the same requirements as to the strength of construction since the purpose of a definite strength of construction is to avoid the contingency of such failure and resulting contact.

Summary.—1. The construction required for direct-current circuits will not be altered by the proposed changes in the rules. 2. The construction for any ungrounded circuits will not be altered. 3. Single-phase circuits grounded on one side, whether run separately or derived from three-phase star-connected grounded circuits, will be raised one grade in requirements if coming within certain limits, where signal lines are exposed. For example, a 6600-volt single-phase branch from a four-wire 11,000-volt main would be grade A where signal circuits are exposed, instead of grade B as heretofore.

This change in classification seems reasonable in order to more adequately meet the hazard actually involved and place the classification upon a more logical basis than in the previous edition.

A NEW STEAM-ELECTRIC POWER PLANT AT LUMBER MILL.

Addition of 3200 Hp. in Motors in Large Bellingham Lumber Mill Requires Power-House Extension.

The Bloedel-Donovan Lumber Co., of Bellingham, Wash., has had plans prepared and has begun work on a new power house, by which provision will be made for an additional motor load of 3200 hp. Its lumber plant, which comprises sawmill, planing mill, box factory and sash and door factory, is operated partly by steam and partly by electricity.

A new boiler and turbine house of reinforced concrete and steel will be built for housing two Allis-Chalmers generating units of 2000 kw. and 1000 kw.; a 500-volt motor-generator set, the necessary exciter sets, and a 13-panel switchboard. Barometric condensers will be provided for both turbines. The condensing water will flow by gravity to the cold well, the circulating pumps to be set over that well.

The 1000-kw. generator to be installed is now in use, and will be moved from the old power house to the new one; the 2000-kw. generator is a nearly new machine that formerly was operated in a cement plant. This is a 2400-volt, 1800-r.p.m. unit, the 1000-kw. unit being for 480 volts, and 3600 r.p.m. The plan is to connect the two units together through a bank of three 350-kv-a. transformers, whereby all motors of 50 hp. and higher will be operated at 2200 volts, and motors below that capacity at 440 volts. Direct-current energy at 500 volts will be produced by means of the motor-generator for an electric railway operating on the premises.

The old wooden boiler house, which contains Stirling and Badenhausen boilers, will be enclosed in a larger structure of reinforced concrete, affording room for B. & W. boilers of 2000 hp., which will be installed. "Hog" fuel storage bins are to be built above the new boiler house, and conveyors will be installed to carry the fuel to the bins and to the boiler-furnace hoppers. Several storage-battery trucks are to be ordered for yard service.

The construction of boiler and generator buildings, and the installation of new equipment are in the hands of Chas. C. Moore & Co., with A. F. Blair as consulting engineer. Geo. T. Thirsk, electrical engineer, of Seattle, made designs for the electrical installations and will supervise them.

Editorial Comment

City and State Utility Regulation

THE outrageous bungling with which our average municipalities handle public utility matters is again coming into strong contrast with the sensible procedure followed by our state public service commissions. For example, if street-car fares were left to the dictates of our demagogic city politicians, they would remain at the old five-cent level, even though much higher wages of the crews and other increased costs and burdens are driving the traction companies into bankruptcy. As a result of municipal blundering one large city was without street-car service for a month and in almost countless other cities the companies are in dire straits or actually in the hands of receivers. As if this muddling were not bad enough, many city officials are advocating municipal ownership of traction lines; in one city a commission has just been appointed to waste $250,000 in drawing up plans for a municipal traction system and not one of the commissioners is versed on traction matters.

In striking contrast is the orderly manner in which those state commissions vested with authority on traction fares have gone about revising these up or down as conditions require. Obeying the findings of the courts that the regulatory powers of the state are superior to any implied fixity of franchise rates, they make an unbiased investigation and, if this discloses existing rates as too low or high for rendering good service and allowing reasonable return on the investment, the rates are adjusted to suit. In view of the fairness of this regulation to all concerned, any effort to curtail state regulation and restore city control should be strongly opposed.

Customer Ownership of Utility Stock

NOT many years ago it was quite prevalent among public utility corporations to regard the public as a sort of avowed enemy. The reason for it was simple enough. Most institutions that serve the public learn, through the petty bickerings, attacks and complaints of individuals that go to represent the public, to acquire a genuine disrespect for it; and this in spite of the fact that the public is the only source of income for the utility.

It is a common instinct for people to return like for like. Disrespect breeds disrespect. So the disrespect between the public and the utilities was mutual. It was due chiefly to misunderstanding and lack of knowledge of each other, that is, to absence of community of interests.

With the latter in view, several central-station companies inaugurated about two years ago the practice of offering shares of their stock or other securities to their customers. Since that time a large number of the representative public utility corporations have followed this lead, and from time to time announcements are made of companies adopting the plan.

Customer ownership has proved advantageous for a number of reasons. For the central station it is an excellent builder of good will, which is now considered necessary to the successful operation of a public utility; customers owning stock are more appreciative of the service and are better prospects for additional appliances and load; customer ownership helps partly to solve the question of securing additional capital. For the customer, purchase of public utility stock usually proves to be an excellent investment.

It is gratifying to note the change of attitude that is developing between the public and the central stations. Another hindrance to progress is thus being eliminated.

Electrical Christmas Decorations and Wiring

SANTA CLAUS without the Christmas tree and the fairy lights of varigated color would hardly be a real Christmas, such as all of us that are now grown up look back upon our childhood days with fond recollection and treasured memory, such as the little ones of today await in the expectancy of hope and joy of innocent youth.

Every Christmas brings its list of accidents and tragedies because of fires, starting from naked flames or sparks around the Christmas trees and seasonal festoon. Every naked flame from candle, or oil or spirit lamp, and every match used around the flimsy decorations is a fire hazard. And many of the hazards materialize every year, to turn joy and merriment to sadness, suffering and death. Every electrically illuminated Christmas tree is a safety measure, every electric lamp that replaces an oil or spirit lamp and the tallow candle makes the danger of fire less.

Electrical interests in selling Christmas tree lamps and fittings have a magnificent opportunity to further the gospel of safety. That such decorations are installed instead of other dangerous types is an immense gain for the cause of safety. Safety should be made still safer, however, by careful workmanship and due regard to the essentials of electric wiring. And that this may obtain is largely a matter of education and publicity.

The electrical industry has a very great responsibility in advocating and encouraging the electrical Christmas decorations. But it has a further moral responsibility of advocating safe wiring methods and the practice of common-sense precautions.

Current Events

New York Section, A.I.E.E., Organized—O.E.L.A. Holds One-Day Meeting — Rural Line Extensions in Wisconsin

A. I. E. E. SECTION TO BE ORGANIZED IN NEW YORK CITY.

Meeting Held on Dec. 10 to Make Arrangements for Organization of Local Section in Metropolis.

The question of organizing a New York City Section of the American Institute of Electrical Engineers has been discussed informally from time to time for several years past, but, as most of the monthly Institute meetings were held regularly in New York City, the need for a local organization was not so urgent as in the other cities of the country. In recent years, however, it has become more and more the custom for some of the Institute meetings to be held in other cities. The growth of the Institute membership and the industrial developments throughout the country make it more essential that in order better to fulfill its function as a national organization, an increasing number of meetings of the Institute, in addition to regular section meetings, must be held in the various cities of the country.

This year, for example, an Institute meeting was held in Philadelphia in October, and others will be held in Chicago, Pittsburgh and Boston, during the months of January, March, and April, no meetings having been arranged to be held in New York City during those months. In order, therefore, that monthly meetings may be held in New York City whenever the Institute meetings are held elsewhere, it is considered essential that a local section be formed, thus placing the New York City membership on the same basis with relation to the Institute as the membership in other parts of the country.

At a meeting of the Board of Directors of the Institute, held Nov. 14, a petition, signed by over 100 members in New York City and vicinity, was presented for authority to organize a section to be conducted under the same general plan as the other 34 sections of the Institute. The directors approved the request and a special meeting for the purpose of organizing, electing officers and taking such other action as was deemed desirable was held in the Engineering Societies building, 29 West 39th street, at 8:15 p. m. Dec. 10.

SPECIAL MEETING OF OHIO ELECTRIC LIGHT ASSOCIATION.

Association Revenues Increased—Safety Code, Fire Marshal's Orders and Legislation Discussed.

At the call of its Executive Committee a special one-day meeting of the Ohio Electric Light Association was held at Miami Hotel, Dayton, Ohio, on Dec. 3. Vice-President F. H. Golding presided because of the inability of President C. H. Howell to attend. About 200 representatives of central-station companies were present. Secretary D. L. Gaskill presented an amendment to the constitution increasing the dues of member companies so as to strengthen the financial resources of the association and enable it to broaden its work in spite of increased costs. After discussion and revision it was adopted. It provides for payment of one-eightieth of 1% of the gross annual receipts, with minimum charges of $5 for towns of 2000 and less, $10 for cities of 2000 to 5000, $25 for those of 5000 to 20,000, and $50 for cities of over 20,000; where companies serve more than one municipality the aggregate population of the cities served is to be taken in determining the minimum charge. It is estimated that the annual income from member companies will be raised from $1754 to $5327 by the change.

There was some discussion of the proposed changes in Part II of the National Electrical Safety Code, containing rules for construction of overhead lines. H. W. Hough, of Cleveland, presented a report of the meeting held at Philadelphia on Oct. 27 to 29 and attended by representatives of the Bureau of Standards, National Electric Light Association and other central-station interests, the object of which gathering was to discuss the proposed changes in these rules.

The recent orders of the Ohio fire marshal calling for inspection of electrical installations of all premises before central stations furnish service thereto, and also requiring safety inclosed switches for service and other locations came in for considerable spirited discussion.

Legislation pending before the Ohio Legislature that affects central stations was reviewed by Secretary Gaskill. One bill proposes to assess part of the cost of street lighting of special character on the abutting property owners. Another bill would allow the State Utility Commission to postpone any proposed rate increase after same and the reasons for it had been filed by the utility company.

As to the coal situation most of the Ohio central stations reported they were in fairly good condition; although some of them had only a few days' supply on hand, they were able to secure more as needed. W. W. Freeman, of Cincinnati, who was assisting the regional coal administrator of that district, urged that the central stations use their best judgment in coal conservation and refrain from bothering the coal administrators unless absolutely necessary.

WISCONSIN CONFERENCE ON RURAL LINE EXTENSIONS.

Meeting Held at Madison to Discuss Formulation of a General Policy on Rural Line Extensions of Central Stations.

At Madison, Wis., there was held on Nov. 21 a conference of utility interests, rural customers and others interested in the extension of electric light and power lines into rural districts. The meeting was called by and held in the rooms of the Railroad Commission of Wisconsin.

The conference was not as successful as was wished, although there was quite a large attendance from all parts of the state. The question of rural extensions and use of electricity by the farmers has come to the fore very rapidly in the last two years due, no doubt, to the unprecedented prosperity of the agricultural districts. This demand for service has come at a time when all utilities were suffering from the financial stringency and were practically unable to secure capital to make needed extensions. It was recognized and was admitted by all utility operators that the most satisfactory method of extending this service would be to have the work done at the expense of the utility. Practical considerations at the present time make this out of the question.

Two methods have been followed in Wisconsin. By the first the utility has made the extension where the cost of it has been borne by the farmers to be served. The result of this method has been that the farmers on a line extending, say, east from the utility, would receive service at an initial expense of $250 each, while the farmers residing, say, west of the utility would be obliged to pay $350 or $400 each due to the fact that their district was more sparsely settled than the district on the other side of town. Another serious objection has been that there might be 12 possible customers on the proposed line, 9 of whom would contribute to the cost of its building. The other three farmers, although refusing to contribute to the initial cost of the line, would demand in many cases and would be able to force the utility to give them service since the utility is a public service corporation and has facilities for serving such farmers passing alongside their farms. In selling energy to rural customers, if the expense of constructing the line has been borne by such customers, the utility has usually put into effect the urban rate modified in some instances by a higher minimum monthly charge.

The other method which has been followed to a considerable extent in Wisconsin has been for the farmers in a certain district wishing to receive electrical service to incorporate as a distributing company, the prospective consumers taking stock enough to cover the cost of building the proposed line. This distributing utility purchases its energy on a wholesale rate at the city limits and in turn bills it to its customers at a higher rate planned to include the ordinary distribution and operating expenses of the farmers' utility. This has resulted in farmers usually paying a higher rate than was charged by the local utility in the city and has also been open to the objection that certain farmers would refuse to become stockholders and yet demand and be entitled to receive service from the company.

At the conference, the utility operators who were present were quite unanimous in their opinion that the present rates for rural electric service in effect are unremunerative and in fact throw a burden upon the urban consumers of making up the deficit arising from the operation of the rural business. The representatives of the farmers and consumers and the representatives of the farmers' distributing companies who were present agreed that the rates for rural business ought to be compensatory and that no burden should be thrown on the urban customers by reason of rural service. The rural distributing companies that have been formed aim in their rates to cover merely operation and provide no return on the investment.

It was pointed out that, if the rate were made sufficiently high to cover a return on the investment, they would then be able to sell their stock on an investment basis and could offer service on equal basis to all prospective customers who applied, whether stockholders or not. One suggestion was made that in both cases the utility should establish a consumer charge which should be equal to the interest charge upon the investment per consumer and that, where the consumer was a stockholder, or where the consumer had contributed his proportion of the expense of constructing the line, this consumer charge should be waived. It was claimed that this would place the nonstockholder and the farmer who refused to contribute to the cost of building the line on the same basis with stockholders and those who did contribute.

All of these plans have ignored those elements of the excess cost of rural service over urban service, such as increased depreciation per customer, increased maintenance per customer, the increased line losses due to the fact that there are fewer customers per mile of line, increased transformer losses due to fewer customers per transformer, etc.

It was agreed when the meeting adjourned that those present should formulate their experience and views and submit them to the commission which would then make a study of the matter presented and, if feasible, have printed in pamphlet form a summary of this information together with such recommendations or proposals as the Commission might deem advisable. In calling this conference it was not the Commission's idea that it would be able to put into effect any hard and fast rule governing rural extensions. It was thought, however, that it might perhaps establish some general principles which would govern the formulating of such rules.

TORONTO CONTRACTOR-DEALERS HEAR ADDRESS ON CO-OPERATION.

At a meeting of the Toronto (Can.) District of the Ontario Association of Electrical Dealers and Contractors, held in Toronto Nov. 24, at which there were present 50 members of the association besides representatives of the Toronto Hydro-Electric System and Hydro-Electric Commission of Ontario, James M. Wakeman, general manager of the Society for Electrical Development, gave an address on cooperation in the electrical industry. He outlined the activities of the Society for Electrical Development, told what it had done in the United States and explained its ability to render similar service in Canada. The Society has among its Toronto members the Hydro-Electric System and the Canadian General Electric Co., besides a number of the largest and most progressive contractor-dealers.

Among other suggestions Mr. Wakeman made were the establishment of an electrical page in a leading Toronto paper and the holding of an electrical exposition in Toronto early next year, with the possibility of having a building devoted entirely to electricity at the great Canadian National Exhibition held each fall in Toronto. These suggestions met with the approval of the meeting and steps were taken to form a committee to perfect the plans.

After Mr. Wakeman had spoken, H. H. Couzens, general manager of the Toronto Hydro-Electric System; C. H. Wilson of the Apex Electric Appliance Co.; George J. Beattie, well-known Toronto contractor-dealer, and Kenneth McIntyre, secretary of the Association, all spoke, expressing their appreciation of the good work the Society has done for them.

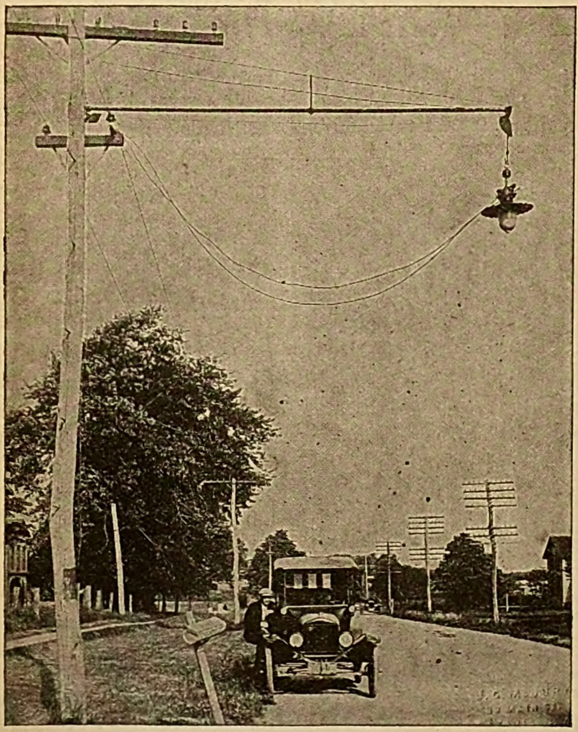
Better Highway Illumination—Municipal Christmas Tree Lighting — Electricity for Heat Treatment of Metals

NECESSITY FOR BETTER LIGHTING OF COUNTRY ROADS.

Trend of the Times Shows Need for Extensions of Lighting to Country Roads—Field for Central-Station Commercial Departments.

The matter of providing illumination for our country roads has been given scant consideration in the past because the need for it has never been seriously felt. The rural roads of today are far different from the rural roads of yesterday. There are conditions existing which demand a better and higher grade of illumination. The great volume of automobile traffic not only demands better illumination from the standpoint of safety to the tourists and pedestrians but also for greater convenience and comfort in traveling. A large number of country roads are narrow and in



Mast-Arm Fixture Suitable for Lighting Country Roads.

order to permit drivers of the various vehicles to pass one another without a collision a reasonable amount of illumination is indispensable. Where the roads are rough and in poor condition, illumination should be provided to help the tourists avoid mudholes and irregularities. This is particularly true in bad weather or after heavy rains when ruts and mudholes are quite common even on the best roads.

One of the main reasons for the retarding of rural lighting is the wrong impression that it would be a very costly and expensive venture. However, under present-day methods of efficient and economical distribution of power, the expense is comparatively small.

In many cases the roads already carry cross-country transmission systems from which power may be taken, and by means of small regulating transformers mounted on the poles the high-voltage transmission may be reduced to voltages suitable for operating small circuits of lamps connected in series and covering several miles of country road. Fixtures of an inexpensive design, with or without glassware, may be used. They should be placed by means of long mast arms, as shown in the accompanying illustration, or by cable strung across the road from post to post, so that the light is well out toward the center of the road where it cannot be obstructed by trees. These fixtures require little attention other than the occasional cleaning of the reflector and renewal of lamps. The entire system may be operated automatically by means of a time switch controlling the regulating transformer, so that no personal attention is needed other than the winding of the clock once in 8 days. In this way a system may be operated at a relatively low first cost and with a maintenance expense consisting mainly of power cost and lamp renewals.

It should not be expected to have a uniform intensity of light attained throughout, because the spacing distance would of necessity be relatively large and direct illumination over the entire area would be out of the question. The silhouette principle may, however, be used to good advantage under these circumstances. The lighting creates a light background on the road surface against which dark objects intervening along the road are shown up in relief. The nature and location of the object may be discerned by its dark outline against the light background. While this type of illumination does not enable one to discriminate or to observe the details of an object in the road, it is at least possible to see enough of it to avoid collision and increase the safety and convenience of travel.

In some cases prismatic refracting glassware can be used to good advantage. The refractor prisms send the light rays into useful directions and cause them to be distributed more extensively along the length of the road. Their function is to make the light intensity more nearly uniform over the entire area to be lighted.

The illustration shows a type of fixture very suitable for road lighting. It is a 20-in. radial-wave reflector streethood body equipped with a diffuser and may be used with lamps as large as 600 cp., consuming approximately 350 watts. The long mast-arm serves to bring the light well into the center of the road, making it possible for the light to be utilized for a considerable distance over the road. Another type of fixture consists of a streethood equipped with a cable clamp for mounting in the center of the road on a cable strung across the road between posts. This is a less expensive method of removing the light from the obstruction of trees hanging over the road, but it has the disadvantage of not being so readily accessible as the mast-arm fixture where the lamp may be lowered to the road for cleaning or renewal by means of the lamp rope and pulleys.

ADVANTAGES OF ELECTRICITY IN HEAT TREATMENT OF METALS.

In presenting the argument for the use of electricity for heat treatment of metals, the central-station salesman can enumerate the following advantages of the electric resistance type furnace, which were compiled by C. A. Winder, industrial heating engineer, General Electric Co.

(1) Their automatic operation greatly reduces the labor cost and does away with the human element, an uncertain thing at all times.

(2) The upkeep of an electric furnace is extremely low and its life very long.

(3) It is possible to obtain a neutral or reducing atmosphere meaning decreased oxidation of the product.

(4) Rejects are practically eliminated often effecting a saving of thousands of dollars.

(5) Experience has demonstrated that gear blanks which have been treated in the electric furnace can be machined 20% faster than heretofore.

(6) Working conditions in a heat treating room equipped with electric furnaces show a great improvement over others due to a lower temperature of the room and the absence of fumes and noise.

(7) Floor space, which is always an item to be considered, is reduced to a minimum on account of the absence of piping, storage tanks, etc.

(8) A reduced fire hazard as a medium for lower insurance rates; again a saving in actual dollars and cents is effected.

The General Electric Co. has equipped heat-treating furnaces in sizes varying from a small car type furnace 4 ft. long, 3 ft. wide and 2 ft. high having a connected load of 18 kw. and a maximum operating temperature of 1800 deg. F. to a vertical cylindrical furnace 34 ft. deep by 7 ft. 6 ins. diameter with a connected load of 750 kw.

ILLINOIS CENTRAL STATION GETS INCREASE IN RATES.

An increase in rates for electric service has been granted to the Athens (Ill.) Electric Light & Power Co. in an order issued by the Public Utilities Commission. The new rates are: For the first 50 kw-hrs. per month, 11 cents per kw-hr.; for the next 250 kw-hrs., 8 cents; over 300 kw-hrs., 6.5 cents. A minimum charge of 50 cents per horsepower of connected load is fixed, no charge to be less than $1 per month per customer.

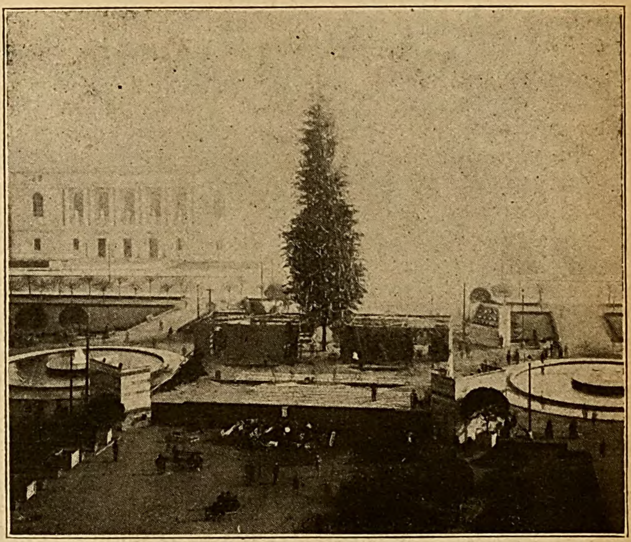
CREDITABLE SPEED IN CHANGING FROM STEAM TO ELECTRIC DRIVE.

The Southern Wood Preserving Co., Georgia, operated its own steam plant, used not only for power purposes but also for producing steam in their operations. The steam engine broke down, immediately interrupting all shafting. Asked to render assistance, the Georgia Railway & Power Co. investigated the situation and the layout of the plant. On the Saturday morning apparatus was ordered and the utility got under way to deliver service. The following Tuesday morning the plant was working again, after two days of interruption, and has been working ever since.

ILLUMINATED CHRISTMAS TREE AT SAN FRANCISCO.

Municipalities contemplating the installation of a Christmas tree in connection with a civic celebration of Yuletide can obtain valuable suggestions from the installation of a tree that was erected in the San Francisco civic center and which was a part of the Christmas eve celebration last year.

The tree was 150 ft. in height and was decorated with 10,000 jewels from the tower of jewels at the Panama-Pacific Exposition. The tree and jewels were illuminated by powerful searchlights placed on the roofs of adjoining buildings and in addition 100 flood-



View of Civic Center at San Francisco, Showing Platforms for Installation of Lighting Projectors for Illuminating Christmas Tree.

lighting units, installed on elevated platforms near the tree, were used to make the lighting effective.

Telephones played an important part in directing the pageant held in connection with the celebration. It was necessary to install a switchboard and a large number of transmitter and receiver sets at various points of the civic center. These were also used in directing the illumination of the tree.

PROVIDING FACILITIES FOR FUTURE POWER REQUIREMENTS.

A good illustration of the advantages to be gained by using foresight in planning for transformer station equipment is given by the case of the Eastman Kodak Co., Rochester, N. Y. About two years ago the company contracted with the Rochester Railway & Light Co. for a maximum demand service of 500 kw. With good exercise of foresight, a transformer vault much larger than was needed was installed. Now, with the approaching completion of a new factory building this service is to be increased to 1200 kw., which can easily be done simply by the installation of additional transformers in the vault. The money saved in planning and construction will more than offset the first cost and aid investment charge on the vault, and there is still room in it to take care of future requirements for a long time.

Operating Practice

Transformer Cooling—Underground Steam Lines—Safety Barriers—Mixing Solid Fuels—Air Supply—Condensers

AUTOMOBILE RADIATORS INCREASE TRANSFORMER CAPACITY.

Georgia Railway & Power Co. Follows Interesting and Unique Practice to Increase Capacity of Large Transformer Bank.

The Georgia Railway & Power Co. connects up with the Tennessee Power through a bank of tie-in transformers of 3000 kv-a. capacity at the Lindale substation owned by the latter company. As it became necessary to take additional quantities of power from the Tennessee Power Co.'s lines it was found that the tie-in bank of transformers was running very hot. The average overload varied between 125 and 150%, so it became necessary to provide additional cooling or higher rate for the dissipation of heat.

The method employed by the Georgia Railway & Power Co. to increase the capacity of the existing transformers was very ingenious and has so increased the safe current-carrying capacity of the transformer bank that 125 to 150% can be carried continuously. Six radiators from Ford cars were mounted close to the transformers and connected in multiple between a 3-in. over-flow pipe at the top of the transformers and a 2½-in. discharge pipe at the bottom of the transformers. A centrifugal pump was connected in the discharge pipe line, this pump being motor driven. The pump forced the oil in the bottom of the tanks under pressure and out of the top, where it was then forced through the six Ford radiators back to the transformers again. Another motor, driving a blower was so located that the air current passed along and through the radiators. The air was humidified before passing over the radiator surface, in this way still further lowering the temperature of the oil.

With the above installation the company was able to pass 150 g.p.m. through the transformers, equivalent to 216,000 g.p.m. every 24 hrs., and by so doing have been enabled to keep the temperature of the transformer oil down to about 40 deg. C. with the transformers carrying 150% of load continuous. A similar outfit is being used by the Georgia Railway & Power Co. where they tie-in with the Columbus Power Co. at the Newman substation.

FACTORS IN INSTALLING UNDERGROUND STEAM LINES.

Recommendations by Wisconsin's State Power Plant Engineer for Reliability and Economy of Maintenance of Underground Steam Lines.

Pipe lines for the transmission of steam and hot water should be installed with greater forethought and care to detail when installed underground than when laid in tunnels and buildings where they are reasonably accessible for inspection and maintenance. When laid in ground, deterioration and failure is only brought to light by failure, which usually occurs during the winter when the demand for service is most pressing and the difficulties for making repairs are greatest.

John C. White, power plant engineer for the state of Wisconsin, recommends careful attention to the following features, if service at the least cost and service of the highest continuity (often compatible with low cost) are to be obtained:

(1) Correct design of piping and construction suitable to the conditions encountered.

(2) The pipes should be protected by a conduit not easily displaced nor broken, and one that is not affected by the temperatures to which it is subjected nor by the character of the soil in which it is laid.

(3) The pipes should be so anchored and supported that their position is assured and that freedom of movement under their temperature changes be ample.

(4) Steam and hot water lines should be so insulated that the heat loss is reduced to the economical minimum, and the insulation should be so applied that it will not be displaced by the movement of the pipes under temperature changes.

(5) Drainage should be such that the pipes are always protected from water, either dripping from above or rising about them, and it should be possible to determine their condition at any time by inspection at manholes or outlets.

(6) The arrangement of the pipes in the conduit should be such that any one of the lines may be removed and replaced without disturbing the others. It is desirable also that a renewal can be accomplished by releasing at anchors and connecting points and uncovering only such length of the conduit as may be necessary to permit withdrawal and replacement.

(7) Steam pipes should be so pitched and drained that they are always free from water.

SAFETY PANEL TO PREVENT EXPLOSION IN TRANSFORMER COMPARTMENTS.

Pertinent Features in Protecting Station Buses, Instrument Transformers, Etc., from Accidental Contact and Internal Explosions.

The Philadelphia Electric Co. has done much toward furthering the interests of safety. Part of this work has taken the form of safety appliances, methods and practices. Part has been in the form of education and instruction for, after all, it is the human element wherein lies the greatest weakness and the most danger.

Telling of some of the practices of the Philadelphia Electric Co. before the Safety Congress convening in Cleveland last October, Walter C. Wagner brought out some pertinent facts relating to barriers for segregating buses, potential and current transformers, disconnecting switches, phases, etc.

He advised that barriers should not support live buses or apparatus subject to stress due to electrical disturbance, and, where isolating live parts, should have a minimum of reinforcement consistent with mechanically safe construction. Doors should cover the openings between the barriers, and be designed to be readily removed for access to the compartments covered. Such doors may be painted white pine frames, paneled with impregnated asbestos where they enclose conductor runs and instrument transformers; paneled with clear wire glass in front of disconnecting switches; and built of heavy wire screening where heat radiation necessitates this construction, as in front of reactance coils. Such doors must be of small size, light weight, not easily damaged in handling, and rugged in construction. A pair of handles for detachable wall doors, and detachable hinge supports, should allow ready removal. Where covering ceiling runs, the doors should be permanently hinged, with latches to fasten them in place. A door having a special panel in which a spring-hinged panel is inserted is placed in front of locked current transformer and oil switch compartments, where an electrical breakdown might cause a sudden formation of gases by the Philadelphia Electric Co.

The general identification of the character of equipment by those concerned in the maintenance and operation of electrical stations, should be based on a knowledge of the nature of the construction—namely, the method of isolation, type of barrier, support, and insulation—and of the general characteristics of the apparatus connected thereto. In a system where unvarying practice in arrangement of equipment exists, as a fixed order of phases and number of compartments and apparatus, the relative positions are a further means of identification, especially when clear and adequate, yet simple, wiring diagrams showing physical arrangements of units, apparatus, and circuits should be at hand, and where the more hazardous situations are, in general, made inaccessible by elevation or enclosures.

HUGE VOLUME OF AIR HANDLED BY POWER PLANTS EMPHASIZED.

Provision for Air and Need for Comforts for the Men Brought Out—Velocity of 26½ Miles an Hour Often Attained.

In commending the Electrical Review upon a recent editorial on "Air Supply to the Boiler Room," because of the importance and timeliness of this subject that affects at once the performance of the furnace, the capacity of the plant and the health, comfort and output of the boiler-room crew, O. R. McBride, Andrews-Bradshaw Co., points out the question of air supply assumes greater importance in the larger plants than in the smaller ones.

"In the small plant the question as to how the air gets into the boiler room and thence into the furnace does not assume the importance that it does for the larger plant," says Mr. McBride. "For a single one-thousand horsepower output, 18,000 to 20,000 cu. ft. of air must get into the boiler room per min. At a velocity of 30 ft. per sec., corresponding to, approximately, 26½ miles per hr., the combined area of all openings is quite large. The above, surely, serves to indicate the serious effects of restricted openings upon the action of draft-producing agencies, regardless of whether the draft is due to chimney or mechanical means.

"Comfort of the man in the boiler room is very important. The old idea that a man would become lazy if comforts were provided him has been answered by facts. It belongs in the discard along with the other one that the use of automatic devices makes men careless."

In designing a boiler room it should be borne in mind that human beings must spend a large portion of their lives in it. Make the boiler room habitable—and men who are comfortable are able to put in more time and effort on their work, lay out the station so that the furnaces will not be partially asphyxiated during the cold weather. Install whatever automatic appliances are indicated, that they may accomplish better work than men, alone, can accomplish, but with the intention that comfortable, satisfied men may supervise the entire performance of the boiler room because that is all that remains for them to do.

MIXTURE OF ANTHRACITE DUST AND SCREENINGS LOWERS FUEL BILL.

Saving of Nearly 14 Per Cent Obtained by Mixing Coals with Underfeed Type of Stoker.

A power plant located on the lake front in Minnesota has brought about a considerable saving in its coal bill and at the same time has so far been unaffected by the shortage of bituminous coal resulting from the strike, by mixing anthracite dust and Pittsburgh screenings in the proportion of 40% of the former to 60% of the latter. The plant contains three 228-boiler hp. B & W boilers, served by 3-retort Taylor stokers.

The anthracite dust and screenings when mixed in the above proportion effect a cost saving of 13.5% per ton of coal burned. High combustion efficiencies are obtained and ratings up to about 125% nominal are maintained, the limit being imposed by permissible draft in the wind box, which if exceeded causes the anthracite dust to be blown into the furnace. By using anthracite dust for banking their fires the company is able to make a further saving, the fuel for banked fires being about 15% of the total fuel used.

INFLUENCE OF THE CONDENSER UPON FUEL ECONOMY.

Attention to the Condenser as Well as to Proper Use of Fuel Emphasized.

It should be borne in mind that economies obtained by careful firing and high combustion efficiency may be counteracted and neutralized through careless operation and maintenance of the condenser. In other words, efficiency in production of steam may be made very largely ineffective by inefficiency in the utilization of the steam. Dirty tubes and leaks will lower the vacuum, and the lower the vacuum the higher the coal consumption per pound of steam, requiring a greater power input to maintain it. Boiler-room instruments are a good investment when used intelligently. So are instruments for indicating the vacuum. Conditions change rapidly in the furnace and one must be ever on the alert if combustion efficiency and operating economies are to be sustained. The condition of the condenser usually changes gradually and so can be the more readily watched and remedied. The thing to bear in mind at all times is that a clean condenser is a factor in coal conservation.

Contractor-Dealer

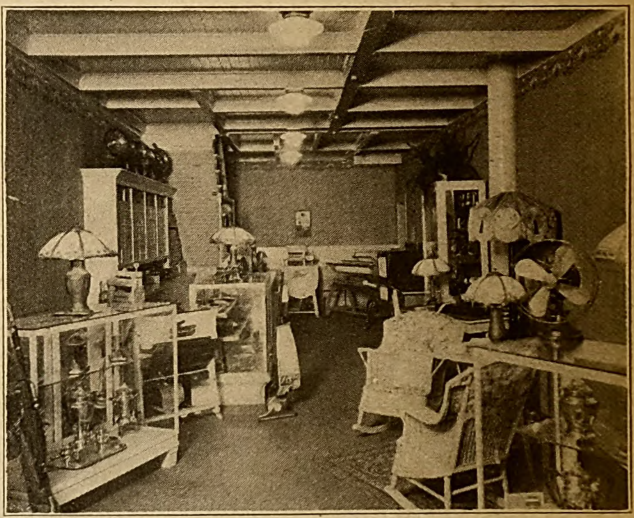
Portland Contractor Opens an Attractive Electric Store—Comments on the Different Angles of Appliance Selling

NOVEL ARRANGEMENT OF NEW PORTLAND ELECTRIC SHOP.

Contractor, Who Becomes Dealer, Shows Ingenuity in Planning New Store in Oregon City—Makes the Most of Window-Display Space.

There is a growing tendency among electrical contractors to enter the merchandising field, and while many statements have been made to the effect that the contractor, as a general rule, makes a poor merchant, this assertion is being disproved in the majority of cases. People are too apt to look for failures than successes in electrical merchandising. But, given a few years' experience in installing electrical material and with an insight into business methods, the contractor is in much better position to ultimately become a successful electrical dealer than some general merchant who branches out to handle electrical appliances. If anything it is less difficult for the contractor to learn merchandising methods than it is for the general merchant to acquire knowledge about the uses and sales points of electrical appliances.

The Smith-McCoy Electric Co. has been in the contracting business in Portland, Ore., for a number of years and recently decided to retail electrical devices. Selecting a desirable location—on Fifth street, between Washington and Clark streets—the company opened a store which demonstrates its insight into merchandising methods. The store has small street frontage, but this disadvantage was overcome in a very effective way. Realizing the value of window display space the company arranged the ground floor of its store so that the entire floor could be easily seen from the street. White walls, high-



Pleasing Arrangement of Interior of New Electric Shop Opened in Portland.

Store Front in Which Window Display Is Used to Fullest Advantage.

intensity lighting, window displays with comparatively little background, and an uncrowded arrangement of electric washing machines, vacuum cleaners, table lamps, etc.—these made an effective display that presented an inviting appearance to the would-be customer. Then to accentuate the effect of the first-floor display the company made window display space out of the second-story front of the store. The novelty and effectiveness of the brilliantly lighted window displays and store are shown in the accompanying illustration.

The other illustration shows there is little counter space on the first floor, but the arrangement makes possible easy demonstration of the larger electrical devices such as washing machines, ranges, ironing machines and vacuum cleaners. It is a novel departure from the usual "store" arrangement.

TRIMMING WINDOWS TO GET CHRISTMAS TRADE.

Some one has said that: "Merchandise well displayed is half sold." This being true, the proper display of merchandise becomes one of the most important phases of the modern retail store. Especially is this true during the holiday season. People are frequently at a loss to know what to purchase as gifts for their relatives or friends. The store that has its merchandise well displayed in the store and its windows well trimmed is the one likely to get the business.

Merchandising Suggestions for the Electrical Dealer

How Salespeople Can Improve Themselves—The Philosophy of Long Profits—Good Illustration of Use of Motion in Displays

IN COMMON with salesmen in other lines, the salesman in an electrical store, in order to increase his income and prospects, should make efforts to improve himself along three general lines—appearance, language and general intelligence.

As to appearance, a great deal of progress has been made in other lines in the general appearance of the salesman. These things should be carefully considered by the salesman—first his haircut, then the collar, shirt, clothing, shoes and the appearance of his face and hands.

At a sales conference held in New York City recently, 100 men were analyzed as to their appearance. Eight men had hair cuts that passed; 20 had collars that were the right size and right style; 10 had neckties that harmonized with their shirts; 15 had shirts that fitted and were of the right sleeve length; 12 had suits that fitted and were pressed and clean; while only 18 had shoes that fitted with heels that were not run down.

It is a difficult matter to criticize a salesman's appearance, but if salesmen and saleswomen are not carefully groomed, absolutely clean from head to foot and trim in appearance, they lose greatly as the customer approaches them. Any salesman can dress better for the same amount of money. The trouble with most salesmen is that they compromise and buy cheap things. They do not study colors and invariably are too "flashy." If their appearance is right, customers sense it very quickly, and the customer unconsciously buys more readily.

As to language—there are more than 100,000 words in the English language, but the average salesman uses less than 2000 in his daily selling. There are four ways of improving one's English. First, study grammar; second, read books rich in description, such as those written by Dickens; third, write a great deal (for instance, write two or three advertisements or sales-letters about electrical appliances each week); fourth, cultivate the acquaintance of and associate with people who use pure English.

By general intelligence is meant knowledge of the merchandise the salesman is handling as well as courtesy, good manners and tact in dealing with customers. The salesman must get out of his own environment and improve his general education regarding people—in other words, live the lives of other people mentally—if he wishes to succeed in selling large quantities of merchandise.

Long Profits or Fat Ones for the Electrical Merchant.

Which would you rather make—40% profit or $10,000?

Forty per cent is a rather long profit. Ten thousand dollars is a fat profit. Nine out of ten electrical merchants, new at the merchandising game, are often hypnotized by the length of a profit and do not stop to figure up its probable fatness. The experienced merchant pays little attention to the discount but figures up his probable gain. Many a man has become a millionaire on 1% profit.

For example, if some bright salesman should offer you some electric irons at "40 off" the proposition would look good at first glance. At $6.50 list, you would be making $2.60 on each iron instead of, say, $2.28. You would want a gross.

But wait—

It is going to be hard to sell these irons. They do not look quite as good as the standard irons. Maybe you can sell only two dozen of these with a gross profit of $67.20 in the same time it would take to sell three dozen of the others, with a gross profit of $77.40. There will undoubtedly be more repairs which will cost time and money, too. So on second thought you had better not buy them. Of course, the clever salesman will tell you his long-profit iron is just as good, that his firm does not advertise and gives you the benefit of the advertising expense.

But don't let that fool you.

National advertising is *not* paid for by the dealer or the consumer. It is paid for out of the reduction in selling expense and the savings of quantity production. A concern making 150,000 irons a year can certainly build and sell irons 20 cents apiece cheaper than the concern making 5000. And 20 cents apiece, saved, will pay for $30,000 worth of advertising to maintain the big production. Not alone that, but the advertising is the surest possible guarantee of quality, because no manufacturer can advertise continuously an inferior product. Advertising acts as a deadly poison to the four-flusher.

There is only one excuse for an exceptionally long profit—cheapness. And for this reason a long profit is generally skinny.

Mechanical Figures in Window Display Attract Attention.

Life or its simulation attracts more attention than anything else in window displays. When wax figures are used and these figures move mechanically, the display is one that never fails to bring to a halt all who pass. The Oklahoma City (Okla.) Electric Co. recently had a display which represented a living room, with the usual quota of chairs, table, rug, curtains, pictures, etc. At one side was a small boy, who at intervals pulled a string attached to a basket in the ceiling, releasing a stream of corn meal. Close at hand was a young matron, with vacuum cleaner, who immediately swept up the fallen meal.

Considerable ingenuity was expended in arranging the mechanical figures. The mechanism required included a fractional horsepower motor belted to a 3-in. pulley keyed in turn to a worm gear shaft, which operated the arm of the patent mother. As the cleaner moved back along a guide wire it struck a button, which, connected to the corn meal trap, opened the trap, each time spilling some meal, and at the same operation lowering the boy's hand as if he had pulled the string.

New Appliances

Small Inclosed Motor for Appliance Drives—Combination Fire Pump—Auto Lamp—Steel Mill Electrical Apparatus

Small Direct-Current Motor Embodies Unique Splashproof Feature.

A new small direct-current motor incorporating a splashproof housing of unique design which completely protects the winding and all live parts from splashing water or accidental contact is proving popular for light domestic and industrial purposes. Made by the Westinghouse Electric & Manufacturing Co., it is known as the CDH type and is built in ⅛ and ¼-hp. sizes.

The large commutators and box-type brush holders with large brush area make these motors particularly well adapted for operation from the low-voltage storage-battery plants now being installed in great numbers on farms and in suburban residences. Motors wound for 32 volts are in great demand in rural communities for application to house pumps, washing machines, cream separators and similar machines.

Also, a wide field of application for motors of this type, wound for 115 and 230 volts, comprises light labor-saving machines used in homes, offices, stores, manufacturing plants, etc. They are interchangeable mechanically with alternating-current motors of similar ratings, and therefore appeal strongly to the manufacturer of motor-driven devices. Their splashproof feature makes them especially adapted to use on washing machines.

The frame consists of a seamless, forged-steel ring to which the cast-iron foot and end brackets are bolted. The pole pieces are bolted to the steel ring, thereby permitting the use of form-wound field coils, which are easily replaced in case of injury. The motors are light in weight, compact, sturdy and uniform in performance.

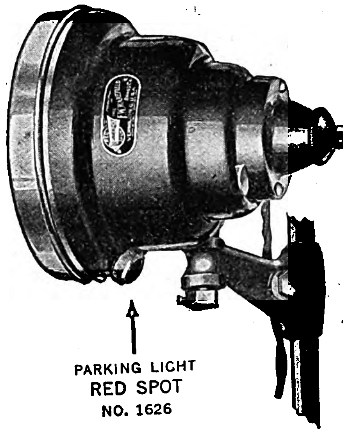
Automobile Searchlight That Also Serves as Parking Lamp.

An improved model of the "Red Spot" searchlight for automobiles is offered by the F. W. Wakefield Brass Co., Vermilion, O. The unique feature of this model is a small deflector and lens in the housing of the lamp which throws a red beam to the rear, thus making it a practical one-bulb "parking light."

Motorists will quickly appreciate the economy and desirability of this device. Cars parked at night at the curb or roadside must be lighted front and rear to comply with the law, and for protection against collision. This commonly requires that sidelights and tail light be left burning, sometimes for several hours at a time—a very serious drain upon the batteries, especially in winter when starting takes more than the normal amount of energy.

The manufacturer of this outfit points out that not only does his invention provide adequate and legal front and rear lighting from a single lamp, but that this light is placed in the position on the car which will insure the greatest protection, since the searchlight is invariably mounted at the extreme left side and well outside the wind shield frame so that passing vehicles will naturally give the parked car plenty of clearance.

This parking light feature makes the "Red Spot" searchlight a triple-duty accessory. In normal service it is a keen and penetrating searchlight with easily adjustable focus and wide range. In emergency and by a single touch of the finger it becomes a red danger signal. Now, with the rearward deflector and lens, it becomes also an economical and safe parking lamp. This device is made in 5½-in. and 7-in. diameters.



"Red Spot" Automobile Searchlight with Rearward Deflector and Lens Serving as Parking Lamp.

Notable Export Shipment of Electrical Apparatus for Steel Mill Operation.

Seventeen carloads of electrical equipment for steel-mill operation are now being delivered for installation with what will be the first electrically driven steel blooming mill to be erected in the Far East. This equipment is to replace a steam engine now operating a 40-in. reversing mill.

The mill will form a part of the plant of the Imperial Steel Works of Japan, located near Tokio, and the electrical apparatus is being furnished by the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa.

The blooming mill in question will be capable of rolling steel ingots measuring 0.5 by 0.5 meters (19.7 ins. square) and weighing 3000 kg. (3.3 tons) normal or 5000 kg. (5.5 tons) maximum. The capacity will be 50 tons per hour.

The mill will be operated by a 3500-hp. single-unit motor, of the reversing blooming-mill type, taking direct-current power at a voltage of 600 and operating with a speed range of 0 to 100 r.p.m. To supply power to the motor a flywheel motor-generator set is being furnished. The direct-current generator is of 2800 kw. capacity, 600 volts, 368 r.p.m. It will be connected in series with the reversing motor and is designed to stand the same momentary current peaks as the reversing motor. The generator is driven by a 2500-hp., 8-pole alternating-current motor of the wound-rotor induction type, taking 3-phase power at 3400 volts, 25 cycles and operating at a speed of 368 r.p.m. A slip regulator is used to control this set. A notable feature of the motor-generator set is a 75,000-lb. cast-steel flywheel measuring 14 ft. 9 ins. in diameter.

For field excitation, there is being furnished a motor-driven exciter set consisting of one 32½-kw., 125-volt, constant-potential exciter, one 12½-kw., 125-volt, variable-potential exciter, and a 70-hp., three-phase, 25-cycle, 220-volt driving motor, all direct-connected and mounted on a common bedplate.

Accessories used with the foregoing equipment are a Sirocco blower driven by a 40-hp. three-phase, 25-cycle, 220-volt squirrel-cage induction motor; an air washer to be used in connection with the blower; and a 125-kv-a. 3400/220-volt, three-phase, 25-cycle transformer (connected high-voltage side in star, and low-voltage side in delta) to supply power for the exciter set and blower motor.

Another part of the shipment comprises switchboard panels containing instruments, switches, circuit-breakers, shunts and relays for the control of the motors, generators and feeders. Additional equipment includes disconnecting switches, oil circuit-breakers, and current transformers to be mounted on pipe framing.

A Motor and Gasoline-Engine-Driven Fire Pump.

It is always desirable to have two independent sources of power for a fire pump so as to lessen the chances of its being put out of commission when a fire occurs. In some states a double drive is required by the underwriters' regulations.

The usual form of drive is a steam engine and electric motor, though where there are two separate sources of current two electric motors are frequently used. Sometimes neither steam nor a second source of current is available, and in that case a pump driven by a motor and internal combustion engine can be used.

This pump is of 1500 g.p.m. capacity and is driven by a Westinghouse 150-hp. alternating-current motor and a 140-hp. gasoline engine. It is built by the Lea-Courtney Co., Newark, N. J.

Trade Activities

Diamond Specialties to Move Factory to Newark—National Carbon Company's Prize Contest—New Trade Literature

W. B. Richards & Co., whose New York office is at 71 Broadway, announce that Ralph S. Rainsford, formerly with J. G. White & Co., Inc., has become vice president of the company. The firm has offices in Boston and Chicago as well as in New York.

Commercial Electric Co. has been incorporated at Seattle, Wash., by A. B. Nelson and associates to build and sell a farm lighting unit of its own design, and to install marine lighting equipment, including the "Ceco" set. Mr. Nelson was formerly connected with the Boat Lighting & Equipment Co.

Harvey Hubbell, Inc., Bridgeport, Conn., is sending out to the trade a new trade discount sheet, dated Nov. 14. Numerous changes on Hubbell material are shown, these applying on Schedules C-1, C-3, D, G, E and H, which include various types of reflectors, shade holders, lamp guards and plug material.

American Steam Conveyor Corp., Chicago, manufacturer of all types of equipment for the economical handling of ashes, soot, coal siftings and similar material, is sending out a new folder which has for its title "A Yard of Installations." It shows in an attractive panel views of installations of the American steam ash conveyor. The folder itself is about a yard in length, as its title indicates, and depicts 19 or 20 installations of this equipment. An attractive post card accompanies the folder and aids in giving the interested prospect an opportunity to secure further information. This folder is being extensively distributed among power plant executives and is one of a series being issued.

Allis-Chalmers Manufacturing Co., Milwaukee, Wis., is distributing bulletin No. 1532-A devoted to Allis-Chalmers oil engines of the Diesel type. This publication comprises 20 pages and fully explains the operation and detailed construction of the Allis-Chalmers Diesel type of oil engine which, it is claimed, combines all the economical advantages of the Diesel system, together with special constructive features essential for reliability in service. The engine is of the four stroke cycle horizontal type with an open fuel nozzle and a low pressure starting system. These features simplify the design and overcome the chief objections of inaccessibility, uncertain piston lubrication and the clogging of the fuel nozzle, to which the older types were subject. The bulletin is well illustrated with cross-sectional and longitudinal views of the engine, diagrams, views of typical installations, and the various parts entering into its construction.

Cooper Hewitt Electric Co. on Oct. 27 and 28 held a convention of its salesmen at the main office of the plant at Hoboken, N. J. About thirty salesmen attended the convention which closed with a dinner at the Hotel Pennsylvania, Tuesday night, Oct. 28.

Edison Electric Appliance Co., 5600 West Taylor street, Chicago, recently issued a new pamphlet describing the "Hotpoint" engine and carburetor heater, which is nationally recommended by dealers as a winter driving necessity for easy starting on cold mornings. This is an electric heating device quickly attached to a garage light socket, placed under the hood of the car, where a steady, uniform heat is concentrated to keep the motor primed for an instant start on a cool morning.

Charles C. Moore & Co., San Francisco and Seattle, have an order for building and installing two new generating units in the mill of Bloedel-Donovan Lumber Co., at Bellingham, Wash. There will be one 2000-kw. unit and one of 1000-kw., to be housed in a concrete building. This firm has an order to furnish three Stirling boilers of 500-hp. each in the plant of Crown Willamette Paper Co. at West Lynn, Ore.; and to install two similar boilers in the paper plant of Pacific Mills, Ltd., at Ocean Falls, B. C.; also, two 500-hp. boilers in plant of E. K. Wood Lumber Co., Bellingham, Wash., and two 500-hp. B. & W. boilers in the plant of Granby Consolidated Mining & Smelting Co., at Granby, B. C.

Cutler-Hammer Manufacturing Co., Milwaukee and New York, is distributing a new booklet on electrical operation of gate valves, which contains a reprint of an address given by Peter Payne Dean before the Metropolitan Section of the American Society of Mechanical Engineers. Several illustrations and drawings have been added to aid the description of the Dean system of electrical control of gate valves. Primarily, the Dean control system consists of a totally enclosed waterproof driving motor, reduction gears and limit trip mechanism combined into a single unit for the operation of the valve gate. The control of the valves is secured by means of one or more remote control stations. The booklet makes mention of the desirability of having remote controlled valves in power stations, waterworks, dry docks, refrigerating plants and oil refineries. It describes some of the standard valves and explains how these may be equipped for power operation with remote control without removing the valve or putting it out of service.

Black & Decker Manufacturing Co., Baltimore, manufacturer of portable electric tools, has placed A. E. Nordwall in charge of the Seattle branch, with headquarters at 201 Maynard building. Mr. Nordwall will have charge of the distribution of the company's products in the state of Washington, under the direction of the main Pacific coast office, 918 Hearst building, San Francisco.

Diamond Electric Specialties Corp., successor to the Import Sales Co., New York City, has purchased from H. Sobo & Sons, Newark, N. J., their three-story brick building located at 101-03 South Orange avenue. The Diamond company will use the premises for the manufacture of its well-known line of Diamond flashlights, batteries and Diamond electric Christmas tree outfits, which heretofore have been manufactured at 27-33 West 20th street, New York. The structure has a frontage of 65 ft. on South Orange avenue and a depth of 100 ft. on Richmond street. The Diamond company was attracted to Newark by the excellent manufacturing and labor advantages afforded in that city, and will take possession of the new quarters after Jan. 1, 1920.

National Carbon Co., Cleveland, Ohio, manufacturer of batteries and carbon products, recently conducted a contest for an appropriate name for its new house organ, which will be published periodically in the interests of salesmen, jobbers and jobbers' salesmen. It was a departure from the usual prize award for similar activities in that an offer of a suit of clothes was made the incentive for suggesting a title. Names were received from all parts of the country, many from owners, presidents, sales managers and advertising managers of progressive concerns. The name selected by the judges was "Columbia Hot Shot," which was considered ideal in implying the purpose of the publication, suggestive of the company's products and in being "catchy," short and easy to pronounce. Instead of one winner, there were 12 salesmen of jobbers and one salesman of the company who each received a check of $75 with which to purchase a new suit of clothes. Eight other contestants were given recognition by the company by the award of a $15 prize for a pair of shoes. In sending the checks which totaled over $1,000 to the winners, the company inferred that the amount of $75 for a suit and $15 for shoes would cover the cost of this apparel, but assumed no obligation for the market fluctuation which might ensue between the time the prizes were mailed and the date when checks were received.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

New Bedford, Mass.—Leigh & Butler, 232 Summer street, Boston, manufacturers of textile machinery, etc., have completed negotiations for the acquirement of the plant formerly occupied by the Baker Manufacturing Co., New Bedford, and will utilize the structure for the establishment of a new plant. Considerable electrical equipment will be required in connection with the new work.

Windsor, Conn.—General Electric Co., Schenectady, N. Y., will double the capacity of its plant here by the erection of a building of 40,000 sq. ft.

Binghamton, N. Y.—An appropriation of $25,000 has been made for ornamental lighting and underground conduit system. Address city clerk.

Lancaster, N. Y.—Plans are under consideration by the Depew & Lancaster Light, Power & Conduit Co., operating in Erie county, for the construction of an electric power plant at Alden, N. Y., for furnishing service to local and neighboring districts.

Little Falls, N. Y.—Barnet Leather Co., Inc., 81 Fulton street, New York, is considering plans for the construction of a new one-story brick addition to its plant at Little Falls. The structure will be about 25x40 ft., and is estimated to cost $7,000. L. E. White is local manager.

New York, N. Y.—Melville Clark Piano Company, 518 West 55th street, has had plans prepared for the construction of a one-story concrete boiler plant addition to its works about 60x93 ft., to be located on 135th street, near Locust avenue. The structure is estimated to cost $20,000.

New York, N. Y.—It is expected that Westinghouse, Church, Kerr & Co. will be in the market soon for electric cranes for a fertilizer plant in Baltimore for Armour & Co.

Sayville, L. I., N. Y.—Navy Department has authorized the immediate installation of new radio apparatus at the local radio transmission station, estimated to cost about $50,000. The new equipment will be of the high-speed sending type recently perfected. The work also includes improvements in the present receiving equipment at the plant.

Oneida, N. Y.—The common council voted to accept the proposition of the Adirondack Electric Co. for ornamental lights in Madison street. Mayor Munson was authorized to sign the contract.

Bloomfield, N. J.—Sprague Electric Works of the General Electric Co. has filed plans for the construction of a new addition to its plant. It is understood that a portion of the proposed extension will be used for storage purposes; the building is to cost about $40,000.

Cape May, N. J.—Fire on Dec. 1 damaged the plant of the Cape May Illuminating Co. to the extent of approximately $5,000. It is understood that the company is considering plans for immediate rebuilding.

Dover, N. J.—New Jersey Power & Light Co. has been awarded a contract by the Mountain Ice Co. for furnishing electric energy for the operation of its plant for a period of five years. The company is planning for the extension of its electric system to the Dickerson mine of the Wharton Steel Co. for the serving of a motor load of 600 hp.

Jersey City, N. J.—Burke Brothers Co. has had plans prepared for the erection of a new boiler plant at its property at 380-84 5th street.

Kearny, N. J.—Town council is considering plans for the installation of a new arc lighting system in Kearny avenue. It is proposed to inaugurate work on the improvement at once.

Newark, N. J.—American Platinum Works, 231 New Jersey Railroad avenue, is making rapid progress on the construction of its proposed factory and boiler plant, to be located at Oliver and New Jersey Railroad avenues. It is understood that the work will be completed at an early date.

Newark, N. J.—John Campbell & Co., Monticello, N. Y., has had plans prepared for the construction of a new two-story factory and boiler plant, about 10x125 ft., at 13-23 New York avenue. The structure is estimated to cost $50,000.

Newark, N. J.—Dye Products Chemical Co., 202 Vanderpool street, has had plans prepared for the erection of a new one-story boiler plant addition to its works. William E. Lehman, 738 Broad street, is architect.

Port Norris, N. J.—Plans are under consideration by the Township Committee for the installation of new street lighting systems in Port Norris, Mauricetown, Bivalse and Haleyville.

Allentown, Pa.—Phoenix Silk Manufacturing Co. is having plans prepared for the construction of a new central power plant, to be utilized for the furnishing of light and heat for its two local mills. The company has been granted permission by the city council to install an underground conduit system between its Adelaide Mill and its ribbon mill in connection with the proposed construction.

Chester, Pa.—American Locomotive Co., 30 Church street, New York, has awarded a contract to Almirall & Co., Inc., 1 Dominick street, New York, for the construction of a new one-story power house at its local plant, about 80x100 ft., to be located on East Dunkirk street.

Connellsville, Pa.—Yough Electric Co. is having plans prepared for a plant.

Littleton, Pa.—Board of Managers of the Hoffman Orphanage is having preliminary plans prepared for the construction of a new one-story central heating plant for the institution, to cost about $15,000. Rev. Andrew H. Smith is in charge.

Liverpool, Pa.—Juniata Light & Service Co. has commenced work on the extension of its electric system to the upper section of the borough to furnish service for lighting. It is understood that a new street-lighting system will also be installed in this district.

Philadelphia, Pa.—Pennsylvania Forge Co., Jenks and Bath streets, has awarded a contract to the William G. Donley Co., Drexel building, for the erection of a new one-story brick power house addition to its plant, about 42x51 ft. The structure is estimated to cost about $5,000.

Philadelphia, Pa.—Philadelphia Electric Co. has awarded a contract to the Stone & Webster Engineering Corp., Boston, Mass., for the construction of its proposed one-story reinforced concrete power station at Beach and Palmer streets. The structure will be about 197x300 ft., and with equipment installation will cost about $5,000,000.

Pittsburgh, Pa.—Jones & Laughlin Steel Co. has filed plans for the erection of a new one-story brick and steel pump house to be located on Second avenue, near Bates street.

Reading, Pa.—Lebanon Steel Co. has had plans prepared for the construction of a new one-story air-compressor building and substation, about 33x39 ft., at its plant.

Scranton, Pa.—Delaware, Lackawanna & Western Railroad Co. has awarded a contract for the foundations for the proposed power plant to be located in the vicinity of Nanticoke, Pa. It is proposed to call for bids for the superstructure early in the coming spring. The new plant is estimated to cost $75,000.

Danville, Va.—Danville Valley Power Co. has been incorporated with a capital of $50,000. H. L. Mitchell and others are interested. The company will build a hydroelectric plant which will be located in Walnut Cove.

Baltimore, Md.—Kaufman Beef Co. has had plans prepared for the construction of a new packing plant and power house, to be located at Sixth street, near Wilkens avenue.

Murphy, N. C.—The city plans to construct a 500 to 700-hp. hydroelectric power plant. Address mayor.

Newbern, N. C.—City is having plans prepared for extensions in the municipal electric lighting plant to increase the present capacity.

Laurens, S. C.—Watts Mills Co. is having plans prepared for the installation of a new transmission system for the purpose of furnishing electric lighting for its mill village and operatives' homes. The work is estimated to cost $15,000. Power is furnished by the Reedy River Power Co. George M. Wright is president.

Ridgeville, S. C.—H. R. Elsworth is in market for a private electric plant.

Melbourne, Fla.—An electric light plant will be established by the Melbourne Beach Co.

St. Petersburg, Fla.—W. D. McAdoo and others contemplate the construction of an electric railway between St. Petersburg and St. Petersburg Beach.

NORTH CENTRAL STATES.

Dayton, O.—Domestic Engineering Co. has purchased the 4-story plant of the Mutual Manufacturing Co., and will use it for making farm lighting systems.

Detroit, Mich.—Mutual Electric & Machine Co., 232 West Fort street, will build a 3-story plant addition to cost $12,000.

Detroit, Mich.—A 1-story plant, 100x120 ft., and a boiler house 40x50 ft. will be erected by the General Carbonic Co. at a cost of $150,000.

Grand Rapids, Mich.—A hydroelectric power plant capable of generating 2500 hp. will be added to the present plant of the Consolidated Water Power & Paper Co., the new building to be completed by next fall. Power for the new paper machines to be installed by the company will be furnished, and surplus power will be sold to concerns in the city. The company is also planning to erect a new sulphite mill to cost more than $500,000.

Manistee, Mich.—An electric railroad is proposed between Manistee and Arcadia. Address J. N. Junge.

Evansville, Ind. — Architect Gilbert Karges, 305 Furniture Exchange building, Indianapolis, Ind., has prepared plans and will let contract for a $75,000 power plant to be erected by Globe-Besse-World Furniture Co., Evansville, Ind. The building will be of brick, steel and concrete construction. Specifications include a freight elevator, steam heating, plumbing and electric lighting.

Indianapolis, Ind.—Commercial Engineering Co. has increased its capital stock from $50,000 to $100,000.

South Bend, Ind.—Heavy rains are saving 100 tons of coal a day for the Indiana & Michigan Electric Co.'s power plant. The St. Joseph river, swollen far beyond its height for this season of the year, is generating enough power to make the use of coal almost negligible.

DATES AHEAD.

Electric Power Club. Meeting, Hot Springs, Va., Dec. 11, 12 and 13. Headquarters, Homestead Hotel. Secretary, C. H. Roth, 1410 West Adams street, Chicago.

American Society of Civil Engineers. Annual meeting, New York City, Jan. 21-22, 1920. Secretary, Charles W. Hunt, 33 West 39th street, New York City.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, O.

Oklahoma Utilities Association. Annual convention, Oklahoma City, Feb. 10-13, 1920. Secretary, H. A. Lane, 611 State National Bank building, Oklahoma City.

American Electrochemical Society. Annual convention, Boston, Mass., April 7-10, 1920. Friday, April 9, joint session with American Institute of Electrical Engineers on "Electrically Produced Alloys." Secretary, Joseph W. Richards, Bethlehem, Pa.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

Mahomet, Ill.—This village is to have an electric light system, a high-tension line to be constructed from Champaign to Mahomet for the purpose of supplying current. Power will be furnished by the Urbana & Champaign Railway, Gas & Electric Co., a subsidiary of the Illinois Traction System.

Bruce, Wis.—A bond issue of $12,000 has been approved for the construction of a municipal lighting system.

Chippewa Falls, Wis.—Wisconsin-Minnesota Light & Power Co. will erect a power line between Stanley and Chippewa Falls to carry current from Wiasota dam to consumers along Soo railway.

Sheboygan, Wis. — Citizen's Telephone Co. will make additions to system at an estimated cost of $85,000.

Marceline, Mo. — Plans are under consideration by the city officials for the construction of a new municipal electric plant.

St. Louis, Mo.—Emerson Electric Co. has purchased a site for a large commercial structure, adjoining on the east the company's present quarters. The projected building, plans for which are being prepared, will be a 7-story structure.

Chanute, Kan.—Architect I. R. Timlin, Boatmen's Bank building, St. Louis, has prepared plans for a $15,000 telephone exchange. Contract let to Geo. W. Copley, Chanute, Kan. Owner Southwestern Bell Telephone Co., Boatmen's Bank building, St. Louis, Mo.

Iola, Kan.—Archt. I. R. Timlin, Boatmen's Bank building, St. Louis, has prepared plans for a $15,000 telephone exchange. Owner Southwestern Bell Telephone Co., Boatmen's Bank building, St. Louis, Mo.

Beatrice, Neb.—Consolidated Electric Co. will build a transmission line from Homeville to Filley, Virginia and Rockford.

Guide Rock, Neb.—Bonds have been voted for installing an electric light system in the city.

Havelock, Neb.—Omaha, Lincoln & Beatrice Interurban Railroad Co., Ralston, has asked for a franchise to construct lines through Havelock. Mr. Bramlette, general manager.

Lebanon, Neb.—The city will hold an election for a bond issue for an electric plant. The erection of a transmission line from the McCook Electric Co., McCook, is also contemplated. Danbury will also secure light from the lines of the McCook company.

Prague, Neb.—The city has voted to issue $12,000 electric light bonds. Work on the line will commence at once, it being an extension of the Blue River Light & Power Co.'s line from Brainard to the towns of Bruno, Abie and Prague.

Scribner, Neb.—City will construct electric lighting plant. Estimated cost, $35,000.

SOUTH CENTRAL STATES.

Birmingham, Ala.—Sloss-Sheffield Steel & Iron Co. is having plans prepared for the construction of a new power house addition to its plant, to cost about $9000.

Birmingham, Ala.—Birmingham Light & Power Co. has had plans prepared for the construction of a new local electric substation, to be equipped with 1000-kw. rotary converter with switchboards, as well as auxiliary apparatus. L. L. Newman is engineer.

Amite, La.—Central Light & Power Co. is understood to be considering plans for increasing the present capacity of its plant. New machinery and equipment will be installed.

Boyce, La.—City officials are planning for a bond issue of $30,000, the proceeds to be used for improvements and extensions in the municipal electric light and water plants. Xavier A. Kramer, Magnolia, Miss., is consulting engineer.

Monroe, La.—Plans are under consideration by the city for the construction of a new electric plant and waterworks system, a bond issue for $450,000 to cover the cost of the proposed work having been passed. Arnold Bernstein is mayor; Walter G. Kirkpatrick is consulting engineer.

Fort Smith, Ark. — Fort Smith Light & Traction Co. is preparing to enlarge its power plant by the erection of an addition to cost $250,000.

Sallisaw, Okla.—City has completed arrangements for improvements and extensions in the municipal electric light plant, to cost about $30,000.

Clarendon, Tex. — Texas Gas & Power Co. is considering plans for extensions and improvements in its electric light plant to increase its present capacity. Plans and specifications will be prepared at once.

Dallas, Tex. — Dallas Power & Light Co. has purchased a 15-acre tract of land on which it proposed to erect a reserve oil storage tank. The tank is to be of 50,000-bbl. capacity and will be erected to insure continuity of service at such times when oil could not be delivered through pipe lines or in tank cars.

WESTERN STATES.

Pueblo, Colo. — About $1,000,000 will be spent in 1920 for improvements by the Arkansas Valley Railway Light & Power Co., according to announcement by W. F. Raber, manager of the plant. Among the items of expense is a new power house made necessary by the increased distribution of electricity both for lighting and power purposes and the present plant is inadequate to care for the expanding business much longer. The present plant is only 7500 h.p., while the new plant will be 10,000 hp. and modern in every respect.

Seattle, Wash.—City Council has recently awarded a contract to the Allis-Chalmers Manufacturing Co. for a new 12,500 kw. steam turbine unit, equipped with exciter. Arrangements have also been completed for the installation of boilers and auxiliary apparatus, for increased operations.

Seattle, Wash.—Contract has been awarded to the Pelton Water Wheel Co. by the city for the furnishing of a new 18,000 hp. capacity water wheel, estimated to cost $76,616. A generating unit will also be furnished by the Westinghouse Electric & Manufacturing Co., 14,285 kw. capacity, to cost $63,175.

Wenatchee, Wash.—Plans are under consideration by the Wenatchee Valley Gas & Electric Co. for extensive additions and improvement in its plant. It is proposed to increase the capacity of the Chelan Falls power station by approximately 1000 hp., at an estimated cost of about $80,000. George D. Brown is general manager.

Astoria, Ore. — Plans are under consideration by the Pacific Power & Light Co. for the rebuilding of its repair shop recently destroyed by fire, with loss estimated at about $20,000.

Baker, Ore.—To prevent a recurrence of the present grave lighting and power situation in Baker and Union counties, extensive improvements that may include the installation of one or more power plants will be made by the Eastern Oregon Light & Power Co., according to J. P. Lottridge, manager.

Bend, Ore. — The construction of two power plants along the Fumalo river at a cost of $229,000 for the development of 4325 hp. is contemplated by the Bend Water, Light & Power Co., which filed application with the state engineer's office for permission to appropriate 50 second feet of water from Tumalo creek.

Auburn, Cal.—Pacific Gas & Electric Co. is making rapid progress on the installation of a new power line from its Wise power station for the furnishing of electric energy to the Sacramento Valley district. It is understood that the company is considering plans for the construction of a new power station to be located in the vicinity of Loomis.

Glendale, Cal. — City has recently authorized the issuance of bonds for $260,000, the proceeds to be used for extensions and improvements in the water and light departments. Included in the proposed work will be the construction of a new pumping plant, with equipment, etc., at San Fernando road and Grand View avenue, to cost $33,500; pumping plant at Grand View reservoir; quantity of new pumping equipment in Verdugo canyon; electric generating plant at Verdugo canyon reservoir, and other work.

Manhattan Beach, Cal.—Town officials have voted a bond issue of $30,000, the proceeds to be used for improvements and extensions in the municipal water system.

Orange, Cal. — In connection with the proposed installation by the city trustees of the new ornamental lighting system on Shapman and Glassell streets, J. A. Lieb, Orange, has submitted the low bid, at $18,000.

Richmond, Cal. — Plans are under consideration by the city council for the early installation of a new electrolier system in the business section of the city, to replace the present arc lighting units. The Merchants' Association is interested in the proposed work.

San Francisco, Cal.—Contract has recently been awarded to the Western States Gas & Electric Co. for the furnishing of electric energy for the operation of the proposed new plant of the Fresno Cooperage Co. at Richmond. The company is a subsidiary organization of the California Wine Association, and about 150 hp. will be required.

Woodland, Cal.—Council is understood to be arranging plans for the installation of a new underground conduit system to be utilized for light and power purposes.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Electrical Supplies (31,332).—Samples, catalogs and price lists are desired by a man in Spain with a view to representing firms for the sale of electrical supplies, carpenters and cabinet-makers' tools and accessories, leather and imitation leather visors for military caps, barber supplies, etc. Correspondence should be in Spanish.

Electrical Appliances (31,394).—A firm in England having a branch office in the United States, desires to be placed in touch with manufacturers of electrical labor-saving appliances, with a view to their sale in England. It is particularly interested in washing machines, vacuum cleaners, dishwashing machines, electrical clothes dryers, motor-driven sewing machines, and electric water heating apparatus. Articles of the highest class, and in large quantities are wanted.

Electrical Supplies (31,395).—An importer in France desires to secure an agency for the sale of hardware, enamel ware, household appliances, electrical supplies, novelties, and toys. Reference.

Lighting Equipment (31,399).—A company in Spain desires to secure agencies for the sale of oils, lubricating greases, crude rubber, chemicals, industrial products, cables, wire, switches, portable lamps, insulators, etc. Correspondence should be in Spanish or French. References.

Electric Vehicles (31,402).—A firm in South Africa desires to get in touch with manufacturers with a view to securing an agency for the sale of motor cars, electric or petrol, of a medium and cheap price; also of elevators for passenger and freight.

Electrical Machinery (31,346).—An American firm in Poland, which is planning to erect a machine shop, desires to secure an agency, purchasing goods outright, for the sale of machine tools, agricultural machinery, machinists' tools, and electrical equipment. Quotations should be given f. o. b. New York. Payment cash. References. Catalogs and price lists are requested.

Electric Lamps (31,196).—A business man in Spain desires to purchase and secure an agency for life-saving motor boats, in accordance with specifications which may be secured from the Bureau or its district offices. He also desires machinery for making cans, bottlers, perfumery, etc., filament electric lamps, hardware and tools. Quotations should be given c. i. f Spanish port. Payment preferably by irrevocable credit in any Spanish bank. Correspondence may be in English. Reference.

Electrical Supplies (31,408).—A trading company in Denmark desires to secure an agency on commission for the sale of foodstuffs, chemicals, electrical supplies, steam turbines, machinery, iron and steel for shipyards, anchors and chains. Quotations should be given c. i. f. Copenhagen or other Scandinavian port. Payment, letter of credit in United States. References.

PROPOSALS

Electric Light System.—Bids will be received by Unadilla, Ga., until Dec. 31 for the installation of an electric lighting system and extension of the water works system. Address the mayor.

Electric Light.—Bids will be received until Jan. 21, 1920, for furnishing electric lighting for streets, residences and industries for 10 years to Natchez, Miss., from Jan. 1, 1921. Address mayor.

Electric Light Plant.—Bids will be received Dec. 19 by J. W. Reig, mayor of Tahlequah, Okla., for an electric light and power plant. Specifications are on file with clerk at Tahlequah and can be secured from W. N. Gladson and E. M. Ratliff, engineers, Fayetteville, Ark.

Personals

W. C. Heath, P. S. Pogue, A. J. Lubeck, F. W. Sinram Promoted—Mrs. Walker's Career in Public Utility Literature

GEN. GEORGE H. HARRIES, vice-president of H. M. Byllesby & Co., New York, will address the New York Electrical League at a December meeting.

HORACE C. DU VAL at a recent meeting of the board of directors, was elected a director of the Brooklyn Edison Co., Inc., Brooklyn, N. Y., to fill the vacancy occasioned by the death of the late James N. Wallace.

J. H. DEPPELER, of the Metal & Thermit Corp., has been elected a vice-president of the American Welding Society, and P. F. Willis, president of the Henderson-Willis Welding & Cutting Co., elected a director of the society.

W. P. NASER, whose resignation as manager of the Trumbull Electric Manufacturing Co., Chicago, was announced in the Aug. 23 issue of ELECTRICAL REVIEW, has accepted the appointment of general manager of the Northern Electric Co., with executive and main offices in Minneapolis, with a branch office in Duluth. Mr. Naser was connected with the Trumbull company for nearly 7 years. During the World's Fair he opened an office in San Francisco and was later promoted to the larger Chicago branch of the company.

W. C. HEATH, assistant general superintendent of Fairbanks, Morse & Co., Chicago, was recently promoted to the office of general superintendent of the Beloit (Wis.) plant. Mr. Heath joined the company in May, 1909, as a draftsman, after leaving Lewis Institute, and by reason by his ability, industry and character, was rapidly advanced in the organization. After spending about 7 years in detail and general designing work in the engineering department, he was transferred to the shops where for a time he looked after drawings, production schedules, standardization and similar matters. He was later appointed superintendent of the BW shop and then promoted to the position of assistant general superintendent.

PHILLIP S. POGUE, general manager of the Louisville Home Telephone Co., Louisville, Ky., for the past 10 years, has been elected president of the company, succeeding E. H. Cady, resigned. Mr. Pogue has been with the Louisville Home company since its inception. After assisting in the construction of the plant in 1901-2, he served as purchasing agent for a year. He was later made general superintendent, in which capacity he continued until 1907, when he was promoted to the position of general manager. He is vice-president and director of the Louisville Heating Co., director of the Louisville Gas & Electric Co., the vice-president of the Kentucky Association of Public Utilities. He is a member of the Pendennis Club, the Engineers and Architects Club and the Jovian Order.

C. W. JOHNSON, general superintendent of the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa., delivered an interesting address at the December meeting of the Industrial Supervisors' Club of Pittsburgh, held on December 3.

ARTHUR J. LUBECK, whose appointment as assistant western sales manager of the Hart & Hegeman Manufacturing Co., Chicago, was recorded in a recent issue of ELECTRICAL REVIEW, has been promoted to the position of sales manager of the Chicago district, succeeding Haynes L. Everest, who has been appointed general sales manager, with headquarters at Hartford, Conn. Prior to his connection with the Hart & Hegeman company Mr. Lubeck was for a number of years in the service of the Benjamin Electric Manufacturing Co., Chicago, serving for 5 years as sales representative in the Middle West. When in May, 1917, the Detroit office of the company was opened, he was appointed manager of that office, having charge of sales in the states of Michigan, Minnesota and Wisconsin, and continued in this capacity until last September, when he resigned to become assistant western sales manager of the Hart & Hegeman company.

Arthur J. Lubeck.

FREDERICK W. SINRAM, who since the death of H. H. Hodell about 2 years ago has acted as head of the Van Dorn & Dutton Co., Cleveland, was recently elected president of the company. This recognition of his services comes after a period of 9 years' service with the company, which began in 1910 when he was made secretary and manager of sales. In 1911 he was elected treasurer of the company, retaining the duties of secretary. He is also treasurer of the Van Dorn Electric Tool Co., and since its organization, about 3 years ago, has been president of the American Gear Manufacturers' Association.

MRS. STELLA FORD WALKER, who is contributing Part VI to the series of articles by H. E. Eisenmenger on "Central-Station Rates in Theory and Practice" appearing in the ELECTRICAL REVIEW weekly since last July, is an experienced student and analyst of public utility regulation by commissions. A graduate of the University of Wisconsin with the degree Bachelor of Arts, she joined the staff of the Railroad Commission of Wisconsin, which she served for 2 years, principally in analyzing and indexing the decisions of the Commission and preparing syllabi in final form for publication. On leaving the Wisconsin Commission's staff she became associate editor of *Rate Research*, the weekly publication of the Rate Research Committee of the National Electric Light Association. This work involved painstaking preparation of abstracts of commission rulings, reviews of court decisions affecting utility companies, digests of state utility laws, besides many special reports and papers on a variety of related subjects, such as going value, rate of return, franchise regulation, discrimination, etc. For nearly 6 years Mrs. Walker had practically complete responsibility of compiling and editing *Rate Research*. During the recent war, when her husband joined the army Mrs. Walker engaged in war camp community service. Since then she has engaged in varied literary work. Mrs. Walker is a well versed, lucid and fluent writer on the many phases of public utility relations, as is readily manifest from perusal of her articles on commission regulation in last week's and the present issue of the ELECTRICAL REVIEW. These articles will be continued in the next two issues.

Obituary.

ALFRED H. MEECH, aged 55 years, an electrical engineer and inventor of an elevator lift air brake, died Nov. 28 in New York.

WILLIAM E. RICE, former president of Washburn & Moen Mfg. Co., and later connected with the American Steel & Wire Co. for many years, died in Worcester, Mass., Dec. 2, at the age of 86 years.

ROBERT FARIES, founder and president of the Faries Manufacturing Co., Decatur, Ill., manufacturer of pumps, regulators, electrical fittings and fixtures, etc., passed away on Nov. 17 at the age of 82 years. He was one of the first men, if not the first, to devise adjustable fixtures for electric lights, and in that line of manufacture and in the manufacture of fixtures for display windows, the business he established has grown to large proportions. He was a leader in industry in Decatur for 50 years and his passing is mourned by the community as well as his many friends in the industry.

Financial News

Little Rock Company to Extend Lines.

Permission has been granted by the Arkansas Corporation Commission to the Little Rock Railway & Electric Co. to sell $376,500 of bonds. The proceeds of this bond issue will be used to make extensive improvements in its plant, extend its electric transmission lines and improve its service generally. The bonds are to be sold at not less than 80 and will bear 6% interest.

American Public Service Offering.

The National City Co. is offering $215,000 first lien 6% bonds of the American Public Service Co., dated Dec. 1, 1912, and falling due Dec. 1, 1942, at 93 and interest, to yield 6.60%. The bonds are redeemable on any interest date at 105 and accrued interest upon 60 days' notice. The American Public Service Co. was incorporated in Delaware in October, 1912, and has acquired the entire capital stock and the bonds of eighteen public utility operating companies situated in eastern Oklahoma and central and eastern Texas.

Standard Gas & Electric Calls Dividend Scrip for Redemption.

Standard Gas & Electric Co. has called for redemption $202,144 outstanding dividend scrip issued several years ago. After Dec. 15 it will cease to bear interest. The scrip will be redeemed at the company's office, Chicago, at face value and accrued interest, in accordance with the following notice from Robert J. Graf, secretary:

"Standard Gas & Electric Co. hereby calls all of its outstanding dividend scrip for payment at its office, Room 1900 Continental and Commercial Bank building, Chicago, Ill., on Dec. 15, 1919. Said dividend scrip will be redeemed at its face value and accrued interest to Dec. 15, 1919.

"You are hereby notified to present your scrip at the said office of the company for payment on said date. On and after said date, interest on said scrip will cease."

Pacific Gas-Sierra Companies' Power Lease in Detail.

In leasing properties of Sierra & San Francisco Power Co. for 15 years, Pacific Gas & Electric Co. will assume responsibility for all fixed charges, according to announcement made by A. F. Hockenbeamer, vice-president of the latter company. These charges during the fiscal year ended June 30, 1919, amounted to $863,567. In addition company will set aside a small amount for bond discount.

Pacific Gas & Electric Co. for the first year will pay a rental of $50,000, $100,000 for the second and third years and $150,000 annually thereafter. In addition Pacific Gas & Electric agrees to maintain the properties in their present state, advancing money to make any additions and extensions required by the California Railroad Commission, taking first mortgage bonds of the Sierra Co. in payment.

Assumption of the fixed charges of the Sierra company by Pacific Gas Company is no doubt responsible for the activity and strength of the series B fives of 1949 of the former company recently. The lease will now go before the state commission for approval. In taking over the plants of Sierra company Pacific Gas Company acquires the 28,000-kw. steam plant located in San Francisco. Major part of the output of Sierra company is sold to United Railroads of San Francisco. The Pacific Gas & Electric Co. will assume this contract under the terms of the lease.

Dividends.

Detroit Edison Co. has declared a quarterly dividend on 2%, payable Jan. 15 to stock of record Jan. 2, 1920.

Babcock & Wilcox Co. has declared a quarterly dividend of 2%, payable Jan. 1, 1920, to stockholders of record Dec. 20.

American Public Service Co. has declared a quarterly dividend of 1¾% on preferred stock, payable Jan. 2 to stock of record Dec. 15.

The board of directors of the Buffalo General Electric Co. has declared a quarterly dividend of 2%, payable Dec. 31 to stock of record Dec. 20.

Twin City Railway & Light Co. has declared a quarterly dividend of 1¾% on preferred stock, payable Jan. 2, 1920, to stockholders of record Dec. 20.

Electric Storage Battery Co. has declared a quarterly dividend of $2.50 per share on both common and preferred stocks, payable Jan. 2 to stockholders of record Dec. 15.

The board of directors of the Springfield Railway & Light Co. has declared a quarterly dividend of 1¾% on preferred stock, payable Jan. 2 to stockholders of record Dec. 15.

The regular quarterly dividend of 1½% on the issued and outstanding preferred stock of the American Gas & Electric Co. has been declared, payable Feb. 2 to stock of record Jan. 16.

Manhattan Electrical Supply Co. has declared the regular quarterly dividends of 1% on common stock and 1¾% on both the first and second preferred stocks. Both dividends are payable Jan. 2 to stock of record Dec. 20.

Niagara Falls Power Co. has declared a dividend of $1.00 per share on common stock, payable Dec. 15 to stock of record Dec. 10; also a dividend of $1.75 per share on preferred stock, payable Jan. 15, 1920, to stock of record Dec. 31.

The Allis-Chalmers Manufacturing Co. has declared a quarterly dividend of 1¾% and an additional dividend of 1¾% in payment of the remaining unpaid and accumulated dividends on the preferred stock of the company, both dividends payable Jan. 15 to the stock of record Dec. 31.

Earnings.

Selecting a Switchboard for a Plant of Moderate Size

How a 30,000-kw. Central Station Came to Select a Truck Type Switchboard — Comparison of Cell and Truck Types—Paper Before Pennsylvania Electric Association

By G. E. WENDLE

Lycoming Edison Co., Williamsport, Pa.

ABOUT the year 1904, the developments about Williamsport indicated clearly the need of a new and efficient generating and distributing plant. This plant was duly authorized, and particular attention was given to the switchboard in the matters of accessibility, convenience and safety and of provision for large future growth.

The board was of the standard marble panel type, supported by a pipe framework upon which the various apparatus was mounted. In order to provide ample space for operation and for safety, the face of the board was placed 8 ft. from the building wall, and when completed and all of the existing outgoing feeders connected, the general effect was one of spaciousness and our satisfaction was complete except for one thought—where was the business to load the spare panels we had bought?

At the time this board was placed in service the principal load on the combined systems was street railway and lighting. Commercial power was only a small percentage of the total output, and what little there was of power was mainly incidental to the large lighting installations. There was not a single polyphase motor on the system except those at the generating station.

The reason for this condition is evident when you consider that the majority of our manufacturing plants were engaged in various woodworking lines and obtained large quantities of wood waste in manufacturing. In order to get rid of this waste, specially designed boiler plants were installed to furnish steam for power and dry-kiln service, and it was a fundamental belief among the majority of our manufacturers that their power not only cost them nothing, but even saved them the expense of hauling the waste away. Under such circumstances our expectations in the addition of power loads were very, very modest. Hence, in planning our board, we provided power panels largely as a matter of faith, and because everybody we talked to, including the salesman, assured us that no self-respecting central-station board was complete without a full line of these panels.

As the years rolled around, we managed to pick up a few power services—mainly to operate special machines in plants where the engines were overloaded or for emergency conditions. The convenience of the motor drive, the added production, and the lessened risk of complete shutdown gradually resulted in additional permanent motor installations in spite of the cheap waste fuel. Finally the development of special machines by which much of the so-called waste could be worked into fillers for veneered doors, etc., and the increased local market for the smaller pieces for kindling reduced the "waste" materially. Power was no longer obtained for nothing—the coal account in the ledgers ended that dream, and we began to add on more power.

The power business developed more and more rapidly until we had used up all of the power panels. overflowed into the reserve lighting panels, and had

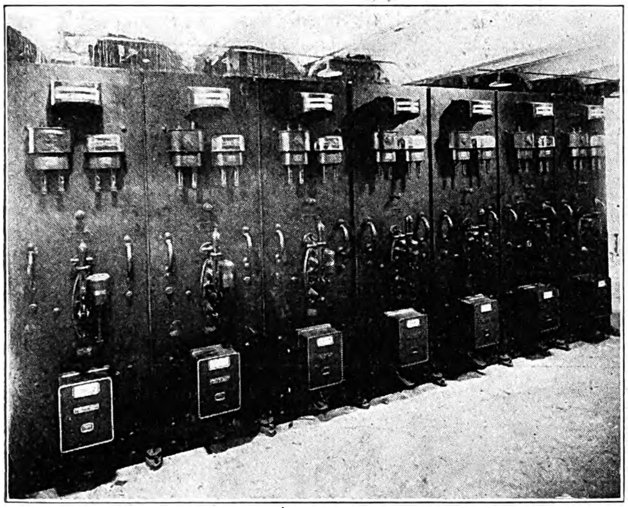

Fig. 3.—Truck Type Panels for 6600-Volt Three-Phase Feeders.

even tied in extra power feeders on existing lighting feeder panels. The old spaciousness disappeared; congestion was everywhere. It was almost impossible to obtain proper clearance spaces so that our operating men could attend to the operation, inspection and maintenance of the various apparatus properly and safely. We devised various ways and means to expand the old board; but the additional capacity obtainable was not worth the price and there still remained the inadequacy of the remodeled board in the matters of safety to our service and to our operators. There was but one proper remedy—a new switchboard, with ample room for expansion. The question was: What type of switchboard was best adapted to our requirements, or to the needs of any station of moderate capacity and voltage?

As a necessary preliminary, the ultimate station capacity, the maximum size and voltage of generating unit, and the probable number of feeders were carefully estimated upon the operating data of the present equipment and the anticipated development of our tributary territory. The figures assumed for these several items were as follows: 30,000 kw.; 7500 to 10,000 kv-a. at 11,000 volts, and 16 three-phase and 10 single-phase feeders in addition to our present lines. These estimated additions actually provided for three times our present capacity and between four and five times our present output.

It was further proposed to build a switchhouse addition to our present plant, in which all switching, controlling, regulating and protective apparatus would be placed. This decision eliminated any switchboard system which did not permit close grouping of the various units; and really limited our choice to three systems, namely, the usual panel type, consisting of a pipe framework which supported the various apparatus, etc., and on which were mounted the marble or slate panels with operating handles, instruments, etc.; the cell type with benchboard control; and the safety enclosed removable-truck type with remote control of all main or master trucks.

After a short study of the panel type, it was eliminated because of the large number of exposed high-voltage parts and the difficulty in meeting the present and anticipating the future requirements of our state safety code in the matter of isolation of dangerous parts. This isolation involved screens, etc., and when these were added, the cost was largely increased and the accessibility greatly reduced. In addition, the present tendency towards more stringent safety requirements made us doubtful of the permanence of our investment in this type of board.

The matter of selection was thus reduced to the cell and the safety enclosed truck types, and as these two types were available in units of ample size and were practically equal in cost for equal number and subdivision of units, the final choice was made after careful consideration of the relative merits of these types under our local conditions.

Essential Requirements of the Installation.

In order to determine some standard basis for comparison of switchboard types, we made up the following list of features which we considered essential in our case:

1. Reliability and continuity of service.
2. Safety to employes and the public.
3. Facility of installation.
4. Facility of inspection and maintenance.
5. Economy in operation.
6. Localization and isolation of troubles and consequent damages.
7. Time required for resumption of service after any interruption due to the switchboard.
8. First cost.
9. Reserve equipment required.
10. Provision for future growth.

Let us consider these features seriatim, assuming that both the cell and truck types have the same subdivisions of the same capacity.

1. *Reliability and Continuity of Service.*—Absolute reliability and continuity are impossible, but an examination of large modern switchboards shows how far designers have gone along these lines. In many of the larger plants duplication is carried to extreme limits, but in every case with which we are familiar duplication was limited to some particular step in the progress from the generator to the outgoing feeder. Usually the main generator leads were not in duplicate, but at the generator panel these leads could, by duplicate oil switches, be thrown on either of the duplicate main buses. Throughout the rest of the board the duplication was carried out as far as the outgoing feeder lines. This method represents the most advanced practice where large amounts of energy are distributed in large units, and commercial considerations warrant the increased investment.

The questions which the station of moderate size must solve are—what investment is warranted by the revenues from the energy distributed and how much will the customers pay for extra insurance of the service against breakdowns and interruptions. These questions can be answered only from a thorough knowledge of local conditions. In our case, we were sure that duplication must be of limited extent and that any extensive safeguarding of the service must be obtained through higher factors of safety in the matters of carrying capacity of the apparatus, insulation of the high-voltage parts and subdivision of the board by fireproof partitions. Having reached this conclusion, we investigated the cell and truck types on the same basis of subdivision, equipment, etc., and found that the devices and separate compartments used were the same in both types; but the material used in making up the compartments, the supporting system for the operating devices and the relative locations of these devices were different. Essentially these types are similar, and for the kilowatt capacity involved in our plant we concluded that equally reliable and continuous service would be obtained from either type.

2. *Safety to Employes and the Public.*—As all high-voltage parts are placed in closed compartments in both types, there is equal safety as far as regular operation is concerned, but when maintenance or repair work is required on oil switches and other apparatus, the removable-truck type, as an inherent feature of its design, must be made absolutely safe in order to get at any of the high-voltage parts. With the cell type the same degree of safety requires opening various separate disconnecting switches, carefully checking the same and making proper voltage tests. In short, the removable-truck type is *positively* safe, while the cell type is *possibly* safe.

3. *Facility of Installation.*—The cell type demands high-grade masonry or concrete construction. involving difficult forms and accurate template work. This requires first-class and experienced mechanics—under present labor conditions very difficult to secure in the smaller communities. After the foundation work is done, skilled electricians must be used in assembling and connecting the various operating devices which make up the board.

The removable-truck type is delivered "knocked down" as far as the compartments are concerned, but the removable trucks assembled. The exact work required is placing and leveling certain drilled channels of light section in the concrete floor and which serve as the foundation upon which the structural steel cells are erected, and two additional light channels per cell which form the tracks on which the truck panels are rolled. The high-grade fitting work and any necessary adjustment of parts to insure interchangeability of the trucks of the same type are attended to at the factory where specially trained men and the necessary jigs, templates and special tools are available for the work. The installation is thus reduced largely to assembly of fitted parts and does not require a staff of skilled mechanics to insure satisfactory results.

4. *Facility of Inspection and Maintenance.*—There is practically no choice between the cell and removable-truck types in the matter of inspection, but when inspection indicates that repairs, renewals or adjustments are needed, the removable-truck type has considerable advantage. The particular truck which requires attention is pulled out, a spare truck is substituted in the cell and service is immediately available. The truck which has been removed can be

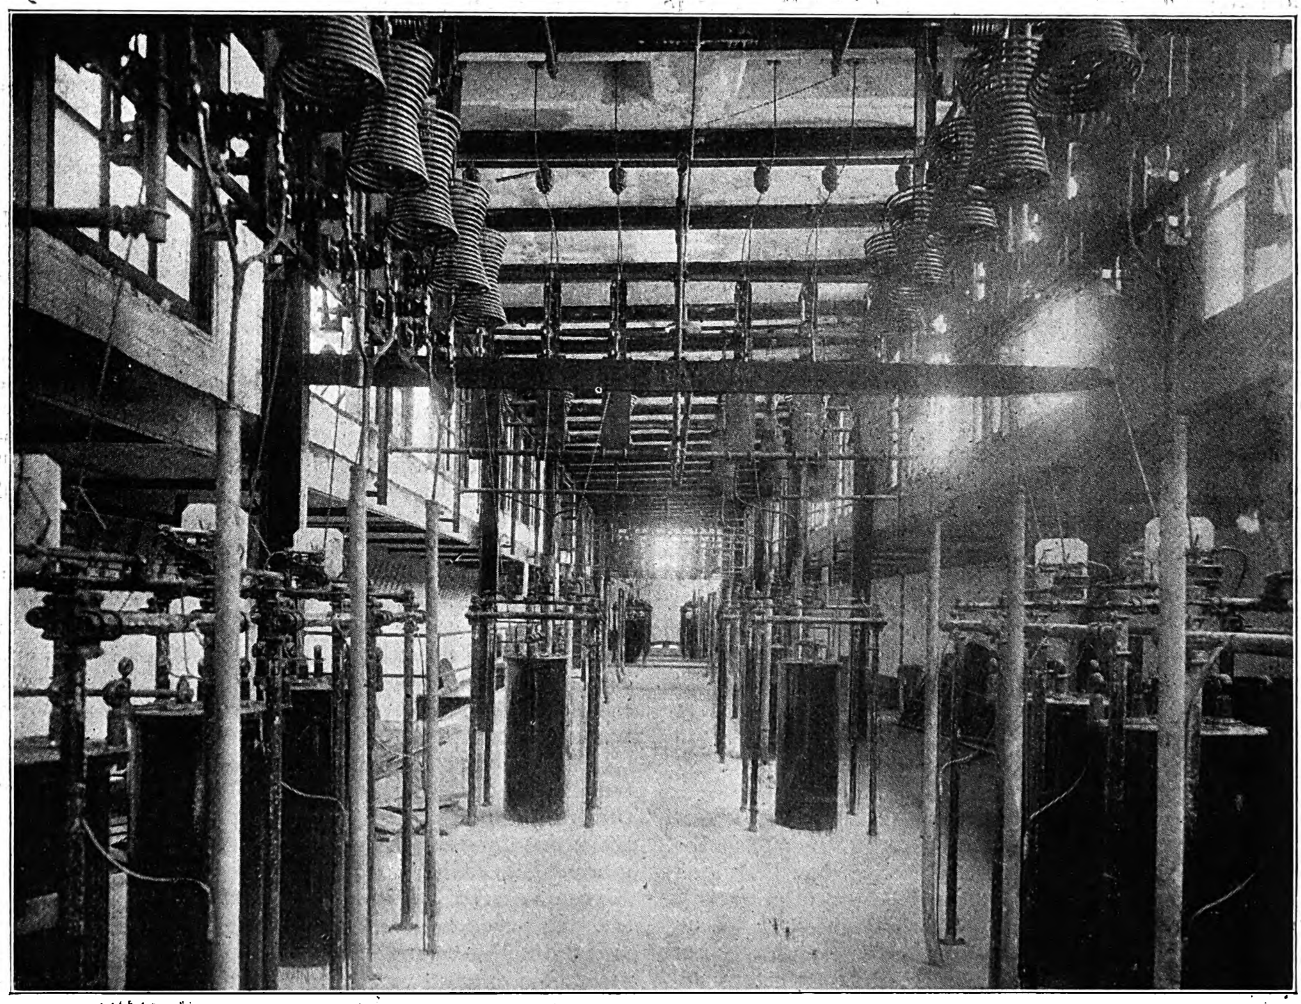

Fig. 4.—Arrangement of Disconnecting Switches and Lightning Protective Apparatus.

wheeled to a suitably equipped workshop where all operating, controlling and measuring apparatus can be inspected in detail and completely tested out. Any necessary maintenance work can be done quickly, conveniently, thoroughly and safely, and when completed the truck can either be set aside as a spare or replaced in its usual compartment.

With the cell type, the entire unit must be cut off and *kept off* until the necessary work is completed and tested. In addition, this work must be done on the various appliances, etc., at their permanent locations, with all the inconvenience due to inaccessibility of parts and the inadequate working space. In general, this means more time to do the work thoroughly and often results in doing *only what is absolutely necessary,* instead of completing *all of the work.*

5. *Economy in Operation.*—As long as regular service conditions prevail, the operating force has little to do except the periodic inspection of the indicating and controlling apparatus, but in order to provide for possible troubles or emergencies which occur with switchboard apparatus and wiring, it is essential that the operating men shall be of proper caliber to insure resumption of service in the minimum time and with the maximum safety to the plant and the consumers.

With the cell type, we would require on each shift at least one skilled operator who had exact and detailed knowledge of the switchboard and wiring and who could quickly and confidently carry out the requisite manipulations and emergency work without referring to diagrams, etc. When the service in any district is knocked out there is no time to be lost in locating and examining blueprints or diagrams or in consultation. This work demands specialized skill and training, good judgment and considerable resourcefulness and commands pay commensurate with these requirements and responsibilities.

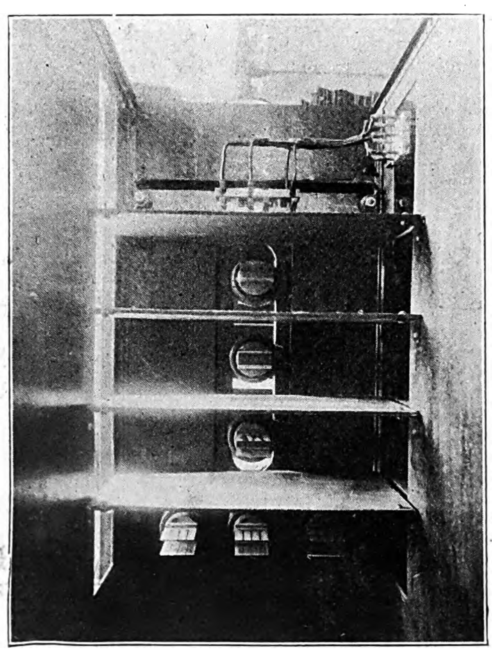

Fig. 5.—Truck Housing Showing Disconnecting Devices and Barriers.

With the truck type, we would require men of average intelligence who can be taught and be depended to observe irregular or defective operation and who can be drilled so that in case of trouble they can quickly remove the truck involved, replace it with a spare truck and resume service. The faulty truck can be wheeled out of the way and a report of the trouble made out for the chief engineer. There is no need of specialized knowledge of the apparatus and wiring nor of making any detailed investigations or tests to locate the faulty part

6. *Localization and Isolation of Trouble and Consequent Damages.*—As both cell and truck types consist of a series of separate compartments, the only question is the relative safety of masonry or concrete cells and steel. On this point we had some doubts, particularly where complete reinforced concrete cells were installed, but as our examination showed that the large-capacity generator and master truck panels were installed in cells constructed with reinforced concrete sidewalls, our fears were dissipated as far as the main truck panels were concerned. The remaining all-steel cell construction housed the feeder trucks of smaller capacity and any damage due to truck breakdown was not likely to be either serious or extensive, particularly as the energy supply to this entire feeder group was limited and protected by a master truck panel.

7. *Time Required for Resumption of Service After Any Interruptions Due to the Switchboard.*—With either type the trouble must be investigated and located. If the switching apparatus or wiring is at fault, the cell type requires that the faulty unit be cut out and repaired before service can be resumed, but with the truck type the faulty truck is pulled out and replaced by a spare truck and service resumed.

In order to obtain fair data on the time required to change trucks, tests were made with men of ordinary physique and average intelligence, but without special drilling or experience in handling the trucks. The series of operations were as follows:

A. Go to a designated faulty truck and remove that truck from its cell.

B. Go to the spare truck, remove it from its usual cell, move it into proper position to enter the faulty truck's cell, and push the truck home.

C. Close the oil switch, thereby locking the truck in place and resuming service.

The time required for the smaller feeder truck was 30 seconds, and for the main trucks 1 minute, 45 seconds.

These tests indicated clearly the great advantage of the truck type when emergency conditions must be handled quickly and surely by men of average capacity.

8. *First Cost.*—For the same number and subdivision of generating and distributing units, the cell and truck types were estimated as approximately equal in cost. The truck type cost was more certain, as its cost was determined very largely by the contract terms. The cell type cost was definite as far as the apparatus and appliances, but there was a large estimated portion which was subject to considerable doubt because of the fluctuating labor and material costs and existing uncertainties. We concluded that a cell type installation would certainly cost as much and probably would cost more than a truck type.

As a further comparison, a complete equipment of trucks and cells cost approximately one and one-third times the older standard panel type, with pipe framework in the rear and manually operated apparatus mounted thereon.

9. *Reserve Equipment Required for Proper Service.*—In order to insure reasonable continuity of service, the cell type requires sufficient reserve stock of assembled apparatus, etc., to provide for quick replacement of any damaged or defective apparatus, etc., by a complete spare. This means at least one assembled

spare for each size and type of apparatus used in the switchboard. In addition, there is required a complete supply of repair and renewal parts for the various sizes and types of apparatus.

The truck type requires as many completely equipped spare trucks as there are separate groups used in the switchboard. These spare trucks are housed in special cells, located conveniently for immediate use. The additional stock is limited to a complete supply of repair and renewal parts for each size and type of apparatus.

The truck type is on a par with the cell type as far as repairs and renewal parts are concerned, but the spare truck with complete equipment ready for immediate use is enormously more valuable from the service standpoint than any stock of spare apparatus, which must be located, mounted and connected before it is of any service value.

10. *Provision for Future Growth.*—It is assumed that the same amount of floor space will be provided regardless of the type of switchboard, and that the cell and truck units will be equal in number and capacity in the original installations and in future extensions until the floor space is taken up. Under these conditions and up to the limit of available space, there is a slight difference in favor of the truck type by reason of the lesser wall thickness of its steel compartments.

With the cell type, whether of brick or concrete, the group of cells must be torn down and a new group constructed for mounting larger capacity switches, etc. This would take considerable time, as it involves tearing down and removing the old masonry, setting up new forms, building the new masonry and waiting a sufficient time for the mortar or concrete to set properly before mounting and connecting the various apparatus. During this period of reconstruction, considerable temporary work must be done to continue service safely on the feeders or units involved, and such work is usually expensive if properly safeguarded.

With the truck type, the problem is largely one of increasing the capacity of the fixed main contacts and connections to the buses, and of replacing the smaller apparatus on the trucks with larger capacity apparatus of the same type. Service would not be interrupted, except for the short time necessary to place larger main contacts and heavier connections to the buses. No extensive reconstruction of the compartments would be required, as the dimensions are ample for the largest future units contemplated. We therefore considered the truck type particularly advantageous in handling increased capacity requirements economically.

Finally, if the capacity of future units exceeds the maximum rating of available truck panels, we can construct the necessary cell type units to take care of such larger apparatus and leave the existing truck panels which are adequate in capacity for their particular service undisturbed. From this standpoint, the truck type seemed to offer greater permanence in service and less depreciation than the cell type.

Description of the Installation.

In the foregoing analysis, we have tried to present the considerations which resulted in the selection of the truck switchboard for our entire alternating system. The complete board is installed and a description of its main features, together with the general layout of wiring, etc., from the separate panels to the overhead system, may be of interest. Your attention is particularly called to the care in designing the layout of the switchboard, wiring, regulating and protective apparatus so that all parts are readily accessible for operation and maintenance. This latter point is, in my opinion, fundamental to the reliability and continuity of service and is generally given small attention until too late to change.

The equipment of the station which the truck panels are to control consists at present of two 6600-volt, 7500-kw., three-phase generators and one 2300-volt, 2500-kw., quarter-phase generator with an ultimate capacity of 30,000 kw. These sources of power

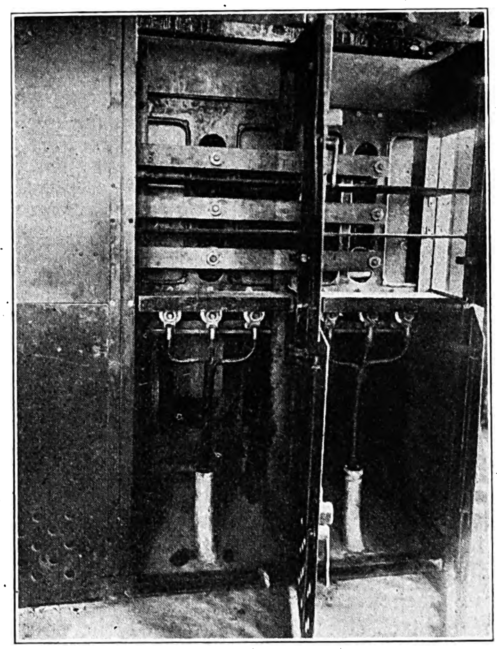

Fig. 6.—Truck Housing, Showing Bus Compartment and Method of Bringing Up Cables.

are interconnected by means of 6600-volt, three-phase and 2300-volt quarter-phase transformers.

The generators, transformers and group feeder circuits are controlled by means of safety-inclosed truck panels equipped with General Electric type FK-12 solenoid-operated oil circuit-breakers. See Fig. 1.

The 2300-volt single-phase lighting feeders and the 6600-volt three-phase feeders are controlled by means of safety-inclosed type truck panels with manually operated type FK-5 oil circuit-breakers. See Figs. 2 and 3.

The control switches for the solenoid-operated oil circuit-breakers on the trucks, together with the instruments, meters and relay equipment, are mounted on an independent slate switchboard of the standard vertical type.

Secondary instrument and control leads only are brought to this board and when the board is inclosed at the ends with grille work the installation will be provided with all the necessary features of safety.

The main control board and the truck panels are mounted on the main floor. The feeder leads from the truck panels run up to the second floor, where the feeder regulators are located, and then up to the third floor to the lightning arresters, choke coils and disconnecting switches, as shown in Fig. 4.

From the third floor the feeder circuits are carried upward through the roof of the station and then to the overhead distributing system. Figs. 5 and 6 show some of the constructional details of the safety-inclosed truck type panels as installed.

Central-Station Rates in Theory and Practice

Twenty-fourth Article — Commission Procedure in Rate Cases —Valuation for Rate-Making Purposes — Changing Attitude as to Importance of Valuation—The Different Bases of Valuation

By H. E. EISENMENGER

This series of articles, of which this is the twenty-fourth, began in the issue of July 12. The first seven articles, forming Part I, dealt with the cost of electric service. Part II contained six articles on the principles governing selection of a rate system. In the six articles of Part III were described the various systems of rates found in practice. Part IV included two articles on rate analysis, while Part V discussed accuracy of rates. The present article is the third one of Part VI on commission regulation of public utilities. Next week's article will close the series.

PART VI—PUBLIC UTILITIES AND PUBLIC REGULATION—Continued.

CONTRIBUTED BY S. F. WALKER,
Formerly Associate Editor of Rate Research.

III. PROCEDURE IN RATE CASES.

THE commissions on first taking up their responsibilities, without precedent to guide them, with little chance of pleasing both parties to a controversy and the probability of pleasing neither, sought to base their decisions upon carefully prepared data so that the justice of their orders might be proved in mathematical terms.

In rate cases the responsibility of the commission lay in securing for the public rates as low as were consistent with good service and at the same time in securing to the company a reasonable income covering all operating expenses, including allowance for the inevitable depreciation of the property and, over and above this, a reasonable rate of return.

VALUATION OF UTILITY PROPERTIES.

To determine upon just what amount the company should be permitted to base the return, the commission made extensive and detailed valuations of the properties. These were often drawn out over many months. In some of the earlier rate cases it would be two or three years after the filing of the complaint before the final rate order was entered.

When a rate case opened up, the commission's valuation engineers went out to make a valuation of the company's property, and, because a rate investigation was a new and untried experience, the company's engineers were also set to work making a separate and complete valuation and, in most cases in a city of any size, a third valuation was prepared by engineers for the city. The different interests of these three sets of engineers led to widely different results and at the hearing before the commission the different arguments were presented, substantiating the findings of the different appraisers. When it came to the writing of the commission's opinion this extensive debate was reflected in a lengthy opinion passing upon the merits and demerits of the different valuations and the arguments presented on the different values making up the total. As a matter of fact, a careful reading of the opinion would not always disclose just what had been used as the final rate base. But the practice of making these extensive valuations was continued, showing the desire of the commissions to determine mathematically the justice of the decision on rates. Arguments and counter arguments were heard, and different bases of valuations were proposed. It would appear that a valuation worth making at all would be worth making well, but the difficulty is that the whole matter is fluid—the property values do not stand still, unit prices fluctuate, depreciation goes on, improvements and extensions are necessary, new developments cause property to become obsolete.

Excessive Accuracy in Valuation Vitiates Its Timely Value.—If the rates under investigation are unnecessarily high or unreasonably low, the injustice to the public or the company is continued during the period of investigation. It is practically impossible to make refunds or adjustments over past charges, as the company's patrons are constantly changing and the transactions are numerous and involve small amounts. For this reason again the rate determinations should not be extended by needless argument over the theoretical differences of opinion. A rate investigation is more or less a disturbing factor in the company's business. The sooner settled the better, as a rule, so that the correction in rates, if a change is found to be justified, can be made promptly.

After expending time and effort to arrive at an exact valuation, the lapse of time makes it necessary to make allowances all along the line to adjust the findings to the present. After all, the new rates are not expected to be reasonable as to past conditions, but they must be reasonable for future operation.

Assuming that an absolutely perfect determination of value for rate-making purposes has been made, the commission is then met with practical difficulties in the way of fixing the rate on a strict cost-of-service basis. Perhaps the utility is still in the developmental stage and cannot be made to bring in a reasonable return immediately or some other circumstance calls for a modification of the rate finding. Competition is a factor, value of the service must be considered, and judgment must be exercised at every step of the investigation, regardless of all attempts to place rate making on an exact mathematical basis.

Changing Attitude as to Valuation.—It would seem that now after some ten years of regulation of public utilities a theory and method of procedure would be clearly mapped out, if such is possible of determination, but the subject is still in a confused state. The holdings of courts on various elements of value in taxation cases or in cases where valuations have been made to determine whether or not there has been confiscation of property, and the holdings of commissions in capitalization and purchase cases have been cited in rate proceedings without proper distinction being made. After much discussion on a certain point commissions have failed to state the final conclusion and value used. So in following precedents one comes to blind alleys, many branching off places and puzzling crossroads.

Valuation has been overemphasized, has been made an end in itself. It should be recognized that the commission is not seeking a value, but is seeking a reasonable-rate base. With a value right at hand, a commission will go out around it, add on and subtract from, in order to arrive at a base which in its judgment is proper in that case. Even if the records of a company were absolutely complete, showing the cost of the property just as it was acquired, the cost, or the first cost less depreciation, would not necessarily be taken as the base for rate making.

In the above discussion it is not intended to present an argument for the entire disregard of valuation in rate cases, but for a practical treatment of the work of making appraisals. The commission must make an investigation and get together facts upon which to base an opinion, but it would seem that, with more complete operating records before the commission and greater familiarity of the regulating commissions with the work given them to do, a more practical handling of valuation may be expected than that found in the earlier decisions.

A very marked change has in fact taken place. One advance was made by one commission which secured more co-operation between the commission's engineers and the engineers of the company and the city. The position was taken that the items of property either were or were not there and an inventory of the property was made up which was acceptable to all the parties making the appraisal. Then the proposition was asserted that the property either had a value in a rate case or did not have a value, and they sought to secure a practical co-operation of the various engineers in determining common-sense values which would appear reasonable to all parties for all practical purposes. In this way many of the differences in engineering practice were worked out before the data were presented to the commission.

In other cases, to avoid the costs of making complete duplicate appraisals, the commission's engineers, representing the neutral body, made the only complete appraisal in the case, their findings being subject to check by the city and the company. Or in still other cases the burden was on the company of showing the reasonableness of the rates complained of and a complete inventory and appraisal was required of the company, subject to check by the commission's engineers.

In the case of an application for an increase when the record showed a deficit from operation under the rates in force, the New Jersey Board prescribed new rates and ordered the company to file an appraisal of its property with the Board at a subsequent date fixed in the order, failure to file the inventory cancelling the permission to increase the rates.

More recently, during the war period, much less importance has been given to the determination of value in rate cases. This is true especially of the emergency rate increases, but it is very doubtful indeed if, even after a return to more normal times, valuation will ever be taken as seriously in a rate case as it has in the past. A number of causes have contributed to the omission of extensive appraisals from recent cases.

The rapid increase in prices has made it difficult to determine what should be considered reasonable unit prices for such valuations. There has been a marked withdrawal of engineers from valuation work to construction work or other work in connection with the demands of war. The emergency rate increases needed to meet the sudden increase in costs of operation could not be postponed for complete investigation. And still another reason lies in the fact that in many cases the commission is familiar with the company's financial standing through previous rate investigations, accounting supervision, or supervision of security issues and cases of purchase and sale. Or if not that particular company, the commission has a practical knowledge of other similar companies to serve as a guide.

Recent Opinions as to Importance of Valuation.—The attitude of the various commissions may be shown by the following excerpts from recent opinions.

In the Queens Borough Gas & Electric Co. case, in which the company applied for increases in gas and electric rates, the New York First District Commission in an opinion rendered June 3, 1918, discussed the question of whether or not a valuation of the properties should be required. Referring to the making of an inventory, the ascertainment of proper unit prices, and examination to determine the present condition of the property and the extent of depreciation, the Commission said:

"All of these matters involve controversial elements which mean delay and mean expense; and after all, proof of present reproduction cost, with or without deduction of depreciation, is not an indispensable element in ascertaining whether the quantum of net operating revenue yielded by present rates and expenses affords to the company's investors an inadequate return upon that which the law and the constitution says an adequate return must be afforded. * * * In a time of war, there should be no avoidable expenditure of money, expert skill or materials, which does not serve the purpose of integrating these local agencies in the successful conduct of the war. To require the present depleted valuation staffs of the Commission or company engineers to bend their energies for several months to a reinventory and appraisal of this company's property, at a time when unit prices for construction work and materials are so abnormally high as to be misleading and of little aid in ascertaining 'value for rate purposes,' would seem to involve unnecessary delay, unnecessary expense, and undesirable diversion of labor and skill."

The New York Second District Commission said, in the Empire Gas & Electric Co. case (decided June 11, 1918):

"All parties to the controversy are to be congratulated and commended for taking such action as will enable this Commission to fix emergency rates without a prolonged investigation involving perhaps a valuation of the company's properties in each community and which would be conducted at a time when costs are shifting so rapidly that, whatever time might be taken as the basis of the calculation, the situation would probably be materially changed while the investigation was in progress."

The Illinois Public Utilities Commission determined rates in the Galva Electric Light Co. case (decided June 4, 1918) without a detailed and exact appraisal of the property being made. The Commission said:

"The valuation of the engineering staff is based upon the original cost of the property. This valuation does not purport to be an accurate valuation of the property and was made by the engineering staff without giving detailed consideration to the costs of each individual item of property. The reason for this method of valuation appears to be the emergency nature of the case and the evident desire to render an opinion as promptly as possible and still present data which represents with reasonable accuracy the property values. The engineering staff testified to its belief that a more careful valuation would not alter the results by more than 5%."

When a large number of applications for emergency increases had to be handled promptly this Commission prepared a questionnaire form which the applicant might fill out, submitting to the Commission the facts in outline regarding the operating revenue and expenses and general condition of the business as compared with the conditions prior to the marked increase in operating costs which were the direct cause of the application for rate increase.

There were many indications of a coming change in opinion, however, before these strictly emergency cases arose.

That the changes in conditions during the time which it would take to make a complete valuation might seriously affect the accuracy of the final figures, is taken into account by the New Jersey Board of Public Utility Commissioners in the New York Telephone rate case. The Board in a decision in that case rendered Nov. 20, 1917, said:

"Since the rates to be prescribed by order are to be operative in the future, it follows that, in the exercise of the power of regulation, past conditions and experience thereunder alone cannot be taken into account. The future and the conditions under which the rates prescribed are in fact to be applied must be considered.

"As was said by Justice Harlan in Smyth vs. Ames (169, U. S. 466), 'the probable earning capacity under particular rates prescribed * * * and the sum required to meet operating expenses are * * * matter for consideration.'

"Especially is this so; where, as here, a long period of time necessarily elapsed in making the inventory and appraisement of the property and in hearings, and consequently the data which form the basis of the exercise of the power relate to a date already some time in the past. In the meantime conditions have materially changed; annual taxes have increased; special war taxes have been and will be imposed; the trend of the cost of labor and materials has been substantially upward; and the proof, in fact, shows that operating expenses have been and are on a steadily ascending scale."

The Supreme Court of Pennsylvania said:

"The ascertainment of the fair value of the property, for rate-making purposes, is not a matter of formulas, but it is a matter which calls for the exercise of a sound and reasonable judgment upon a proper consideration of all relevant facts." (Borough of Ben Avon *et al. vs.* Ohio Valley Water Co.)

After discussing the valuation data submitted in the fare case of the Chicago, North Shore & Milwaukee Railroad Co., the Illinois Commission in an opinion under date of Sept. 5, 1917, said:

"Finally, it must depend upon the good judgment and impartiality of the regulating body which has before it all facts bearing upon the matter. In all proceedings of this nature there will always be found outstanding certain points which will serve as guide-posts by which the amount shall be determined that is fair both to the corporation and its patrons. More than this cannot be expected, and justice is satisfied if this be done."

The simplifying of valuation problems through continued regulation of accounts and capitalization is illustrated by the following New York and New Jersey cases.

In the New York & North Shore Traction Co. fare case, before the New York First District Commission, the records as to investment and return were unusually free from dispute for the reason that the company had been continuously subject to commission supervision. The Commission in that case (decided Jan. 7, 1918) said:

"The compactness and convenience with which it was possible to present the petitioner's case in this proceeding, and the absence of confusion or controversy as to the accuracy or significance of the items appearing in the various exhibits submitted to the Commission, may be ascribed almost wholly to the fact that the petitioner's financing, accountancy and operations, except in respect to the sufficiency of its depreciation reserve, have been conducted in conformity to the Commission's rulings and directions. In consequence, it was possible, with little difficulty, to present the petitioner's property costs, operating statistics, revenue needs, and the like, with complete fairness and clarity."

The New Jersey case referred to above is the New Jersey Northern Gas Co. rate case (decided Dec. 19, 1917) in which the Board said:

"In lieu of an inventory and appraisal, the company submitted a table showing its issue of bonds, the net proceeds therefrom and the amount of stock issued at par, which securities were issued under the authority of this Board. It does not necessarily follow, however, that a valuation made *ex parte* for the purpose of approving an issue of securities would be conclusive for purposes of developing a schedule of rates. For the purposes of this report, however, the difference will not be such as to affect the validity of the conclusions which may be arrived at."

Valuations in Capitalization and Sale Cases.—Valuations have been made by commissions in capitalization cases and in cases involving purchase and sale of utility properties. The commissions have held in such cases that the process of valuation is not the same as in a rate case: The purpose for which the valuation is made is controlling. But it would appear that under regulation there should be little difference between the value for a rate case and value as a basis for capitalization or purchase. The earning power of a utility would ordinarily have weight in fixing a purchase price, but the earnings are subject to modification by a commission's order. If the commission approves the purchase of a property at a higher value than the value upon which the company would be allowed a return in a subsequent rate case an injustice will be done. A similar circumstance would arise if securities were issued under commission approval on a larger basis than would be used in a rate case. Provision might be made for amortization of an excess value capitalized or allowed in a purchase case, or the buyer might be willing to pay a higher price for the property, expecting to improve the property by more efficient management and the working out of economies in operation, trusting that the commission would permit him to share in the resulting benefits. But, as a rule, the approval of a different and higher value in capitalization or purchase cases than in a rate case subjects the industry to an element of instability which is unnecessary under regulation.

There may continue to be cause for uncertainty in the determination of a proper rate base in cases where the company has been established long before commission regulation was instituted, but it is of greater significance to determine the attitude of commissions toward new capital which has been invested in these properties with their approval and where the company's accounts have been open to inspection and regular reports made to the commission. Any uncertainty as to the treatment of this new capital by commissions in rate cases will be reflected in the attitude of capital toward investment in the public utility field and will have much to do with fixing the interest rate which it is necessary to offer such capital for development and extension of these industries.

BASES OF VALUATION IN RATE CASES.

Earning Value.—Commissions have pointed out that earning value cannot be considered in a rate case, for the proceeding is for the purpose of determining what earnings are reasonable.

Market Value.—Market value is not available as a base in public utility cases, as properties do not change hands very frequently as a rule, and under regulation the usual considerations affecting a purchase price are modified by the very fact that the property is under regulation.

Original Cost.—The original cost of a property determined from actual company records or an estimate of original cost built up by the use of unit prices which were probably paid at the time the property was constructed may be used as the measure of value or one of the bases of value in a rate case. When regulation was first established it was seldom possible to find actual cost records. Properties had changed hands, and perhaps the present property was the result of consolidations and original records were not available, but with regulation continued over a considerable period, in the case at least of properties more recently established, complete cost data will be on record.

Present Value.—The present value of the property may be taken as a basis, judged by present-day prices of labor and material necessary in building up the property, the possibilities of development of the business in the field, the adaptability of the property as erected to serve the demands of the community, and the depreciated condition of the property. This value should reflect appreciation as well as depreciation.

Reproduction Cost New.—Lacking exact records, the commissions have built up estimates of the cost to reproduce the property. In some cases the aim has been to determine the cost of an identical property, in other cases the cost of a property planned to meet the present needs of the community. In some cases the estimate has been made using unit prices such as might have gone into the property at the time it was constructed, in others present-day prices have been used, while in others the prices used do not belong to any definite date but are averages covering a number of years.

Actual-Performance Method.—A basis called the actual-performance method was used in a recent case purporting to bring a new angle to bear upon the question of value. The method was used by the Pacific Telephone & Telegraph Co. in presenting cases before the Washington and Oregon Commissions. The Oregon Commission discusses the method as follows:

"The utility has strongly urged the acceptance of this theory, contending it is superior to the 'reproduction-cost method,' which, we believe, all will admit has not proven entirely satisfactory in its application when considered as a determining factor of value.

"The company maintains an elaborate system of cost accounting which is of particular value in investigations of this nature, and by reason of which it is enabled to present this 'Actual-Performance' estimate. Briefly stated, this estimate was made up by an analysis of the entire cost of doing work, including supervision, general and other so-called overhead expenses, as shown by the company's cost records over a period of years, from which analysis unit costs were derived. These unit costs were then applied to the various items of property as shown by an inventory of the system. In the case of land, studies were made to determine the cost of acquisition over and above the price paid the seller, and this cost was added to the value of each parcel as determined by appraisals made by real estate dealers and land appraisers.

"The result, the company contends, is not 'Original Cost,' neither is it 'Book Value,' nor 'Reproduction Cost,' but is rather an 'Appraisement on the Basis of Actual Performance' and presents 'an array of facts as distinguished from an array of opinion, expert or otherwise, that ought to be the recourse for constructive and efficient regulation.'

"The theory commends itself to us very strongly. It embodies many features which are lacking in the reproduction theory and, in a measure, meets many of the meritorious objections to original-cost figures. Taken in connection with original-cost statements and reproduction estimates, it supplies information which is of inestimable value in arriving at a correct solution of a problem which, at best, is surrounded with uncertainties and frought with technical considerations. We do not wish to be understood, however, as accepting this theory as a substitute for the reproduction method. Neither do we think it should supplant original-cost figures. It conflicts with neither, and we are inclined to view this new presentation rather in the light of a valuable addition to those theories which have been accepted as bases for the determination of values."

(*To be concluded.*)

ANOTHER UTILITY INSTALLING WIRELESS TELEPHONES.

The Public Service Co. of Northern Illinois is installing wireless telephones at its Blue Island and Joliet stations, the intervening distance as the crow flies being only about twenty-five miles. The two stations tie-in together and also are interconnected with the Fisk and Quarry street stations of the Commonwealth Edison Co.

The wireless system will have a radial power of about 100 miles, and will be used primarily during such times as the metallic telephone lines are out of service, due to weather or high-voltage system trouble.

Modern Electric Furnace Practice in Foundries

Advantages of Electric Furnaces — Acid Type of Furnace for Foundry Work—Comparative Operating Costs—Furnaces for Malleable Iron — Abstract of Paper Before A. S. M. E.

By W. E. MOORE

UP TO the present time the electric furnace has seen its largest commercial development, first, in the manufacture of aluminum; second, in the manufacture of steel; third, in the manufacture of ferroalloys, and fourth, in the manufacture of calcium carbide. At the end of 1913 there were only 19 electric furnaces installed in the steel-making industry in America. This number had increased to 136 at the end of 1916 and to 269 at the end of 1917. Now the number of steel-making furnaces in use in various industrial countries of the world is 815, of which 290 are in the United States and 45 in Canada.

The average capacity of these furnaces in America is 0.37 tons per heat for ingot furnaces, and 1.7 tons per heat for foundry furnaces, though the 3-ton size is now most generally used in foundries. More than 99% of all the steel-making furnaces are of the arc type, less than 1% being of the induction type, which was popular in the early days of the art.

Electric furnaces are used for the following principal purposes in the metal industries:

(1) Forging steels, tool steels, alloy steels, etc.

(2) Making steel castings in foundries.

(3) Making high grades of strong cast iron for difficult or fine castings.

(4) Melting brass, bronze and other nonferrous metals.

Properties of Electric Steel.

Primarily, electric steel became popular because of its superior physical properties. While such steel can be made with a more satisfactory chemical analysis, using a given grade of raw materials, than by other processes, experience has abundantly demonstrated that when made according to the same chemical analysis electric steel will have about 15% greater tensile strength or ductility, depending upon its heat treatment, and that it is more resistant to shock and better able to receive heat treatment. The reason for this is that the steel, being made in a closed furnace and in a reducing atmosphere away from the contaminating influences of combustion gases, is more solid, freer from gases and less prone to non-metallic inclusions of slag oxides.

TABLE 1.—COMPARISON OF OPEN-HEARTH AND ELECTRIC-FURNACE STEEL.

	Open-hearth furnace.	Electric furnace.
Elastic limit, lbs. per sq. in....	41,060	64,850
Tensile strength, lbs. per sq. in.	89,100	105,140
Per cent elongation in inches..	21.5	22.0
Per cent reduction of area.....	31.74	52.37
Elastic torsion	16,750	33,700
Character of fracture..........	Granular	Silky cup

As an example, the tests in Table 1, made by R. W. Hunt & Co., Chicago, Jan. 30, 1919, for the Chicago Surface Lines, illustrate the physical properties of A. E. R. A. specification heat-treated electric-furnace axle steel. It was heated from 1450 to 1460 deg. F. held 1 hr., quenched in 65-deg. oil, drawn from 1185 to 1200 deg. F. for 1 hr. and then slowly cooled in the furnace. The open-hearth steel was also heat-treated in the same manner.

The Bureau of Standards reports regarding the superior qualities of electric steel as follows: The characteristics of electric steel are great homogeneity and freedom from segregation. It is somewhat higher in tensile strength and elastic limit than other steels, and, owing to its greater density, shows a marked resistance to fatigue.

Being absolutely "dead" when properly made and averaging lower in sulphur, electric steel in the foundry is less liable to show shrinkage cracks between ribs of castings, and, being more fluid, it is not so liable to piping, blowholes, cold shuts or misruns, and in tool steel it takes heat treatment more effectively and will stand greater abuse in heating.

The electric furnace is especially useful for making alloy steels. Since the metal is treated in a reducing atmosphere, there need be no large losses of the added elements, such as silicon, manganse, vanadium and chromium, which in the ordinary open-hearth practice are oxidized in large quantities and carried to waste in the slag, thus producing uncertain mixtures. Indeed, the added elements in open-hearth practice frequently show losses of from 30 to 50%, while in the electric furnace they will be practically nil.

With the electric furnace it is much easier to carry the finishing operation to a more exact limit in carbon and silicon content than is practicable in the case of the open-hearth furnace. Gases of solution and inclusion (oxygen and nitrogen) are eliminated.

Electric Versus Open-Hearth Furnaces.

In open-hearth furnaces it is impracticable to melt down fine scrap, such as turnings in quantity, without excessive additions of pig iron, for the reason that the oxidizing flames, which furnish the heat to the furnace, will reduce the metal when in an attenuated form to a mass of oxide before it becomes molten, whereas with the electric furnace it is entirely practicable to melt turnings exclusively, which, under ordinary market conditions, are purchasable at a price from $5 to $10 per ton lower price than that for the heavy melting grade of steel required in open-hearth practice.

In the electric furnace it is possible to obtain a heat-transfer efficiency of from 60 to 70% of the heat energy of the electric power supply put into the molten charge, whereas with open-hearth practice the efficiency ranges from 8 to 15% and in a crucible practice from 2 to 6%. The fuel-developed heat unit of the open-hearth furnace is, however, bought in a much cheaper form than the heat unit supplied by electric power, and if the electric furnace did not have the other advantages mentioned it could not at present compete against the open-hearth furnace on the basis of cost.

On account of the very intense heat of the electric arc, it is entirely feasible to melt down and refine a charge of foundry steel in 1 hr. or less which in the open-hearth furnace might require from 6 to 14 hrs. In other words, a 12-ton electric furnace may be practically equivalent to an 80-ton open-hearth furnace, so far as steel output is concerned, and involve far less installation cost.

The Arc Type of Electric Furnace.

The arc type of electric furnace is practically the only one being installed for steel making today, although induction-type furnaces are in use. The induction-type would appear to have advantages over the arc-type furnace, but practice has shown that it is in no way a competitor of a proper constructed arc furnace. In large sizes the power-factor is low, the efficiency poor, and the cost of replacing the refractories high.

Arc furnaces may be classified into long-arc and short-arc types. There are many theoretical inducements for using the long-arc furnaces. With a given energy input, the electrode is correspondingly smaller and the electrode cost therefore reduced proportionately. With the water-cooled bottom-contact type of furnace either the furnace size must be kept small or the voltage must be increased in order to keep the current low and prevent that form of contact from overheating; hence, it is the custom to operate the bottom-electrode furnace with a long arc and low current, and in small sizes only.

Arc furnaces may again be classified into single-phase, two-phase and three-phase types. The single-phase furnace is ideally simple, but is poorly adapted to modern power-plant conditions, as central-station power is universally generated and transmitted at three-phase. The long-arc single-phase furnaces have the disadvantage of operating on low power-factor, thus causing waste in transformer, line and generator capacity, which usually makes them prohibitive from the central-station man's viewpoint in any but small sizes, say, 1/8-ton to 1-ton capacity per heat.

The two-phase furnace may be operated from either a two or three-phase source of supply. When operated from the latter it is necessary to use Scott-connected transformers, which are slightly more expensive and inefficient than ordinary transformers. The two-phase furnace is usually built with four arcing electrodes and, while it gives a theoretically balanced load on the power system, it has the objection of requiring an additional electrode, which increases the electrode consumption 33% over the three-phase furnace.

For installations of moderate and large size the three-phase is the most satisfactory, fulfilling all the conditions as to balanced load and high power-factor required by the central stations, at the same time giving the minimum electrode loss and the simplest form of automatic electrode-adjusting gear.

It is possible to obtain satisfactory operation of the direct-arc-type furnace for melting nonferrous metals only where the content of metals which volatilize at low temperatures is small, as, for instance, in making bronze and low-zinc metals. Where the zinc or aluminum content is high, as in yellow brass, Muntz metal, etc., this type of furnace is unsatisfactory and results in great waste of the more volatile metals and the making of porous castings. Consequently special furnaces of the resistor, rocking, rolling, tumbling

Electric Furnaces in Foundry of Standard Steel Co., Hammond, Ind.

induction or distributer-arc types are required, the latter referring to furnaces in which the heat of the arc is transmitted by radiation alone.

Disadvantages of Crucible Furnaces.

The crucible furnace was first used for making steel castings and high-grade tool steels. However, it is now being displaced by the electric furnace, which has the advantages of rapidity of operation, reduced cost and the ability to make sounder castings and better tool and alloy steels. Due to the absorption of carbon from the crucible, it is difficult to make castings low enough in carbon to obtain the ductility desired for many purposes. Furthermore, the steel reduces the silica from the clay of the crucible, tending to run the silicon content of the product high. The overpowering objection to the crucible process, however, is the high cost of the products, due to (1) high cost of pure melting stock, as no refining is practicable; (2) high labor cost on account of the small heats handled; (3) extravagant fuel consumption, sometimes using 3 tons of coal per ton of steel; (4) high cost of crucible renewals, often averaging two to four crucibles per ton melted, and costing $9 to $11 each, or $18 to $44 per ton. For these reasons the crucible process is being discontinued for castings as well as for tool steels.

The Converter Process in Steel Founding.

During recent years the side-blow converter process has become popular in steel foundries making castings of medium and small size. This process requires high-grade, high-silicon, low-phosphorous and low-sulphur pig iron to be melted in a cupola furnace with the finest grade of coke obtainable. The advantages of the converter process are: The steel may be made fluid enough for reasonably thin castings; the heats, usually running 1 to 2 tons, are of convenient size to be poured off quickly before cooling; the fuel consumption is moderate, averaging from 400 to 600 lbs. of coke per ton; the first cost of the apparatus is low, and the process is available for intermittent service.

The disadvantages are: The metal must be handled twice in the ladle; the metal picks up sulphur and phosphorus and nitrides from contact with the fuel and the air blast; the losses in the cupola and converter are quite high, running from 16 to 24%, further concentrating and increasing the percentages of impurities in the original metal and wasting costly melting stock; the steel is full of oxides and gases and requires large quantities of expensive ferroalloys to kill; the quality of the steel physically, as well as chemically, is below par; a heat once blown too cold cannot again be brought up in heat enough to cast and must be "pigged"; only the highest grades of melting stock may be used, costing generally $15 to $25 per ton more than for the acid open-hearth furnace and $20 to $35 per ton more than for the electric furnace; and the refractory maintenance is high, as the cupola and converter linings must be repaired after each 10-hr. run. Liquid-metal costs of converter steel frequently run up to from $60 to $80 per ton.

The electric furnace is the most modern steel-producing agency and is gaining in popularity more rapidly than all others. It is the most compact furnace, and the rapidity with which it will melt down cold charges adapts it splendidly to the making of steel castings as well as forgings and tool steels. It is the cleanest and most certain method of making steel, and its small bulk makes it feasible to locate the furnace near the center of the floor where the metal need be transported short distances only.

Acid-Type Electric Furnace for Foundry Work.

The acid-type furnace is best suited for foundry work and the most popular size has a capacity of 3 tons per heat, though sometimes 1.5-ton or smaller furnaces are required. The more highly powered and rapid furnaces for such work turn out from 8 to 16 heats in 24 hrs. with a power consumption of from 500 to 650 kw-hrs. per ton of liquid steel. Taking the consumption of large turbogenerators now used in central stations at, say, 1.5 lbs. of coal per kw-hr., the fuel consumption of the acid-type electric furnace may be said to be equivalent to from 750 to 900 lbs. of coal per ton melted, and the coal need not be so high grade or low in sulphur and phosphorus as that necessary with fuel-fired furnaces. Basic furnaces require more time and power, heats ranging from four to eight per day, and since the charge is melted in a reducing atmosphere there is practically no oxidation of the metal; consequently thin scrap, light turnings or scrap of other forms that can be conveniently charged into the furnace, may be melted. Such scrap now sells for approximately from $5 to $10 per ton less than low-phosphorous, heavy melting scrap necessary with the ordinary acid open-hearth melting-furnace installation.

The furnace atmosphere, being of a reducing nature, makes it easier to refine and kill the steel, resulting in a saving amounting frequently to half of the ferroalloys necessary with converter steel, effecting a saving of, say, $2 per ton. The melting losses in the electric furnace are much the lowest of any modern process, averaging from 2 to 5 per cent as against 6 to 9 per cent in the open-hearth and from 16 to 24% in the converter process.

The electric furnace does not contaminate the metal as do fuel-heated furnaces and an acid electric will therefore readily make No. 3-U.S.A. specification steel, whereas it nowadays is practically impossible to find melting stock sufficiently pure to do so with the converter process. The saving alone in the cost of melting stock will more than pay for the entire conversion cost of electric steel. The greatest points in favor of the electric furnace are the much higher grades of steel produced and the higher percentage yield in castings and bars.

Comparative Costs of Electric and Converter Steel.

With the electric furnace, men can more readily make and check their steel to an exact percentage of carbon, manganese and silicon and can more easily keep the undesirable sulphur and phosphorus to lower limits than by any other process. The steel may be readily alloyed with nickel, chromium and vanadium to make the higher grades of steel castings to replace forgings and for special purposes such as may be required for cutting tools or parts of unusual strength and ductility. It is entirely feasible to make castings which will run up to an ultimate strength of 130,000 lbs. per sq. in., or to cast high-speed-steel milling cutters and reamers to form for grinding. The figures in Tables 2 and 3 show present-day comparative operating costs for liquid steel in the ladle under favorable conditions such as in a steel foundry under operation 24 hrs. per day.

Reports of a recent test of cupola iron shows a transverse load of 2950 lbs. with a 0.10-in. deflection in a standard arbitration test bar. After treatment for 25 mins. in an electric furnace, using 104 kw-hrs. per ton, a similar bar was cast and broke at 4400 lbs. with a 0.115-in. deflection.

Good results have been obtained with malleable iron made by treating cupola metal or by melting cold scrap in an electric furnace. The ability to refine for sulphur and phosphorus and to add ferroalloys to adjust the mixture to the proper malleabilizing formula, together with its rapid operation, give the electric furnace a decided advantage in malleable-iron foundries, particularly in working on high-phosphorous southern irons.

TABLE 2.—AVERAGE COST PER TON FOR TWO TONS OF CONVERTER STEEL DIVIDED INTO FOUR CUPOLA CHARGES.

(Two-ton Converter Charge.)

	Cost per ton of liquid steel.
Low-phosphorous pig iron	$14.09
Bessemer pig iron	7.89
Steel scrap	10.14
Silicon and spiegel	5.55
Coke, 863 lbs	1.01
Cost of material per ton of liquid steel	$38.68
Additions per ton of steel:	
10 lbs. 80% ferromanganese at 6 cts	$ 0.60
6 lbs. 50% ferrosilicon at 5 cts	0.30
2 lbs. aluminum at 30 cts	0.60
Power for blower motors	1.25
Cost of materials and power per ton of liquid steel	$41.43
Average cost of cupola and converter linings	1.20
Labor costs	3.00
Cost of converter steel per net ton in ladle	$45.63

TABLE 3.—AVERAGE COST PER TON FOR THREE-TON ACID-LINED, RAPID-TYPE, POLYPHASE, ELECTRIC FOUNDRY FURNACE STEEL.

(Three-ton Electric Furnace Charge.)

	Cost per ton of liquid steel.
Axle turnings (included above 3% losses, 200 lbs.)	$12.40
Mill scale (included above 60% losses, 60 lbs.)	0.09
Electrodes at 7 cts	1.40
1650 kw-hr. (550 per ton) at 1 ct. per kw-hrs	5.50
Losses in melting 260 lbs.:	
80% ferromanganese	0.40
50% ferrosilicon	0.25
Aluminum at 30 cts	0.15
Cost of material per ton of liquid steel	$20.19
Average cost of linings and roofs	0.40
Labor cost on furnace attendance	1.00
Cost of electric steel per net ton in ladle	$21.59

In the non-ferrous-metal industry the electric furnace has shown remarkable economies, due to the saving of cost of crucibles and the greatly reduced metal losses caused by oxidation and volatilization. For such work special types of furnaces designed to avoid localized heating are necessary.

Selection of an Electric Furnace.

As to the most suitable type of electric furnace for a given installation, if the scrap be inferior and high in sulphur and phosphorous, then the extra cost, slower operation and shorter refractory life of the basic furnace must be endured to obtain the lower limits of sulphur and phosphorous not practicable to reach with the acid furnace using poorer grades of scrap. At present the call is for acid-lined furnaces, and cheap, good scrap is available in large quantities for foundries and basic furnaces for alloy and tool steel. The acid furnace is simpler, cheaper and faster to operate and the steel casts more easily, while the basic furnace is essential for tool steels.

In any case it is recommended that a furnace be so designed and constructed that it is adaptable to basic operation. This means that the furnace shell must be of large diameter and the bath shallow and of large area. The furnace should not, it is thought, be of the long-arc type, nor of the small-diameter, deep-bath type if the best and most rapid work is contemplated. Indeed, even for acid melting there is a noticeable difference in the quality of the steel obtained from the large-diameter, shallow-bath furnaces compared with that made in the deep-bath-type furnace, for with the latter it is not feasible to obtain the same mechanical reactions from the additions put in to refine and kill the steel as when the bath is of the shallower type. Nor is it possible to deoxidize the metal so thoroughly by maintaining a reducing atmosphere in the furnace.

It is quite important that the furnace should operate at the highest practicable power-factor that can be obtained without undue disturbance of the power company's load, for by so doing the electrode, transformer, line and generator losses are maintained at a minimum. Engineering skill of a high order is required to forecast and select the best type of equipment under the many varied power-supply conditions which obtain in different localities.

By reason of the now generally acknowledged superior quality of the product, greater flexibility of operation, quicker and more convenient size of heats, and saving in alloys and in cost of melting stock, the electric furnace is rapidly coming to the front in the steel foundry and alloy- and tool-steel works wherever suitable power is available and progressive policies are in vogue. It is making possible the profitable operation of widely distributed small steel foundries to an extent not generally realized and greatly reducing the investment cost required in tool-steel works.

INVESTIGATION TO BE CONDUCTED OF FATIGUE OF METALS.

Joint Research to Be Made at Engineering Experiment Station of University of Illinois.

An investigation of fatigue phenomena in metals under repeated stress has just been started under the joint auspices of the National Research Council, Engineering Foundation, and the Engineering Experiment Station of the University of Illinois. The Engineering Foundation is providing $15,000 a year for two years for this investigation and the Engineering Division of the National Research Council is acting in an advisory capacity, largely through its Committee on Fatigue Phenomena in Metals. The experimental work is being done in the laboratories of the Engineering Experiment Station of the University of Illinois, under the immediate direction of Prof. H. F. Moore, research professor of engineering materials and chairman of the committee above mentioned.

Plans are laid for a two years' program of tests, and apparatus and material are already arriving for the tests. It is hoped to secure a considerable amount of data on tests of various metals, including a number of tests of each metal to 100,000,000 reversals of stress. It is hoped to study the various short-time physical tests which are used for metals—such as the impact test, magnetic analysis, and short-time bending tests—to see whether any of these tests give reliable indices of the ability of the metal to resist fatigue under millions of repetitions of low stress. It is hoped that some reliable commercial test for this important property may be developed by this investigation.

A test party of four or five persons is being organized and the University of Illinois is fitting up a special laboratory with about 2500 sq. ft. of floor space for the use of this investigation.

Records of Lamp Service in a Large Park System

Lamp Record System Used by the Electrical Department of Lincoln Park Proves Simple and Discloses Interesting Facts Not Only on Lamp Life But Often Also on Apparatus Trouble

By C. H. SHEPHERD

Electrical Engineer in Charge, Electrical Department, Commissioners of Lincoln Park, Chicago.

To secure satisfactory operation and maintenance of lighting systems for streets, boulevards and parks, for which large, high-efficiency lamps are used, it is necessary to keep complete service records of all lamps installed in order to check the actual average life of the lamps against the guarantee and to determine other important engineering data relating to these units in actual service.

Fig. 1.—Lamp Record Card for a Typical Lighting Post—Reverse Side Gives Explanatory Notes and Supplementary Data.

Close co-operation between the operating and maintenance departments is needed in order to keep such records, but if the record system is not complicated and if the entries on the records are properly systematized so that each man is required to keep only his particular part of the record, a matter that need take only a very small part of his time, the keeping of the records can be made largely automatic. The various parts of the records, although each is made out by a different man, can be easily correlated and made to fit together so that a recapitulation of the complete record can be quickly prepared at the end of each month or year or both, as desired. Each card, sheet or other part of the record system should be kept on file as a check in case any discrepancies are discovered later, but the likelihood of serious errors should be small with a system that is properly conceived.

Outdoor Lighting of the Lincoln Park System.

Before describing the lamp record system of the Electrical Department of the Commissioners of Lincoln Park, the following particulars of its outdoor lighting may be of interest. The Lincoln Park system includes Lincoln Park—the best known large park in Chicago—and five small parks (Lake Shore, Seward, Stanton, Hamlin and Welles), the total area aggregating 630 acres; besides these six parks there are over 22 miles of boulevards, including on the south the world-famous Lake Shore Drive with its connection with Michigan Boulevard, and on the north Sheridan Road connecting with the North Shore suburbs.

For outdoor lighting there are in use 1561 type C Mazda 400-cp., 15-ampere lamps, operating on 18 series, 7.5-ampere, 60-cycle circuits, each with its individual transformer and regulator. For special lighting of bathing beaches, monuments, etc., there are about 300 large-sized special multiple lamps and floodlights ranging from 1000 watts down. The inside lighting comprises about 6500 outlets of various sizes. All the lighting circuits run underground from a centrally located substation in Lincoln Park where energy is received from the hydroelectric system of the Sanitary District of Chicago.

All of the series lighting was formerly done by means of arc lamps, which were changed over to the present type beginning in 1914. The results obtained from the series incandescent units have amply justified the change, the saving in operating costs having paid the cost of the change several times over. The

Fig. 3.—Recapitulation of Life Data Covering 4 2/3 Years.

rejected, the good ones being placed in storage and drawn out as required for replacement.

When a lamp is placed in service it is designated by the location of the particular standard on which it is placed and recorded on the record card No. 1, which is shown in Fig. 1. On the face of this card is recorded information covering the location, circuit, make, size, filament and salient dates of the installation, while on the back of the card are recorded the electrical data on the compensator or transformer serving this particular lamp, including the ratio of transformation of the unit, the primary reactance, etc. This card is held on file until the lamp burns out or is replaced for any other reason, at which time the closing entries are made on the same line of the card.

All burnouts are recorded on the outage report shown in Fig. 2, which is filled out daily, first by the patrolman, who records the outage, and later by the trimmer having charge of the particular district where the burnout occurs, who records the replacement. These records are made out in duplicate, the original remaining on the operator's file, the copy being taken out in the morning by the trimmer and returned in the evening as part of his daily report. From this report, the operator completes the filling out of the record card, Fig. 1, after obtaining the data on the life of the lamp.

The figures covering the data on the life of the lamp naturally depend on the length of run of the circuit on which the lamp is operating and the length of run, in turn, depends on the time of cutting in and cutting out the circuit each day. This time is entered each day on the daily substation load record, together with such other data as may affect the question. From this record, known as No. 3, the daily length of run is entered on the monthly trimming schedule, No. 4. From the first to the last day of each month, the daily length of run is recorded and a progressive total carried through for each month on the length of run of each particular circuit. Knowing the date of installation of any lamp, and the length of run of its circuit, from that date to the time the lamp is renewed, month by month and also daily, it is apparent that it is a comparatively simple matter to figure up the life of any lamp. The date of renewal and the life of the lamp in hours are then entered on the lamp card, together with the data on the replacing lamp, after which the whole process starts all over again.

Valuable Facts Incidentally Disclosed by the Lamp Records.

While the above processes may, at first sight, appear to be more or less complicated, still the operation of this or any similar system becomes a matter of routine as the men doing the work become more accustomed to it. It has been found that the recording of the performance of each and every lamp, compensator and transformer often results in the discovery of irregularities which would otherwise result in serious losses and which might run on indefinitely before being found out. The equipment necessary to carry on such a system costs very little, the time required to carry it on is dovetailed into the work of the various men in such a way that their other duties are not injuriously affected, and the results obtained more than justify the expenditure from any point of view.

In order to illustrate the nature of the life data obtained from the actual workings of this system, there is presented herewith an annual summary, Fig.

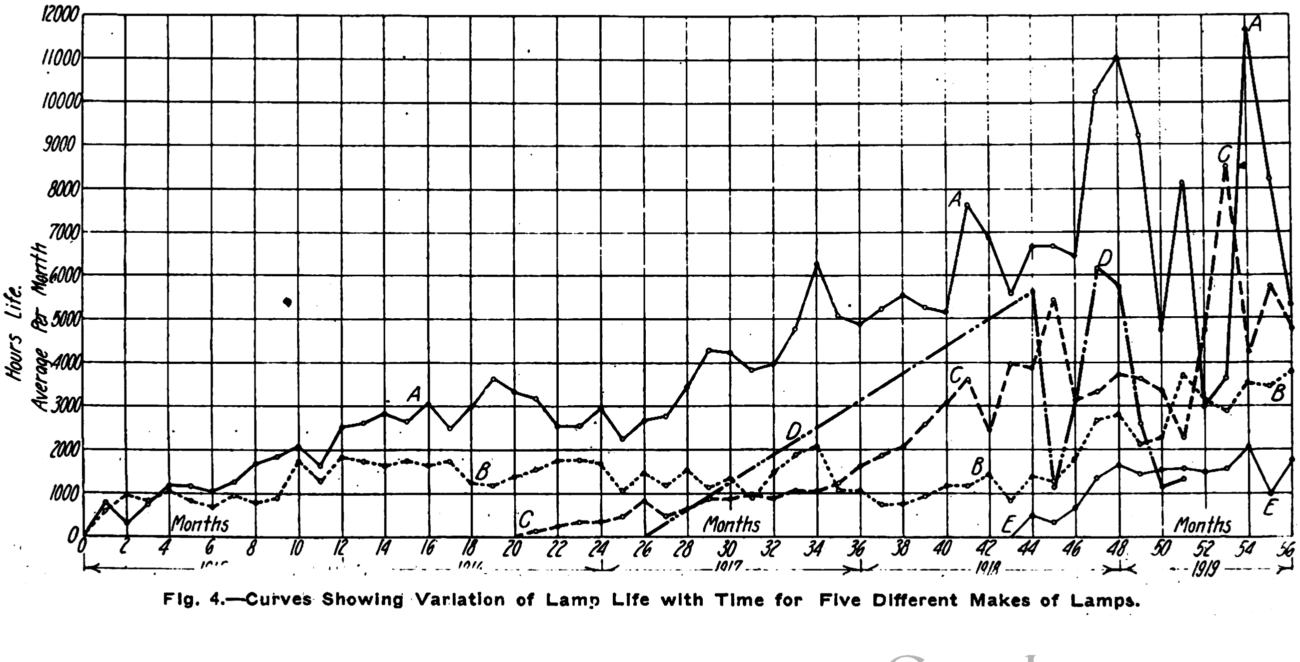

Fig. 4.—Curves Showing Variation of Lamp Life with Time for Five Different Makes of Lamps.

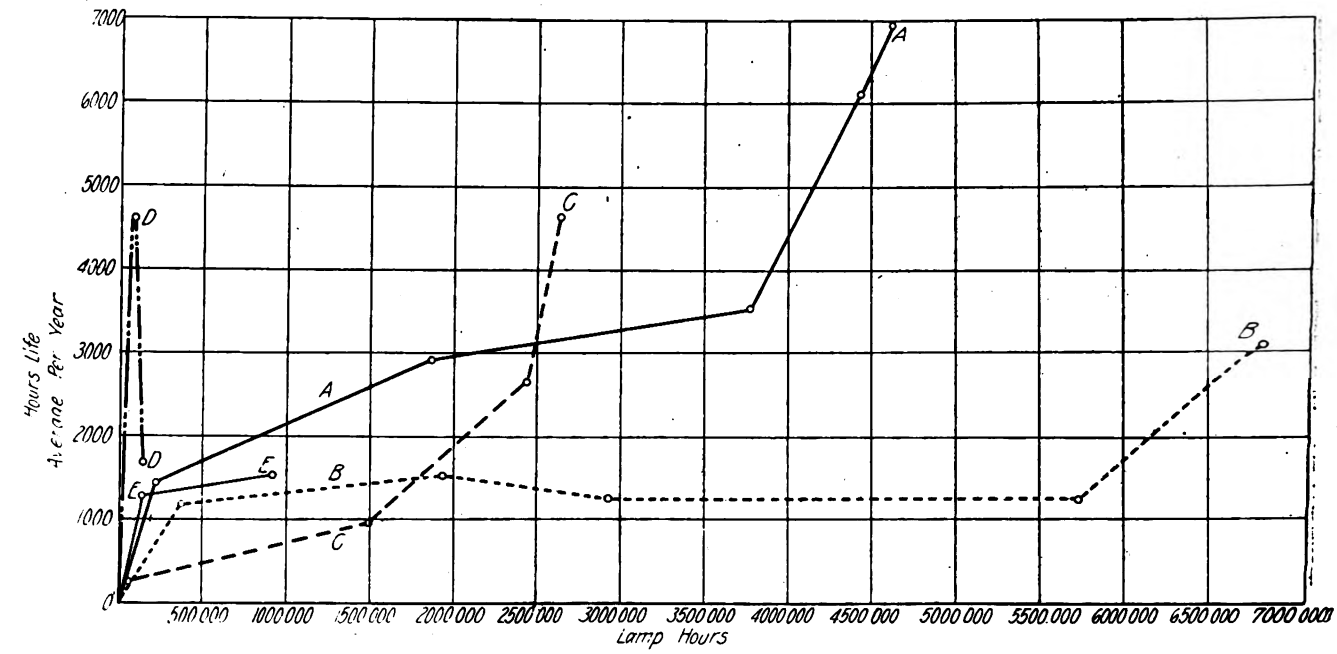

Fig. 5.—Curves Showing Variation of Lamp Life with Increase in Lamp-Hours.

3; from this and the progressive totals covering the number of lamps used, and the corresponding lamp-hours the average lamp life in hours is obtained. The various makes of lamps are designated by the letters *A, B, C, D, E.* From an inspection of the various figures it is evident that the presentation of these data in graphical form would show a number of points which might serve to further the analysis of the subject. For any given make of lamp, assuming a certain number installed and in operation, the short-life lamps of course burn out first as may be seen from the dates, average life and number of burnt out in any given period, under the same conditions. Since the lamps in question have been operated on circuits running all night, or approximately 4000 hours per year; half night, or about 2200 hours per year; and alternately all night and half night, or about 3100 hours per year, all ordinary conditions of operation are represented, all of which tend to maintain a true average. The increasing life under continued operation is also very evident, as well as the variation in periodical burnouts. The record of lamp-hours during any given period supplies a stable basis in the determination of unit costs. Knowing the cost per lamp, the calculating of unit and total costs is facilitated.

Apparatus Troubles Detected from Records—Switching Seems to Affect Lamp Life.

The keeping of apparatus records in conjunction with the lamp records offers an easy method of checking the performance of this apparatus and provides a sure and ever-present indication of any trouble occurring and, in many instances, about to occur on such equipment.

An interesting point which was discovered in analyzing the life records is that in a preponderant number of cases lamps installed on the same date on circuits operating all night, half night and alternate, will not give the same life but will burn out on approximately the same date. This would seem to indicate that the life of a lamp of this kind depends to a larger extent on the number of times the lamp is cut in and cut out perhaps than on the number of hours of actual operation.

Records of this nature are capable of extensive analysis, the amount of which depends on the time available for devotion to the subject. The fact that these records are those of actual operation, under any and every kind of operating condition, makes them especially valuable as an adjunct to the results obtained in the laboratory.

In order to illustrate the variations of lamp life with time and with lamp-hours for the five different makes of lamps used, the curves of Figs. 4 and 5 were plotted, giving a complete graphical record of operation of the units in question for a period of 4 years and 8 months. The seasonal variations are very apparent in the time curves and the plotting of lamp life against lamp-hours (Fig. 5) produces a criterion upon which true judgment of the performance of any lamp may be based. Fig. 3 gives a tabular summary of the lamp-life data of the five makes of lamps used since the beginning of 1915.

REGULATING APPARATUS FOR ELECTRIC RAILWAYS.

A meeting of the Pittsburgh Section of the American Institute of Electrical Engineers was held Dec. 9 at which a paper on "The Power Indicating and Limiting Apparatus for the Columbia and Coast Divisions of the C., M. & St. P. Railroad" was presented by B. H. Smith of the Westinghouse Electric & Manufacturing Co. The paper, which was illustrated by lantern slides, dealt with a new design of apparatus which enables the regulation of the load on 200 miles of electrified road and enables the dispatcher to read at one point the totalized power consumed.

ELECTRICAL CREDIT ASSOCIATION POSTPONES MEETING.

The twenty-fourth annual meeting of the Electrical Credit Association of Chicago, scheduled to be held at the Hotel LaSalle, Chicago, Dec. 11 and 12, was postponed indefinitely on account of conditions brought about by the coal strike. When another date is set for the meeting notices will be sent out by Frederic P. Vose, secretary of the association.

WAR DEPARTMENT'S POLICY RELATIVE TO EXPORT OF SURPLUS SUPPLIES.

Domestic Orders Being Given Preference Over Those from Abroad—Machine Tools Being Sold Here and Also Exported.

The United States War Department authorizes publication of the following statement from the office of the director of sales:

In view of concerted attempts made by certain industries to divert particular surplus stocks of war materials from the domestic to the export market, the director of sales takes this opportunity to state briefly that the sales policy that controls disposition of surplus supplies for foreign consumption.

Full and adequate opportunity is afforded the American public to acquire the surplus supply of each and every commodity and material held by the War Department before attempt is made to dispose of any part of the surplus for export purposes. The export market is developed only for those surplus stocks the supply of which exceeds the quantity that the domestic market is capable of consuming, or for which, because of the manner of manufacture, there is no demand except that existing in foreign markets.

In offering its surplus war materials for sale to foreign governments or peoples, the War Department does not extend to the foreign buyer any terms of sale which are not afforded domestic consumers, except, in a few instances, a period of credit. The exception as to credit is not made to any foreign buyer who purchases with a view to reselling at a profit, but is granted only to distributing agencies which, set up for relief purposes and acting under governmental sanction, provide a channel through which the commodities or materials may reach the ultimate consumer.

The disturbed state of labor and unseasonable weather have seriously curtailed the production of raw materials in the United States, with the result that stocks of both raw and finished products are extremely low in the nation's primary markets. As a consequence, the domestic demand for practically all of the surplus war materials held by the War Department is so strong as to make domestic offers for these stocks more attractive than those which are being received today from foreign countries.

My attention has recently been invited to the pressure that is being brought by members of the National Machine Tool Builders' Association upon members of Congress to have the legislative branch of the Government direct the War Department to attempt to market as large a part as possible of its surplus of machine tools in European countries.

The War Department has a large stock of surplus machine tools. It is attempting to market these tools to the best advantage of the Government and, with this object in view, is offering machine tools for sale both at home and abroad. By contract, dated Sept. 5, last, it sold to Belgian manufacturers, in whose interest the Belgian Government had established considerable credit through American financiers, more than 2500 machine tools, which are now being selected by Belgian representatives and put in transit; it is negotiating with the French Government for the sale of an additional large number of machine tools held by the War Department in the United States. But there is a strong demand on the part of American users of machine tools for certain types of tools of which the War Department has a stock. The American manufacturers need these tools to increase their production and enhance the wealth of the nation. They are willing to pay good prices for those which they desire to acquire. The War Department stands ready to sell its surplus stock of machine tools to these domestic users. It is filling its machine-tool orders in the sequence of their receipt. No machine tool is being held off the market to be applied upon the Belgian contract.

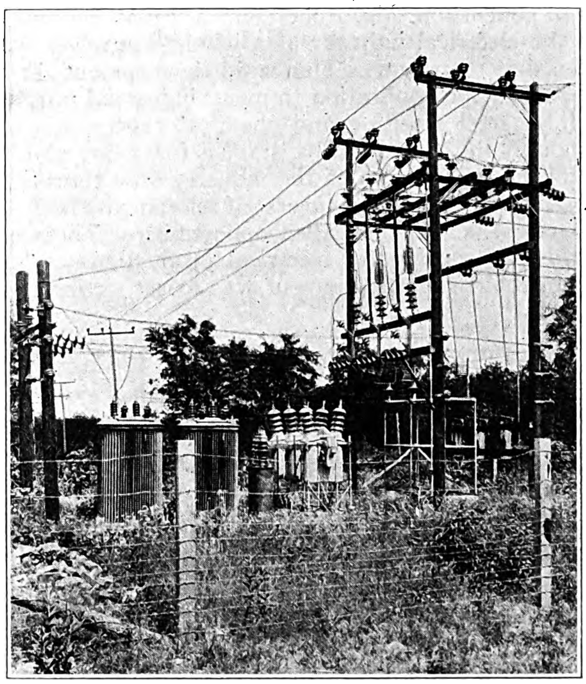
The surplus supplies held by the War Department were acquired with funds furnished by the American people; the War Department proposes to give the American people the opportunity to derive any benefits that may inure to them through the sale of these surplus stocks.

OUTDOOR SWITCHING AND SUBSTATION FOR 33,000 VOLTS.

The outdoor substation installation shown herewith taps a transmission line supplying power to a small town and also controls a 33,000-volt three-phase feeder line to another town at which point a second stepdown substation is located.

A rack near the top of the station supports the three-pole feeder switch and also a three-pole switch controlling two 200-kv-a. 33,000-2300-volt transformers connected in open delta. These switches are operated from ground level by means of an interlocked mechanism with locking type handles. The choke coils are suspended directly in the vertical bus leads, separately mounted horn-type lightning arresters being connected just ahead of the coils.

Overload protection is secured by means of an automatic oil switch and ahead of this are installed



Economical and Simple Construction for 33,000-Volt Outdoor Substation and Switching Center.

three fuses so rated that they will operate only in case of oil-switch failure. This type of installation has many advantages, as it is simple in construction and has a low cost per kilovolt-ampere.

For the above information and illustration we are indebted to H. W. Young, president, Delta-Star Electric Co., Chicago, Ill.

BRITISH ENGINEER ON THE ELECTRICAL OUTLOOK IN GREAT BRITAIN.

Expenditure of $500,000,000 for Construction of Power Stations in United Kingdom Within the Next Five Years Predicted.

J. A. Robertson, addressing the North-Western Center (Manchester, Eng.) of the Institution of Electrical Engineers, of which he is chairman, said it was likely that within the next five years a sum of not less than $500,000,000 would be expended in the United Kingdom upon the construction of new power stations and transmission lines. He said that a small fraction of this amount, say, one-fourth of 1%, expended immediately on research work would prove a thoroughly sound investment. There was still much investigation required regarding the properties of insulating materials for high-pressure cables and generating plant, the corrosion of turbine blading, protective devices for high-tension systems, switchgear to deal with pressures up to 50,000 volts, and many similar problems. Mr. Robertson gave the present cost of super-power station construction as $100 to $110, as against $35 to $40 per kilowatt installed a few years ago; a corresponding increase had taken place in cost of material for and construction of transmission lines.

Referring to legislation, the chairman described the Electricity Supply Bill, which was before the British House of Commons for three days in the last week in November, as by far the most important event in the history of the British electricity supply industry. It was bound to exercise an enormous influence on future developments.

In conclusion, Mr. Robertson said that the outlook for the electrical industry as a whole was never more promising than now. The rapid development during the war of the application to many industrial purposes such as steel smelting and chemical processes which were only in the speculative stage a few years ago had established the future of the industry on a thoroughly sound basis. Manufacturers of electrical plant and apparatus had an unrivalled opportunity. The whole world was waiting for electrical productions and the great problem of the moment was to secure increased output.

ACTIVITIES OF THE SCHOOL OF ENGINEERING OF MILWAUKEE.

The School of Engineering of Milwaukee, Wis., now has 72 members on its faculty board, or more than twice as many as a year ago. It has increased its buildings by the addition of two and its courses by the addition of three. An illustrated description of the electrical courses at this school appeared in the ELECTRICAL REVIEW of March 23, 1918.

The recently organized School of Engineering Branch of the American Institute of Electrical Engineers broke all records for attendance at its first meeting, there being 241 present. This seems to exceed all recorded attendances for initial meetings of similar branches. The school has over 100 fellow members and associates enrolled in the Institute and 257 student members in the student branch. At the meeting referred to Dean John D. Ball presided. W. M. White, consulting engineer of the Allis-Chalmers Manufacturing Co. and president of the Milwaukee Society of Engineers, delivered an address on the subject of "Hydroelectric Development in America."

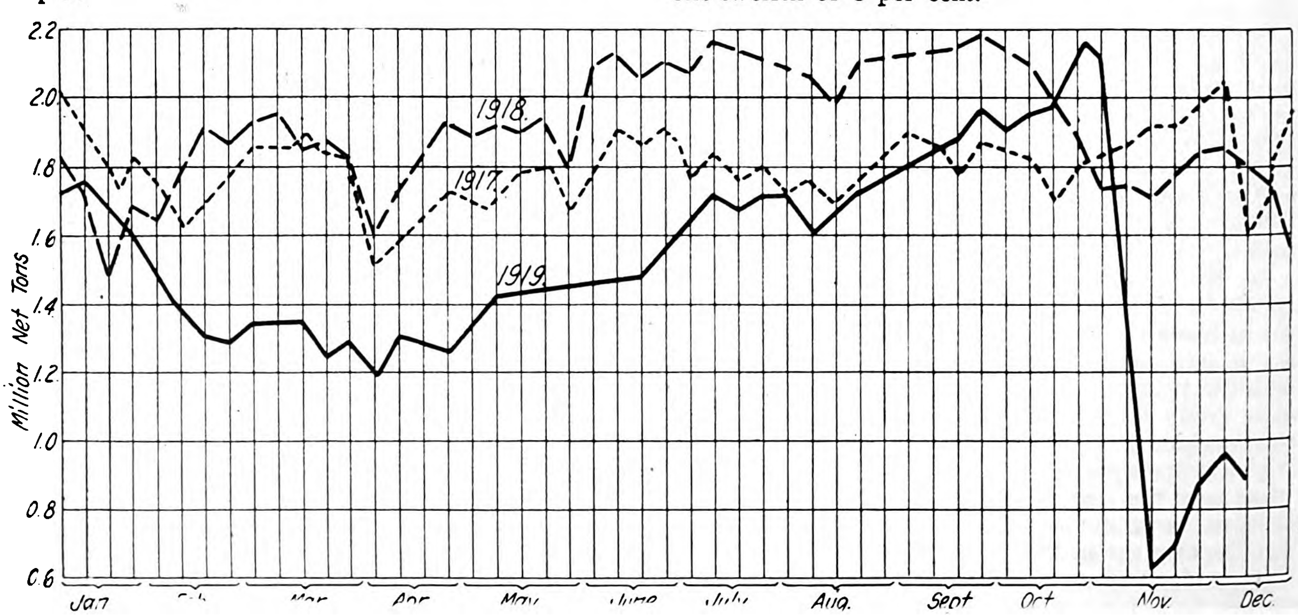
EFFECT OF STRIKE UPON BITUMINOUS COAL PRODUCTION.

The accompanying curves, prepared by C. E. Lesher, United States Geological Survey, show the effect of the strike of bituminous coal miners upon the output of bituminous coal. The annual bituminous production of coal for the years of 1918 and 1917 are also given.

Production during the first week of December—the fifth week of the strike—was 43.5% of normal. The course of the output from week to week has been as follows:

1st week (Nov. 2-8).. ..	29.6% of normal
2nd week (Nov. 9-15)..	33.3% of normal
3rd week (Nov. 16-22)..	44.5% of normal
4th week (Nov. 23-29)..	47.3% of normal
5th week (Nov. 30-Dec. 6)	43.5% of normal

The last week was thus lower than at any time since the first two weeks of the strike. Compared with the fourth week when the wage negotiations were broken off, the tonnage per working day fell off one-twelfth or 8 per cent.



Estimated Average Total Production for Working Day of Bituminous Coal, Including Coal Coked.

Editorial Comment

The End of the Coal Strike

THE great coal strike is over. After cheating themselves out of nearly six weeks' wages, inflicting needless hardship upon the whole country, defying the government and pitting their strength against that of the nation, the miners' union officials have accepted a settlement which could just as well have been accepted without any strike. Moreover, the settlement is so closely similar to the original offer of Dr. Garfield, being only more specific because time enabled it to be made so, that it may be said that the miners' union officials capitulated to the demands of the government.

For this settlement, the American people owe thanks to a few men who performed their duty without fear or favor, who refused to be stampeded by an outcry of powerful forces and who stood aloof above petty politics. Dr. Garfield frustrated a plot to grant increased wages to the miners at the expense of the coal-buying public—although we do not know how long his brave stand will serve its purpose. Attorney General Palmer and Judge Anderson upheld the supremacy of the law. President Wilson, with his gift of clear vision and direct expression, brought added pressure to bear which, with that exerted by threatened proceedings for contempt of court of the miners' officials and lack of income by the miners, combined to bring cessation of the deadlock.

It is well to remember that the strike could undoubtedly have been settled much earlier and in all probability have been prevented entirely. Meanwhile the miners are deserving of steadier work and safer working conditions. The purchase of coal during the off months will do much to bring about the former, while public opinion can do the latter if the facts are properly presented.

Stability of the Central-Station Industry

A SEVERE test has been applied to the central-station industry of the Middle West during the last few weeks, and it has come out of the ordeal not only unscathed but with renewed evidence of its virility. As the coal shortage became more acute, the light and power utilities had to appeal to the public service commissions for permission to curtail their service in less essential lines in order to conserve coal reserves as long as possible for the absolutely essential needs of the communities. On their own initiative some of the leading companies suggested measures for reducing the service and the curtailment thus effected was so severe as to seem almost suicidal to the central-station business. The public responded in full co-operative spirit, although heavy losses were involved thereby to sorekeepers, manufacturers, wage earners and business interests in general. The ffect was extremely impressive visually and depressive mentally, in many cases being more serious than anything found necessary during the war. The question therefore arose, would this depression be more or less permanent in its effect on central-station income?

Last Monday the answer came positively when utility customers, on removal of the fuel restrictions, restored their normal uses of electric lighting, heating and power service. The days of curtailed use of light, heat and power only showed the value of these services from central-station lines. Thus the industry has again shown its firm stability and marked prestige in the public's esteem.

High Tension

HIGH TENSION aptly describes the condition of the times. We are all working at high pitch, at high nervous tension. Everything is at high tension.

In the home, whether the work is done by the housewife or the maid, it is the same story—electrical appliances are taking the place of old-time ways. Things are being speeded up. Labor-saving, time-saving and more healthful ways of doing things are taking the place of manual methods. On the farm, mechanical apparatus is taking the place of man power. Thrashing, milking, plowing, nearly everything, is now being done by machines instead of by men and animals. The farms are beginning to work at higher tension.

Apparatus is being made larger and larger, and more powerful. The large turbogenerators and machines of the waterwheel type, transformers, all machines, in fact, are working at a higher rate of work per unit of weight than formerly, at a greater energy density, at higher tension. Boilers are working at higher rates of evaporation per unit of boiler heating surface than was the case a few years ago. Three and more times as much water is now being evaporated for a given heating surface than was once considered safe or possible.

As was said before, high tension aptly describes the condition of the times. But to be more specific. During the coming year and subsequent years electrical engineers and central-station engineers especially will do well to have before them at all times the term high tension. It is the keynote of many things, the solution to many problems, pressing problems of the hour.

Without high-tension transmission lines, it will never be possible, so far as present knowledge goes, to transmit energy from coal mine to central station by wire instead of transporting chemical energy as coal by rail. Without the high-tension transmission line it would not be feasible to tie-in the distant water power with the market for the electrical energy it is able to produce. The transmission line is the connecting link between water power and the industrial center. Without the high-tension transmission line it would not be practical to link up generating systems, tie-in individual plants and systems so as to co-ordinate their loads, stream flow, and so forth.

California without her high-tension transmission lines would not have been enabled to attain the industrial status she holds today. Her wealth and her prosperity would be very different if she had had to depend upon her oil and costly coal instead of being able to use her vast water power by the medium of the high-tension transmission line. The rural transmission line, at sufficiently high tension for economy —and the tension is a matter of economics at present and not one of materials or of theory or experience— holds one of the greatest promises in the way of emancipation for the farmers and the rural communities. The time may not be quite yet, but the time must come when the farm lighting outfit will be found only where the transmission line cannot go for economical reasons. When that time shall be depends upon the progressiveness or the latent conservatism of the central stations.

Railroad electrification, mine electrification, irrigation and cultivation of swamps, of deserts and waste places, the linking up of water powers, of coal mines with cities, electrification of rural communities and farms, these are some of the things that are urgently awaiting to be done. All are important, some vitally so economically. These are things that are waiting upon the electrical engineer. They are pressing problems, problems of high tension that can be solved by high tension.

Electric Furnaces and Industrial Foundries

FOUNDRIES have not been slow to appreciate the value of the electric furnace, taking into due consideration existing conservatism. They have found that the electric furnace increases the output of the foundry; produces better castings at a lower cost and from poorer quality of metal than former methods, providing the proper precautions are taken; accomplishes a certain degree of refining incident to melting as contrasted to segregating melting and refining; produces more uniform metal; lowers the loss due to variable quality and defective castings and conserves foundry floor space.

With the electric furnace it is possible to obtain a heat-transfer efficiency of from 60 to 70% of the heat energy as compared with an efficiency of 8 to 15% with open-hearth practice, and from 2 to 6% in crucible practice. Heat made other than electrically is so much cheaper than heat produced electrically, however, that the higher heat-transfer efficiency would not permit electricity to compete with other forms of heat were it not for the advantages mentioned above. Elsewhere in this issue will be found an article by W. E. Moore on the electric furnace and the foundry in which is taken up specifically the application of the electric furnace to this industry. Study of this article should prove interesting to everyone; it offers sound talking points to the power engineers seeking to place the electric furnace in the foundries adjacent to their transmission lines.

The electric furnace of the arc type, with its intense heat, is able to melt down a ton of steel and refine it in one hour and less, whereas from 6 to 14 hours would be required if using the open-hearth process. Expressed differently, a 12-ton electric furnace is the equivalent of an 80-ton open-hearth furnace so far as concerns rate of steel output. The saving in labor, in floor space, investment and other incidentals for equality of steel output are in proportion. High rates of steel production per furnace means fewer furnaces and by proper choice of size of furnace great flexibility as well as economy may be obtained by the foundry. With the electric furnace there is little delay incident to starting up for the periodic run such as occurs in the open-hearth and crucible methods of melting. Delays are a minimum, and heat may be taken off or turned on with ease. The maintenance and variation of heat is simple in the extreme.

The foundry offers almost ideal working conditions for the electric steel furnace—ideal conditions when 24-hour service obtains—where the work comprises the production of high grade castings, refining and conversion of scrap into castings. In addition there are many foundries connected with large industrial plants where the installation of an electric furnace for producing castings and melting down the scrap into ingots or castings would bring economy and a better price for junk. For such service as this an electric furnace with its operating characteristics should prove a very good investment in many large industrial plants.

We have become accustomed to look upon the electric steel furnace as apparatus for the large foundry and steel mill. And for this work the electric furnace is the furnace *par excellence.* But it should be emphasized once again, that the smaller electric furnace in the smaller foundry, the foundry of the industrial plant, in the shop of the tool maker and similar trades, opens up a vast field for the manufacturer of electric furnaces, the user of steel and the central station. This field for the smaller electric furnace is not, we believe, receiving nearly the attention it deserves from all so vitally concerned. Why not?

Current Events

Electrical and Mechanical Engineers Discuss Wide Range of Problems — Progress in Solving Inductive Interference

WESTERN ASSOCIATION OF ELECTRICAL INSPECTORS TO MEET IN ST. LOUIS.

Fifteenth Annual Convention Will Consider Varied Inspection Problems on Jan. 27 to 29.

The recently issued tentative program for the fifteenth annual meeting of the Western Association of Electrical Inspectors to be held at Planters Hotel, St. Louis, Mo., on Jan. 27 to 29, 1920, augurs well for an interesting and helpful meeting. Men prominent in the industry will discuss the hazard to life and property in the use of electricity, a matter of grave concern to electrical men generally, in view of accident and fire-loss statistics.

A practical way out of the difficulty is being sought by the association. The electrical inspector's responsibility as well as that of the other members of the electrical fraternity will be outlined as clearly and comprehensively as possible. All electrical men interested in the conservation of life and property are urged to be present and participate in the conference. The representatives of all branches of the electrical business will be welcome and extended the courtesy of the floor.

The Western Association of Electrical Inspectors has long recognized that only by co-operation can the perils of the industry be coped with successfully. Those planning to attend should make hotel reservations early. Information concerning hotel rates may be secured from James H. Fenton, Hotel Committee, Pierce building, St. Louis, Mo., or from William S. Boyd, secretary, 175 West Jackson boulevard, Chicago. Prospective exhibitors should negotiate direct with the Planters Hotel for any spaces that may be desired.

A condensed summary of the tentative program is as follows:

Jan. 27, 10 a. m.—Address of welcome by Mayor Henry W. Kiel of St. Louis; reply by Vice-President K. W. Adkins, Kansas City, Mo.; annual address by President C. K. Cregier, Chicago; reports of officers; address by Thos. J. Yeahy, St. Louis, on "The Responsibility of the Public Service Company for Safe Wiring on Consumers' Premises"; address by Chester L. Dows, Cleveland, Ohio, on "The Use of Incandescent Lamps in Dusty Places"; general subject: "Introduction of High-Voltage Current Into Buildings,"—(a) "The Underwriters' Viewpoint," by H. J. Woods, St. Louis; (b) "The Central Station's Viewpoint," by W. H. Millan, St. Louis.

Jan. 27, 2 p. m.—Address on "The Elimination of Conflicts Between the Fire and Safety National Electrical Codes," by A. Waldschmidt, Bureau of Standards, Washington, D. C.; address on "Analysis of Electrical Fire Causes," by Chas. H. Lum, of National Board of Fire Underwriters, New York City; general subject, "Regulating the Electrical Appliance Hazard,"—"The Manufacturer's Duty," by H. J. Manger, Edison Electric Appliance Co., Chicago; "The Electrical Contractor-Dealer's Duty," by A. C. Brandt, Frank Adam Electric Co., St. Louis; "The Central Station's Duty," by speaker to be chosen; "The Electrical Inspector's Duty," by H. F. Strickland, chief electrical inspector, Hydro-Electric Power Commission of Ontario, Toronto, Canada.

Jan. 28, Morning and Afternoon Sessions.—Discussion of inspectors' problems; reports of standing committees.

Jan. 29, Morning and Afternoon Sessions.—Address on "Technical Subcommittees' Work in Revising Motor, Moving-Picture Machine and Garage Wiring Rulings," by F. A. Barron, engineer, General Electric Co., Schenectady, N. Y.; reports of special committees; new business; nomination and election of officers.

A. I. E. E. MEETING DISCUSSES AUTOMATIC TELEPHONY AND SEARCHLIGHTS.

Two Papers Presented at New York by Arthur Bessey Smith and Ralph Kelly.

The 356th meeting of the American Institute of Electrical Engineers was held in New York on Dec. 12. A diversified program was presented which consisted of a paper on the "Applicability of Automatic Switching to All Classes of Telephone Service," by Arthur Bessey Smith, and one on "The Searchlight in the United States Navy," by Lieut. Ralph Kelly.

Mr. Smith's paper was more generally popular than technical. It sought to point out to the audience the practicability of the automatic telephone and the desirability of a more general use of it in these times when operating help is so scarce. The paper showed that automatic switching is uniformly fast and involves reduced mental stress to the user because the passing of the number is positive and waiting time is reduced to the minimum. The life of the automatic apparatus is a matter of speculation, inasmuch as the first automatic apparatus that was installed 15 or 20 years ago is still in service. The apparatus that has been built recently is much more durable and reliable than that in the older installations. A referendum taken among the people who have used both the automatic and the manual apparatus was very largely in favor of the automatic. The difficulty of employing large numbers of people in exchanges is entirely eliminated when the automatic apparatus is installed.

The apparatus that is now being manufactured has been so generally standardized that it is simple to operate and easy to maintain. The amount of training required for those who are employed in maintenance service is not greater than the training required for those who maintain the manual service. Certain parts of the apparatus should be inspected weekly, certain parts monthly and certain parts annually. The telephone, like any other piece of apparatus, requires proper maintenance.

The automatic telephone is adaptable to nearly any condition to which the manual telephone is adaptable. At present the automatic system is being installed in rural communities so that such service may be only a very little inferior to the service obtained in urban communities. Toll switching in an automatic exchange gives the toll operator direct dialing to the subscriber, complete control over the lines, and periodic ringing. The toll network has been improved also by applying automatic switches to intermediate points, so that the originating toll operator can set up the complete connection. Experience during the past 12 years shows that this manipulation increases the carrying capacity of toll lines at least 50 to 100%.

Lieutenant Kelly gave a brief description of the types and uses of searchlights and signaling lights on naval ships. He suggested a changed form of 12-in. incandescent light that will maintain the lamp filament at the focal point of the mirror. The present type of low-power searchlight has many faults. These faults may be corrected by supporting the carbon rigidly near the arc, the positive carbon being held at the focal point by a simple automatic control. The best size and material of carbons should be used regardless of the burning ratio.

The introduction of the high-power searchlight revolutionized the application of the searchlight to naval ships. Although great improvements have been made since the introduction, there is room for a material reduction in the number and complexity of the parts. It is believed also that there is a possibility of considerable improvement in the electrodes.

The use of the dome glass door has extended the possible uses and developments of searchlights. Before this door was used, the concussion of big guns destroyed the flat doors. Lieutenant Kelly said that he knew of no instances in which a dome glass door had been ruptured by concussion. The door enables the searchlight to operate in close proximity to large rifles without harm and makes possible the building of still larger searchlights than those now in use. Star shells have great possibilities, but it is doubtful if they will ever supersede the high-power searchlight.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS HOLDS ANNUAL MEETING.

Election of Officers and Presentation of Many Papers on Many Subjects Features of Successful Meeting.

One of the most successful annual meetings ever held by the American Society of Mechanical Engineers was held in New York City Dec. 2-5. The meeting was notable, not only for the nature and number of technical papers delivered, but also because of the nontechnical aspects of some of the sessions. Instead of devoting the entire program to the discussion of purely technical papers and subjects, those who arranged the program provided a liberal supply of entertainment, opportunity to discuss the political and economic conditions of the day, several excursions, and several functions for the entertainment of the ladies. The technical and nontechnical sessions alternated. Introducing the nontechnical sessions caused an accumulation of papers at the technical sessions which was taken care of by conducting three simultaneous sessions. The most important events on Tuesday, Dec. 2, occurred in the evening, and consisted of the presidential address by M. E. Cooley, election of officers, and conferring honorary membership on two of the most widely known French engineers, Charles de Freminville and Auguste C. E. Rateau. Monsieur Freminville is consulting engineer for the Cruesot Works, and Monsieur Rateau is chairman of the Board of Directors of Rateau, Battu & Smoot Co. of France.

The officers elected are Fred J. Miller, president; John Robins Allen, Robert H. Fernald, and Edward C. Jones, vice-presidents; Elbert C. Fisher, Dexter S. Kimball, Earle F. Scott, and L. E. Strothman, managers; and William H. Wiley, treasurer.

The program for Wednesday included a business meeting in the morning, technical sessions in the afternoon, and the De Lamater-Ericsson Memorial celebration in the evening. The technical sessions of the afternoon consisted of three parallel sessions in which the subjects discussed included appraisal and valuation, aims and organization, and gas power. The appraisal and valuation section met in conjunction with the American Society of Refrigerating Engineers.

The principal matters to come up at the business meeting in the morning was the memorial to Frederick Remsen Hutton, who served as secretary of the society for 23 years. At the end of his service as secretary and coincident with the removal to the United Engineering Society's building, Professor Hutton resigned his position as secretary. He was made president for the year 1906-7. In 1908 he was elected honorary secretary, a distinction which he held until his death.

Greater efficiency in appraisal and valuation methods was urged in the session considering appraisal and valuation which met in joint session with the American Society of Refrigerating Engineers.

David H. Ray, consulting engineer, read a paper on appraisal and valuation methods in which he pointed out the unfairness of some methods of valuation of public utilities and industrial plants, and urged that better plans be adopted for allowing for fluctuating values. He cited instances of extravagance and waste in estimating the value of war plants that are being dismantled and showed how the application of common sense would reduce greatly the cost of such work and would yield satisfactory results.

Other papers read at the appraisal and valuation session included one by George E. Wells, entitled "Ice-Plant Depreciation"; one by John E. Starr, entitled "Depreciation of Insulators"; one by James Rowland Bibbins, entitled "Fundamental Principles of Rational Valuation"; one by Cecil Elmes, entitled "Price Levels and Value," and others.

In the gas power session, E. B. Blakely, of Chicago, described the new Hvid engine. Other papers read at the gas power section included one by L. T. Seaton, entitled "Kerosene as Fuel for High-Speed Engines"; one by Leon Cammen entitled "Combustion of Heavier Fuels in Engines of Constant-Volume Type and Super-Induction Type Engines"; and one by S. A. Sulentic, entitled "Oil Pipe Lines."

The evening session consisted of a joint meeting to commemorate the 80th anniversary of the beginning of Capt. John Ericsson's work in this country, and the 30th anniversary of his death; and of Cornelius H. De Lamater, founder of the De Lamater Iron Works, at which Captain Ericsson's most important work was executed.

The night session consisted of addresses by Lewis

Nixon, Public Service Commissioner of New York City; Rear-Admiral Bradley A. Fiske, and W. A. F. Ekengren, Swedish Minister at Washington; and of a musical program by the Swedish Singing Society.

The Thursday sessions consisted of a morning session in which the industrial situation was discussed, three parallel afternoon technical sessions, and a one-hour session in the evening at which matters of aviation were discussed. This discussion was followed by a social gathering and reunion for members and their guests.

The speakers at the morning session included Frederick P. Fish, chairman, National Industrial Conference Board; A. L. De Leeuw, consulting engineer; William L. Leiserson, chairman of the Labor Adjustment Board of the Rochester Clothing Industry, and Ralph E. Heilman, dean of the School of Commerce of Northwestern University, Chicago.

Frederick P. Fish, in a paper on "The Cause of Industrial Unrest," declared that on the whole and individually the efficiency and productive power of American workmen is less now than it was before the war. In one plant he found that wages had increased 110% since 1914, although the cost of living has increased only about 75%. The manager of the plant was convinced that the efficiency of the individual workman had been reduced 40% since 1914. He expressed the opinion that there could be no cure for the present evils until personal antagonism between employers and employes is eliminated and is replaced by a fair, cordial, and sympathetic co-operation. Every employer should come in personal contact with his employes or should work out a plan that would be equivalent to personal contact. The speaker said that it is of vital importance that the unions should be held to their legal obligation to carry out the agreements that they make.

A. L. De Leeuw, in his paper on "Wage Payments," called attention to the fact that the main terms in controversies between capital and labor are not satisfactorily defined or are not defined at all. The present system of wage payment provides for time given whereas it should provide for work produced.

Mr. Leiserson spoke on "Systems for Mutual Control of Industry."

Professor Heilman, who discussed the possibilities of profit sharing in industry, showed that profit sharing applies more properly to salaried men than to wage earners. He does not think that profit sharing by wage earners is feasible. His reasons for this belief are that the wage earner usually sells labor, an item that cannot be measured definitely; that the wage earner is not in a position to see the advantage of increasing production; and that wage earners are in such large numbers and of such varied degrees of productivity that any system of profit sharing would be difficult to apply. In his investigations he has found instances in which profit sharing has been abandoned in the case of wage earners but he has never found an instance of its abandonment for salaried employes.

Hon. George M. Barnes, member of the British Joint National Labor Conference, stated that within his years of experience labor had risen from a position of illiteracy to a position of well-advanced intellectual attainment.

The program for Thursday afternoon consisted of three parallel technical sessions devoted to machine design, power machinery and textiles. Charles de Fremninville opened the machine design section with a discussion about the reliability of materials and mechanism of fractures. He showed that fracture originates internally and that it flows like water or liquid. His illustrations of fractured surfaces showed waves similar to waves of water caused by disturbances in a pond.

His paper was followed by one by W. J. White describing the pumps used to dredge the inner harbor navigation canal at New Orleans. The paper was read by Professor Gregory in the absence of Mr. White. Other papers read at the machine design section included one describing a perfected high-pressure rotary compressor, by C. B. Lord; one on turbo-compressor calculations, by A. H. Blaisdell; and one describing a new type of hydraulic-turbine runner by Forest Negler. Papers read at the power machinery section included one describing the Emergency Fleet Corporation water-tube boilers for wood ships, by F. W. Dean and Henry Kreisinger; one on the flow of water through condenser tubes, by William L. De Baufre and Milton C. Stuart; one on air pumps for condensing equipment, by Frank R. Wheeler; and one on thermal conductivity of insulating and other materials, by T. S. Taylor.

Thursday evening session was limited to one hour in order to provide time for the usual social evening and dance that is arranged for the members and guests. The topic discussed at the session related entirely to aviation—two papers, one by Col. E. A. Deeds, on the future of aviation, and another by Col. Thurman H. Bane, on the present development of the military airplane.

The formal program ended on Friday noon with the close of the three parallel sessions, at one of which matters on transportation were considered, at another of which under the auspices of the subcommittee on machine-shop practice matters relating to machine shops were considered and at the third of which general technical matters were discussed. The afternoon was devoted to the council meeting, and the evening to the college reunions which have come to be an important part of the program.

Papers presented at the transportation session include one on scientific developments of the steam locomotive, by John E. Muhlfeld, and another on motor transport vehicles for the United States Army, by John Younger. Mr. Muhlfeld discussed the scientific factors that have been considered in the design and development of a new, high-power, freight locomotive for the purpose of increasing the average thermal efficiency, as well as the maximum and sustained drawbar pull and horsepower per unit of weight. These factors now are limited by the capacity of the generally adopted boiler superheater. Mr. Younger presented a discussion of the types of vehicles best adapted to various military needs. He showed that motor transport vehicles have been classified by the army into 10 general groups, ranging from the motorcycle to the 5-ton truck. He illustrated his paper with slides showing photographs and tables.

In the machine-shop section papers were read by C. H. Bierbaum, on common errors in designing and machining bearings, by H. R. Trotter, on lubrication of ball bearings; by B. F. Waterman, on thread forms for worms and hobs; and by H. L. Unland, on electric arc welding.

Papers presented at the general session included one by H. A. S. Howarth on slow-speed and other tests of Kingsbury thrust bearings; one by Alfred

Watkins on octaval notation and the measurement of binary inch fractions; one by W. E. Moore on modern electric furnace practice; and one by Alfred Musso on an investigation of strains in the rolling of metal.

Several excursions were provided for the members. These included a visit to the 74th street plant of the Interborough Rapid Transit Co., on Wednesday; an inspection of the power plant in the Equitable building on Thursday morning; one to the Brooklyn Navy Yard on Thursday afternoon; and an inspection of the Curtis aeroplane plant and flying field at Garden City, L. I., at which exhibition flights were given and an opportunity was provided for the members to make flights.

Various excursions and social functions were arranged throughout the week.

ELECTRIC POWER CLUB HOLDS SEMI-ANNUAL MEETING.

Nearly a hundred members of the Electric Power Club were present at the semiannual meeting of the organization held at Hot Springs, Va., Dec. 11-13. The sessions during the three days were occupied chiefly with reports of committees and sections.

At the meeting held last May plans were adopted for creating sections for dividing up the work of the organization according to the class of products manufactured. The reports submitted indicated the work done in establishing these sections and outlined the working plans to be used by the different sections.

James Burke, of the Burke Electric Co., Erie, Pa., president of the club and who was one of the delegates to the International Technical Commission, addressed the meeting on conditions affecting foreign trade. Mr. Burke recently returned from Europe and commented on the European demand for motors and other electrical apparatus.

W. G. Merritt, of the League for Industrial Rights, outlined the work of that organization regarding relations between employers and employes, and explained the League's plans, which were indorsed by the Electric Power Club.

Three new companies were elected to membership, these being the Union Electric Manufacturing Co., Milwaukee, Wis.; Marble-Card Electric Co., Gladstone, Mich., and Sangamo Electric Co., Springfield, Ill.

DENVER MEETING OF N. E. L. A. INDUCTIVE INTERFERENCE COMMITTEE.

The second meeting this season of the Inductive Interference Committee of the National Electric Light Association was held in Denver, Colo., on Dec. 1 to 3. The meeting was well attended by members from many parts of the country, with a specially liberal proportion of western representatives owing to the geographical location.

Some of the sessions were devoted to a continuation of the attention given at the Chicago meeting in September to organizing for the work in hand, including the establishing of a centralized agency to assist power companies to effective co-operative effort and a better understanding in meeting the difficult problems of the inductive interference situation—a situation continually increasing in proportion with the rapid multiplying of power and communication circuits.

Other sessions were given to subcommittee work in analyzing and compiling information gathered pertinent to the situation, and to consideration of requests from several localities for advice in meeting specific and active inductive-interference problems.

The discussions lent renewed emphasis to the committee's realization of its need for thorough support from the power companies, at this stage, by contributing information of their experience and methods of meeting the problems of this kind encountered.

The chairman of the committee is A. E. Silver, of the Electric Bond & Share Company, 71 Broadway, New York City.

NEW YORK ENGINEERS' CLUB DAMAGED BY FIRE.

Early in the morning of Dec. 13 fire broke out in the kitchen of the twelfth floor of the New York Engineers' Club building, 34 West 40th street, New York City, imperiling a number of employes in the servants' quarters close by, disturbing about 350 members sleeping in the guest rooms of the club, and doing damage to the furnishings, etc., estimated at about $100,000. The auditorium and library of the club were severely damaged by water and the eleventh, twelfth and thirteenth floors were badly gutted by the fire.

For a time the fire threatened the Engineering Societies' building directly back of the club and fronting at 29 to 35 West 39th street. By skillful work of the firemen, however, this structure was saved from practically any damage.

MARCONI FUND FOR ITALIAN WAR RELIEF.

In connection with the general work of the Italian War Relief Fund of America, a special fund in honor of Marconi is being raised by an electrical committee of which the members are T. C. Martin, chairman, Dr. Elihu Thomson and J. W. Lieb. Considerable success has attended this laudable effort and the Marconi Fund has already reached over $3500, and a first installment of $2500 has been forwarded to Senator Marconi in Rome for Christmastide.

In view of the fact that sore distress in Italy deepens as the winter advances, it is believed that many others in the electrical field, as well as outside it, would like to embrace this opportunity presented by the special fund. The committee therefore renews its plea for aid and co-operation.

Each subscription is accompanied by an autograph card, with the object of assembling all these cards later in a memorial album to be delivered to Mr. Marconi. Such cards can be obtained from the committee whose address is 29 West 39th street, New York City.

GOVERNMENT TO DISPOSE OF LARGE QUANTITIES OF CABLE AND WIRE.

Announcement has been made by the Director of Sales, War Department, Washington, D. C., that a total of approximately 1,710,000 ft. of telephone cable and 854,923 lbs. of copper wire, packed as originally prepared for overseas shipment, is available for purchase and that proposals for this purpose will be considered. It is understood that the greater part of the wire and cable is located in the Philadelphia Ordnance District.

Commercial Practice

Electricity in Tissue-Paper Manufacture—Central-Station Power in Great Demand—Ohio Inspection Order Rescinded

CENTRAL-STATION POWER FOR MAKING TISSUE PAPER.

Description of Processes of Manufacture and of Electrical Equipment of California Mill Supplied With Energy by Southern California Edison Co.

Within the past few years the paper manufacturing industry in the Pacific Coast states has reached important proportions. Paper manufacturers found that plants operating on the Pacific Coast have a large and growing market at its doors, while wood pulp, produced principally from spruce and hemlock and used as a base for the better grades of paper for commercial purposes, can be obtained from Oregon, Washington or British Columbia and delivered to any part along the Pacific Coast at water transportation rates.

Prior to 1917 California growers of citrus and deciduous fruits depended upon eastern manufacturers for their supplies of tissue paper for wrapping fruits. Hundreds of cars of paper were shipped into California annually for this purpose. Early in 1917 the California Tissue Mills was organized at Vernon, Cal., to manufacture tissue paper to meet the requirements of the fruit growers and for wrapping other foods such as bread and candy.

The new paper mill uses central-station service from the lines of the Southern California Edison Co. *Edison Current Topics,* the monthly publication of the company, gives the following description of the manufacturing processes and electrical equipment in the mill.

Two kinds of pulp are used—"sulphate," from which anti-tarnish and kraft papers are made, and "sulphite," from which tissues and other lightweight papers used in packing fruit are made. The wood is reduced or "digested" to a pulp by chemical process; that is, cooked under steam pressure with sulphuric acid in the case of sulphite pulp and with soda ash in the case of sulphate pulp.

The first process in the manufacture of paper from the raw pulp is "beating." The pulp is put through a vat or tub with a large roll cylinder grinding on a bed plate with horizontal knives under which the pulp passes repeatedly until it is sufficiently reduced. Coloring, if desired, is added in the beaters. The pulp is refined by passing it through three or more Jordan refining engines, which are powerful centrifugal churns, conical in shape, with knives revolving among other knives. The result of this refining is to brush out and separate each individual fiber, thus imparting additional strength to the paper.

The pulp, having been diluted with approximately 90% of water, is then flowed out onto a wire cloth conveyor. This conveyor is an endless copper screen cloth of 90 meshes to the inch, which travels from the pulp vats to the dry end of the paper-making machine. In the process of flowing on the wire conveyor, most of the water is removed by filtration and by suction pumps until at the ends of its travel the thin film of pulp remaining on the conveyor has been well formed and is ready for the pressing and drying process.

At the end of the wire conveyor the paper is delivered to a felt or woolen conveyor which takes the sheet from the wire conveyor and by means of heavy rollers under pressure squeezes the remainder of the water from the sheet of pulp and conveys it to the drying cylinders. The dryers are large horizontal cylinders, steam heated to a high temperature, over which the paper passes in much the same manner as mangles operate in a steam laundry. The paper is then passed off the paper machine, being wound up into rolls where it is ready for cutting up for waxing or printing, as the case may be.

Paper manufacture requires a heavy consumption of power. Continuity of service and constant speed are two important essentials. Electric motor drive, operated by central-station power, relieves the paper manufacturers of an investment in steam-engine equipment, together with its inherent trouble and expense. Motor drive makes higher operating speeds possible because of easier and quicker control, and higher operating speed means greater production.

The California Tissue Mills started with a 100-hp. steam engine and 160-hp. in motors operated by energy supplied by the Southern California Edison Co. In January, 1917, 232 hp. in motors were added, and in August, 1919, 361 hp. in motors were added, making a total connected load at the present time of 753 hp. During the year ending in June, 1919, the load-factor average was 77%, indicating a favorable power-factor and a heavy off-peak load.

Service is supplied from the Vernon substation over three No. 00 wires at 2400 volts, a distance of approximately 4600 ft. This line is used exclusively by the California Tissue Mills and is protected in the substation by an automatic oil switch with a time-limit device set for approximately 5 seconds at 43% overload at normal demand. A similar switch is provided on the primary side of the transformers at the mill with a time-opening device set for approximately 40% overload. Three 250-kw. transformers are used to deliver power to the California Tissue Mills board at 440 volts.

There are 15 induction motors in the mill. The four largest motors are rated at 250, 150, 100 and 75 hp. capacity each. Grid resistances are used in connection with motors where a slight variation of speed is desired.

An interruption to service stops the paper machines with paper on the drying cylinders, where it bakes and makes it necessary to wash up, a loss of over an hour for each paper machine. This circuit is watched very carefully and every effort is made to give an uninterrupted and satisfactory service, which in the past has been done with a high degree of success.

ENLARGEMENT OF CENTRAL STATIONS NECESSARY IN NEAR FUTURE.

Big Demand for Central-Station Power by Industrial Plants Taxing Capacity of Generating Stations and Calling for Extensive Construction.

A good summary of the power situation and its effect on the manufacturing and electric central-station industries is presented in a recent issue of the *Wall Street Journal,* which is noted for being exceptionally well informed on financial, industrial and public utility conditions. It reports that: "Electrical engineers say the demand for power is far in excess of capacity of central generating stations and the electric power companies of the country must add materially to their plant capacity to meet the requirements of industrial companies.

"This situation has been developing since early last summer. The slowing up in industrial activity after the armistice was reflected in a decreased power demand, but now consumption is greater than ever. Plants which were on priority lists during hostilities are now using as much electrical energy as during the war and added to this is the demand from those nonessential industries whose activities were curtailed during the war.

"The use of central-station power has grown tremendously in the last five years as manufacturers generally realize it is more economical than producing their own power. The result is that practically all new plants and most of the old ones not using central-station service want power which generating companies find impossible to supply.

"Central stations in the large industrial centers of Michigan, Ohio and Pennsylvania have experienced a rapid growth. An Ohio plant had one industrial consumer in 1912 using a 50-hp. motor. The manufacturers of the town now use 75% of the production of a 15,000-hp. plant, one factory alone consuming more power than is required for residential lighting in a city of 100,000 population. The Metropolitan Edison Co., at Reading, Pa., a subsidiary of General Gas & Electric Co., doubled its plant capacity to 50,000 kw. during the war and now finds further additions are necessary to supply the needs of its industrial consumers. In 1913 the plant's capacity of 13,500 kw. was only half used.

ORDER ON INSPECTION AND SAFETY SWITCHES HELD IN ABEYANCE.

Ohio Fire Marshal Rescinds Order Requiring Inspections Before Service Is Connected—Also Order Requiring Use of Inclosed Safety Switches.

Electrical contractors and central-station companies will be interested in a notice sent out Nov. 21 from the office of fire marshal of the state of Ohio holding in abeyance recent orders from that office requiring inspection of all wiring before current is turned on and installation of inclosed safety type main service switches.

The notice will relieve the embarrassing situation in which most of the Ohio central-station companies found themselves by reason of the former order. In very few of the municipalities is there any provision for inspection of wiring, and to place this burden on the utilities was considered unfair from the cost standpoint and dangerous from the legal standpoint of creating liability in case anything should occur after the risk is connected. If the law should be made to hold companies for fires that might occur on consumers' lines by reason of defective wiring, it would drive central-station companies in the country out of business; not that so many fires occur from this cause, but the unthinking public charges up to electric wiring every fire the origin of which is uncertain. There is no question but what some action should be taken to counteract and bring about truthful statements in this particular.

It was stated the order pertaining to service boxes would not be seriously opposed by the central-station companies if the order was made so that boxes can be easily and cheaply purchased. Companies look with suspicion and possibly opposition to devices, the cost of which will deter people from the use of electric service. Wiring is essential to the marketing of their output, but no company will object to appliances that will make such wiring safe for the consumer. The principal objection to the recent orders was the inspection, of which no company cared to assume the responsibility or cost.

KENTUCKY UTILITIES FORM BUREAU OF INFORMATION.

Utilities Get Together and Form Bureau for Giving Publicity to Utility Affairs.

The electric light, gas, telephone, traction and water utilities of Kentucky have organized the Kentucky Committee on Public Utilities Information. The purpose of this committee is to give publicity to utility affairs, and in this way bring the utilities and the public closer together and develop a better understanding. It is a combined effort to place their "after war" case directly in the hands of the public, to whom the utilities are responsible and to whom they look for existence and support. The intention is to make known to the public the facts as affecting the service and credit of the utilities and the necessity of the public supporting such utilities so as to enable them to give to the public the best service possible and equal to the needs of every community that is served.

The office of the committee is at 215 West Oak street, Louisville, Ky., and the name of the official organ is the "News Service Bulletin."

CREDITABLE PERFORMANCE OF METER INSTALLING.

Since July 1, 1067 new meters have been installed in the Long Beach district of the Southern California Edison Co. Approximately 1000 of these were installed in individual residences. On the basis of 250 working hours per month, the above is equivalent to an average of one dwelling completed every hour. Monthly gain of meters set during the past four months shows July, 237; August, 234; September, 283, and October, 312. The number of meters in operation on Oct. 31, 1915, was 12,575; in 1916, 13,443; in 1917, 13,929; in 1918, 15,489, and in 1919, 17,746.

ELECTRIC SERVICE FOR PRODUCTION OF OXYGEN.

Large quantities of oxygen are used in Detroit for welding and other purposes, as can be deduced from the report there were used from the Detroit Edison Co.'s system 8,117,850 kw-hrs. during the year from October, 1918, to October, 1919, for the commercial production of oxygen.

Operating Practice

Transmission Line Data—Rearranged Baffling Improves Boiler Operation—Data on Cleaning of Condenser Tubes

DATA ON COSTS AND LOSSES OF CANADIAN TRANSMISSION LINES.

Interesting Data on Some of Canada's Long and High-voltage Transmission Lines.

In the accompanying table is shown the costs for constructing some of the chief transmission lines in Canada. The year during which these lines were built is given in the second column of the first table, an important factor, since the cost of everything has so risen during the last few years.

In the table of line losses it is interesting to note that of the 11 transmission lines tabulated, the average length is about 52 miles and the average line loss is approximately 11.4%.

COST DATA OF TRANSMISSION LINES.

Line.	Year built.	Length, miles.	Voltage.	Cost per mile.	Remarks.
Canadian Light and Power Co., Montreal	1911	27	44,000	$11,000	2 circuits of 2-0 copper, steel towers.
Laurentian Power Co., Quebec	1916	24	50,000	6,875	2 circuits of 1-0 copper, steel towers.
Shawinigan Water & Power Co.	1902-10	550	50,000	1,500	Single circuit, aluminum, wooden poles.
				3,500	2 circuits, aluminum, steel towers.
" "	1910	94	100,000	7,500	2 circuits, aluminum, steel towers.
Sherbrooke Municipal	1917	30	45,000	2,334	Single circuit, No. 4 copper, wooden poles.
Hydro-Electric Power Commission, Niagara system	1907-13	325	110,000	14,000	2 circuits 4-0 and 3-0 copper and equivalent aluminum, steel towers.
" "	1907-13	765	26,400 and under.	2,200	Single circuit, aluminum and copper, wooden poles.
				3,000	2 circuits, aluminum and copper, wooden poles.
Muskoka system	1915	26	22,000	2,025	Single circuit, No. 2 aluminum, wooden poles.
St. Lawrence system	1913-15	60	26,400	2,458	Single circuit of 3-0 aluminum, wooden poles.
Kamloops municipal	1916	42	44,000	1,667	Single circuit of No. 2, aluminum, wooden poles.
West Kottenay Power and Light Co., Rossland, B. C.	1897-1905	170	60,000	4,000	Single circuit, 92,000 c. m. copper, wooden poles.
" "	....	32	20,000	2,000	2 circuits, No. 2 copper, wooden poles.

LINE LOSSES.

Name of company.	Termini.	Voltage at generating end.	Distance, miles.	Loss, per cent.
Shawinigan Co	Grand'mère to Montreal	100,000	94	10
Can Light & Power Co.	St. Timothée to Montreal	44,000	27	8
Laurentian Power Co.	St. Féréol to Montmorency	50,000	24	5
Sherbrooke Municipal	Weedon to Sherbrooke	45,000	30	13
Hydro-electric Power Com.	Napanee to Kingston	44,000	30	10
Toronto Power Co.	Niagara Falls to Toronto	60,000	80	20
Dom. Power & Traction Co.	Power Glen to Hamilton	44,000	33	6
Winnipeg Municipal	Pte. du Bois to Winnipeg	66,000	78	20
Calgary Power Co.	Kananaskis to Calgary.	50,000	50	7½
West Kootenay Power & Light Co.	Bonnington to Greenwood	60,000	82	10
B. C. Electric Ry. Co.	Jordan plant to Victoria	60,000	43	16

With present high prices showing every indication of remaining at the present high level, transmission lines now under construction and planned will cost considerably more than lines built under pre-war conditions. The following costs are approximately those existing in Ontario at the present time.

A main line "heavy duty" steel tower transmission line, carrying two lines at 110,000 volts, such as the latest type of line used by the Hydro-Electric Power Commission of Ontario between Niagara Falls and Toronto, with 66-ft. right-of-way, the equivalent to four No. 4/0 copper conductors, telephone service, and all items of expense, would be about $17,000 per mile.

A 110,000-volt line, single circuit, supported by wood poles, with 66-ft. right-of-way, and the equivalent of No. 1/0 copper conductors, and telephone line, would be about $8500 per mile. The cost might be reduced to about $5500 per mile if pole rights alone are secured.

A 44,000-volt, wood-pole line, with steel conductor and telephone line on same poles, could be erected for about $3000 per mile. If there were considerable rock excavation for poles, however, this cost might be doubled.

A 22,000-volt line, carrying one circuit of approximately the equivalent of No. 1 copper conductor and with telephone line, would cost about $3500 per mile.

Smaller lines for about 4000 volts, with equivalent of No. 4 copper conductors, have been built for about $2000 per mile under present conditions.

REARRANGEMENT OF BAFFLES AND SETTINGS IMPROVES OPERATION.

Four Instead of Three Passes and Rear-End Firing Banish Smoke and Increase Capacity—Excerpts from Paper Before O. E. L. A.

By W. A. Aldrich,

Cleveland Electric Illuminating Co.

The Cleveland Electric Illuminating Co. operates 70 Stirling boilers at its Lake Shore Station, averaging about 600 hp. each. All are equipped with chain grates. Some extremely interesting experiments and changes have been made on this equipment.

The first big change on our Stirling boilers was made some years ago, when after months of testing we changed them all from the standard three-pass baffling to four-pass baffling. That is, instead of using two baffles with each bank of tubes acting as a pass, we use four baffles. The first one is located between the first and second tube of the front bank. The second baffle is located between the first and second tube of the second bank. The third baffle is at the rear of the second bank and the fourth baffle is between the second and third tube from the rear of the third bank.

This arrangement gives the gases a much longer line of travel through the boiler and helps to eliminate smoke. The hot gases do not have the same tendency to shoot directly for the baffle opening at the top of the first bank of tubes and we were enabled to do away with a short sprung arch behind the flat stoker arch. Last, but not least, repairs are confined almost entirely to the first row tubes of the front bank which are very accessible.

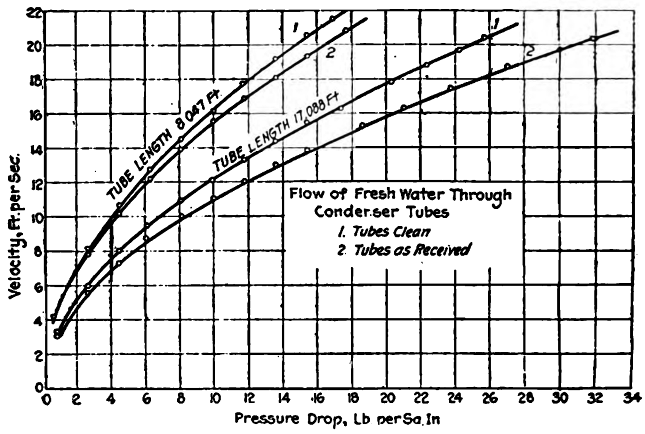
The next radical change in boiler settings was made a year ago when we installed sixteen 685-hp. Stirling boilers of the ordinary single type, four-drum boilers. These were raised up about 11 ft. higher than the standard setting, turned around, and fired from the rear end, namely, with the mud drum directly over the flat combustion arch which the company uses. The result is that the combustion space has been doubled, giving about 18 cu. ft. of combustion space per square foot grate area.

At no time since the boilers were installed has any black smoke issued from the stack which serves 16 of these boilers. The normal appearance of the stack shows a light gray haze which sometimes increases in quantity but never grows black. While as yet no very complete boiler tests have been made on this installation, it has been found feasible to operate at 12½% CO_2, and at 200% rating when desired, with all other combustion conditions satisfactory.

CLEAN CONDENSER TUBES AS AFFECTING FLOW OF WATER.

That condenser tubes become coated with a film of varying properties in course of time is known to every user of condensers. Sometimes this film is soft and slimy, sometimes hard and brittle and adheres to the surface of the tube with considerable tenacity. The rate at which these deposits are thrown down depends upon the water and foreign matter entrained and somewhat upon the velocity with which the water passes through the tubes.

Some recent experiments carried out at the U. S. Naval Engineering Experiment Station at Annapolis were described in a paper entitled "Flow of Water Through Condenser Tubes" which was presented at the December meeting in New York of the A. S. M. E. One fact brought out by the investigation, and a fact not perhaps usually appreciated by operating engineers, is that the amount of water—hence, the velocity—passing through new tubes for a given pressure may be affected considerably by the condition of the tubes as received from the manufacturer. The accompanying set of curves show the velocity of the water passing through two sets of ⅝-in. tubes, the one about 8 ft. and the other 17 ft. in length, as received from



Curves Showing Effect of Tubes as Received From the Factory and Cleaned Tubes Upon Flow of Water.

the manufacturer and after cleaning. The cleaning was done by passing a small rag soaked in kerosene through the tubes several times.

The tubes were standard ⅝-in. condenser tubes (as used for marine purposes), being of No. 18 gauge with an inside diameter of 0.522 in.

The accompanying curves are interesting because failure to clean the tubes of a new condenser preparatory to a test might give results that would be misleading and unfavorable to the manufacturer.

TWO STATION GROUNDS MAY BE SOURCE OF TROUBLE.

In substations containing apparatus for serving street railways and also a 4000-volt four-wire three-phase distribution system it appears advisable to employ the same ground for the railway negative or return that is used for the neutral or middle point of the 4000-volt system. Failure to do this, by employing two separate earths, namely, the water piping system for the railway system and an earth plate for the distribution system, may lead to trouble during times of short circuit, due to resistance drop resulting in piling up of voltage between the two station grounds.

EXTENSIVE GROUND TESTS CONDUCTED BY SOUTHERN CALIFORNIA EDISON CO.

Eleven different types of grounds have recently been made by the Southern California Edison Co. The purpose of these grounds is to enable extensive tests to be made to determine the relative efficiency of each type, its permanence during the different seasons of the year, unit cost, etc. With this data obtained, the tests are to be carried on over an extended period of time, the company will be able to know the type of ground best suited to different conditions, the constancy of the ohmic ground resistance, etc.

Contractor-Dealer

Method of Getting List of Prospects—Making Window Display Sell—Ten Commandments for Retailing Appliances

HOW TO GET A LIST OF PROSPECTS FOR VACUUM CLEANERS.

An Effective Method Used by Illinois Dealer to Obtain Names and Addresses of Prospective Customers.

It is often an easy matter to reach through their children people who do not respond readily to a direct appeal. The experience of an electrical dealer in Cairo, Ill., is a case in point. A manufacturing firm whose line of sweepers he handled had prepared an attractive little booklet entitled "The Story of a Lump o' Dirt." It was attractively illustrated and related the experiences of a lump of dirt—"just an ordinary lump o' dirt out of the road"—(to use its own designation as it writes its autobiography) in connection with a broom, a carpet sweeper and a vacuum cleaner. Here was a fairy story, with a deeper meaning, that would appeal to all.

This enterprising merchant secured a quantity of these books and then advertised in the papers: "A Modern Fairly Tale—free to all children between the ages of eight and sixteen." The advertisements went on to state that to all children who called on a certain Saturday afternoon one of these books would be given free. All that was necessary to secure a book was to sign a card containing the name and address of their parents. If any one doubted the efficacy of advertising he had only to stand near the store that day and watch the crowd of children that streamed through the door from one o'clock until closing time. Close to a thousand booklets were distributed and they found their way into homes in every section of the city. Best of all, they were read by hundreds of grownups who would never have taken the trouble to glance through the book if it had been handed or mailed to them direct. From the list of addresses mailing list was compiled, and about a week later a circular letter was mailed to the parents:

> Dear Sir (or Madam):
>
> We presume you read the little booklet brought home by your young son or daughter—and of course the story had a deeper meaning than it did to the children. Have you not often had experience in your own home with the lump of dirt that was tracked into the house and deposited on carpet or rug, becoming so imbedded that it resisted all your efforts to dislodge it?
>
> You read in this little story how the Blank suction cleaner did the work, and it ocurs to us that you might like to see this proven in your own home. Just ear off the slip at the bottom, sign your name and address, and we will be pleased to arrange for a free demonstration of the wonderful cleaning powers of this electric suction cleaner.

At the bottom was a perforated slip, requesting a free demonstration of the merits of the Blank cleaner, with space left for name and address. The demonstrations took place at the earliest date practicable, and at its conclusion full information as to the cost of the cleaner and the remarkably easy terms on which it was sold was left with the mistress of the house. The firm's efforts did not end here, as later a personal call by one of the salesmen was made, while literature on the subject was sent at regular intervals until a sale was made or intimation given that the householder was no longer interested—something that very rarely happened.

USING THE WINDOW DISPLAY TO SELL AS WELL AS SHOW.

Here's a suggestion from an electrical jobber—the Doubleday-Hill Electric Co., Pittsburgh. It's about window displays.

Every one knows that electrical devices lend themselves readily to display, not only because most of them are well appearing but because of the natural

Window Display Arranged with the Idea of Creating Sales.

curiosity that attaches to all things electrical. According to the Doubleday-Hill company, the electrical dealer can't afford to depend upon those appeals alone in planning his window displays. Instead of just "showing" some appliances, the dealer has to give some message or idea in connection with his display in order to get the window shopper's attention and interest. A few appliances in the window display space won't do. There must be something more.

To interest householders in vacuum cleaners the company recently had a display in which a vacuum cleaner was taken to pieces and the component parts were neatly arranged against a green velvet background, the idea being to show the simplicity of construction of the machine in question. Cards were used to invite those interested to go into the store to see just how the cleaner worked.

There wasn't much more to this display than one in which a few machines were just "shown," but there was enough idea and suggestion to give it good sales value. And it brings out the point that electrical goods must not only be displayed, but some distinct effort be made in the display toward selling them.

The Ten Commandments for Selling Electrical Appliances

Pertinent Rules That the Salesman Should Know and Use in Dealing with Customers in an Electrical Store

THOSE with limited experience in selling electrical appliances will find here time-tried and tested methods worthy of being followed. Older and more experienced heads may perhaps find refreshment of memory concerning some methods they learned long ago and have been neglecting to use.

For convenience in presenting and, also, making use of these helps, they are being given in the form of "The Ten Commandments of Appliance Selling."

1. *Know your appliances—what they will do and how they do it.*

When explaining the electric grill, don't stop with saying "this compartment is for broiling, this section is for frying and that one for stewing." That's too indefinite. It does not properly lead the customer to think of the service of the appliance. It's the need for the service of the appliance that has aroused the prospect's desire to possess it, rather than any interest in its constructional features.

When discussing the broiling section of the grill, for illustration, state in definite terms that it will broil steaks, chops, ham, fish, oysters, pressed meats and, if desired, vegetables such as egg plant and parsnips. That is to say, the way to bring the prospect to think of and desire the service of the appliance is to explain in detail the scope and advantages of that service. Failing to do that, you cannot hope to effect a sale.

Be able also to give, and make a point of giving, reasonably accurate figures as to the cost in cents per hour for each and every service and operation performed by the appliance you are selling. Put stress also upon the saving in time made possible by "doing it electrically." Above all else, be able to demonstrate—not merely tell—just how the appliance should be operated to insure the best results.

2. *Know your customer.*

Old hands at the selling business classify all prospective customers as either "lookers" or "listeners." By the first term they mean those who trust entirely to their own judgment and buy only those things which pass their close and critical scrutiny. They are the ones who must be shown, who demand that every little phase and feature of the thing to be bought be submitted to examination of hand and eye. They place little or no confidence in the words of the salesmen—they insist upon being shown.

The second class much prefer to be guided by the suggestions and statements of the salesmen and they will do so always, provided he can inspire them with confidence. They will listen attentively to what is told them and they will get the general sense of it all. But their first concern is to decide if they may safely trust to the judgment and sincerity of the salesman. They don't particularly desire to be shown—they want to be told, as it is only by getting the salesman to talk and analyzing his statements that they can decide whether he knows his business and is to be trusted. Once they have decided that point in his favor, they then will revert to this, that or the other feature of the appliance as explained by the salesman up to that time and desire further enlightenment or instruction regarding points they appeared to understand in the first instance but did not, because at that time they were more concerned in judging the salesman than in deciding the merits of the appliance.

Your own intelligent study of your customers will be your best guide in classifying them properly. The listeners desire to be told, and the lookers must be shown. If you are not conducting your selling talk in harmony with their preferences you will, if you are acutely alive to your opportunities, recognize your mistake very quickly and can then change over.

3. *Aim to discover and cater to the prime desire that prompts the customer to buy an appliance.*

The need behind the need, so to speak, is the one that should be catered to in effecting a sale. Man has certain basic instincts. They constitute the source of all desire. All actions, efforts and thinking is to the end of satisfying or appeasing desires occasioned by the persistent or momentary urge of one or the other of those basic instincts. If the prospect's desire is strong enough, and his belief in the thing offered for sale is well grounded, the matter of closing the sale simmers down to the operation of inciting the prospect to satisfy that desire by the action of buying and possessing that thing.

An illustration will make that principle plain: Mrs. A., for instance, is a woman in whom the desire for comfort and ease is paramount. She abominates having to arise and prepare breakfast for her husband, who departs for business at a very early hour. Her object is: "How to provide breakfast for her husband without having to sacrifice her own love of ease." An invalid friend explains how her husband prepares his own breakfast by the aid of electrical table appliances. Mrs. A. immediately develops a desire for electrical table appliances and calls upon you that she may learn more about them.

Eventually, of course, she will come to appreciate their fuel, food, time and labor-saving qualities. But for the moment her chief interest is in how they will enable her husband to prepare his own simple breakfast of eggs, toast and coffee. The arguments regarding the appliances that will work best in this instance are those relating to the ease, simplicity and reliability of their use and operation. Those are the factors that cater to her desire for ease and luxury, by enabling her to lie comfortable abed while her husband prepares his own breakfast.

Aim to discover the controlling desire which prompts the need for the appliance. There is such a basic desire in every instance. A little study of your prospect will enable you to discover it. Then conduct your selling talk accordingly.

4. *Keep away from talking watts, amperes, voltage, and so on.*

Every item brought into a sales talk about appliances which the prospect does not understand adds just one thing more, one doubtful point, which must be explained before the sale can be consummated. Such terms as watts, amperes and voltage are not understood by the average woman; and women buy most of the appliances.

Confine your talk to plain, everyday terms that all will understand. If you must employ technical terms make a point always of explaining them.

5. *Don't refer to electrical appliances as "current-consuming" devices.*

That electrical table appliances consume current is true. Nevertheless that is merely incidental to the service their use affords. They should be referred to in terms suggesting their services. They are fuel, food, time, labor and money-saving devices. Refer to them accordingly.

6. *Always refer to operating cost of appliances in terms of cents per hour.*

To refer to operating cost in terms of current is confusing to all but the technically informed. Besides, it's a lazy man's way of conveying the facts. Because when the operating cost is given in terms of current the prospect then is compelled to translate the statement into terms of cents per hour to operate.

If the translation is not made the statement only serves to confuse. It fails to further the customer's understanding. Attention which should be devoted to following the salesman's talk is distracted by the effort to understand the technical phraseology.

7. *Show appliances in actual operation.*

The power of demonstration is too well recognized to require emphasis. Telling the customer that a toaster, say, will within two minutes generate ample heat for toasting is a poor substitute for allowing the customer to place a hand near the appliance and discover by actual experience the heat radiating therefrom.

8. *Don't invite consideration of too many appliances.*

Attention must be concentrated upon one appliance before a purchase is made. The greater the number of appliances suggested the greater the number which must be eliminated from consideration before attention can be centered upon the one particular appliance it is held in mind to buy.

Decide as quickly as may be possible in your own mind which appliance will best suit the needs of the customer. Then concentrate your efforts upon selling that appliance. Make every reasonable effort to sell it before suggesting another one. That method becomes particularly desirable when you are dealing with a "listener."

9. *Aim always to display the best make of appliances first.*

In selling it is always easier to come down in the scale of quality and price than to start at the bottom and work up to the most costly. Also, a customer is always secretly flattered by being shown the most expensive article of a class first, even though it is in mind to purchase something less costly.

Frequently, too, such tactics lead to the sale of a better article than otherwise would have been so. First impressions are apt to be lasting. So aim to have that first impression truly representative of the best in quality and service possible with the class of appliances in question.

10. *Attach to appliances tags showing price and cost in cents per hour to operate.*

Many who visit your store have used electrical appliances and are thoroughly sold on their manifold advantages. Frequently they come in with minds made up to purchase a certain type of appliance and require only to be told the price. In such instances the tag makes the sale while you perhaps are busy with other customers.

There are many occasions in even the best equipped and regulated stores when customers cannot be given attention immediately they have entered. At such times, the tags will prove helpful in occupying the customer's attention.

Best of all is the service the tags perform in connection with a very generally observed human characteristics. Many folks incline to place more confidence in what they read than they do in what is told them, and the tags support the salesman's statement regarding the operating cost of the appliances.

TIMELINESS IS FEATURE OF NOVEL SALES PLAN.

California Dealers Build Up Sales Campaign Around Fact of Shortage of Sugar.

A note of timeliness is just as desirable in advertisements and selling plans as it is in window displays. Taking advantage of the recent (?) shortage of sugar, Alfred Stahel & Sons, San Diego, Cal., offered a prize each week for a period of six weeks for the best menu in which sugar substitutes were used.

Each week they advertised a different electric utensil—percolator, toaster, waffle iron, grill, etc., and alongside of it the winning menu of the previous week—coupling the two by showing how much easier it was to prepare food by the electric method. Their advertisements received wide publicity, since they were scanned by all the competitors and their friends, to see if their own particular menu had been published, while the way in which they linked the menus with electric cooking utensils brought them to the attention of scores who had never before given much thought to the wonderful efficiency of these devices.

The window display each week featured the particular electric convenience which was being advertised in the papers, and set in racks were printed cards containing some of the best menus submitted, together with the names of the originators. You may be sure that these windows received careful scanning from hundreds of feminine eyes, and as there were cards, lettered in bright colors, stating the name, use and price of the electrical merchandise shown, it was brought prominently to the attention of everybody who saw the display.

QUESTIONS AND ANSWERS

All readers are invited to submit questions and answers to this department. Anonymous communications will not be considered. Questions should relate to electrical matters of any kind. Answers contributed by readers should be submitted preferably within eight days of the date of publication of the question and should be limited, if possible, to 300 words. Payment will be made for all answers published.

Questions.

No. 475.—Pricing Motor Repair Work.—Can some of the readers through the questions and answers columns give me the best methods of pricing repair work on electric motors, armature winding, etc., and the best methods of setting the selling price of insulating materials and of magnet wire?—D. D., Indianapolis, Ind.

No. 477.—Floor Outlets in Living Rooms.—I should like to have the statements of readers as to their practice in wiring large living rooms in residences where several floor and table lamps are likely to be used and no ceiling fixtures are specified. In a particular case of this sort the architect called for six bracket fixtures and no wall or floor receptacles. I pointed out to him that on account of the size of the room (18 ft. by 22 ft. 6 ins.) any table or floor lamps would require long cords to reach the brackets unless these lamps were used quite close to the wall, in which case the lighting of the center of the room would be poor. Such long cords and few outlets would cause trouble. Therefore I recommended adding at least two floor receptacles and four baseboard receptacles. The architect objected to floor outlets as too likely to cause trouble. Was my recommendation in accord with the best practice in such cases? Has any serious objection been found to floor outlets?—J. O. B., Pittsburgh, Pa.

No. 478.—Lamp Bank for Testing.—In several repair shops I recently noticed use of a lamp bank arrangement with 0-300 ammeters for testing armatures for "opens," "shorts," etc. I would like to get through the queries column a wiring diagram for such a lamp bank arrangement that is not too complicated to make in the shop. I have tried several schemes without good results.—J. D., Detroit, Mich.

No. 479.—Boiler-Furnace Explosions.—I would like to know if anyone has had similar experiences to mine. We find since burning bituminous run-of-mine, that the fire door is often blown open with considerable force. At other times when the fire door is opened an explosion occurs and flame and coal is ejected into the boiler room. Just what are the causes of this, and how may they be overcome without changing the grade of coal?—J. R. K., Belvidere, Ill.

No. 480.—Depreciation Reserve of Utilities.—What is the present prevailing practice on the part of public service commissions as to how the depreciation reserve of public utilities shall be kept? Is this fund always kept separate and distinct from other sinking funds or reserves? Do the commissions approve lumping it in with the general reserve of the utility?—A. E. M., Little Rock, Ark.

Answers.

No. 467.—Operating Cost of Electric Household Refrigerators.—I would like to know from some reliable source what is the operating cost of the electrically operated refrigerators that are being recommended for household use. What is the experience as to their dependability?—R. H. T., New York, N. Y.

So far as the writer is able to ascertain, actual operating costs of small electrically operated refrigerators, such as are employed in small stores, residences, etc., are not available. The manufacturers of such outfits are able to give operating costs as estimated by them, but these do not cover all the actual costs, which embrace maintenance charges, interest on investment, etc.

The cost of operation depends, of course, upon the size of the refrigerator and the conditions of its use, that is the amount of ice it produces or the degree of refrigeration accomplished, the climate, the temperature maintained and the frequency with which the refrigerator is opened and closed to permit removal and replacement of the product cooled.

Of the actual operating costs, neglecting the interest upon the investment, the cost of electric power is the chief. There is also a maintenance charge, but this is usually extremely small, and is due to the periodic cleaning of the motor, cooling coils, lubrication, etc. The conditions under which the refrigerators are usually installed are such that the owner pays little attention to his cooling apparatus once it is in service. The monthly electric bill is rendered and paid, the water meter is read, the bill is rendered and paid, and so on.

The better of these refrigerating outfits appear to be reliable and to give little trouble. Where the annual consumption of ice or the amount of refrigeration is sufficient, money invested in a self-refrigerating outfit is a sound investment. But for such to be the case the total operating costs plus the interest on the investment must be less than the cost of purchasing ice. This condition practically precludes the use of small domestic refrigerating plants except by the large user of ice.—M. S. O., Detroit, Mich.

No. 476.—Colored Lighting Effects in Theater.—In producing the various changeable colored lighting effects in a theater that are now becoming so popular what is the smallest number of primary colors that will serve? Is it possible to get more pleasing gradations of color through using more sets of differently colored lamps than of primary colors alone? What is the most practical way to secure such color effects?—H. M. P., Seattle, Wash.

The best results for the polychrome lighting of theater auditoriums, etc., are most effectively produced by the use of type "C" Mazda lamps in silvered mirror glass reflectors of the proper capacities and design set in suitably ventilated holders with provision for glass or gelatine color screens or mediums. To get the most effective distribution of colored illumination it is absolutely necessary to use the best reflectors obtainable; also avoid color screens which contain opaque colored particles from which the colored light is produced by reflection. The three primary colors: red, violet and green constitute the smallest number that will serve to obtain the most pleasing effects. It is possible to get the greatest number of shades and gradations by the use of the graphite compression type dimmers, which give a greater number of variations and stand up better than the commutator contact type for this purpose. If the dimmers are driven by means of motors, the various colors can be blended into each other much more gradually than if same are worked manually. Although white lighting can be produced by the proper mixture of the three primary colors, it is the usual practice in laying out polychrome lighting installations to include white lighting in addition for efficient general illumination and for use also in fading the various colors.—A. R. L., Chicago, Ill.

SKIP-STOP MAKES PLEASING SAVING IN NEW HAVEN, CONN.

Among the traction companies adopting the skip-stop during the acute fuel shortage that occurred during the winter of 1917-1918 was the New Haven Traction Co., which serves New Haven, Conn., and adjacent territory with transportation. It is reported that the skip-stop has resulted in an annual saving of about $8000 and that both the public and the utility favor retaining the skip-stop.

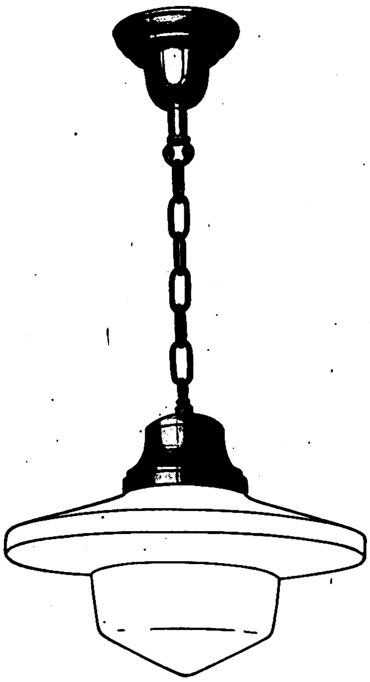
New Appliances

Commercial Fixtures Especially Designed for Glass Units—Cigarette-Making Machine Employing Electric Heater

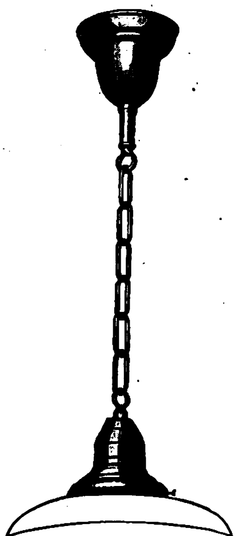
Brass Fixtures Specially Designed for Glass Commercial Lighting Units.

A series of commercial fixtures for use with the Ivanhoe "Ace," Phoenix and other recently designed glass units employed in connection with high-powered lamps, is announced by the F. W. Wakefield Brass Co., of Vermilion, Ohio. These units bear the Wakefield "Red Spot" mark, which identifies and guarantees all goods of this company's manufacture.

These Wakefield commercial fixtures are made wholly of brass and as regularly shipped, include porcelain receptacles of special patented design built into the holders. They are entirely dustproof and cannot serve as the graveyard for flocks of bugs.



Wakefield Brass Fixture Specially Designed for the Ivanhoe-Regent "Ace" Glass Unit.



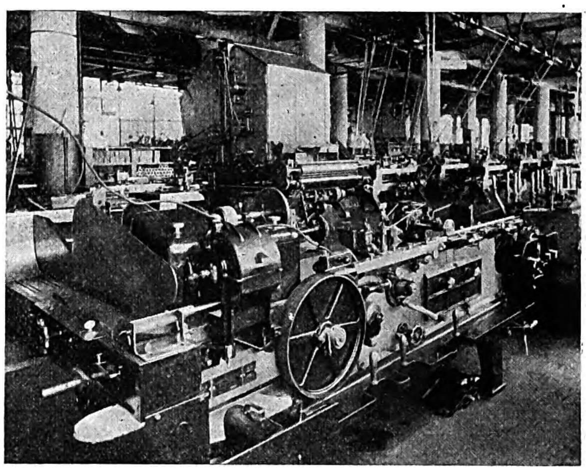
Wakefield Commercial Fixture for Glass Inclosed Unit.

Being packed one unit to the carton and plainly labeled, these fixtures are particularly convenient for the jobber and dealer to handle. The package need not be opened until the fixtures are on the job, thus there can be no possible loss of parts, injury to finish or deterioration in stock.

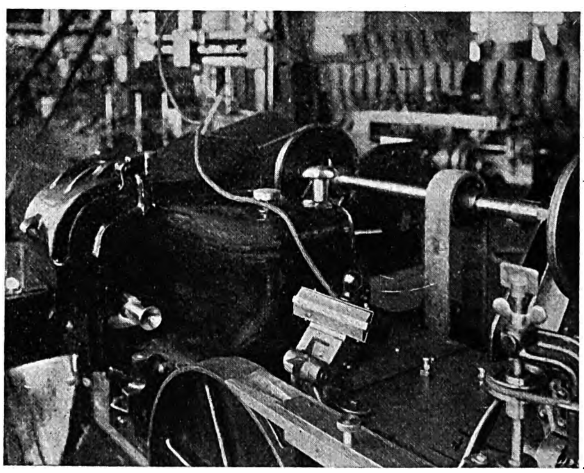
The designs of these Wakefield commercial units, as indicated by the illustrations, are such as to appeal to contractors and fixture dealers supplying equipment to the better class of stores, offices and public buildings.

Electric Heater Used in Cigarette Manufacture.

An interesting and novel use of electric heating is found in a cigarette-making machine manufactured by the American Machine & Foundry Co., Brooklyn, N. Y.



General View of Cigarette-Making Machine.



Near View of the Electric Heater Swung Up for Inspection.

Cigarettes, being now produced by the million, are of course made by automatic machines which perform the entire process. At one end of the machine is a roll of cigarette paper, and a hopper containing the tobacco. The paper goes through the machine in a long continuous strip. It first passes through a series of rolls, which print on it at the proper intervals the maker's name, etc., and then it is carried over a concave plate, several feet long, where it receives the tobacco. Then the paper strip with its load of tobacco passes under a grooved wheel which molds the tobacco into the proper shape, and next the edges of the paper are folded over. The remaining steps of the process are the application of paste to the edge of the paper, the drying of the paste by the electric heater, the cutting of the long cylinder into cigarette lengths by a circular saw, and finally the stacking of the cigarettes in the hopper at the end of the machine.

The electric heater is of an oblong shape with a long, narrow ironing surface which rests on the traveling cigarette tube and quickly drives out the moisture in the paste. It consumes about 100 watts and is of Westinghouse make. A similar heater is also used for drying the paste of labels and stamps on boxes and cans.

Trade Activities

Fairbanks-Morse To Erect Large Modern Foundry at Beloit —F. H. M. Riley Appointed Manufacturers' Representative

Edison Electric Appliance Co., 5660 West Taylor street, Chicago, is sending out announcements of an advertising campaign on Hotpoint electrical devices to be conducted in various national publications. In this connection the company is introducing the Hotpoint gift certificate idea, which consists of neatly printed certificates which may be used by dealers, who may have depleted stocks of electrical devices, to enable customers to make electrical gifts, even though deliveries cannot be made before Christmas.

Francis H. M. Riley, formerly associated with Vaughn & Meyer, Milwaukee, consulting engineers, announces his appointment as Wisconsin representative, with offices at 514-615 Security Building, Milwaukee, for the following companies: Vulcan Soot Cleaner Co., Du Bois, Pa., designer and manufacturer of Vulcan mechanical soot cleaners for all types of boilers and economizers; Vulcan Fuel Economy Co., Chicago, manufacturer of Vulcan Lastite, Vulcan-Orsat gas analyzers, Vulcan gas collectors, boiler tube cleaners, differential draft gages and smoke indicators; Green Engineering Co., East Chicago, Ind., designer and manufacturer of Green chain-grate stokers, jet ash conveyors, pressure waterbacks, Sel-flex ventilated arches and materials, transfer and storage hoppers. Mr. Riley and the organizations which he represents will render especial service and assistance to all who are interested in the effective solution of the problems of reduced fuel, power plant operation and production costs.

Benjamin Electric Manufacturing Co., Chicago, Ill., has published a book on industrial lighting that embodies much practical information for applying the principles laid down by illuminating engineers as the best practice in the lighting of buildings and areas devoted to industrial uses. The book has been prepared with a view of being helpful to anyone whose objective is the attainment of correct industrial lighting. It is a response to the demand for genuine service to all departments of industry seeking to raise standards of production, reduce accidents and spoilage and to make the task of the worker more acceptable through the application of higher lighting intensities. The considerations governing the selection of lamps and reflectors are explained in simple terms. There is a chapter on general illuminating information, with tables and definitions which reduce to simple terms the complex formula out of which correct deductions with regard to the specification of lamps and fixtures are solved. There is a table giving the foot-candle intensities desirable as worked out from a consensus of the best opinions of illuminating engineers and physicists, and a complete presentation of the electrical symbols used on architects' drawings. The catalog data relating to Benjamin industrial lighting equipment is arranged in orderly sequence, carefully indexed, and gives the reader a comprehensive idea of the material available to meet the wide range of industrial lighting requirements. A feature of unusual interest is the charts of industrial fixtures which present a study of reflector contour, light distribution diagram and lamp size so that the specification for any particular use is easily arrived at without recourse to any data other than those given in the book. Numerous examples of industrial lighting requirements, with actual photographic reproductions of results, add greatly to the usefulness of this very practical book on industrial lighting.

Fairbanks, Morse & Co., Chicago, will start next year the erection of a new plant in Beloit, Wis., which it claims will be the largest and most modern foundry in the world and will involve an expenditure of approximately $1,500,000. Many months of study have been given to this enterprise, with the result that every protection for the safety and health of the employes, every modern, scientific foundry device, improvement in the casting of gray iron, will be incorporated in the new plant. Electric cranes will carry the raw materials to and from the big cupolas. Electric grab buckets will unload the molding and core sand and coke; electromagnets will grip the raw pig iron and remove it from the cars; and electric cranes and conveyors will carry all molten metal from the cupolas to every mold, whether for giant castings of 10,000 lbs. or a few ounces. The structure will, when completed, be 900x550 ft. and will contain 495,000 sq. ft. of floor space. This building, including storage of flasks, iron, sand, etc., which will also be under the roof, will cover 11 acres of ground, and will be located directly to the north of the present house, bordering the River road. The completed structure will have an ultimate capacity of 350 to 400 tons of gray iron daily. The foundry will eventually employ 1,500 additional men; and 1,500 more men will be required in other departments of the factory to meet the increased production that will result. Although the comfort of the employe has been intensively emphasized in the construction plans, mechanical efficiency has received due consideration, provision having been made for a giant electric crane system which will distribute all materials to every part of the plant. The new foundry will allow the company not only to handle the iron now used with greater efficiency, but will increase the output greatly. Excavation work will be started as soon as weather conditions permit in the spring and construction work will be pushed rapidly.

Altorfer Company to Double Manufacturing Facilities.—The remarkable growth of the electric washing machine industry and the constantly increasing demand for this labor-saving device, is exemplified in the announcement of the Altorfer Brothers Co., Peoria, Ill., manufacturer of the "Super-electric" washing machine. Notwithstanding the fact that the company moved into a large new factory last June, it again finds its facilities wholly inadequate to meet the demand for its product and is, therefore, erecting another new structure which will increase its present output by 50%. The building will be 100x600 ft., and will provide total floor space of 200,000 sq. ft. This will be the second factory erected this year, the new building being of the same size as that occupied June 1 last. The Altorfer company, which was one of the first to enter the washing machine field, is now one of the largest producers, and the "Super-electric" washing machine which it has developed is considered one of the most efficient and most popular on the market.

Leeds & Northrup Co., 4901 Stanton avenue, Philadelphia, Pa., manufacturer of electrical measuring instruments, is distributing catalog No. 86-B which has for its title "The Optical Pyrometer," a portable instrument for works temperature measurements. This book, containing 28 pages, describes the instrument and its practical applications in gaging temperatures in the open, fuel beds, heat treating furnaces, muffle furnaces, in the rolling and forging of steel, blast furnaces, electric furnaces, of molten steel and slag, molten cast iron, molten non-ferrous metals, molten glass, ceramic furnaces, etc., for checking thermocouple pyrometers. This optical pyrometer, employing a balance method of comparising luminous radiations, measures temperatures from a dull red (1,200°F.) up to the highest known temperatures, and makes use of the most accurate method based on radiation so far developed for measuring temperatures. The bulletin is well illustrated and contains considerable data on temperature measurement with optical pyrometers.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

North Stratford, N. H. — Warner Sugar Refinery Co., 79 Wall street, New York, has awarded a contract to C. A. Ridlon, Roulette, Pa., for the erection of a 1-story power plant and barrel works, about 75x80 ft. and 64x120 ft., respectively, at North Stratford.

Rutland, Vt. — Stasa Milling Co., Castleton, Vt., is negotiating with the Rutland Railway, Light & Power Co. for the furnishing of additional power for the operation of its plant. The company will require a total of about 1500 hp.

Watertown, Mass. — Oakville Co. has recently inaugurated work on the construction of a new 1-story generator house at its plant in the Oakville district. The structure will be about 44x56 ft. The Fred T. Ley Co., Main street, Springfield, Mass., is the contractor.

Pawtucket, R. I. — In connection with the construction of the new 2 and 4-story plant of the Tubular Woven Fabric Co., to cost approximately $200,000, considerable electrical equipment for operation will be required. O. D. Purington & Co., Industrial Trust building, Providence, are the contractors.

Amenia (Dutchess County), N. Y. —Application has been filed with the Public Service Commission by the Amenia Electrical Light & Power Co., for permission to construct and operate a local electric light and power plant. The company has been granted a franchise by the municipality.

Binghamton, N. Y. — Binghamton Light, Heat & Power Co. is completing the installation of a 2500-kw. turbine unit at its plant. The company has completed the construction of a new 5-mile transmission line to the plant of the Endicott Johnson Corp., Endicott, N. Y.

Buffalo, N. Y. — City council is understood to be considering plans for the construction of a new municipal electric light and power plant.

Churchville, N. Y.—The city contemplates the installation of a new electric lighting and power systems. Bonds in the sum of $25,000 have been voted for the construction.

Hamden, N. Y.—Hamden Electric Light Co. (Delaware county), has filed application with the Public Service Commission for permission to construct and operate an electric light and power plant for local service.

New York, N. Y.—Ophuls, Hill & McCreary, Inc., 112 West 42nd street, engineer, is completing plans for the French Government, Artillery Department, Commissariat General Des Affairs de Guerre, France Americanes, 65 Broadway, New York, for the construction of a large new electric lighting plant to be located on the Isle of St. Pieppe, off the Coast of New Foundland.

Portville, N. Y. — Portville-Cattaraugus County Utilities Co., Inc., has recently filed application with the Public Service Commission for the necessary permission to erect and operate a local electric lighting plant for furnishing service to the municipality from which a franchise has been secured. The company also requests approval of the issuance of capital stock for $50,000, the proceeds to be used to cover the cost of the proposed work.

Rochester, N. Y.—Josiah Anstice Co., 220 North Water street, has had plans prepared for the construction of a new 1-story power plant and boiler house, to be located on Humboldt street, between Culver road and Coventry avenue. The structure will be of brick and steel, about 50x 100 ft. G. Morton Wolfe, 1377 Main street, Buffalo, is architect for the company.

Butler, N. J.—Borough council has authorized the lighting committee to prepare plans and specifications for the installation of a new electrically operated pumping unit for the municipal plant.

Dover, N. J.—In connection with the proposed opening of a new mine in the vicinity of Dover, the Prior Chemical Co. will utilize electric power comprising a total of about 150 hp. in motors.

Dover, N. J.—Dover Boiler Works has recently completed the installation of a quantity of new equipment at its plant, including new air compressor unit operated by a 264-hp. capacity synchronous motor, new pumping unit direct connected to a 150-hp. motor, and other apparatus. Power for operation is furnished by the New Jersey Power & Light Co.

East Orange, N. J. — Plans are under consideration by the city council for the installation of a new municipal electric lighting plant, as well as a new electric street-lighting system.

Jersey City, N. J.—Plans are under consideration by the city officials for the establishment of a new "white way" street-lighting system in lower Broadway. The Downtown Business Men's Association is interested in the proposed work. Service is furnished by the Public Service Electric Co.

Midvale, N. J.—Tri-County Electric Co., Pompton Lakes, is making rapid progress on the installation of a new electric street lighting system.

Newark, N. J.—General Laundries have had plans prepared for the construction of a new brick and reinforced concrete plant to be located at 93-97 Summer avenue and 33-41 High street, to cost about $72,000. Considerable electrical equipment will be required.

Newark, N. J. — Hochbaum-Rylander Electric Co. has filed notice of organization to operate at 539 Central avenue, for the production of electric and gas fixtures, etc. Frederick Hochbaum and Ernest J. Rylander, 15 Montrose street, South Orange, head the company.

Orange, N. J. — Central Storage Battery & Radiator Co. has filed notice of organization to operate at 353 Central avenue, Orange. The company will specialize in the repair of storage batteries. H. S. Johnson, Sr. and Jr., both of Glenwood avenle, Orange, head the company.

Beaver Falls, Pa.—Electric Service Co., Inc., operating a local plant for the repair of storage batteries, armature winding, electric welding, etc., has completed the removal of its works to its new plant at 700 3rd avenue, Pittsburgh. The new plant is a 3-story, and considerable new equipment and machinery has been installed to allow for increased operations.

Erie, Pa.—Plans are under consideration by the General Electric Co. for extensive additions to its local plant. It is understood that the plans include the erection of a large new machine shop, which will be the largest department at the local works.

Essington, Pa. — Westinghouse Electric & Manufacturing Co. is having plans prepared for the construction of a new 2-story steel and concrete addition to its local plant, about 130x500 ft., to cost, including equipment installation, close to $1,000,000. The company has completed negotiations for the sale of its land holdings on Duquesne Way, extending through to Fayette street, Pittsburgh, 66x328 ft., with 1-story steel factory building, for a consideration of about $175,000.

Philadelphia, Pa. — Considerable new electrical equipment will be required in connection with the construction of the proposed new newspaper publication plant of the Philadelphia Public Ledger Co., to be located at 6th, 7th, Chestnut and Ransom streets. The building will be a 10-story brick, about 230x385 ft., and will cost about $5,000,000.

Reading, Pa. — Reading Transit & Light Co. has recently completed work on extensive improvements in its traction system in Reading, Norristown and Lebanon.

Youngsville, Pa. — The city will

soon have its streets lighted by electricity through the public spirited action of a number of its business men. Power will be secured from the surplus power of the water plant. The new equipment will be purchased by business men.

Norfolk, Va.—Virginia Railway & Power Co. is understood to be arranging plans for its expansion program for 1920. The work will include extensive improvements to street-car and lighting facilities, plant improvements, the purchase of new rolling stock, and other work, and will cost in excess of $1,000,000.

Janelow, W. Va.—Plans are under consideration by Burton M. Davisson for the installation of new electric light and water systems.

Weyer's Cave, W. Va. — Weyer's Cave Light & Power Co. has filed notice with the Secretary of State of an increase in its capitalization to $100,000, to provide for general business expansion.

Chimney Rock, N. C. — Southern Bell Telephone & Telegraph Co. will construct a line from Asheville to Chimney Rock.

Lexington, N. C.—Lexington Telephone Co. will erect a 2-story brick building and install an automatic telephone system.

Rocky Mount, N. C.—Home Telephone & Telegraph Co. will install underground conduit system, and add additional section of switchboard. About $70,000 will be expended in improving the plant.

Denmark, S. C. — American Telephone & Telegraph Co. will erect a 3-story brick and stone building. Estimated cost from $75,000 to $100,000.

Due West, S. C. — City will construct a light plant. The sum of $16,000 in bonds has been voted. R. B. McDill, clerk.

North, S. C.—North Electric Light & Power Co. has advertised for one 50 or 75-hp. 3-phase generator, alternating current, also 1, 2 or 3 kw. exciter and switchboard complete.

Simpsonville, S. C.—Bonds to the amount of $15,000 have been voted for installing an electric light system. Address Mayor.

Summerville, S. C.—Commissioners of Public Works have approved the issuance of bonds for $40,000, the proceeds to be used for the installation of a new municipal electric light plant.

NORTH CENTRAL STATES.

Dayton, O.—About $200,000 will be expended for telephone exchange. Architect W. S. Hays, 212 Washington street, Chicago, Ill., has prepared plans. Owner, Union Central Telephone Co.

Hamilton, O. — An ordinance has passed the council providing for an issue of $50,000 in bonds to improve the municipal light plant. Address Mayor Smith.

Springfield, O. — Springfield Light, Heat & Power Co. is preparing to add equipment which will double its present capacity.

DATES AHEAD.

American Society of Civil Engineers. Annual meeting, New York City, Jan. 21-22, 1920. Secretary, Charles W. Hunt, 33 West 39th street, New York City.

Western Association of Electrical Inspectors. Annual convention, St. Louis, Mo., Jan. 27-29, 1920. Secretary, W. S. Boyd, 175 West Jackson boulevard, Chicago, Ill.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., February, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, O.

Oklahoma Utilities Association. Annual convention, Oklahoma City, Feb. 10-13, 1920. Secretary, H. A. Lane, 611 State National Bank building, Oklahoma City.

Central Electric Railway Association. Annual meeting, Louisville, Feb. 26-27. Secretary, A. L. Neereamer, Indianapolis, Ind.

American Electrochemical Society. Annual convention, Boston, Mass., April 7-10, 1920. Friday, April 9, joint session with American Institute of Electrical Engineers on "Electrically Produced Alloys." Secretary, Joseph W. Richards, Bethlehem, Pa.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

Northern White Cedar Association. Midsummer meeting, Lake of the Woods, Minn., June 12-17, 1920. Secretary, Norman E. Boucher, 702-3 Lumber Exchange, Minneapolis.

National Association of Electrical Contractors and Dealers. Annual convention, Baltimore, Md., Oct. 6, 1920. Secretary, W. H. Morton, 110 West 40th street, New York City.

Youngstown, O.—About $80,000 will be expended for telephone exchange. Architect W. H. Hays, assistant engineer, 2122 W. Washington street, Chicago, has prepared plans. Owner, Central Union Telephone Co.

Ashley, Mich.—The Ashley Community Association has been formed with a capital of $20,000. Electric lights are assured the village and work on the power house and plant will be started at once. Harry O. Rose, chairman.

Detroit, Mich.—Mutual Electric & Machine Co., 232 W. Fort street, will extend and remodel its 3-story plant and will cost about $12,000.

Decatur, Ind.—The contract for the General Electric Co. factory building in this city has been awarded to the Ferguson Construction Co., of Cleveland, O. The building will be 260x 360 ft. The company plans to have its Decatur branch operating by March 1. It is said that the General Electric Co. will erect another building of the same size when the first one is completed.

East Chicago, Ind. — Edwards Valve & Manufacturing Co., which had extensive war munitions contracts, has converted its shop into an electric washing machine factory.

Evansville, Ind.—Schroeder Headlight & Generator Co. has changed its name to Sunbeam Electric Manufacturing Co.

Hagerstown, Ind.—Charles Brassman, 1503 Merchants Bank building, Indianapolis, will prepare estimates for a municipal light plant.

Indianapolis, Ind.—L. H. Van Briggle Chemical Co. will erect a new factory building which will adjoin the building of the Van Briggle Motor Device Co., both of which are controlled by the same interests. It is to be of reinforced concrete construction, of the same type of architecture of the motor device plant, and will house the factory and storeroom of the chemical company.

Indianapolis, Ind. — Pittsburgh Plate Glass Co. is having plans prepared for a new power plant.

Seymour, Ind. — A high-tension line, which is being built by the Interstate Public Service Co., between its hydraulic station at Williams, Ind. and this city, will soon be completed. The system is connected at Seymour with a high-tension line between Indianapolis and Seymour, also owned by the Interstate company. When the line is in operation the Williams' station will supply a large part of the electrical energy for light and power in Greenwood, Franklin, Edinburg, Columbus and Seymour, as well as many other towns.

South Bend, Ind. — Studebaker Corp. has announced plans for the erection of 1000 homes, made necessary by the opening of its new $15,-000,000 automobile plant. A subsidiary home building company has been formed with a capitalization of $1,000,000 to carry on the building project.

Chicago, Ill.—Plans are being made for the erection of the Allerton Hotel, 16 stories, 600 rooms, 150x107 ft., to cost $1,500,000.

Chicago, Ill. — American Bond & Mortgage Co. has purchased the Unity building and will expend $450,-000 in alterations. Indirect lighting fixtures will be installed throughout the 16-story building and the entire heating and power plants will be rebuilt and modernized. Between $75,-000 and $90,000 will be expended in alterations of the bank floor, which will be occupied by new owners.

Chicago, Ill.—Mutual Tailoring Co. will build a 7-story plant, 100x120 ft., containing 84,000 sq. ft. of floor space and costing $400,000.

Grayville, Ill.—The city council will hold a special election for issuing bonds for the purchase of additional equipment at the electric power plant. It is expected the bond issue will carry, enabling the city to buy sufficient equipment for the light plant to guarantee continuous power service for a button factory which is under contract with the chamber of commerce to locate here.

Valdalia, Ill.—The question of issuing municipal light bonds will be submitted to vote. Address village clerk.

Benson, Minn.—City contemplates electric light plant improvements. Engineer W. E. Skinner, 15 South 5th street, Minneapolis, and Theo. B. Lee, superintendent, are preparing plans. Estimated cost, $40,000. I. M. Peterson, city clerk.

Duluth, Minn. — Western State Bank will erect $30,000 1-story bank building next spring.

Duluth, Minn. — Duluth Edison

Electrical Co. will install lighting system on Superior street, from 3rd Avenue East to 7th Avenue West. Eight 600-cp. incandescent lights in each block. Constructing Engineer W. S. Heald, 216 W. 1st street.

Glyndon, Minn.—A municipal light plant is under consideration. Address, M. H. Stadum.

Minneapolis, Minn. — Expenditures aggregating $300,000 for the installation of equipment for an underground pneumatic tube system in the business district, which will connect 10 downtown branches with the main Western Union offices, have been authorized by the executive committees of the Western Union Telegraph Co. L. F. Weise, manager.

Minneapolis, Minn. — Northern States Power Co. will erect a power station in southern Minnesota to take care of increased business. Plant will include 13,500-hp. steam turbine and provision will be made to install a second 20,000-hp. turbine later. R. W. Fuller, vice-president, Minneapolis General Electric Co., 610 3rd Avenue, North.

Davenport, Ia. — New machinery will be installed in the 4-story addition to the Davenport branch of the American Hominy Co., formerly the Purity Oats Co. This building is now practically completed.

Meservey, Ia.—The sum of $93,500 in bonds have been voted for an electric light system. The Iowa Falls Electric Co. will build the line and furnish the current.

Guilford, Mo. — Plans are being made for the installation of electric service from the Maryville Electric Light & Power Co.

Jasper, Mo.—Plans are being made to call a bond election to purchase and improve the light plant.

Slater, Mo. — Election carried to vote $22,500 in bonds for repairs at the city power plant. Plans are being made for the improvements.

St. Louis, Mo.—The Committee on Streets, Sewers and Wharves of the Board of Aldermen of St. Louis have approved a bill providing for the lease by the city to the Union Electric Light & Power Co. of a tract of land at the foot of Ashley street at a rental of $13,807.50 a year. The tract comprises approximately 2 acres. The lease will be for 10 years with an option to be renewed for another 10 years provided that the rental shall be on the basis of 5% per annum upon the valuation of the property.

St. Louis, Mo.—Emerson Electric Manufacturing Co. is selling $1,000,000 preferred stock, the proceeds to be used for the construction of a new factory building immediately adjoining its present St. Louis factory.

St. Louis, Mo.—Blue Bird Manufacturing Co., manufacturer of electrical washing machines, etc., a Delaware corporation, has filed notice with the Secretary of State of an increase in its capital from $500,000 to $1,000,000, to provide for general business expansion.

Burns, Kan. — Election to vote bonds in the sum of $15,000 carried. The funds will be used to build necessary transmission lines to meet the high-voltage lines of the Kansas Gas & Electric Co.

Harper, Kan.—The installation of a white way, to cost $7000, is contemplated. Miss A. E. Crocker, city clerk.

Meridan, Kan.—A petition has been submitted for electric lights.

Milton, N. D.—The committee appointed to get plans for the new electric lighting plant here has completed such plans and will soon begin to advertise for bids.

New Rockford, N. D.—The city will construct "white way" on Willard avenue, Dakota street, Lamborn avenue and Chicago street. F. H. Collins, city auditor.

SOUTH CENTRAL STATES.

Maysville, Ky. — Mason-Bracken Electrical Co., recently incorporated with a capital of $25,000, is planning for the operation of an electric light and power plant at Germantown. Plans are being prepared to furnish service to Brookville and Maysville, a transmission system to be constructed through Maysville via Germantown and Brookville. H. L. Corlis, Germantown, is president of the new company.

Pikeville, Ky.—Kentucky & West Virginia Power Co. will purchase new equipment for its plant.

Yeager, Ky. — Fork-Elkhorn Coal Co. will install electrical equipment.

Birmingham, Ala. — Birmingham Light & Power Co. will erect substations of 1000-kw. capacity, rotary converter with switchboard to supply 250-volt energy to Edison service. L. L. Newman, engineer.

Brundidge, Ala.—G. L. Beck contemplates the installation of a generating unit in the electric plant.

Montgomery, Ala. — Montgomery Light & Water Power Co. is understood to be arranging plans to double the present capacity of its hydroelectric plant. The work will include the construction of a new 44,000-volt high-tension transmission line to connect with the line of similar capacity of the Alabama Power Co., near Vida, on the Mobile & Ohio Railway, about 25 miles northwest of Montgomery. The expansion program is estimated to involve an expenditure of about $500,000. S. B. Irelan is general manager.

Roanoke, Ala. — Alabama Power Co., Birmingham, Ala., will construct a power line to Rock Mills, to furnish electric power to Wehadkee Yarn Mills.

Fort Smith Ark. — Fort Smith Light & Traction Co. is making plans to enlarge its power plant by adding an addition to cost $250,000.

Harrisburg, Ark. — Three brick buildings will be erected by the Harrisburg Light & Power Co. About $20,000 of ice machinery, $30,000 light and waterworks machinery and $20,000 of cotton gin equipment will be installed.

Dewar, Okla.—Dewar Electric Co. is arranging plans for the construction of a new electric light plant to furnish service for local and nearby operations.

El Reno, Okla.—Waterworks improvements are contemplated including pipe line extensions, reservoirs, etc., to cost $300,000. Ethel Deel, city clerk.

Lindsay, Okla. — Election to vote $75,000 in bonds to extend the water works system and $25,000 to extend the electric light system, carried.

Oklahoma City, Okla.—Oklahoma Gas & Electric Co. will construct a station in Western Oklahoma, 10,000-hp. capacity, condensing water from Arkansas river. Address H. M. Byllesby & Co., 208 La Salle street, Chicago, Ill.

Sallisaw, Okla.—About $140,000 will be expended improving the light and water system. Address city auditor.

Tahlequah, Okla.—City will install electric light plant. $1,000,000 in bonds have been voted. Address mayor.

Abilene, Tex. — American Public Service Co. plans to take over and rehabilitate the electric street railway system here. The property has not been operated for some time. Abilene Gas & Electric Co., subsidiary of the American Public Service Co., will expend about $40,000 in making improvements to the system. This company has also begun the construction of a new electric power station here which will cost about $750,000. It will build a system of transmission lines from the new plant to Cisco, Baird, Anson, Stamford, Hamlin, Merkel and other towns of central west Texas, it is announced by A. Hardgrave of Dallas, vice-president and general manager of the American Public Service Co.

Clarendon, Tex. — Texas Light & Power Co. contemplates light plant extensions and improvements. Mr. Coursen, engineer.

Donna, Tex.—Donna Light & Ice Co has increased its capital stock from $10,000 to $40,000. It plans to install new machinery and greatly enlarge the capacity of its electric light and power plant.

Gainesville, Tex. — Gainesville-Sherman Traction Co. has submitted propositions to the citizens of Gainesville, Whitesboro and Sherman looking to the construction of an interurban electric railway between Gainesville and Sherman, about 30 miles. From these three towns a total cash bonus of $175,000 and stock subscriptions to the amount of $275,000 are asked. George M. Easley of Dallas is president and Burt C. Blanton of Dallas is general manager of the company. Construction of the proposed line will be started next February.

Mineral Wells, Tex. — Two allied companies have been organized for the purpose of constructing an interurban electric railway between Fort Worth and Mineral Wells, about 60 miles, and between Mineral Wells and Breckenridge, about 55 miles, with branch lines from the latter town to Eastland, Ranger and Cisco, about 60 miles. One of these companies is the Fort Worth & Mineral

Wells railway and the other is the Fort Worth, Mineral Wells & Breckenridge railway. H. E. Robinson of Fort Worth is president of both companies. Surveys have been made and right of way obtained for the proposed lines, according to Mr. Robinson. Construction will be started early in January.

WESTERN STATES.

Buhl, Ida.—James J. Chambers of Denver, Colo., who owns power rights in Sand Springs, north of Riverside Ferry, and H. E. Lindon, engineer of the firm of Beckman & Linden, San Francisco, met with the citizens of this place recently to discuss propositions of furnishing water to this city from Sand Springs. Chambers stated that if the city would vote bonds for water system and municipal lighting system, his company will supply water and current and take compensation in municipal bonds.

Challis, Ida.—State Public Utilities Commission has granted to W. M. Adamson, authority to begin work on a hydroelectric power plant here, work to begin in 60 days.

Chehalis, Wash. — North Coast Power Co. has filed with the Public Service Commission of Washington, tariffs covering power and residential lighting current, showing increase of rates amounting in some instances to 100%. The company furnishes electric service to Centralia, Chehalis, Tenino, Bucoda, Kelso and Kalema. For supply current to municipal distributing plants, the company establishes a minimum ready-to-serve charge of $600 a month for Chehalis and $1000 a month for Centralia.

Everett, Wash.—Eclipse Mill Co. will make improvements in its plant to cost $25,000. A 2-story building will be constructed equipped throughout with electrically driven machinery.

Matlock, Wash. — District Telephone Co. has decided to extend the line to Sheldon.

Montesano, Wash.—E. H. Bishop, Bishop Lumber Mill, will construct an electrically operated lumber mill with a daily capacity of 60,000 ft.

Seattle, Wash.—Newcomb Carlton, president of the Western Union Telegraph Co., announced that a new cable line will be laid between Seattle and China by way of Japan.

Bend, Ore.—Bend Water, Light & Power Co. contemplates the construction of 2 power plants along the Tumalo river, at a cost of $220,000.

Portland, Ore. — North Portland Box Co. plant, destroyed in a recent fire with a loss of $25,000, will be rebuilt. Machinery will be electrically operated. Coast Steel & Machinery Co. of Portland has contract for a considerable portion of the machinery.

Salem, Ore.—Bend Water Light & Power Co. contemplates construction of power plants on the Tumalo river, at a cost of approximately $230,000.

Redding, Cal.—Pit River Power Co. is completing preliminary survey work in connection with the proposed power development along the Pit river above Copper City. It is said that this work will involve an expenditure in excess of $15,000,000.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Engineering Equipment (31,407).—Engineers in England desire to secure an agency for the sale of engineering equipment (mechanical, electrical and mining). References.

Electrical Apparatus (31,464).—An engineer in the United States who is about to make a visit to Venezuela and Porto Rico, desires to secure the representation of firms for the sale in those countries of machinery, electrical apparatus, automobile trucks, power plants and anything in connection with the mechanical and electrical trades. References.

Electrical Supplies (31,474). — A trade organization in Greece desires to purchase and secure an agency for the sale of electrical supplies. Correspondence may be in English. References.

Electrical Machinery (31,496). — A firm specializing in American electrical manufactures in England desires to secure an agency or purchase electrical machinery and control gear, motors, and generators, alternating and direct current. Will purchase if agency is unobtainable. Quotations should be given c. i. f. English port. References.

Heating Appliances (31,500). — A commercial agent in Belgium desires to secure an agency for the sale of heating appliances, such as valves, radiators, boilers, and similar articles, and to buy various kinds of goods.

Electrical Apparatus (31,503).—An American exporting house which has established branches in all the principal cities of the Levant, and maintains showrooms, warehouses, and service stations, desires to represent American firms for the sale of agricultural machinery, electrical apparatus, automobiles, etc., and all spare parts and accessories thereto. References.

Motors, Compressors, Cranes, Etc. (31,516).—An agency is desired by a firm in Switzerland for the sale of stationary motors and engines driven by gasoline and kerosene; stationary motors driven by electricity, horizontal 20 to 120 h. p.; and compressors, cranes and rigs; and mining machinery. Correspondence may be in English. Reference.

Electrical and Electromechanical Products (31,519). — An importer in Belgium desires to secure an exclusive agency for the sale of electrical and electromechanical products of all sorts. Correspondence and catalogs should be in French. References.

Incandescent Lamps (31,523).—An import and export firm in Bulgaria desires to secure the exclusive agency for the sale of oil and incandescent lamps, sewing and knitting machines, adding and calculating machines, etc. References.

PROPOSALS

Light Plant.—Bids will be received Dec. 31 at Unadilla, Ga., for the erection of an electric light plant and extensions to the waterworks system, which is now being contemplated by the city council. Address mayor.

Electric Light System.—Bids will be received Jan. 5, 1920, by the clerk of the board of education, Ohio National Bank building, Columbus, O., for installing an electric lighting system at the Normal, Fleser, Franklinton, Mound Park and Spring street schools, according to the specifications of D. Riebel, architect, on file in his office, New First National Bank building, and the Builders' Exchange. Edward B. McFadden, clerk.

Rewiring of Building.—Bids will be opened in the office of the supervising architect, Treasury Department, Washington, D. C., at 3 p. m., Jan. 5, 1920, for remodeling plumbing system, rewiring, etc., in the United States Appraisers Stores, St. Louis, Mo., in accordance with the specifications and drawings, copies of which may be had at that office or at the office of the custodian, St. Louis, Mo., in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

Electric Elevators. — Bids will be opened at 3 p. m., Dec. 30, in the supervising architect's office, Treasury Department, Washington, D. C., for the installation complete of two electric elevators in the kitchen and mess hall, United States marine hospital, at New York, N. Y. (Stapleton), in accordance with the drawing and specifications, copies of which may be had at this office in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

Electric Freight Lift.—Sealed proposals will be opened in the office of the supervising architect, Treasury Department, Washington, D. C., at 3 p. m., Jan. 8, 1920, for the installation complete of electric freight lift, etc., in the United States post office at Springfield, O., in accordance with the drawing and specification, copies of which may be had at this office in the discretion of the supervising architect. James A. Wetmore, acting supervising architect.

Telephone Cable and Copper Wire.—Director of Sales, War Department, Washington, D. C., will consider proposals for 1,710,000 ft. of telephone cables and 854,923 lbs. of copper wire. This material was originally packed for overseas shipment and is now available for purchase. It is understood that the greater part of the wire and cable is in the Philadelphia Ordnance District.

Personals

C. P. Bruch Takes Charge of South American Interests, Marconi Telegraph—E. C. Jones a Vice-Pres. of A. S. M. E.

J. W. SMILEY, formerly of the securities department of the Minneapolis General Electric Co. (Northern States Power Co.) has been appointed manager of the new "investment department" of the Louisville Gas & Electric Co.

BURDETT STRYKER, formerly associated with the Chesapeake & Potomac Telephone Co., Washington, D. C., and Baltimore, Md., and later with the Bell Telephone Co. of Pennsylvania, has been appointed general manager of the Chesapeake & Potomac company, Baltimore.

PAUL P. SWEARINGEN has entered the service of the Electric Products Co. in the capacity of sales engineer, making his headquarters at the Chicago office. Mr. Swearingen built the first Liberty motor at the Thomas Morris Aircraft Corp., Ithaca, N. Y., and was transferred as supervisor to the Wright Martin plant, with the rating of captain.

P. R. MCCOMAS has been named general manager of the Illinois Central Electric Railway Co., with headquarters at Canton, Ill. Mr. McComas had had a number of years' experience in both steam and electric railway work and was formerly assistant manager of the Peoria & Pekin Union Railroad Co., Peoria, Ill.

EDWARD F. SISE, president of the Northern Electric Co., Montreal, has resigned. In 1890 Mr. Sise organized the Wire & Cable Co., of which he was managing director until its amalgamation with the Northern Electric Co., at which time he became president of that company. He is succeeded by Paul F. Sise.

J. C. MCQUISTON, manager of the Westinghouse Department of Publicity, East Pittsburgh, Pa., was elected president of the Association of National Advertisers at its annual convention held last week. J. D. ELLSWORTH, publicity manager of the American Telephone & Telegraph Co., New York, was elected a vice-president of the organization.

CLAYTON O. SMITH, the new manager of the O. S. Walker Co., Worcester, Mass., was graduated in 1892 and 1893 as mechanical and electrical engineer, respectively, from Worcester Polytechnic Institute. He then took a student course at the Westinghouse Electric & Manufacturing Co., East Pittsburgh, Pa., following which he accepted a position with the C. W. Hunt Co., Staten Island, N. Y. After 5 years' service with the Norcross Brothers Co., Worcester, in the engineering and drafting department, Mr. Smith became affiliated with the Norton Grinding Co., in its early days, being placed in charge of the drafting department. In 1902 he was promoted to superintendent, in 1905 took charge of the office and 2 years later became sales manager.

HOWARD POWER, secretary of the White Lily Manufacturing Co., Davenport, Ia., manufacturer of electric washing machines, has resigned to become associated with the H. F. Brammer Manufacturing Co., Davenport, effective Jan. 1, 1920.

EDWARD C. JONES, chief engineer of the Pacific Gas & Electric Co., San Francisco, Cal., was elected a third vice-president of the American Society of Mechanical Engineers at its annual meeting held recently. Mr. Jones has taken an active part in the Society's affairs and has been prominently identified with the gas and electric power industry for many years.

PROF. I. O. BAKER has been designated by Dean Charles R. Richards of the college of engineering of the University of Illinois to write a history of the growth and development of the engineering work at the University of Illinois. This history will include the courses in electrical, civil, mechanical, railway, architectural, ceramic and chemical engineering.

WILLIAM LEROY EMMET, consulting engineer of the General Electric Co., Schenectady, N. Y., delivered a very interesting and instructive address on "The Electrical Propulsion of Ships" at a meeting of the New York Electrical Society held on Dec. 17 at the Engineering Societies building, New York City. Mr. Emmet discussed the advantages of the adoption of this method of propulsion in ships of different types and presented valuable engineering data which have recently been developed. Lantern slides of constructions which have been produced or planned were also shown.

CHARLES P. BRUCH, until recently vice-president and director of the Postal Telegraph Co., has just been placed in charge of the interests of the Marconi Wireless Telegraph Co. in a large part of South America and is sailing immediately for Buenos Aires. Himself the son of a distinguished telegraph manager, Mr. Bruch has all his life been engaged in telegraphic operation and administration, and served in the late war as major in the Signal Section of the Officers' Reserve Corps, U. S. Army, and also as a member of the committee on Telegraphs and Telephones of the Council of National Defense. Mr. Bruch is a past-president of the Magnetic Club of New York and the Ohio Society of New York, and is president of the Society of the United States Military Telegraph Corps. He has also taken a prominent part in the affairs of various telegraphic organizations, notably the old time Telegraphers and Historical Society, New York Telegraphers' Aid Society, the Society of the U. S. Military Telegraph Corps and the Telegraph and Telephone Life Insurance Association.

WILMOT L. MATTHEWS and STEPHEN HAAS, both of Toronto, Ont., have been elected directors of the Canadian General Electric Co.

G. E. QUINLAN, chief engineer, Puget Sound Traction, Light & Power Co., Seattle, attended the meeting of the Code Committee of the National Electric Light Association at Denver, Colo.

WALTER BRINTON, general manager of the American Manganese Co., New Castle, Del., has been appointed a member of the Delaware Public Utilities Board, succeeding C. D. Garretson, resigned.

WILLIAM S. BOYD, who for a number of years has been purchasing agent of the Page Steel & Wire Co., Monessen, Pa., has become manager of the steel and iron scrap department of the Thomas D. Prosser Co. He will make his headquarters at the main office of the company at Wooster, O.

P. D. SEXTON, who for several years has occupied the office of secretary and treasurer of the Public Service Co. of Northern Illinois, has been elected an officer of a large bank in Syracuse, N. Y., and will assume his new duties in the near future. He will be succeeded by George R. Jones, assistant to Vice-President J. H. Gulick. Mr. Jones was formerly purchasing agent and was elected to the position of assistant to Vice-President Gulick a few months ago. Both Mr. Sexton and Mr. Jones are widely known and are among the most popular men in the company's organization.

ALBERT E. BERRY, division manager at Philadelphia of the Chesapeake & Potomac Telephone Co. of Philadelphia, has been elected president of the company. He was born in Washington in 1878, and after his graduation in law from Georgetown University about 20 years ago, he entered the offices of a law firm in his native city. In 1901 he entered the service of the Chesapeake & Potomac company as a salesman in the contract department. He later held positions in the office of the general manager and the rights-of-way department, following which he became special agent reporting to the general manager. He then entered the construction department as chief clerk for the Washington division. In 1908 Mr. Berry went to Philadelphia, where he was division manager and where he directed the work of the commercial department during 10 years of unprecedented telephone development.

Obituary.

CHARLES KEITH BLACKWOOD, vice-president of the Sullivan Machinery Co., Chicago, died at his home in Kenilworth, Ill., on Dec. 14. Interment was made in Detroit, Mich. Mr. Blackwood is survived by his widow.

Financial News

Indiana Telephone Companies Merge.

The Indiana Public Service Commission has before it a petition for the consolidation of 8 telephone companies in the vicinity of Seymour into the Southern Indiana Telephone & Telegraph Co. The new company requests permission to issue $300,000 common stock at par; $200,000 of 7% preferred stock at not less than 90% cent of par; and $45,000 of 7% short-time notes at not less than 94. The petition shows that the companies now being merged are worth $239,500, having net assets of $243,000 and gross assets of $300,000. Address L. C. Griffiths, Seymour, Ind.

Public Utility Bond Issues.

Notices have been filed with the Public Service Commission by a large number of public utility companies of the issuance of bonds and stock, for increased operations. Among the companies are: United Gas Improvement Co., Philadelphia, common stock, $5,550,300; Keystone Telephone Co., Philadelphia, bonds, $3,100,000; Penn Central Light & Power Co., Altoona, bonds, $129,000; Philadelphia Suburban Gas & Electric Co., Philadelphia, bonds, $45,000; Eastern Pennsylvania Railways Co., Pottsville, bonds, $42,500; Lycoming Edison Co., Williamsport, notes, $15,000; Citizens Light & Power Co., Oil City, bonds, $16,000; Lehigh Valley Light & Power Co., Allentown, preferred stock, $46,900; State-Centre Electric Co., Clearfield, preferred stock, $100,000; Citizens Traction Co., Oil City, bonds, $100,000; Lehigh Industrial Power Co., Philadelphia, bonds, $33,500; Chester Valley Electric Co., Coatesville, bonds, $630,000; and Conestoga Lawrence Light & Power Co., New Castle, common stock, $1000.

Receivers Operate Sixth of Electric Railway Lines.

"The electric railway industry nearly suffered annihilation through conditions caused by the war," said Gen. Guy Eastman Tripp, chairman of the board of directors of the Westinghouse Electric & Manufacturing Co., speaking before recent reconstruction conference of the Association of Life Insurance Presidents in New York. Life insurance men, as trustees of approximately $160,000,000 of policy holders' funds invested in street and interurban railroad securities, should, he declared, be deeply interested in the situation.

"With respect to the judgment used in making this investment," continued General Tripp, "the facts are all favorable. From the beginning to the present time street railroads have had all the fundamentals of a sound investment. They furnish now and always have furnished an indispensable service to our urban population. The very existence of modern community life depends upon this form of transportation, and, after water and sewerage, it is the most important public utility. In short, if our urban communities have made for the wealth, comfort and culture of this country, then an investment in street railway transportation is in one of the cornerstones of the structure; and, if the investment is in danger, it is not because of poor financial judgment.

"More than a sixth of the total electric railway mileage of the country is in the hands of receivers. A very large additional number of companies are on the verge of bankruptcy, some of them kept from this fate only by the financial strength of the much criticized 'holding' companies. Alone of the important industries of the nation, the electric railway industry nearly suffered annihilation through conditions caused by the war, and back of all these facts is the further and by all means the most important fact that the industry, by reason of restrictions in statute law, in ordinances and by franchises is unable to take measures to save itself from the fate which events show to be imminent.

"The restoration of credit is fundamental to the continuance of private capital and private enterprise in the public service, and the main task that confronts the country, insofar as the electric railways are concerned, is the restoration and the future preservation of that credit.

"The street railway problem has passed the stage where it is simply a concern of the owners and operators of the properties. They have lost and are losing a great many millions of dollars, and for them the situation is deplorable enough, but the communities, and through the communities you men of business, the workmen, the ordinary everyday citizens, are today threatened with the loss or demoralization of a service that is absolutely necessary if business is to continue in our large urban centers, if the health and morals and comfort and convenience of our citizens are to be preserved."

Adoption by municipalities and street railway companies of "cost and service agreements" in which the cost of maintaining the integrity of the investment is included was recommended as a means of giving the street railway financial problems by General Tripp.

Business of General Electric Company Increasing.

General Electric Co. is enjoying unprecedented prosperity explaining the stock's refusal to participate in the recent break in the general market. Goods are now being shipped at the rate of $20,000,000 monthly, a volume in excess of the highest point attained during the war period.

Business was slack in the four or five months following the signing of the armistice, but the recovery has been so rapid since that time that billings for the entire year should average $18,500,000 monthly, bringing the aggregate for 1919 to around $225,000,000, against $216,815,277 in 1918.

Bookings are now being received at an annual rate that betters the showing made in 1918 when orders aggregated $234,134,037. For the first nine months of this year the annual rate of bookings ran less than $200,000,000, but the improvement since then has been so striking that the total for 1919 should be higher than the preceding year's figure.

Applying General Electric's 1918 ratio of manufacturing costs to $225,000,000 gross indicated for 1919, earnings of $15.70 a share, after taxes, are shown for the approximately $20,000,000 stock which will be outstanding at the close of the year. This compares with $14.76 a share earned on $115,874,800 stock in 1918.

An outstanding feature of General Electric's financial position is the great strength of its working capital. Cash on hand at the close of 1918 was $34,010,024, against $21,190,675 at the start of the year. Total net quick assets as of Dec. 31, last, were $180,298,731. Excluding the $10,000,000 6% notes which were paid off Dec. 1, 1919, current liabilities as of Dec. 31, 1918, were $27,416,082. This left working capital of $152,882,649, equal to $132 a share on $115,874,800 stock outstanding at the close of last year.

Pacific Gas & Electric Earnings Show Improvement.

Report of earnings of Pacific Gas & Electric Co. for the 12 months to Oct. 31, 1919, shows considerable increase in both gross and net indicating that the fiscal year ending Dec. 31 next should be a record year. Gross earnings for the 12 months to Oct. 31 were close to the $26,000,000 mark. This does not include earnings of the Northern California Power Co. purchased by Pacific Gas & Electric Co. recently and which in 1918 reported gross earnings of $1,154,943.

Earnings report for the 12 months to Oct. 31, 1919, compared with previous 12-month period follows:

	1919.	1918.
Total gross inc. misc. inc.	$25,999,888	$22,397,899
Net after taxes	8,748,201	7,876,925
Surplus after fixed charges	4,325,871	3,570,376

There was paid out in dividends on the preferred stock $1,528,997, leaving $2,796,894 earned on the common stock. Surplus after charges of Northern California Power Co. amounting to $340,000 theoretically should be brought in, inasmuch as Pacific company owns this company and its surplus accrues directly to it.

The company during the 12 months charged off for depreciation $3,277,437, compared with $2,796,510 the previous 12 months. This does not include the special depreciation charge of $1,000,000 ordered by the California Commission for seven years. As the company is retiring bonds at the rate of this amount annually, this is not generally considered a proper charge upon earnings. On this basis, the company is earning at the rate of between $8 and $9 a share annually on the common stock. This does not include revenue to be derived from Northern California Power Co.

Water conditions this fall have not been of the best, but it is reported that rains and snow fell commencing the latter part of November, which will improve the situation.

The full effect of the acquisition of the plants and transmission lines of Sierra & San Francisco Power Co. will be in the future rather than immediately. The Sierra company in 1918 earned little more than approximately $66,000 in excess of its fixed charges, just about the amount which the company will pay for its rental during the first year. The rental of the properties will give Pacific company an opportunity to increase its hydroelectric output, which is believed to be the reason for the taking over of this system.

Dividends.

Central States Electric Corp. has declared a regular quarterly dividend of 1¾% on preferred stock, payable Dec. 31 to stock of record Dec. 10.

New York Telephone Co. has declared a semi-annual dividend of 3%, payable Jan. 1.

A quarterly dividend of 1¾% on preferred stock has been declared by the Utah Power & Light Co., payable Jan. 2 to stockholders of record Dec. 16.

Dayton Power & Light Co. has declared a quarterly dividend of 1½% on preferred stock, payable Jan. 2 to stock of record Dec. 20.

Northwest Telephone Co. has declared a semi-annual dividend of $5 per share, payable Jan. 1.

The Illinois Traction System has declared a quarterly dividend of 1½%, payable Jan. 1, 1920, to stockholders of record Dec. 15, 1919.

Electric Storage Battery Co. has declared a quarterly dividend of 2½%, also a dividend of 2½% on preferred stock, payable Jan. 2, 1920, to stock of record Dec. 15.

Manhattan Electrical Supply Co. has declared a quarterly dividend of 1%, a quarterly dividend of 1¾% on first preferred stock, and a quarterly dividend of 1¾% on second preferred stock, payable Jan. 2, 1920, to stockholders of record Dec. 30.

Eastern Texas Electric Co. has declared a cash dividend of $4 per share, also a semi-annual dividend of $3 on preferred stock, payable Jan. 2 to stock of record Dec. 15.

Niagara Falls Power Co. has declared the quarterly dividend of $1 a share on common stock and $1.75 on the preferred

For the Readjustment Period—What?

LXI.

Higher Costs Ahead

I do not think that all commodity prices have reached their peak. I base that conclusion on many facts, foremost of which is world scarcity of goods. Years will pass before world production can again become normal. Two illustrations show the widespread want of necessities. Europe has only 55 per cent of its food requirements; it needs more than four and one-half billion bushels of grain, for instance, and there is available in all the world only about one billion bushels.

Europe's shortage of coal is in excess of two hundred million tons. That means, of course, greatly decreased production, as well as intense suffering. Europe must have these necessities, and, consequently, as the law of supply and demand is ever operative—despite legislative enactments and bureaucratic decrees designed to suspend such fundamental economic laws—there is seemingly little prospect of materially reduced prices, at least for the immediate future.

And surely we cannot reasonably expect commodity prices to decrease in this country while there exists here the present epidemic of strikes, especially in such industries as coal and steel, which lower our production not only in those industries, but, by virtue of their basic character, in practically all other industries.

We cannot hope to reduce the cost of living when the individual output of American workmen has declined, on an average, from 15 to 50 per cent in the last year or two, although he has obtained—if not wholly earned—unprecedented increases in wages.

It has aptly been pointed out that the simplest mind can grasp the meaning of this deplorable situation—to wit: If a greater number of people must be employed to turn out the same quantity of goods as before, the cost of the goods must be increased. This increase comes simultaneously with increase of wages. Plainly the country is taxing itself in high prices in order that some of its inhabitants may indulge a slothful spirit.

As a concrete example, the Pennsylvania Railroad has 14 per cent more employes than before we entered the war, but gets 11 per cent less work from them. In other words, it requires 127 men today to do the work of 100 in 1917. The fact that the employes now work only eight hours a day instead of ten, as in 1917, does not account for the decrease in results, because even with a 20 per cent reduction in time, were the men to work with the same effort they did in 1917 they would be able to move 91,000 traffic units a day instead of only 89,000, the present daily average.

We cannot hope to ameliorate the tax burden very materially, and thereby lessen its power in raising costs all around, if Congress appropriates practically five billion dollars for conducting the peace time activities of the government during the coming fiscal year—which is the aggregate amount of proposed appropriations submitted to Congress by the Secretary of the Treasury a few days ago, and which is five times as large as the sum required to transact government affairs in the year immediately preceding the world war.

I do not advocate niggardliness in government expenditures, but I must assuredly declare for common sense economy, such as any large business corporation would practice, and I am a firm believer in a practical budget system for the government, which should be adopted without further delay.

stock. The former is payable Dec. 15 to stock of record Dec. 10 and the latter on Jan. 15, 1920, to stock of record Dec. 31.

Buffalo General Electric Co. has declared a dividend of 2%, payable Dec. 31 to stock of record Dec. 20.

American Power & Light Co. has declared a quarterly dividend of 1½% on preferred stock, payable Jan. 2 to stock of record Dec. 17.

Penn Water & Power Co. has declared a quarterly dividend of 1½% on common stock, payable Jan. 2 to stock of record Dec. 19.

A dividend of $2 per share has been declared by the American Telephone & Telegraph Co., payable Jan. 15, 1920, to stockholders of record Dec. 20.

The regular quarterly dividend of 1½% on preferred stock has been declared by the American Gas & Electric Co., payable Feb. 2, 1920, to stockholders of record Jan. 16, 1920.

General View of North Substation and Surroundings, Showing 66,000-Volt Tower Line in Right Background.

North Substation of Duquesne Light Company, Pittsburgh

Outdoor Substation in High-Voltage Loop Around Pittsburgh Proves Economical and Dependable—Used for Feeding 22,000-Volt Lines from 66,000-Volt Network and Sectionalizing Latter

NOTABLE among the electrical installations built for permanent service during the war is the North substation built and designed by the Duquesne Light Co., of Pittsburgh, Pa. This is an outdoor installation located in the open country a short distance north of Pittsburgh, in Ross township, Allegheny county, Pa. It forms part of a 66,000-volt transmission system which connects with substations now built and other substations to be built, all of which will form a loop around the city of Pittsburgh. This particular substation, during nearly two years of operation, has proved rugged, efficient and reliable. Its record in this regard shows that outdoor substations can be made an economical and dependable part of extensive central-station networks in suburban districts of large metropolitan cities.

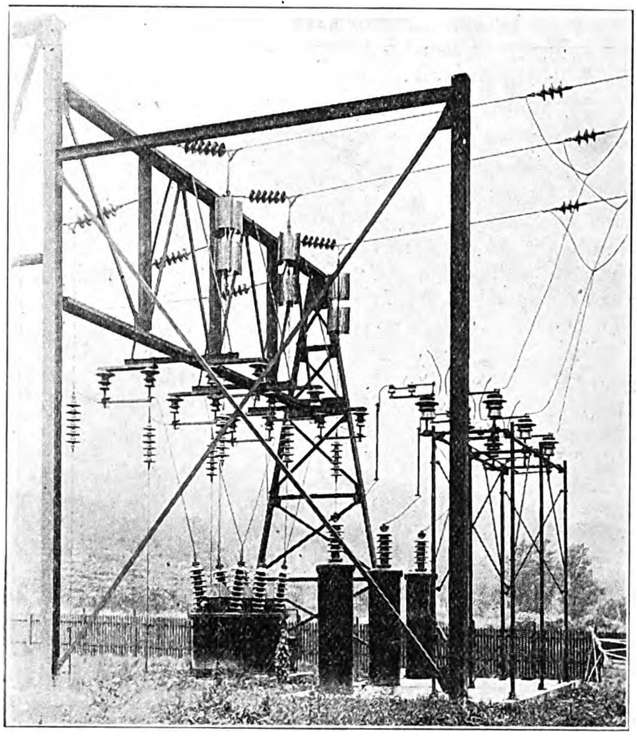
A fair idea of the topography of the district where North substation is located is gained from the two large illustrations herewith. The site was selected where at least the main part of it is fairly level and permits of easy installation of additional equipment in the future. In the initial installation provision is made for one 66,000-volt line, three main stepdown transformers and three 22,000-volt outgoing feeders. The plans provide for the ultimate installation of another 66,000-volt transmission line, three additional main transformers with a spare unit, and five other 22,000-volt feeders with necessary breakers and other auxiliaries. The complete layout, present and ultimate, is shown in the accompanying single-line diagram on which future additions are indicated by dotted lines.

Main line transformers of the self-cooled, radiator type are used. Each has a rated capacity of 4166 kv-a. and they are designed for a voltage of 66,000 on the primary side and 22,000 or 11,000 on the secondary. The secondary winding is so designed that voltages of 22,000 and 11,000 can, if desired, be supplied simultaneously. Under these conditions the transformer can give a rating of one-third normal kilovolt-amperes at 11,000 volts and two-thirds normal kilovolt-amperes at 22,000 volts.

Numerous difficulties were met in hauling the first of the three big transformers to the site from Millvale, where they had been brought by railroad. With the special haulage truck these units each weighed nearly 28 tons. Twelve heavy draft horses and the company's big electric truck had quite a task negotiating the hilly roads between Millvale and the substation site, the load lurching away from control on several occasions and sinking deep into the roadway. By means of block and tackle and the motor-driven winch on the electric truck the load was finally moved from the stalled places. Profiting from the experience gained in moving the first unit, the two others were moved without mishap.

Oil circuit-breakers of the electrically operated automatic overload type are used for the control of the power on both the 66,000 and 22,000-volt sides.

Those on the primary side are of the GA type and are mounted directly on the concrete foundations. One is used as a main-line breaker, while two others are used selectively in cutting the transformers in or out. On the secondary side, there is a breaker of the GB type



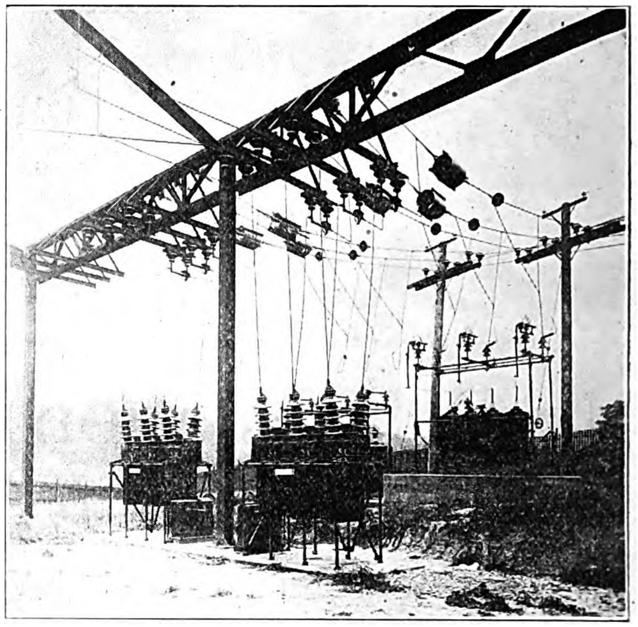
The 66,000-Volt Incoming Line With Kickoffs, Lightning Arresters, Choke Coils, Circuit-Breakers and Disconnects.

on each of the three 22,000-volt feeders, the breakers being mounted on pipe framework resting on the concrete foundation.

The substation, in addition to its transforming and distribution functions, serves as a lightning-arrester and sectionalizing station on the 66,000-volt line, the station being so connected to the line that a section of the latter forms a 66,000-volt station bus. By means of switching equipment located at each end of the bus, either the eastern or western section of the line may be disconnected from the station and the other section. One section of the high-voltage tower line comes from the company's Brunots Island generating station and the other section runs on to Cheswick.

Five sets of electrolytic lightning arresters are used, with auxiliary horn gaps, choke coils and disconnecting switches. Two sets are connected with the 66,000-volt line, one being at the east end of the 66,000-volt bus and connected with the line section at that end, and the other correspondingly located and connected at the west end. The other three electrolytic arrester sets are connected to the 22,000-volt outgoing feeders. For each set of electrolytic arresters there is an auxiliary set of horn-gap arresters, choke coils, disconnects, etc.

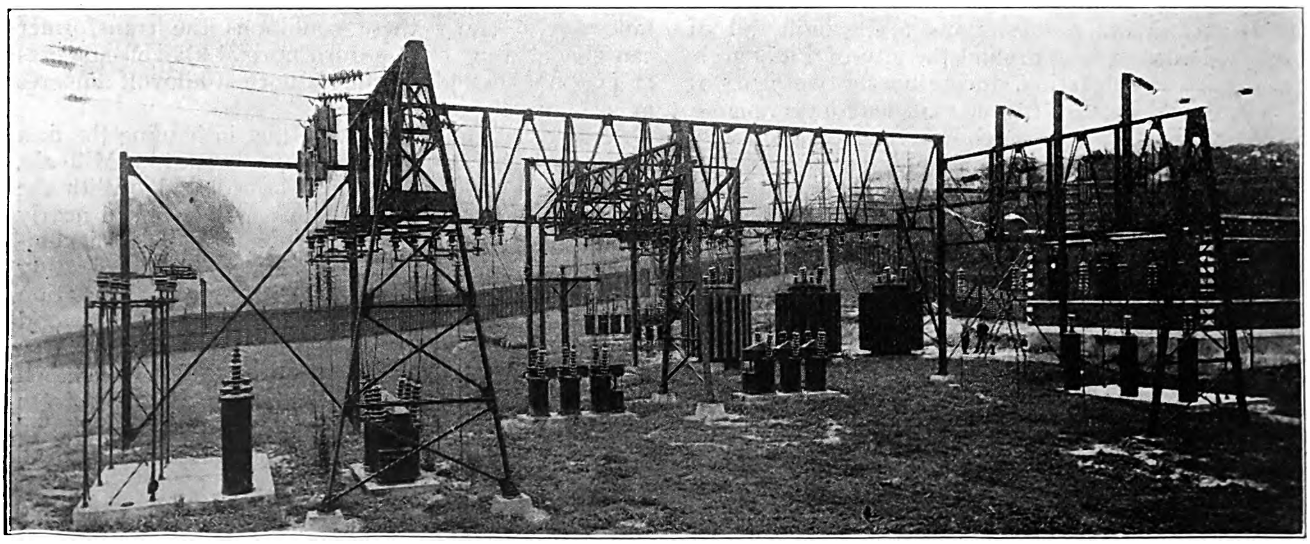
Steel framing is used throughout for the support



Control and Protective Apparatus for the 22,000-Volt Outgoing Lines.

of all overhead apparatus, ample provision having been made for anchorage and bracing. Concrete foundations are provided for the legs and main columns of the framework and for the support of all transformers, circuit-breakers and lightning arresters.

Immediately adjoining the outdoor equipment is an attractively designed small brick building for housing



Another (Nearer) General View of North Substation, Showing Initial Installation of Three of the Big Transformers and Substation Building at Right.

of the office, meters and such other accessories and equipment as must be kept indoors. A battery-operated system is installed whereby the outdoor circuit-breakers are remote-controlled.

The transformers, oil circuit-breakers and elec-

trolytic lightning arresters were furnished by the Westinghouse Electric & Manufacturing Co. Horngap arresters and certain other parts of the equipment were supplied by the Railway & Industrial Engineering Co.

THE BRITISH LAMP AND FIXTURE SITUATION.

The Illuminating Engineering Society of England at its first meeting for the season held in London on Nov. 25 had a demonstration of Pointolite lamps by P. Freedman, of the Ediswan laboratory, and an exhibition of a new form of illumination photometer by Haydn T. Harrison. The Sheringham daylight lamp was exhibited by L. C. Martin. This lamp or lamp attachment makes use of a colored reflector for correcting the distribution of energy in the spectrum of the artificial source. It was originally founded on the invention of G. Sheringham, a well-known artist who used simple colored reflectors or shades with artificial sources and found the quality of the light for painting greatly improved. The possibilities of the system have been to some extent worked out by Mr. Martin, the requisite distribution of colors being calculated on spectrophotometric measurements on opaque pigments made by means of Abney's color-patch apparatus. It is necessary in general to make use of arrangements to reflect the whole of the light from the colored surface, thus producing a type of indirect lighting unit which should have great possibilities in connection with shop-window lighting and many other commercial industrial uses.

A report was submitted to the meeting by the Committee on Progress in Lamps and Fixture Appliances, reviewing the present position of the metal-filament lamp and fittings (fixture) industry. The supply of lamps was shown to be rapidly improving after war-time difficulties and the production was now approximately equal to the consumption but it had not been possible to accumulate stocks in addition to meeting the demand. This may be possible within six months. It is anticipated that in the near future the whole of the British lamp manufacturers' requirements of glass bulbs will be met by home production, largely due to the adoption of automatic machinery for making bulbs and tubing. There are adequate supplies of drawn tungsten wire for filaments. During the war it was practically impossible to obtain argon (for the manufacture of lower wattages of gas-filled lamps) in England, but this difficulty has been overcome and adequate supplies are available.

When the new scheme of house building comes into operation the demand for metal-filament lamps will greatly increase.

The situation with reference to the supply of fittings scientifically designed has not been satisfactory, especially fittings for use in conjunction with gas-filled lamps. The manufacturers have lately been able to get to work designing and producing lanterns suitable for use with such lamps but shortage of the necessary globes was one of the chief difficulties. The committee expressed regret that there is not a supply of scientific fittings or reflectors for the smaller sizes of gas-filled lamps particularly for shop lighting. In several of the foregoing cases, it will be observed, the underproduction of glassware in England has militated against rapid progress.

WEST VIRGINIA POWER CO., TO MAKE CONSIDERABLE PLANT EXTENSIONS.

In connection with extensive construction work to be inaugurated by the Kentucky & West Virginia Power Co., 30 Church street, New York, plans are being prepared for the erection of large electric power stations at Logan, Sprigg, W. Va., and Pikeville, Ky. The work in the Logan district will, it is estimated, cost approximately $2,500,000 to extend over a period of two years, at which time the plant will have a generating capacity of 78,000 kw. The plans include extensions in the turbine room to allow for the installation of two 15,000 kw. capacity turbines with condensing equipment; the construction of a large boiler plant, etc., construction of a new 88,000-volt transmission line covering about 75 miles; as well as extensions in its 44,000- and 33,000-volt distributing systems covering about 100 miles, the 88,000-volt line to be used for tying in with the plants at Sprigg, Hazard, etc. A new 3,000-kw. turbine and surface condenser will be installed at the Sprigg plant, and plans have been prepared for the erection of a new addition to the outdoor transformer station. At Pikeville, it is proposed to install a new 10,000 kv-a. step-down transformer station, plans for which are now in process of formation. R. E. Breed, 30 Church street, New York, is president; Francis R. Weller, Hibbs building, Washington, D. C., is consulting engineer for the company in charge of the work.

LONG TRANSMISSION LINE UNDER CONSTRUCTION IN CANADA.

A transmission line from Winnipeg to Portage la Prairie is under construction at the present time. This line will be 60 miles long, will use steel towers and will have an ultimate capacity of 20,000 kw. The immediate installation is of one circuit of No. 0 aluminum cable which is estimated to carry 5000 kw. at 66,000 volts with a 3% drop in voltage at Portage la Prairie, or 10,000 kw. with 15% voltage loss. The second circuit will be installed as soon as the demand for power warrants it. The estimated cost is $4600 per mile, which includes substations at Winnipeg and Portage la Prairie. As it follows the highway, no right-of-way was purchased except at a few points where the line is on private property.

Central-Station Rates in Theory and Practice

Concluding Article—Appraisal in Rate Cases—Questions Involving Valuation of Physical and Intangible Property of the Utility—Operating Expenses, Depreciation and Rate of Return

By H. E. EISENMENGER

This is the twenty-fifth and last article of this series which began in the issue of July 12. The series has consisted of six main parts as follows: Part I—The Cost of Electric Service; Part II—The Price of Electric Service; Part III—Systems of Charging; Part IV—Rate Analysis; Part V—Accuracy of Rates; Part VI—Public Utilities and Public Regulation. There were also sixteen inserts of supplementary matter.

These articles have attracted so much favorable attention on the part of companies, individuals and commissions interested in electric light and power rates that it has been decided to republish them in book form in the near future. Detailed announcement of the book will be made in an early issue.

PART VI—PUBLIC UTILITIES AND PUBLIC REGULATION—Continued.

CONTRIBUTED BY S. F. WALKER,

Formerly Associate Editor of Rate Research.

III. PROCEDURE IN RATE CASES—CONTINUED.

INVENTORY OF THE PHYSICAL PROPERTY OF THE UTILITY.

THE first step in making an appraisal is to make a complete inventory of the physical property. In this connection a number of matters may come up for decision in determining what property to include.

Donated Property.—Often a certain part of the properties used and useful to the furnishing of the service has been donated. For example, land has been donated to induce street railways and railroads to furnish service over a certain route. The question of whether or not donated property should be included in an appraisal for rate making has been variously decided, but the rule has been, unless there are certain modifying circumstances, to include all properties however acquired that are now used and useful to the furnishing of utility service.

Service Paid For by Consumers.—When public utility companies were first established it was customary to require consumers to furnish their own service connections. Where this has been done, commissions in making valuations have sometimes held that the value of such services should not be included, that the customer having paid for the property should not be made to pay a return to the company on the value of that property. But usually the customers who furnished the property will not be the ones affected by the rates to be established in the case. The records do not always show just what services were furnished by the customer and what by the company. The commissions have usually included this property, holding that the ownership is in the company the same as in the case of gifts and the manner of its acquisition, having belonged to a period prior to regulation, is one with which the commissions are not concerned.

Discarded Property.—Discarded property, such as may be found in any utility system due to construction of a larger property than later developments in the community justified, or more often due to the consolidation of competing properties, is another matter for consideration. It has generally been conceded that such discarded property must be included until provision can be made for its gradual amortization in cases where the investment in such property has been made in good faith and with a reasonable exercise of judgment to best serve the interests of the community.

In one case where the property under investigation was the result of consolidation of a number of competing companies the Pennsylvania Public Service Commission refused to allow the value of parallel lines and duplicate equipment in the rate base, but in reviewing the Commission's decision the Supreme Court pointed out that such holding was not in public interest. The court said:

"If the utility companies in organizing into one operating plant a number of smaller ones must be deprived of a fair return on the value of the properties purchased and are also limited to the reduced cost of operation by reason of such consolidation, it is evident that the more practical way should be to permit the companies to remain separate operating concerns.

"The public is entitled to a fair benefit from every such move made by a utility concern and where they assemble a number of plants with separate overhead and operating charges into one plant with one overhead charge and one or more operating plants, while the operating plant of some of the separate units may be rendered useless, still the new concern has paid for it, and the capital was originally and is now invested on its account. Investors could not be inducd to traffic in such an unsatisfactory and unstable security, where the risk is not failure by reason of operation, but failure through confiscation. The benefit that should come to the public is through the reduced cost of operation; but the value of the dismantled plant should not be taken from the books as a capital charge until such time through sale, or other equitable arrangement, such value has been reamortized. So, too.

with respect to the parallel lines in question." (Ben Avon Borough *et al. vs.* Ohio Valley Water Co. Decision of Supreme Court of Pennsylvania, Oct. 8, 1917.)

Paving Over Mains.—In making an estimate of the cost to reproduce a property, allowance has not been made for the cost of paving over mains where the history of the plant shows that the mains were laid before the streets were paved. Such costs would, however, have to be reckoned with in a true estimate of reproduction of the property as of the present time.

Unit Prices.—To the list of properties included in the complete inventory unit prices are applied. The determination of unit prices depends upon whether the basis of the valuation is original cost, present value or some reproduction value. Usually to determine a fair value for rate-making cases, the unit prices used represent an average of prices over a period of years (in most cases five years is taken). The sudden advent of present high prices of machinery and equipment of all kinds has led commissions to postpone the making of valuations "until prices and times are normal," and in fact this marked fluctuation in unit prices has been a factor in reaching the conclusion that complete valuations are not essential in a rate case.

Overhead Charges.—To the property cost obtained by the application of prices to the item of property in the inventory is added, usually as a percentage allowance, an amount to cover overhead charges—that is, costs which are attached to the construction of the property as a whole and not included in unit prices—such costs as promotion, legal expense, engineering, incorporation and organization, interest during construction, early experimental work, contractor's profit, costs of piecemeal construction, contingencies, and allowances for possible omissions in inventory.

INTANGIBLE ELEMENTS OF VALUE.

In addition to the determination of value of tangible property, consideration must be given to intangible values, principal of which is going value.

Going Value is the value which is added to a property by the fact that it is a going concern. In some cases the commission has not made a separate determination of going value, holding that a property with an attached business is of more value than the property without such business, and stating merely that the property has been valued as a going concern.

Other commissions have made a definite addition as a percentage of the physical value or as a separate sum for this element. The estimate has been based upon the actual or estimated cost of developing the business, including costs of soliciting the business and deficits in earnings during development of the business. The objection to this method is that an unprogressive company slow in attaching business would have a greater going value than a more progressive company. Adjustments can be made to a reasonable amount, however, or an estimate may be made of the cost to reproduce the business just as an estimate is made of the cost to reproduce the physical property.

Both courts and commissions have varied widely in the treatment of this intangible element, considering it as a value in one case and as a cost in another.

Considered as a value, the authority may hold that a plant which has an established business is clearly of greater value than an identical property without an established business and where it has not been shown that it is possible to secure sufficient patronage to make a success of the undertaking. It is often added as a conclusive argument on this point that any buyer would pay more for the plant and going business than for the plant without such business.

Considered as a cost, the authorities have pointed out that a business can not be secured without expenditure of time and money. On this basis, as stated above, an allowance may be based on deficits in earnings during the period of business development, or the company may show what it costs to connect a new customer, including such costs as advertising and soliciting new business and the attention necessarily given to the prospective customer in acquainting him with the adaptability of the service to his needs, proper use of the equipment installed on the customer's premises, and similar considerations. This cost per customer is then multiplied by the number of customers attached to the going concern at the time of the valuation.

Good Will.—Going value is not the same as good will, which is recognized as an element of value in competitive undertakings where the patronage can be built up and a business given value by securing the good will of the customers. Good will has never been included in a valuation of public utility property, although the element is a factor in such undertakings. A public utility which has the good will of a community will develop faster, get more business, have less controversial expense, and to that extent be more valuable.

Franchise Value.—While the cost of securing a franchise which the company has actually borne in the form of a special tax or free service to the municipality is allowed, no intangible value attaching to the right to operate on the public streets is included in the rate base on the ground that such right is a grant of the public and should not be capitalized against a service to the public.

Working Capital.—An allowance should be made in the valuation for working capital sufficient to maintain the company's credit, permit purchases to be made at advantageous times and maintain company supplies sufficient for efficient and uninterrupted conduct of the business. The amount of working capital necessary may be determined in each case by an examination of past expenditures, consideration of the value of supplies on hand, the tendency toward increase or decrease in the cost of such supplies, and the time and frequency of the company's collection of bills for service rendered. The cash reserve and value of supplies is as much a part of the valuation as the investment in the property installed, as it represents capital used in the interest of the business of the public utility and withheld from other investment.

ELEMENTS OF VALUE GIVEN SPECIAL CONSIDERATION.

Land.—The same theory or basis of valuation followed in valuing physical property other than land is seldom applied to the value of the land. Land has perhaps most often been valued at its present value estimated by those familiar with real estate transactions in the community or judged by the value placed upon adjacent land.

The present value of the land is in many cases higher than the price paid by the company in acquiring the land. The amount of the appreciation has been considered in some instances as sufficient to cover certain overhead charges incurred in connection with the purchase of land and as reward for the exercise of good judgment in selecting a suitable location and securing property adapted to the proper development of the undertaking.

If the property is particularly well adapted to the public use to which it has been put a special value may be allowed as representing that added value to the public service, and as a reward for the exercise of the business sagacity that saw the possibilities in the unimproved land and put it to public service.

The actual purchase price of the land has been considered instead of present value in some cases where the land has depreciated in value. If the purchase price of the land is known and the property values in the community have gone down, the company has not been penalized where it appears that the investment was made in good faith and with reasonably good judgment.

Again in cases where the purchase price of land is used, the company may be denied the return on the appreciated value on the theory that the property is held in public trust and that so long as the land is held for that use the purchaser is entitled only to a return on the money actually invested. But this practice clearly prejudices property in public use as compared with property held where the owner is free to sell at an advantageous price or do what he wishes with the property to bring a return on increased real estate values.

Water-Power Rights.—Another matter which has received considerable discussion is that of value of water-power rights. Some authorities have held that such rights should be entered at the original cost of acquisition. In electric rate cases a comparison has often been made between the cost of operation of the hydroelectric property as compared with steam operation and a value found by capitalization of the saving in operation made possible by the company's water-power rights.

OPERATING EXPENSES.

Investigation to determine reasonable operating expenses, provision for depreciation and the fixing of a proper rate of return are important in any rate case and this work has often been passed over lightly where the importance of valuation has been overemphasized.

The Colorado Public Utilities Commission said: "In the opinion of the Commission the operating expense of a public utility should be as carefully considered as the amount allowed for fair value of the property of the public utility." (Suburban Light & Power Co. rate case, decided Nov. 16, 1917.)

Future operating expense, which must be provided for in the rate ordered, cannot always be judged alone by past records. Allowances must be made for the probable trend of material and labor costs.

An interesting example of rate regulation in which operating expense was made an important factor was that of the decision of the Oregon Commission in the Portland Railway, Light & Power Co. case (decided Jan. 5, 1918). The company applied for an increase in fares; the employes were asking for an increase in wages; and the city was opposed to any increase in fares.

The Commission found that the company was in need of relief and it was suggested that the city grant a modification of certain paving requirements and service exactions which were considered by the Commission to be unjustly burdensome upon the utility service. The decision of the city with respect to lightening operating expenses was obtained, and the wage disputes were submitted to arbitration before the Commission took up the matter of rate adjustments. The Commission said:

"States should so regulate that neither an increase in profits to the utility nor lower rates to the consumers will be given without considering the wages of the employes."

The reasonableness of salaries paid, the reasonableness of payments of subsidiary companies to a holding company for certain service rendered, the possibilities for instituting economies in operation, the proper maintenance and upkeep of the property, the necessity of provision for unusual expenses caused by sleet storms, ice jams, or whatever the hazard may be to which the particular utility under consideration is subject, may enter into the discussion of what are reasonable operating expenses in any rate case.

Increase in Operating Expenses.—The sudden increases in operating expenses of public utilities, due to war conditions, have emphasized the need for greater flexibility in rate systems to maintain a proper relationship between expenses of operation and the rate schedules.

Provision for the automatic variation of the rate with fluctuations in the cost of fuel became quite common during recent times. Coal clauses have been adopted by electric and gas companies and have been generally approved by commissions, which provide that the rates shall be increased or decreased each month to correspond to an increase or decrease from the price as of a certain date for coal or fuel oil as the case may be.

In at least one case, a company applied to a commission to extend this automatic adjustment of rates to provide for fluctuations in total operating expenses. The commission had made a complete investigation of the value of the company's property and operating accounts and had prescribed rates for the company's business in 1912. The company recently asked that the commission take the rates thus established as a base and provide for automatic increase or decrease in those rates corresponding to the increase or decrease in operating expenses from those of that date. The commission refused to adopt such a radical departure from former practice under the exigencies of the war period.

However, there has been at least one new adaptation of this principle which has come to the writer's notice in the form of a wage clause. Starting with the rates as of a certain date and the scale of wages as of that date, the rate supplement provides for increase or decrease in the rate for electric service corresponding to the increase or decrease in the scale of wages paid to the company's employes.

DEPRECIATION.

As soon as property is constructed depreciation must be considered. Ordinary maintenance and upkeep costs do not cover the depreciation of the property. In addition to the regular wear and tear from operation there may be special agents to be reckoned with, such as electrolysis, corrosion, incrustation or decay, which are peculiar to the equipment of the different utilities.

Obsolescence.—Aside from the wearing out of the property there is the more uncertain element of obsolescence. Machinery new or in good operating condition may be hastened on its way to the discard by the appearance on the market of a greatly superior type of machinery. The plant and system may also become inadequate to meet the demands of the community for service which may require the building of a new plant and the abandonment of much of the old.

Accrued Depreciation.—The question of whether or not the estimated first cost or reproduction cost of the property should be depreciated to correspond to the present depreciated condition of the property has received much discussion in rate cases. Where the deduction for accrued depreciation has been made it has been generally decided that the amount of the depreciation should be determined by actual inspection of the property and not on a theoretical basis considering merely the number of years the property has been in use.

It has been contended by the company in many cases, that if the property has been efficiently maintained so as to furnish 100% service no deduction should be made for depreciation. In support of this view it has been pointed out that a property which has been adjusted and in working order is of more value than an absolutely new plant from the standpoint of quality of service rendered. This claim for undepreciated value has been sustained by the regulatory commission in some cases.

It would seem that the treatment of accrued depreciation is necessarily bound up with the question of whether or not the company has, in the past, earned sufficient to provide for depreciation, and what sort of appropriation the commission will make in the rate case for future accruals to a depreciation fund.

Depreciation Funds.—Considering the inevitableness of depreciation of property, good business practice requires the building up of an adequate reserve against the day when the different portions of the plant and system must be scrapped and new equipment purchased.

Instances have arisen where large varied properties have found that replacements occur with regularity, the property having struck its gait as is said, and that no reserve fund need be carried, the depreciation allowance simply appearing as an enlarged upkeep or maintenance cost, but in most properties a depreciation reserve must be provided.

There are two methods used by commissions in creating a depreciation fund, called the straight-line method and the sinking fund method. The straight-line method calls for the setting aside annually of an amount which, at the time of the expiration of the life of the property, will be sufficient, without interest accruals, to replace the property.

Applying the other method, the sinking-fund method, the amount set aside annually is such that the amount together with interest will replace the property. Commissions have discussed the merits of these two methods and their adaptation to short-life property, a telephone property, for example, or a comparatively long-life property, such as a water utility.

No broad general rule can be deduced from the holdings of the commissions in this respect, it being a matter for determination in each case depending upon the life and present condition of the property, the treatment of depreciation by the company in the past, the maintenance and upkeep of the property taken care of in operating expenses, and the holding of the commission as to whether or not a deduction should be made for accrued depreciation in determining the amount upon which the company will be allowed to earn a return.

In determining an adequate depreciation reserve, account must be taken of the fact that the trend of prices has been upward for a number of years. Where replacements have been necessary during the war period an additional burden has been placed upon the replacement fund because of the high prices of machinery, materials, and labor prevailing. It is not always possible to delay such replacements until prices are favorable as public interest demands safety of service and continuous operation. Allowance for depreciation should be liberal so that the company may be required at all time to maintain its property in good operating condition.

RATE OF RETURN.

The rate of return which the company is to be allowed to earn in fixing rates is more than interest on invested capital. There should be a margin of profit as an inducement to capital to continue to flow into the public utility industries, and a compensation or reward for efficient management and skillful economic operation.

Other factors which have been given consideration by commissions in fixing rate of return are hazards and risks in the business, bond discounts, effect of political interference and popular whim, and the necessity for allowance to cover possible undervaluation of the property.

Attracting Capital.—Capital cannot be forced to invest in public utilities, but must be attracted in the open market by the offer of security of investment and an adequate rate of interest. During the war period, the utilities have had to compete in a restricted market with other industries offering high rewards.

The California Commission recognized the advantages accruing to the public from the adoption of a liberal policy in fixing the rate of return. The following excerpt from the Palo Alto Gas Co. case (Vol. 2, Opinions and Orders of the Railroad Commission of California, pp. 300, 317) has been cited by the Commission in subsequent decisions and may be quoted as an expression of its policy.

"The Commission in fixing a rate of return must be liberal, lest too strict a policy result in turning capital to other fields of enterprise. California needs development of public utilities, and this Commission's policy should be a broad and liberal one, so as to encourage capital to develop the state by legitimate public utility enterprises where needed. The Commission should be careful not to permit an inflation of prices in ascertaining the value of the property of a public utility used and useful for the public purposes; but should be liberal in establishing the rate of return on that value."

The Michigan Railroad Commission in the Michigan State Telephone Co. rate case, discussing the need of capital in the public utility field, said:

"It is important, therefore, to the development and extension of public service, that the exercise of the power of public regulation be such as will not discourage the investment of new capital in such enterprises. The destruction or serious impairment of the value of securities issued by such companies, by undue limitation of rates, would strongly tend to discourage such investments, and this would result in inevitable and serious public injury through the impairment of the service adequate to the constantly expanding needs of the public. The exercise of the power of public regulation should promote the confidence of the public in public service securities, rather than constitute a menace to such securities. The State does not guarantee public utilities against losses nor insure them any specific rate of return upon their investment. While costs of operation and maintenance—costs of new material and labor—fluctuate with changing conditions of production and use, there should be some margin allowed to public utilities, over bare present costs, and those happenings which can be foreseen and estimated with reasonable certainty." (Decision rendered Jan. 30, 1918.)

The Oregon Public Service Commission, in the Portland Railway, Light & Power Co. case, decided Jan. 5, 1918, said:

"If the rates fixed by the Commission, while sufficiently high to escape condemnation by the courts as confiscatory, will yield only a return insufficient to attract capital into needed public service, it is the public and not the investor who will suffer."

The Illinois Commission in the Chicago, North Shore & Milwaukee Railroad Co. fare case, decided Sept. 5, 1917, said:

"Legislation cannot compel the investment of funds in a concern, and only the opportunity to earn sufficient to attract investors will avail in obtaining support for any enterprise. Without its support the enterprise will perish and a community may thereby be deprived of a necessary service."

Business Risks and Reward to Management.—The Illinois Public Utilities Commission in the rate case of the Central Illinois Public Service Co., fixed the rate of return, "after giving due consideration to the circumstances governing this case, including the character of the service, the hazards connected with the business, and the cost of securing capital; and further taking into consideration the testimony regarding the degree of ability displayed by the management which was found to compare favorably with that shown by other small gas utilities in the state of Illinois."

The Maine Public Utilities Commission said:

"The rate of return on the value of the property in a rate case must be sufficient to compensate and attract money to such undertakings under the conditions as to business risk, etc., which existed in the beginning. If the rate of return is reduced from time to time as it appears that the risk in that particular undertaking in the light of developments was less than might reasonably have been expected, or has been eliminated by successful management, it would practically amount to a penalty for skillful administration." (Maine and New Brunswick Electrical Power Co., *et al.*, purchase case, decided Dec. 4, 1917.)

The Illinois Public Utilities Commission in the Union Gas & Electric Co. rate case, decided Jan. 16, 1918, found proof that the utility had been ably directed in its policies and efficiently managed, and the Commission said:

"Where causes of an opposite character have produced poor results the Commission has not hesitated to conclude it had cause to penalize a utility by reason of such poor management. A rule of this kind should operate both ways, and it is considered just in this case to recognize, in a substantial way, that good management should not be penalized but ought to be further encouraged. It is realized that a utility can very materially control the cost of production in more ways than one, and if the expense per unit of service is reduced by reason of an increase above the normal in the sales per customer and per capita, the company should be given some incentive to maintain its good record. Any proof that is made of excellence in the operation of a utility ought to entitle the operators, as well as the holders of the securities, to a reward for their meritorious work."

Undervaluation of the Property.—In the Addison Gas & Power Co. case, decided Feb. 28, 1918, the New York Second District Commission estimated that the rates prescribed would yield a return equal to 8.6% of the value of the property, and the Commission said: "This is not inordinate in itself, and permits a small margin to cover any possible undervaluation of the property."

Bond Discount.—In some cases commissions have allowed for bond discounts in fixing the value of the property by considering it as a necessary cost of building up the property, while in other cases bond discount has been considered as an interest charge to be taken care of in the rate of return.

The Supreme Court of Pennsylvania, in reviewing the decision of the Pennsylvania Commission in the case, Ben Avon Borough *et al. vs.* Ohio Valley Water Co., said:

"Concerning the item of brokerage, the courts and commissions of other states have held that discounts on securities should be allowed, as utilities, like other companies, are not able to make their financial arrangements without allowing such discount. The difference between the amounts derived from the sale of its bonds and the amount which the company must eventually pay on the bonds has been regarded as a part of capital charges for construction. While corporations should not be permitted to capitalize their lack of credit, still, where bonds are sold at a reasonable discount and bear a fair rate of interest, such discount should be allowed."

In the Chicago, North Shore & Milwaukee Railroad Co. fare case, decided by the Illinois Public Utilities Commission, Sept. 5, 1917, the company submitted a valuation of its property to the Commission in which an amount was included for bond discount during the construction period. The Commission said:

"It is believed, however, that a more equitable disposal of the matter of bond discount may be had by considering it as a form of interest. Doubtless, a utility, by making its interest rate sufficiently attractive could dispose of its bond securities at or above par, but this basic principle would not be vitiated should it choose to fix a lower rate of interest and thereby be compelled to dispose of its bonds at less than par. The effect has been merely to change the rate of return which it provides upon such securities. This idea is well expressed by the District of Columbia Public Utilities Commission, *in re* Potomac Electric Power Co., wherein it is said 'Bond discount, constituting a payment for the use of money, is in the nature of an interest payment; that is, it is not a proper capital charge but rather an adjustment of the interest rate to the existing market conditions and chargeable to interest account, and not capital.' The Commission is of the opinion that brokerage and bond discount are matters to be considered in connection with, and to be reflected in, the rate of return allowed; that such costs should be made up out of income by the creation of a sinking fund or reserve sufficient to cover the cost during the life of the bonds; and that, therefore, such costs should not in equity be considered a part of the cost of reproduction or of the 'fair value' to be taken as a base for the fixing of rates.

"This Commission is of the opinion that the doctrine thus enumerated is sound and affords a proper disposal of the matter of bond discount."

Surplus.—The wisdom of following a liberal policy in the fixing of a rate of return has found ample illustration under war conditions. Where the companies have been held down to a close margin hardship has been experienced under the increase in operating costs which could not be prevented entirely by emergency increases. While in the case of other properties it has been possible to tide over the period of high costs to some extent by the surplus built up under more normal conditions, commissions in granting emergency increases have held that it is impossible to maintain the rate of return earned previous to the war period and have held that the hardships must be borne jointly by the public and the utility. They have also pointed out that utility rates should not fluctuate with every rise and fall in costs. The steady rate level cannot be maintained by the company in a period of high costs unless a surplus has been built up in a preceding period, and if such surplus is not sufficient a portion of the loss in net earnings during the period of high costs may be spread over the years following a reduction of operating costs to normal.

The Oregon Commission in the Portland Railway, Light & Power Co. case, decided Jan. 5, 1918, said:

"Under state regulation of rates no utility is permitted to earn a surplus during good times by which to carry itself over the lean years which may lie ahead of it. Rates must at all times be kept down in conformity with the value and the cost of service rendered. Justice, therefore, requires that when costs go up, rates should do likewise. * * * No starved horse ever pulled a heavy load. The utilities have been deprived of the power to make unjust profits. They must also be protected against unjust losses. If a utility is driven into a position where its credit is impaired and it can obtain money for operations and extensions only at unreasonable cost, the public must share the loss."

However, some commissions have adopted a policy of providing for the building up of a surplus in the rate of return, to provide for unforseen contingencies and to guard against the necessity of adjusting the rate to correspond with every fluctuation in price. For example, in the case, City and County of San Francisco *vs.* Pacific Gas & Electric Co., decided by the California Railroad Commission, Oct. 8, 1917, the Commission said:

"In permitting this return, we do so with a frank realization that it allows a liberal margin over the cost of money. We are animated in doing so, not merely by a desire to be fair to the company, but also in part by the uncertainty as to whether the price of fuel oil will not further advance and by the desire to create a margin of profit which will take care at least for a time, of such further advance, if it occurs."

(THE END.)

NORTHWEST PLANTS FOR FIXATION OF ATMOSPHERIC NITROGEN.

The American Nitrogen Products Co., of Seattle, Wash., is now operating two plants in the Northwest for the production of nitrites and nitrates from the nitrogen of the atmosphere. The first plant, which has been in use most of the time during the last two years, was built in Nisqually canyon, at La Grande, Wash., and has a capacity of 125 tons of product per month. Electrical energy is derived from the municipal hydroelectric plant of Tacoma. The second plant, having a capacity of 100 tons per month, was built at Vancouver, B. C., and was completed in November of this year. Electric power for this plant is supplied by the British Columbia Electric Railway Co. In each case the nitrogen plant was constructed in close proximity to the power plant to obviate the expense of building and maintaining transmission lines.

Energy for the electric arc, in which nitric oxide is produced by the combination of nitrogen and oxygen of the air, is conducted into a double-tube furnace, from both ends, at 6600 volts. Air is forced into these tubes by motor-driven fans, entering at the center. This volume of air, on entering the furnace, is forced toward both ends and into the field of the electric arc in which heat is generated at 5400 deg. F. The space between the inner and outer walls of the furnace is kept full of flowing water to prevent the destruction of the tubes by intense heat. The nitric oxide product passes from the furnaces to a cooler, thence to a vat in which dissolved soda ash and the nitric oxide are combined to form a nitrite solution. This nitrite solution is held in the vats about 8 hours, after which it is drawn off into cooling trays where evaporation of the water takes place, resulting in a nitrite product, which after being dried is in the form of a white powder. In the Vancouver plant nitric acid is produced.

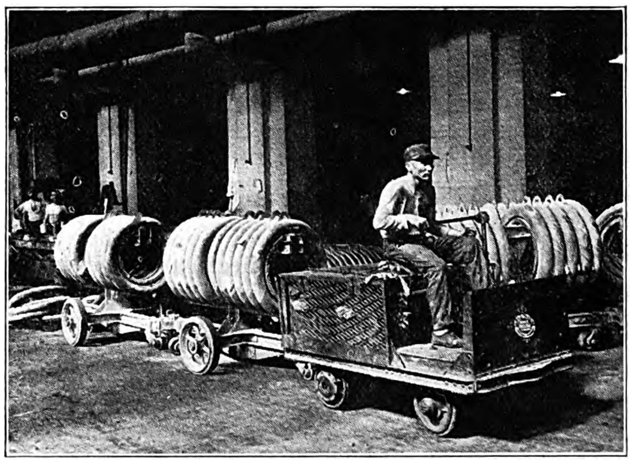
The processes by which nitrites are produced are applied, with only slight variations for the production of nitrates. But for the industries in which those products are required about 96% of the demand is said to be for the nitrite.

It is intimated that this company may erect hydroelectric plants to meet plans for a much heavier production and that water-power rights have been acquired with that purpose in view.

EXCELLENT RECORD MADE BY ELECTRIC INDUSTRIAL TRACTOR.

Herewith is an illustration of the first electric factory tractor operated at the big Akron, Ohio, plant where Goodyear tires are made. For six years this truck has been operated in Department 150B and has traveled approximately 180,000 miles.

The outfit hauls a load of 3,100 lbs. on each trip,



Electric Tractor That Has Traveled About 180,000 Miles in Hauling Tires About Large Goodyear Plant.

making a trip once every four minutes about the department. In one eight-hour shift it pulls over 200,000 lbs. of tires and cores, doing the work that it formerly took 25 men to do.

In all, there are 25 electric trucks and tractors at the Goodyear works. The three types used are the self-loading truck, the tractor and the flat freight truck.

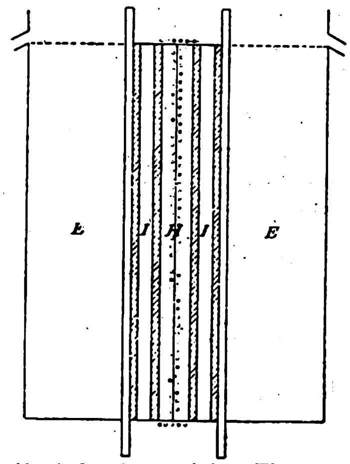
Thermal Conductivity of Insulating and Other Materials

Outline of Method of Carrying Out Tests—Tabulated Results of Thermal Conductivities—Summary of the Results

THE thermal conductivity of materials is important because it determines the ability of the materials to absorb or dissipate heat. In a paper entitled "The Thermal Conductivity of Insulating and Other Materials," presented before the New York meeting of the A. S. M. E. this month, T. S. Taylor Westinghouse Research Laboratory, described a large number of tests carried out to determine the thermal conductivity of a large number of insulating materials. The tests were very extensive and considerable effort was made to obtain accurate data. The data obtained is given in the accompanying table.

The thermal conductivity was determined by what the author terms a "thermal meter." This is shown in the diagrammatic sketch to consist essentially of an electric heater *H* constituting two hot equitemperature surfaces or sources of heat and two cooling chambers *E, E* (one on either side of the heater) or cold constant-temperature surfaces. The heat generated in *H* passed laterally through the samples *I, I,* of a given material to the cold reservoirs *E, E.* The heater was made from two disks of soapstone 9 ins. in diameter and 3/8 in. thick. Each disk had a spiral groove of 3/16-in. pitch cut in one face. A heater wire of No. 21 constantan, was wound and cemented securely in the groove of each disk and then the iron disks were cemented together with the sides containing the heater wire adjacent. The two heating elements in the two disks were joined together at the center by means of a peg in one disk being pushed into the spring contact in the other. Potential leads were brought out from each heating element at points 2 ins. from the centers. It was later found that potential leads fastened to the heating elements at the points where the wire started in the outer terminals of the spirals served equally well, since the temperature coefficient of resistance of the constantan wire is very small and furthermore the temperature of the heater was constant over its entire face. Extra turns of wire were wound around the outer edge of the heater in order to prevent the loss of the heat generated in the heating element proper through the edge of the heater. After several trials it was found that this procedure gave a heater which in use had a very constant temperature over its two faces, even up to the outer edge.

Two samples of the material to be tested were always used, each being 9 ins. in diameter and from 0.1 to 0.75 in. thick, depending upon the nature of the material. One sample was placed on each side of the heater, *I, I.* Extra disks of lagging of the same material of the sample or something else suitable were placed on each side of the sample, as shown by the shaded portions in the diagrammatic sketch of the thermal heater. This made the ultimate drop at high temperatures less than it otherwise would have been and likewise gave a wider range of mean temperature. The faces of the cold reservoirs *E, E,* constituting the cold equitemperature surfaces, were made of heavy brass having a diameter of 10 ins. The samples, heaters and cold reservoirs were held securely together by means of bolts extending between these two plates. At first strong spiral springs were used around these connecting bolts to insure uniform pressure, but it was found later that equally satisfactory results could be obtained by merely turning down the nuts on the bolts till the samples, etc., were drawn tightly together. Thermocouples of 5-mm. copper-constantan wire were inserted on each side of the samples, *I, I.* under test. Great care was taken in order to insure good contact between the sample and the thermocouple junction. Two couples were placed on each side of a sample, one at the mid-point and another about 1½ ins. from the center. The electromotive



Thermal Unit Used for Determining Thermal Conductivities.

force of the couples (the cold junction being always kept at 0 deg. C.) was measured by means of a thermocouple potentiometer. The current in the heater was likewise measured by the same potentiometer by measuring the drop through a standard resistance placed in series with the heater. The potential drop per unit length of heater wire was also measured by means of the potentiometer. This necessitated placing a high resistance in parallel with the heater and then measuring the potential drop across a small fraction of this. The current was supplied by a storage battery and consequently remained quite steady. The cold equitemperature surfaces *E, E,* were maintained so by having water from the tap circulating through them continuously. The outer edges of the samples and heater were surrounded by felt in order to prevent undue loss of heat from the edges of the heater and samples.

By putting vaseline, glycerine, glue, shellac or a similar material on the division between two surfaces the thermal drop due to such division can be largely eliminated. This is particularly true for poor conductors.

The thermal conductivity has been measured for a large number of materials both across and along the laminations. For the poor conductors the ratio of the longitudinal to the transverse conductivity varies from 2 for black bias cloth to 5½ for mica tape.

The temperature coefficient of thermal conductivity has been measured whenever the experimental results justified doing so.

Of the electrical insulating materials tested, those containing mica have in general the better thermal conductivity.

As a thermal insulator soft pine is the best of the woods tested and is but little inferior to dark-gray felt.

The transverse conductivity of iron stampings can be increased some three or four times by the insertion of some suitable material between the stampings so as to make better thermal contact. This is for a pressure of about 50 lbs. per sq. in. Nothing destroying the electrical insulation could be used, however. By using something between sheets the ratio of the longitudinal to transverse conductivity could be reduced to 20 to 25 instead of 80 to 100.

In general, the thermal conductivity of laminated products can be considerably increased by suitable impregation so as to get rid of the air film.

Oil-soaking soft fuller board increases its thermal conductivity by about 50%.

For the best thermal insulation for a given thickness it would be better to make it up of several thin

Material, thickness in in.	Thickness of sample, in.	Sp. gr.	Direction of heat flow.	Temp., deg. cent.	Cal. per cm. per deg. cent. per sec. $\times 10^{-6}$	Watts per in. per deg. cent. per sec. $\times 10^{-5}$	Temp. coef. $\times 10^{-4}$

sheets rather than of a single sheet. This effect is more pronounced the better conductor the material is.

A layer of dust, say, coal dust, upon the surface of a body will increase its internal temperature by 1/3 deg. C. per watt flowing through unit area.

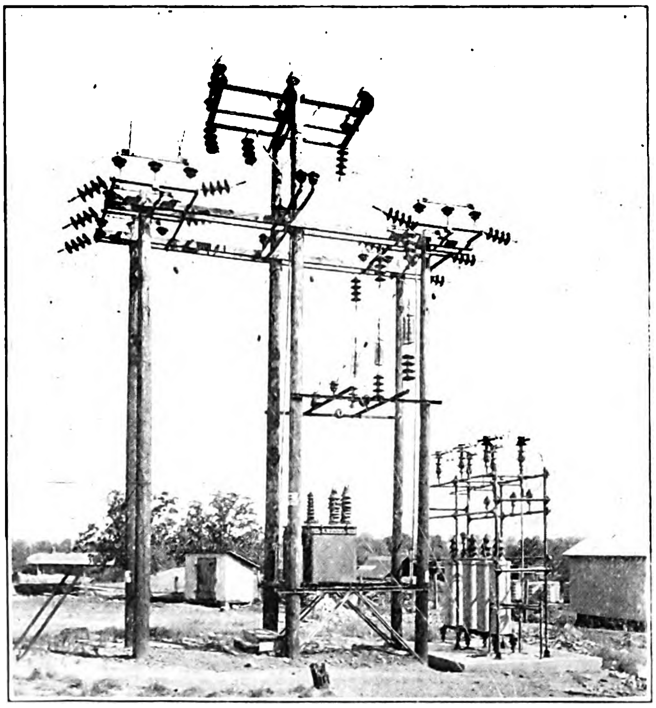
FRANCE AND BELGIUM USING ASHES AS FERTILIZER.

It has been found that the ashes from glass, iron and steel works and allied industries stimulate vegetable growth enormously through carbonic acid fertilization. The technical body working for the restoration of France and Belgium have found that plant life can be spurred by this means to unusual growth. It is proposed that ashes from the industries as above mentioned be used for refertilizing the devastated areas of Belgium and France.

NOTEWORTHY INSTALLATION OF 33,000-VOLT SWITCHING CENTER.

Features Are Simple Design and Construction, Flexible Operation and Neat Appearance.

The accompanying illustration shows a recent installation of a 33,000-volt, 3-phase outdoor switching station with one incoming line, one outgoing line and a third line to a stepdown substation which supplies power to a local load. The features of this installation are that it is free from complicated design or operation, insures flexible operation and is of good appearance.



33,000-Volt Switching Center.

An electrolytic arrester is so connected as to drain lighting disturbances from the transmission system. The metering equipment is connected to the incoming line of the transmission system, and the power taken from the high-tension side is thereby recorded; if the meter were connected on the secondary side the transformer losses would not be recorded.

The three-pole, double-break-per-phase, air-break switches are operated from ground level by means of remote-controlled interlocking mechanisms which are equipped with handles which can be locked in either open or closed position.

The arresters and metering equipment were supplied by the General Electric Co., the strain and wiring insulators by the Locke Insulator Co., and the air-break switches and choke coils by the Delta-Star Electric Co.

COAL CONSUMPTION BY UTILITIES IN CHICAGO AND SUBURBS.

Investigation carried on previous to the coal strike brought out the fact that 3,200,000 tons of coal were consumed in Chicago during the year 1918 by utilities supplying light, heat and power.

The Commonwealth Edison Co. consumed 1,962,960 tons of coal and the Public Service Co. of Northern Illinois, which supplies the outlying suburbs adjacent to Chicago, with electricity and gas, consumed 364,970 tons of coal for generating electricity and 40,290 tons for producing gas in addition to 11,601 tons of hard coal, 62,637 tons of coke and 12,033,258 gallons of fuel oil. The Peoples Gas, Light & Heat Co., which supplies the city of Chicago with gas, used 194,368 tons of soft coal, 138,979 tons of hard coal, and 302,599 tons of coke. In addition it used 89,515,690 gallons of fuel oil and 2,573,145 gallons of fuel tar in gas production.

In consuming 1,962,960 tons of coal total, the Commonwealth Edison Co. generated 1,490,000,000 kw-hrs., or an equivalent of about 2.63 lbs. of coal per kw-hr. It should be borne in mind that while this result is very good, so far as fuel economy is concerned, the actual result is really better than at first appears, for of the total coal used, not all was used for producing electricity.

VENEZUELAN GOVERNMENT TO ERECT LARGE WIRELESS STATION.

The government of Venezuela advertises for sealed bids addressed to Ministerio de Fomento de los Estados Unidos de Venezuela to be submitted before June 30, 1920, and marked (in Spanish) "Bid upon wireless telegraph."

The station is to be located in the vicinity of Caracas. It must be sufficiently strong to communicate with similar stations in the United States and Europe. It must have one installation for emission of sustained waves served by high-frequency alternators and another for the emission of damped waves to communicate with wireless stations not provided with the system of sustained waves.

Alternating, tri-phase electric current now distributed at 190 volts and 50 cycles is available, but the plant must have a reserve motor generating capacity.

Bids should show the general plan of the installation and detailed plans and cuts necessary to give a complete idea of the work; a general description of the machines and of their operation; time required to complete the work and the detailed and total cost. The government will pay quarterly, according to the progress of the work, reserving 10% of each payment until final completion. Bidders must undertake to manage and operate the plant for six months after completion. Bids should not include the cost of transmission lines for the current nor of telegraph lines to Caracas.

Editorial Comment

Lessons of Christmas Shopping

EVERYONE is agreed that this year's Christmas shopping has exceeded in magnitude everything heretofore experienced in this line in this country. After the depressing influence of the war and the uncertainties of the early months following the armistice, which reduced the volume of Christmas purchases for several years, we have found ourselves generally in quite a prosperous condition.

There has been an unusually large percentage of the more expensive gifts bought. Costliness has proven of little hindrance and in many cases it has been overcome by the plan of partial payments. Not only have phonographs, pianos, diamonds, etc., been sold on this basis, but also many electrical appliances. In fact, adoption of this plan accounts partly for the large volume of electrical sales. The chief reason for the record-breaking sales of electrical appliances, however, is the high intrinsic value of these devices.

This last feature deserves still greater emphasis in the future. An extremely large part of each year's Christmas shopping still consists of practically valueless trinkets and trivialities. The electrical industry must show how far greater appreciation of a gift is experienced when it is a useful one, such as an electric washer, cleaner, floor or table lamp, percolator, toaster, flashlight or similar device.

The Form of Public Ownership in Which We Believe

SPEAKING at the convention of investment bankers at St. Louis, O. B. Wilcox made a few statements that should serve to bring to many a different feeling toward public ownership. He said:

"About $15,000,000,000 capital, representing a considerable part of all the savings of the people of the country, are invested in public utilities. The securities representing these savings are held by thousands of investors, large and small, and by nearly every bank and financial institution of the country, and in endowment funds of churches, colleges, schools, hospitals, and in other trust funds. The integrity of these investments is of direct or indirect consequence to every citizen; and the maintenance of the service and the expansion of the time and money and labor-saving devices of public utilities is incalculably important to every man or woman with an industrial interest in the country whether as investor, employer or wage earner."

We hear so much said against the capitalist. We are hearing so many declare against private ownership as contrasted with the public ownership or ownership by municipality, state or nation. We have often pointed out before that everyone with one or more dollars in the bank is a capitalist just as is everyone with money invested in anything, whether a utility, a store or a shoe shine parlor.

When we hear demagogs damning the capitalist and the public utility and the politician calling for the revocation of franchises and operation by the people, it would be well to remember how many individuals, who, as stockholders of public utilities, are affected.

Coal Prices and Methods of Burning

IT IS a well established law that the price of any commodity is determined very largely by the supply and the demand. There are exceptions to this statement, of course, for example, the cost of electrical energy from the central station costs less the greater the demand. But in the main, however, the statement is true as the coal situation, the sugar situation and similar situations during the last few years have emphasized in an unpleasant way.

Apropos of coal, we have all seen and felt the increasing costs of all grades of coal. Many of us have encountered the rising price of some certain grade or size of coal, first finding that the cost per ton was gradually rising, and then that this same size and grade commenced to become scarcer. The explanation is as that given above—that the supply and demand are the factors that very largely determine the market price.

Screenings once were cheap. There was little demand for this size of coal because boiler-room practice had not assumed the status it has today. There was a very limited market for screenings, and the mine operators were glad to get rid of screenings at a loss rather than have large quantities of this grade of coal around. The demand was very limited, screenings were somewhat of a glut upon the market, and screenings were cheap.

Screenings being cheap, the demand for screenings increased as boiler-room practice developed and evolved efficient methods for handling and burning this size of coal. The demand for screenings increased and the price increased. Whereas formerly the mine owners had sold screenings at a loss, a loss taken care of by purchasers of other grades and sizes of coal, the mine owners found they were able to increase the price of screenings so that the sale became profitable. The supply and demand argument also offered an excuse for a still higher price for screenings. Today screenings are no longer cheap, but neither is any size or grade of coal.

The demand for screenings has grown to one of such magnitude that the large consumer of coal is already looking around for some other size of coal less generally applicable than screenings, hence one that is in less demand and therefore of lower price per ton. Just as pulverizing of coal has enabled culm and low-grade coal high in ash, sulphur and extraneous matter to be used, so has mechanical draft brought about considerable latitude as to the choice of fuel that can be burned, a latitude still further extended by the evolution of the underfeed type of stoker. Looking at the coal situation from this aspect—that of turning to lower grades of coal, and developing apparatus for burning them—one immediately realizes that much has already been done.

By means of the underfeed stoker it has been possible to increase the combustion rate, pounds of coal per square foot of grate area, several hundred per cent; in this way higher rates of evaporation have been enabled to be obtained on the one hand and lower grades of coal to be used on the other without loss of steam-making capacity. High rates of combustion have been made possible only by the employment of comparatively high draft intensities, calling for forced and sometimes induced draft as well. This has brought with it high temperatures and the formation of clinker and usually increased loss of combustible in the ash. These things have, in turn, resulted in the development of the clinker grinder, the reciprocating grate, the power dump, and the air-cooled clinker-proof furnace walls.

So it goes. New conditions arise and new apparatus is evolved to meet them. A grade of coal is plentiful and cheap because there is no demand for it and it occurs incidentally to producing other grades of coal. Apparatus is evolved for using it and the demand grows until the price becomes sufficiently high to encourage other grades of coal lacking a market to be used. The time is ripe now for power plant designers and operators to turn attention to the feasibility of using the culm banks, of mixing the various dusts now wasted in mining, the lignites, peat and briquettes. The use of some of these fuels should receive great impetus within the next few years. And this in turn will perhaps start on the way upon a large scale, the large power plant directly at the mine. If these things come out of the bituminous miners' strike, that strike may be considered after all as a blessing in disguise.

Development of Automatic Control

AUTOMATICALLY accomplishing things is undoubtedly one of the features of the times. Instances of this are legion, in the multiplicity of fields of our industrial endeavor, and every phase of our civic life. Just as machines are replacing men, *genus homo*, so are automatic features of machines taking the place of human supervision, human effort for operating and controlling these machines.

The statement was recently made by an authority that the next war will find available aeroplanes capable of flying more than one hundred miles and back and dropping bombs, both actions being automatic and controlled from a distance. And there are many more automatic features connected with war. To come closer to everyday existence, we would cite a paper presented before the A. I. E. E. early this month by A. Bessey Smith on the applicability of automatic switching to all classes of telephone service in which it is shown that the limitations have not yet been reached. Automatic telephony is making rapid headway and before another ten years have elapsed we may expect to find the telephone girl much less of a necessity than she is today.

Into many manufacturing processes automatic features of control are vital to the uniformity and quality of the product. Such industries are the treatment of steel, the preparation of many foodstuffs, and the production of many finished articles. And perhaps not the least of these is the electrical industry, the central-station industry especially.

Into the production and marketing of kilowatts automatic functioning is found at almost every step. The overspeed of steam and hydraulic turbine is automatically controlled. The circuit-breakers are usually automatically operated. Tirrill regulators maintain bus pressure or pressure at the end of a line in the smaller stations. Feeders have their voltage regulated according to load and power-factor at any specified location in the feeder. Automatic control sometimes permits loss of voltage on one line to be picked up by another. Short circuits may be automatically suppressed on long-distance transmission lines; synchronous condensers operate and correct for low power-factor miles from the generating station and miles from human supervision, and distant plants are automatically started up. Along the electric railroad, stations housing synchronous converters or motor-generators may be started up when approaching trains reach a certain stretch of track and shut down in due time, while in the coal mine and the industrial plant, on the wharf, in the steel mill, grain elevator and scores of other plants automatic electrical control is perfecting processes, cutting costs and doing better than could be done in other ways.

Electricity permits of ready control, to such an extent that water, gases, temperature, pressures and motion are often measured and controlled electrically because of the accuracy, simplicity and reliability thus obtained. Automatic control is prone to play an even more prominent part in the scheme of things as the years go on. It is electricity that makes so many automatic features possible. And it is to the manufacturers of apparatus and the manufacturers of electrical energy that one looks to hasten matters along.

Current Events

Clearing of Renewable-Fuse Status — Vacuum Cleaner Makers Organize—Conference on Industrial Safety Codes

LIGHTING FIXTURE MANUFACTURERS AND DEALERS TO MEET IN DETROIT.

Chandelier Show and Fixture Market to Be Held Throughout Week of Feb. 9, Together with Meetings of Producers and Dealers.

Special preparations are being made for making the next meeting of the National Council of Lighting Fixture Manufacturers a memorable one. The meetings of this organization will be held each morning at 9:30 o'clock from Tuesday, Feb. 10 to Saturday, Feb. 14, inclusive. Some of the sessions will be joint meetings with the Glassware Guild and with the National Lighting Fixture Dealers' Society, which will meet in Detroit during the same week. Among the topics to be discussed will be cost accounting, design protection and standardization. A luncheon with interesting talks will be given each day and the banquet will be given on Thursday evening.

During the entire week of these meetings there will be held a special exhibition to be called the Chandelier Show and Fixture Market. Each afternoon is especially reserved for this purpose. Wednesday evening will be set apart as architects' and builders' night and Friday evening as public night. This show, as well as all the meetings referred to, will be held at the Hotel Statler, Detroit, Mich. Fred R. Farmer, president of the Beardslee Chandelier Manufacturing Co., 216 South Jefferson street, Chicago, is president of the National Council of Lighting Fixture Manufacturers.

UNDERWRITERS' LABORATORIES ISSUE APPROVAL OF RENEWABLE FUSES.

Performance Records and Tests Show that Certain Fuses of Renewable Type Are Considered Standard and Satisfactory for Installations.

Removal of much of the opposition that has existed in regard to renewable fuses is indicated by the issuance of approval cards by the Underwriters' Laboratories this week covering renewable fuses manufactured by several different companies.

Following extended controversy on the subject of approval, the matter was referred to the Bureau of Standards in 1915 and the Bureau, in the capacity of arbitrator, decided that while renewable fuses appeared to be satisfactory, further performance records and tests were necessary before formal approval should be made. Specifications for standard renewable fuses were drawn by by the Underwriters' Laboratories and were issued last July after being approved by the Fuse Section of the Associated Manufacturers of Electrical Supplies and the Electrical Council of the Underwriters' Laboratories. Samples were submitted for test by the different manufacturers and such tests have resulted so far in the approval of the following:

Chicago Fuse & Manufacturing Co., Chicago. "Union," 0-600 amperes, 250 volts.

Economy Fuse & Manufacturing Co., Chicago. "Economy," 0-600 amperes, 250 volts; 0-600 amperes, 600 volts.

Federal Electric Co., Chicago. "National," 0-400 amperes, 250 volts; 0-100 amperes, 600 volts.

Trico Fuse & Manufacturing Co., Milwaukee. "Trico," 0-600 amperes, 250 volts; 0-600 amperes, 600 volts.

Samples from a number of other manufacturers are in process of test at the Underwriters' Laboratories and approval cards will be issued as soon as they are found to meet the test specifications.

This action by the Underwriters' Laboratories means that inspectors will be at liberty to pass renewable fuses and that the Electrical Committee of the National Fire Protection Association, which will meet next March for the purpose of revising the National Electrical Code, will undoubtedly revise the rules relating to fuses as a technical indorsement of the action of the Underwriters' Laboratories.

SALE OF ELECTRIC GENERATOR SETS BY WAR DEPARTMENT.

Surplus Stock of 25-kw., D-c., Gasoline Engine-Driven Sets to Be Sold.

The War Department authorizes publication of the following statement:

The director of sales announces that the Surplus Property Division, office of the quartermaster general of the Army, is offering for sale 400 gasoline-driven, electric generator sets, complete with switchboards and gasoline tanks, which have been declared surplus by the War Department and on which offers will be received at any time by the Surplus Property Division, Munitions building, Washington, D. C.

The generator is a 25-kw., direct-current, commutating-pole type. Either 115-volt, two-wire, or 230-volt, three-wire, generators can be supplied. The engine is of the closed, four-cycle, single-acting, vertical type, with four cylinders and is capable of operating the generator at full load indefinitely and at a 25% overload for two hours. The sets are high grade in every respect and combine a number of improved safety and gasoline-saving features.

These machines are designed for close regulation which makes them very desirable for small electric light and power plants, such as are required by rural stores and hotels, isolated small factories and even small towns. Owing to the continued coal shortage, these gasoline-driven generators should prove particularly useful as auxiliary or emergency lighting and power equipments in many cases.

The sets which the Government is offering for sale are new and have been carefully stored since they were purchased by the Government about a year ago. They are packed in the crates in which they were shipped from the factory. They are located at Schenectady, N. Y., and New Cumberland, Pa., and will be shipped promptly upon approval of submitted offers.

Inspection of the machines, switchboards and tanks may be made at the points of storage or complete specifications may be obtained from the Surplus Property Division, Munitions building, Washington, D. C. Information relative to the terms of sale, storage points, etc., may be obtained from the same office.

IMPORTANT COMMITTEE MEETINGS OF N. E. L. A.

Public Policy and Executive Committees to Hold Meetings with Full Attendance in January—Important Measures to Be Discussed.

Important meetings at which the enlarged program for the future activities of the National Electric Light Association is to be discussed will be held in New York City in January.

A meeting of the Public Policy Committee will be held at the headquarters in the Engineering Societies Building on Jan. 29. John A. Britton, chairman of the committee, will come from San Francisco to preside. President R. H. Ballard, of Los Angeles, will also be present. It is expected that the full membership of the committee will be present. Suggestions and advice will be requested from the committee in regard to the future activities of the association and the new program which is now being arranged.

The Executive Committee meeting will be held on Jan. 30. Action will be taken on the program for future activities and an effort will be made to settle definitely the matter of the geographic sections. In speaking of the progress which is being made in the organization of the central stations of the country into geographic section affiliation with the National Electric Light Association, M. H. Aylesworth, executive assistant to the president, said: "The outlook is very encouraging. The plan is receiving widespread favorable comment and many state organizations have shown a desire to aid in carrying it through."

COMMITTEES OF NORTHWEST ELECTRIC LIGHT AND POWER ASSOCIATION.

President Fisken Appoints Leaders of Central-Station Industry of Northwest States to Conduct Committee Work Actively.

The Executive Committee of the Northwest Electric Light and Power Association met at Portland, Ore., on Nov. 26, to mature plans for proper representation of the association at the National Electric Light Association's national convention to be held in Pasadena, Cal., next May. Another phase of the meeting was the decision to have an advisory committee to evolve a plan of co-operation among power companies, contractor-dealers, jobbers and manufacturers, and to report to the Executive Committee. It is proposed to define the work of the new sections, comprising accounting, commercial, public relations, hydroelectric and technical, and membership, for all of which the president of the association will appoint a governing committee.

The Public Policy Committee of the association, whose duties are highly important, is made up of following members appointed by President John B. Fisken: Franklin T. Griffith, president of Portland Railway, Light & Power Co., chairman; Guy W. Talbot, Portland, president Pacific Power & Light Co.; Guy C. Pierce, vice-president and general manager Northwestern Electric Co., Portland; A. W. Leonard, president Puget Sound Traction, Light & Power Co., Seattle; D. H. Huntington, president Washington Water Power Co., Spokane; F. M. Kerr, general manager Montana Power Co., Butte; W. R. Putnam, vice-president and general manager Idaho Power Co., Boise; F. T. Johnson, president Idaho Power Co., Boise; Geo. L. Myers, assistant to president of Pacific Power & Light Co., Portland; F. D. Nims, vice-president and general manager of Washington Coast Utilities, Seattle. There is also a separate public policy committee for each of the states of Oregon, Washington, Idaho and Montana.

A special effort is to be made for enlarging the membership of the association by the following Membership Committee:

Geo. L. Myers, of Pacific Power & Light Co., Portland, chairman; A. S. Moody, of General Electric Co., Portland; F. D. Nims, Washington Coast Utilities, Seattle; J. F. Farquhar, Washington Water Power Co., Spokane; J. I. Colwell, Western Electric Co., Seattle; J. F. Orr, Idaho Power Co., Payette, Idaho; T. W. Neill, Kootenai Power Co., Coeur d'Alene, Idaho; R. J. Coban, Westinghouse Electric & Manufacturing Co., Butte, Mont.

ELECTRICAL EXPORTS FOR OCTOBER UP TO AVERAGE OF YEAR.

Nearly 50% Increase in Value of Shipments Compared with October of Last Year.

Although below the record monthly total of last June, the electrical exports of the United States during last October were nearly equal to the average monthly figure of the preceding months of this calendar year. They exceeded the total value of the electrical shipment of October, 1918, by nearly 50%.

The classified figures for last October and for the corresponding month of 1918, as extracted from the monthly summary of the foreign commerce of the United States, just issued by the Bureau of Foreign and Domestic Commerce, Washington, D. C., are given in the following table:

Articles.	October 1919.	October 1918.
Batteries	$ 507,704	$ 276,730
Carbons	121,621	114,991
Dynamos or generators	452,946	254,156
Fans	79,406	15,679
Heating and cooking apparatus	164,114	86,144
Insulated wire and cables	487,444	525,031
Interior wiring supplies, including fixtures	168,902	83,656
Lamps—		
Arc	2,239	273
Carbon filament	6,075	5,758
Metal filament	334,835	191,344
Magnetos, spark plugs, etc	222,972	222,099
Meters and measuring instruments	237,077	83,674
Motors	1,007,930	1,147,159
Rheostats and controllers	63,153	30,281
Switches and accessories	347,152	124,720
Telegraph apparatus, including wireless	44,566	19,689
Telephones	388,428	148,312
Transformers	218,789	206,575
All other	2,425,310	1,324,313
Total	$7,280,663	$4,860,584

The above figures do not include electric locomotives, of which there were exported last October 13 engines valued at $51,130.

For the ten months ended Oct. 31 last, the total value of electrical exports, excepting locomotives, was $75,719,867, compared with $48,618,300 for the corresponding months of 1918, and with $44,130,615 for the similar months of 1917.

VACUUM CLEANER MANUFACTURERS' ASSOCIATION ORGANIZED.

Charles S. Beardsley, of the United Electric Co., Made Chairman of the Association.

An interesting meeting of vacuum cleaner manufacturers was held at Cleveland, Ohio, on Dec. 5. All the vacuum cleaner manufacturers in the United States were represented and the Vacuum Cleaner Manufacturers' Association was formed for the betterment of the vacuum cleaner industry which it is believed will be of decided benefit to the trade in this useful appliance.

Officers for the coming year were chosen at this meeting and Charles S. Beardsley, general manager of The United Electric Co., Canton, Ohio, was unanimously elected chairman of the association. A. J. Stecker, president of the Stecker Electric Co., Detroit, Mich., was made vice-chairman, and C. G. Frantz, general manager of the Apex Electrical Manufacturing Co., Cleveland, Ohio, was chosen secretary and treasurer.

An executive committee was appointed consisting of F. S. Hunting, general manager of the General Electric Co., at Ft. Wayne, Ind.; H. W. Hoover, general manager of the Hoover Suction Sweeper Co., North Canton, Ohio; and A. S. Phillips, of the Spencer Turbine Cleaner Co., Hartford, Conn.

ELECTRICAL CONSTRUCTION PROJECTS INCREASING.

Indications Show Increase in Building of Power Plants to Supply Demands for Electrical Energy.

That electrical construction activities are being increased is indicated by a statement recently made by G. O. Muhfeld, general director of Stone & Webster Engineering Corp., in which he said that probably never in the company's experience has so great a volume of electrical construction projects been impending at any one time. The situation is accepted as reflecting the confidence of business generally in the favorable trade outlook of the immediate future.

Among new contracts lately taken by Stone & Webster is one for the design and construction of a 20,000-kw. steam-driven electric power plant for the New Bedford Gas & Electric Co. at New Bedford, Mass. This development is in the eastern textile territory and is required to meet the growing power demands of that expanding industry. A contract for the design and construction of a 12,000-kw. steam-driven electric power plant for the Pittsburgh Plate Glass Co. is another of the new projects. This unit will be erected at Kokomo, Ind.

MAINTENANCE OF LIGHTING EQUIPMENT DISCUSSED IN CHICAGO.

Symposium on Maintenance Held by the Chicago Section of the Illuminating Engineering Society.

The importance of maintenance of lighting equipment and dependable methods of insuring proper maintenance formed the general topic of a symposium of short papers and talks before the Chicago Section, Illuminating Engineering Society, held on the evening of Dec. 18.

J. L. Stair, chief engineer, National X-Ray Reflector Co., opened the series by describing the national and local maintenance campaigns conducted by that company in the effort to get owners of its lighting installations to adopt regular cleaning schedules. A card system was developed for reminding of the need for cleaning. In Chicago a window-cleaning company was induced to organize a fixture-cleaning department that was later established as a separate company. It makes maintenance contracts, including periodic cleaning of fixtures (usually monthly), lamp renewal and replacement of broken reflectors and fixture parts. The average charge has been about 21 cents per fixture per month. This service has proven very satisfactory for offices, stores, shops, etc.

F. A. Kaup, supervisor of the service and repair department, Commonwealth Edison Co., described the maintenance service of this large central-station company, which takes care of the lighting maintenance of some 25,000 customers using rental fixtures. The organization that renders this service is quite a large one, consisting of cleaners, patrolmen, foremen and supervisors, besides many clerks and telephone operators at headquarters. The work is very systematically carried out, the men keeping in touch with the office hourly by telephone for emergency orders. Not only is the cleaning done at fairly regular intervals, but lamp and fuse renewals are made at very short notice. Among the fixtures looked after are store and factory fixtures, store-window lighting, signs and ornamental street posts. Trucks and wagons are commonly used for carrying ladders, extra lamps, globes, cleaning equipment, etc. Numerous difficulties are experienced in getting at fixtures in some factories. The experience has been that, unless such maintenance service is furnished by a specially organized crew, the customer quickly neglects his lighting equipment and then complaints become frequent and vociferous.

Henry Nixon, deputy commissioner of gas and electricity of the City of Chicago, explained the methods used by the city in maintaining its street-lighting system of some 46,000 series incandescent lamps. Patrolling is done every night on every circuit in the city and on lamps that can be lowered an effort is made to renew burnouts immediately, the patrolmen carrying a stock of lamps on their automobiles. In other cases the lamps are renewed during the following day, the remaining time of the trimmer being devoted to cleaning. On business streets the cleaning is done more frequently than on residence streets. Some difficulty has been met with the class of labor that the city has been compelled to employ, which makes the maintenance service more expensive and less reliable than it should be. All lamps are tested as received from the factory and defectives immediately rejected. With the special lamps now used the average life runs from 2200 to 3000 hours. Experiments with a sealed fixture show that the lamp temperature is not seriously affected while the dirt getting into the fixture is very much reduced, so that a higher state of cleanliness is maintained.

C. H. Shepherd, electrical engineer, Lincoln Park Commissioners, described the system of maintaining park and boulevard lamps of the Lincoln Park system. The lamps in buildings are attended to about once a week on the average, while outdoor lamps are cleaned regularly about once each fortnight. Trouble is met in cleaning the globes on lamps along the lake shore of sand flies and other insects during the summer, scouring the globe with sand being often necessary. A tower wagon or truck is used; it has a compressed-air tank for blowing out the inside of the globe, compensator, free from dust and insects. A 20-in. opal globe is used on all outdoor posts; at first there was considerable breakage of these globes till the men became skilled in handling them on top of the post. Mr. Shepherd also explained the lamp record system he described in the last issue of the ELECTRICAL REVIEW.

E. D. Tillson displayed a number of fixtures collected from various installations and showing typical instances of neglected maintenance. He also showed an ingenious type of self-cleaning fixture for foundries and other dusty places; it has a wiper that cleans off the plate-glass bottom of the fixture every time it is turned on or off. A. L. Arenberg showed a fixture that is easily cleaned by means of a feather duster. Others joining in the general discussion were J. R. Cravath, F. A. Kaup, A. C. King, J. L. Stair, F. H. Bernhard and Messrs. Lucas and Curtis.

INDUSTRIAL SAFETY CONFERENCE HELD AT BUREAU OF STANDARDS.

Condensed Report of Meeting at Washington, Dec. 8—Joint Committee on Safety Codes to Be Organized.

In the absence from Washington of the director of the Bureau, Dr. S. W. Stratton, the meeting was called to order by Dr. E. B. Rosa, who summarized at some length the events leading up to this conference and referred especially to the proceedings of the similar conference held on Jan. 15, of which this in a sense was an adjourned meeting. The discussion at that conference was summarized and reference made to its action for the appointment of a committee which has since made a printed report.

The principal subjects which came up at the January conference were the reorganization of the American Engineering Standards Committee and the question of whether the safety work of the Bureau of Standards should be conducted under the scheme of procedure laid down by that committee.

The last question was the subject of a letter ballot on Plans "A" and "B" sent out in the spring, the result of which was a decided majority in favor of procedure under the plan of the American Engineering Standards Committee. This committee has adopted since the January conference a revised constitution which opens its membership to other organizations in addition to the original five founder societies and three government departments.

Dr. Rosa also announced the appointment of a General Advisory Committee on Industrial Safety Codes for the purpose of assisting the Bureau of Standards in deciding upon policies and procedure in its work on safety codes. He said: "The Advisory Committee recently appointed by the Bureau is not the Managing Committee proposed under Plan A. It is for the present merely an advisory committee for the Bureau of Standards. After this conference is ended that committee will meet and deliberate. If this conference wishes to make any recommendation on request to that committee it can do so, or if it wishes to adopt it as a committee of this conference it can do so. Or this conference can have a different committee if it prefers, or can appoint some additional members to sit with or become a part of the Bureau's committee. We want this conference to feel entirely free to discuss the important question submitted without hindrance or restriction of any kind."

Prof. Comfort A. Adams, chairman of the American Engineering Standards Committee, then spoke on the work of that committee and its recent reorganization. Membership in that committee is now open to such organizations or groups of organizations of national scope as may be approved; there shall be no more than three members from each such organization, and the annual dues are $500 for each representative. Applications for membership must set forth the scope of their standardization interests and activities and the number of members. If such application is approved by three-fourths of the committee it is submitted to the organizations having membership on the committee, and unless disapproved by more than one-fourth of these within 90 days, it is considered to be ratified. The speaker stated that he would be superseded as chairman of the committee by A. A. Stevenson, and that the permanent secretary of the committee will be Dr. P. G. Agnew, at present in the Bureau of Standards. The headquarters of the committee will be in New York City.

The procedure to be followed in the development and adoption of American engineering standards was then outlined. Committees to formulate standards shall be organized by suitable engineering societies, government bureaus or other bodies which shall be designated as sponsors and shall be responsible for the carrying out of the work. Such a committee must include representatives of all interests concerned in the formulation of a standard, and upon completion of its work and substantial agreement upon the same, shall report to the sponsor body. If the latter adopts the standard it is forwarded to the American Engineering Standards Committee for approval, and when so approved, shall be designated as either recommended practice, tentative standard, or American standard. The Standards Committee will not itself pass judgment upon the details of the proposed standards but rather upon the composition of the committee which has formulated the standard or approved it. This committee must not be confined to the membership of the sponsor body, but must include representatives of all interests concerned in the standard.

A number of other organizations have already applied to the American Engineering Standards Committee for membership. These include the National Safety Council, American Mining Congress, insurance, utility and technical associations. To become a member an organization must be national in its scope. Thus individual state industrial commissions would not be considered eligible, but as a group they might join through their national association.

The status of industrial safety codes now existing was next discussed by Dr. M. G. Lloyd of the Bureau of Standards, Dr. L. W. Chaney of the Bureau of Labor Statistics, S. D. Collette of the American Society of Mechanical Engineers and W. S. Paine of the Aetna Life Insurance Co. Dr. Lloyd exhibited a number of charts on which it was attempted to show the scope of existing safety rules in the industrial field but exclusive of the subjects of transportation, mining and industrial hygiene. The relation of fire prevention to human safety was considered and a distinction drawn between rules for fire prevention of property and accident prevention to individuals. The regulations considered included those of state laws, commission orders, city ordinances and the rules prepared by insurance organizations, technical societies and manufacturers' organizations as well as Federal Government bureaus, the National Safety Council, etc. A knowledge of such existing rules was considered essential to the intelligent development and revision of safety regulations.

Dr. Chaney pointed out that a survey of accident records would show what hazards are greatest and consequently what industries are most in need of safety regulations. The method of administration of safety rules is of more importance than the contents of the rules themselves and good results depend upon general co-operation and efficient administration. Compensation laws have brought about an improvement in accident prevention work.

Mr. Collette referred particularly to the Boiler Code of the American Society of Mechanical Engineers and the recent work of that society in preparing an Elevator Code in co-operation with the Bureau of Standards.

Mr. Paine referred to the disadvantages of non-uniformity of temporary rules and said that to have a satisfactory code it was necessary to have the co-operation of all interested. The insurance companies had done a great deal to promote universal standards, especially through the medium of their rating bureaus and were in a position to introduce rules and apply them before they were made mandatory by law.

The symposium on Methods and Policies to Be Pursued in the Development and Introduction into Use of Safety Standards was participated in by S. J. Williams of the National Safety Council, O. B. Connelley of the Department of Labor and Industry of Pennsylvania, C. M. Talbert, director of the Department of Streets and Sewers, St. Louis, W. C. L. Eglin of the National Electric Light Association, A. C. Morrison of the International Acetylene Association, A. Rousseau of the Abrasive Wheel Manufacturers' Association, Henry Sterling of the American Federation of Labor, and Lew R. Palmer of the Equitable Life Insurance Co.

Chester C. Rausch of the Safety Institute of America introduced the following resolution which was adopted by the conference:

"Resolved: (1) That the American Engineering Standards Committee be asked to request the International Association of Industrial Accident Boards and Commissions, the Bureau of Standards and the National Safety Council to organize a Joint Committee on Safety Codes, this committee to include representatives of these bodies and such others as they may consider advisable; (2) that this Joint Committee report upon the safety codes required, priority of consideration of the codes, and sponsor bodies for their preparation; (3) that this report be put in writing and placed not later than Feb. 1, 1920, in the hands of the American Engineering Standards Committee."

Before taking the vote on this, however, another motion was passed confirming the result of the letter ballot taken last spring and expressing the decision of the conference that safety codes should be established under the procedure of the American Engineering Standards Committee.

In the discussion on this subject it was pointed out that the American Engineering Standards Committee was not primarily interested in safety matters and that the committee contemplated in the resolution of Mr. Rausch would be directly concerned in such matters and might well serve as a steering committee on safety-code work. The opinion was freely expressed that such a committee should be a permanent one, that it should contain representatives of all interests involved in safety codes and that it might well be called a National Safety Code Conference and hold annual meetings. Such a committee would be in position to co-ordinate work on safety codes, to arrange for necessary interpretations, to initiate new codes as they become necessary, and to form a central agency to insure co-operation.

At a meeting of the General Advisory Committee of the Bureau on the following day, the work of the proposed committee which the American Engineering Standards Committee has been asked to appoint was further discussed and the opinion was generally expressed that such a committee, if made a permanent organization, would render the General Advisory Committee of the Bureau of Standards unnecessary. There was also a discussion of means for introducing codes and for securing interpretations of rules in particular cases as the necessity for the same might arise. Before adjournment a motion was passed giving the Bureau of Standards a vote of thanks for taking the lead in calling these conferences and bringing the matter of engineering and safety standards to the attention of all concerned.

LECTURE ON FUNDAMENTALS OF ECONOMICS BEFORE LYNN SECTION.

Before the Lynn (Mass.) Section of the American Institute of Electrical Engineers, on Dec. 17, George E. Roberts, of the National City Bank of New York, gave a closely reasoned address on "The Fundamentals of Economics." He paid a glowing tribute to the work of the engineer who has been at his task and calling all the time for the most efficient means of investing capital in machinery and thereby adding to the general good. Capital is really physical equipment for the increase of production. Distinction was drawn between the two kinds of wealth, consumable and nonconsumable, the latter being that most useful kind of capital that is not hoarded but is put back into productive business.

About 250 attended the lecture and at its close Richard H. Rice, acting manager of the Lynn works of the General Electric Co., spoke briefly. On Jan. 7 there will be a lecture on the manufacture of steel.

SPECTACULAR ILLUMINATION PLANNED FOR ELKS' CONVENTION.

Arrangements are already being made on a big scale for the convention of the Grand Lodge of the Order of Elks which will be held in Chicago on July 5 to 10, 1920. Among the attractions for this big national gathering will be special electrical displays that will center in Grant Park on the lake front where the largest elk's head ever built will be erected and encrusted with thousands of colored lights. From this point the chain of lighting will extend to every part of the city, with special features for the Municipal Pier, the principal parks and other entertainment centers.

UNIVERSITY OF ILLINOIS TO HOLD ELECTRICAL SHOW.

The department of electrical engineering at the University of Illinois is making plans for an electrical show to be held April 8-10. Several large and successful expositions have been held at the university in the past, but they were discontinued during the war period. Tentative plans for the 1920 show indicate that it will be larger and more elaborate than those of preceding years.

Commercial Practice

Making Extensions in Rural Communities — Factors Affecting Electric Furnaces—Moving Poles from Streets

EXTENSIONS OF ELECTRIC SERVICE TO RURAL CUSTOMERS.

An Outline of Practice in Illinois Regarding Rural Service, Presented in Paper Read Before the Illinois State Electric Association.

By D. W. Snyder.

General Superintendent, Bloomington & Normal Railway & Light Co.

The exceptional prosperity of the farmers during the last few years has created a demand upon central stations for rural service, which few, if any, were prepared to meet. The result has been that an immense mileage of low-voltage rural transmission lines has been built, with little attention paid to standardization in construction, method of ownership, or to a scientific system of rate making. The continued activity in rural business, however, has awakened the Illinois Public Utilities Commission and most of the central-station managements in the state to the fact that rural business is not a negligible factor and presents some costly and intricate problems.

A number of small central stations which have allowed rural lines to be attached to their systems have discovered too late that these customers are unprofitable and quite troublesome, with the result that they are disgusted with the business and opposed to any more additions. This hostile attitude is natural, but the rural business must be served and can be developed in much the same way that the small central stations developed day service. Necessarily, there will be some initial disappointment, but with proper methods the business can be handled and at a profit.

The usual rural single-phase line is of 2300 or 6600 volts, 30-ft. cedar poles, 6 or 7-in. tops spaced 35 to 40 to the mile, with wooden cross-arms and insulator pins. No. 6 hard-drawn copper wire is used and the line built under the Commission's standard rules. A line of the above type can be built from $500 to $800 per mile and will meet the requirements of 90% of the rural business.

A quite satisfactory method of financing such a line to serve a small group of farmers is to build the line proper and divide its cost equally among the farmers and then charge each farmer in addition for the equipment, such as transformers, etc., necessary to his individual use.

The line and equipment should be maintained by the utility but the cost borne by the farmers, who retain ownership. A contract for maintenance preferably should be between the company and a responsible trustee or a committee for the farmers and must provide for proper inspection and maintenance at a cost based on material and labor. In case of the farmers failing to meet their obligations under the contract, the company should have the right, by reasonable notice, to terminate the agreement and the service. This arrangement would come under the second section of the Commission's order No. 59 and insures a line that will be kept in good operating condition.

Under this plan the only problem presented to the utility is to give adequate service at a proper rate. It has been demonstrated that such a line as has been described, equipped with lightning arrestors on each transformer, will provide good service when proper size service wires and transformer are installed, so the only remaining factor is the rate.

In the matter of rates, practically all of the companies operating in Illinois have either failed to file a rural rate or have applied their regular lighting schedule with a slightly higher minimum; in the majority of cases a $2 minimum is required. This use of established urban rates to rural customers is the reason most central stations are opposed to taking on the business.

The average farm customer not using electric power will require a 1-kw. transformer, which, in most cases, serves no other customer. The core losses on a 2300-volt 1-kw. transformer for one month will average 14 kw-hrs. Average consumption of a number of farmers, each served by a 1-kw. transformer, showed 19 kw-hrs., which, at 15 cents per kw-hr., made a gross income of $2.85 per customer. Adding the core losses to the consumption, a resultant income of 8.5 cents per kw-hr. is obtained. This rate will invariably be less than that charged for adjacent urban service, where, because of the diversity factor of a large number of customers on each transformer, the core losses are practically negligible per customer.

In the case of a small power customer, a 3-kw. transformer is usually required. The core loss will be about 23 kw-hrs. per month. An average of customers so equipped was 20 kw-hrs. per month, making a gross bill, at 15 cents per kw-hr., of $3 per month and an average return of slightly less than 7 cents per kw-hr. when the core losses are added.

The above data shows that the application of city rates with slightly higher minimum to rural service is economically unsound. The remedy is a primary charge sufficient to cover transformer core losses at a low rate plus city rates for the actual energy used. This form of rate has only one objection and that is the difficulty of making the farm customer see that the service to him is different than city service and that a charge for transformer core losses is a proper one. The Illinois Public Utilities Commission probably would approve such a rate, for in commenting on the application of the Central Illinois Public Service Co. to place certain farm-lighting customers on its standard farm rate, it said: "It would be perfectly feasible and legal to file a schedule of rates applicable to farm houses only and then if there are any industries in the locality the service to them would not come under that rate." The Central Illinois Light Co. placed in effect last August a schedule of rural rates, rules and regulations similar to the plan outlined above, but omits the primary charge covering core losses.

The Illinois Public Utilities Commission, under its general order No. 59, ordered: "If the proposed rural customers contemplate receiving service as individuals, the arrangements as to the construction and ownership of the necessary lines must be such that the title of the said lines when completed will rest in the electric public utility and that the electric public utility will be responsible for their maintenance, and it must be agreed that any other consumer along the route of the said lines will receive service, if applying for same, upon a nondiscriminatory basis."

This provision, if used by any utility serving customers at its regular rural rates, would create a condition of discrimination against the customers owning and maintaining their own lines, unless the Commission will allow a maintenance contract to be made with the individual, as is the case previously cited.

In the event of the utility accepting the gift of a half mile of line, and being obliged to maintain same, the following would be a fair representation on usual rural rate:

First cost one-half mile of line	$300.00	
3-kw. transformer and lightning protection	60.00	
Meter, service, etc.	40.00	
Total	$400.00	
Maintenance and depreciation, estimated at 10%		$40.00
Core losses at 4 cents per kw-hr		11.05
Meter reading, billing, testing, etc., estimated		6.00
Energy, 21 kw-hrs. at 6 cents per kw-hr		12.60
Total annual cost		$69.64
Annual revenue at 15-cent rate, $1.00 min		$37.80
Anual loss per customer		$31.84

The above revenue figures are actual averages from 3-kw. rural installations in a wealthy farming section of the grain raising district. This shows conclusively that even under ordinary operating conditions this type of business does not pay.

The practice of taking over and maintaining rural lines will lead to disastrous results, and immediate steps should be taken by all the operators to correct the present tendency of letting this important matter drift. The farms will never use sufficient energy to make the business remunerative unless they are made to pay for maintenance cost and core losses.

The first section of the Commission's order No. 59 reads as follows: "If the prospective rural consumers have formed a corporation for the purpose of constructing the said lines and receiving the said service, and propose to render such service to all applicants along the routes of the said lines, this corporation shall secure a certificate of convenience and necessity and file rates with the Commission, as requird by law. Any electric public utility shall refuse to connect its circuits with the circuits of such a corporation until these requirements of the law have been complied with."

This has been found to be the most satisfactory method of handling larger groups of rural service. The practice is to sell them their requirements on a kilowatt-of-demand rate and an energy charge. This, of course, places the responsibility on the rural utility, but as they usually are co-operative in that each customer owns stock, the burden falls where it belongs. Following is the rate used: $3 per month per kw. of demand for first 10 kw.; $1.50 per month per kw. of demand for all over 10 kw. The energy charge is as follows: For first 500 kw-hrs. used in any month, .04½ per kw-hr.; for next 2000 kw-hrs. used in same month, .03 per kw-hr.; for all over 2500 kw-hrs. used in same month, .017 per kw-hr. A discount of 10% for payment by the tenth of month is allowed on all bills. The resultant rate per kw-hr. at the substation switchboard has been $0.061 per kw-hr., with a load-factor of 16%.

This rate has been given to two groups of rural customers, each one comprising a small town in connection with 10 miles of 6600 and 2300-volt lines.

The widespread use of farm-lighting systems show that farmers want and are willing to pay for electric service. These systems are costly both in first cost and maintenance and are at best a substitute for central-station service. If the farmer will invest $500 to $1500 in a private lighting system and pay the high maintenance cost they should not object to contracting for their share of a line to serve them and pay an equitable rate based on actual cost of service. It is general opinion that farmers are willing to do anything that is right, and the exception is the fellow who would make the undesirable customer anyway.

The rural business is too experimental to give much concrete information concerning it. Points needing emphasis are that central stations should recognize the fact that rural communities are demanding service and their demands must be met, that one or two standard plans of rendering service must be adopted, and that the present system of rates must be corrected.

FREQUENCY FOR AND CAPACITY OF ELECTRIC FURNACES.

Twenty-five and 60 cycles are both being used for electric furnace supply. The use of 25 cycles permits of a greater power input to a given furnace than does the use of 60-cycle energy, due to the lower magnetic losses and decreased heating and inductive effects of the higher periodicity. A very much better power-factor exists with 25-cycle energy than with 60 cycles, for the same reasons, and these same factors apply to the maximum power input feasible.

At the present time the largest electric furnace operating on 60-cycle supply is rated at 15 tons of steel. Experience has shown that a furnace for melting steel can take a molten charge of about 30 tons and will require from 2000 to 2500 kw. to handle this amount of metal satisfactorily. Such a furnace can be operated from a 60-cycle supply at 60 cycles. For a three-electrode furnace about 3000 kv-a. probably represents about the limit as imposed by economy. A furnace of this size, handling molten metal, should be capable of producing from four to five thousand tons of steel per month, with an input varying between 2000 and 2500 kw.

CO-OPERATION BETWEEN UTILITIES RIDS STREETS OF POLE LINES.

The Southern California Edison Co. and the Southern Sierras Power Co. were ordered by the city council of San Bernardino to remove their pole lines from certain of the streets within the city. The two utilities got together and by mutual agreement decided to move their respective lines, one north and the other south from the street to the alley. In this way all poles and wires were removed from the main thoroughfare and services have been made at the rear of buildings. By co-operation and reciprocity the two power companies were able to save themselves time and money and bring about a pleasing conclusion to the city's demand.

Operating Practice

Hydraulic Turbine Bushings — Power-Factor Correction —Operation of Thrust Bearings — Exhaust Steam Heat

ELECTRIC HEATER FOR BRONZE AND STEEL BUSHINGS.

Method of Simplifying Installing Bushings on Hydraulic Turbine Shafts.

By R. H. Pickens.

Southern Public Utilities Co.

In installing new bronze and steel bushings, on the shafts of vertical waterwheels, some method of heating them in order that they be expanded enough to allow of their being forced to their seats upon the shafts, was found necessary. After some experimenting it was decided that some form of electric heater would be most satisfactory.

The bushings fit on the lower part of the shaft, above the turbine rotor, and serve the purpose of preventing wear on the shaft proper, where it passes through the turbine guide bearing; these bearings being of the conventional *lignum-vitae* block type of underwater bearing. The original bushings were of bronze, and it was found necessary to heat them to about 300 deg. F. in order that they might be forced upon their seats with the equipment on hand.

The bushing was first wrapped with one layer of a heavy smooth wrapping paper, put on tightly and without wrinkles. The heating element consisted of a single layer of No. 18 B. & S. black iron wire, spaced about ¼ in. between turns and wrapped tightly over the paper; no heat insulating material was used over the wire as experience showed this to be unnecessary. Fig. 1 shows the bushing in place and the connections as made when heating it.

To heat the bushing, current was taken from the exciter circuit of the plant at a voltage of 125 volts. The field leads of the alternator being disconnected from the brush holder studs, and No. 4 copper wire connected to the leads, was dropped into the wheel pit, where connection was made to the heater; field switch and rheostat of the alternator controlled the

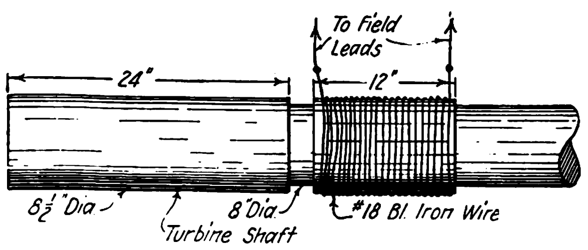


Fig. 1.

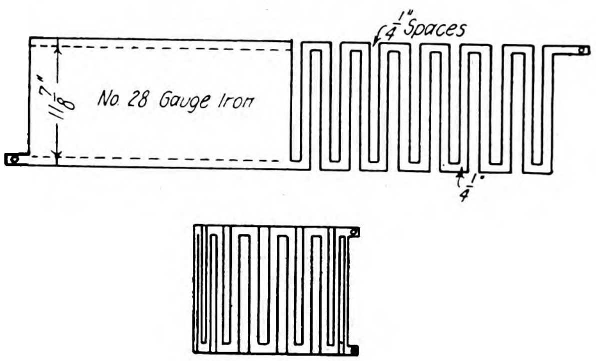
current. A current of about 60 amperes was found sufficient to expand the bushing enough to allow its being forced upon the shaft with a press made of two small screw jacks.

After experience had shown that a bushing made of cast-iron or steel gave superior service and a longer life on these underwater bearings, it was decided to install bushings made of manganese steel.

The bronze bushings were ⅜ in. in thickness and in 12-in. sections, the steel bushings were of manganese steel, without temper and in sections of the same length as the bronze ones.

In installing the steel bushings it was found that the method used in expanding the bronze was not effective, so a different type of heating element was designed. This heater was made of No. 28 gage



Figs. 2 and 3.

black iron sheet 11⅞ ins. wide and of such length as to encircle the bushing, this sheeting being cut into the form shown in Fig. 2.

Brown wrapping paper was used as the insulator between the metal and the heater as was used on the bronze bushings, the heater being placed on the bushing as in Fig. 3.

A heat insulator of sheet asbestos was placed around the outside of the bushing, covering the heating elements, and a few turns of iron wire were wrapped over the asbestos jacket in order to bind the heating element firmly against the bushing. This later type of heater proved rapid and effective in service, being superior to the original form of wire wound heater. It required about 20 minutes in each case to raise the temperature of the bushings to the proper expansion point to allow their being forced upon their seats, with the home-made press that was used.

TWO 4000-KV-A. 13,200-VOLT CONDENSERS CORRECT POWER-FACTOR.

Power-Factor Raised from 76.4 to 86% and Improved Voltage Regulation Major Advantages.

The Hydro-Electric Power Commission of Ontario is operating two 4000-kv-a., 13,200-volt synchronous condensers at its Toronto Terminal station for the express purpose of bringing up the power-factor and improving voltage regulation. Each machine obtains its excitation from its individual exciter, which is belt driven. The condensers are connected to the

13,200-volt bus, which in turn receives its energy from the incoming 110,000-volt lines through transformers. It has been found that the total kilowatt capacity of the station has been increased 12% by the use of these two synchronous condensers.

The following data was obtained during special tests soon after the machines were installed and indicate the power-factor can be raised from 76.4 to 86%, representing a reduction in wattless current of 21%, which not only increases the capacity of the transformers in the Toronto substation but likewise reduces the line loss and thereby extends the line capacity of the transmission lines and the generating capacity at the other end of the line. Voltage regulation is correspondingly improved.

	Condensers both off.	One condenser operating.	Both condensers operating.
Input to consumers, kw......	0	310.0	619.5
Input to condensers, kv-a.....	0	3450.0	7052.0
Total excitation in kw.......	0	39.41	76.15
Power-factor Toronto station load (lag)	76.4%	81.0%	86.0 %
Power-factor of total hydro load measured at Niagara.	84.9%	85.4%	88.6 %
Power-factor of condenser bus		9.0%	8.78%
Watless factor, Toronto station load	64.5%	58.5%	51.0 %

DATA UPON KINGSBURY THRUST BEARING OPERATION.

Hydraulic Turbine Characteristics, Lubrication and Bearing Loads and Friction.

The Kingsbury bearing, invented by Albert Kingsbury about 1910, is largely used for the step and thrust bearings of hydraulic turbines, for steam turbines and also centrifugal pumps. The bearing in its simplest form consists of one or more pivoted segments or shoes against which the thrust collar presses as it rotates. The bearing faces are copiously supplied with oil so that perfect film lubrication takes place with its resultant low friction coefficient. That this type of bearing may be employed when the load carried is either great or small, the speeds high or low, and the oil heavy or light, is proved by some very complete tests, which are described in a paper presented by H. A. S. Howarth before the A. S. M. E. at the New York meeting held this month.

Tests were made upon various machines, including a steam turbine driving a large passenger steamer. However, central-station operating engineers are chiefly interested in the influence of the tests upon hydraulic turbine bearings and lubrication in general. Hydroelectric units ordinarily run on light engine oils and the film thicknesses are therefore much less at any speed and load than would be the case if heavy oils were used. They have to start and stop under practically full thrust load, consequently that service may be considered as the most severe for thrust bearings. When one of these units slows down it passes gradually through the whole range of speeds from normal to the very low speed at which the oil film breaks in the thrust bearing. All this time the friction coefficient, and hence the torque required to turn the rotor, is reducing. When the film breaks up the friction coefficient immediately increases and the rotor comes to rest.

Consideration of these severe service conditions suggests the following questions: At what surface speed does the film break? What happens to the bearing if it continues to turn after the film breaks? Does the film break suddenly? These questions are of great importance.

It is known that in a given bearing carrying a known load the film thickness at a given speed is greater for a heavy oil than for a light one. Hence a heavy oil will sustain a given load at a lower speed than will a light oil. It may be assumed that the oil film breaks when it gets so thin that the high spots begin to rub. If the bearing surfaces are poorly fitted the film will break at a higher speed than otherwise. When it is said that high spots rub on each other it is not meant that the metals come into contact with no oil between them. If the high spots are wet with oil, oil will persist in remaining between them. The local pressure may be enough to cause the softer of the two spots to be "ironed off" or crowded back out of the way. If the high spots are not of great magnitude the local heating will not be sufficient to make trouble and as soon as the high spots rub they will pass and cool. The softer high spot will recede on cooling and may even fall below the general surface. If the harder surface be perfectly flat it might iron off the soft high spots and make the soft face also flat. If the harder face is not perfectly flat the softer face will gradually conform to it as far as possible.

The results of the tests already carried out indicate that the lower the speed at which the Kingsbury bearing is run continuously, the better the condition of the bearing surfaces. Speeds as low as 0.38 r.p.m. have thus far been employed and further tests will be made with yet lower speeds. The range of pressures that may be employed extend from the initial test of 132 lbs. per sq. in. and a light oil to as high as 2000 lbs. per sq. in. with a light and a heavy oil.

INTERESTING METHOD OF HANDLING EXHAUST STEAM AND ELIMINATING CLOSED HEATER.

Excerpt from Paper Before Station Operating Meeting, Ohio Electric Light Association.

By W. H. Aldrich.

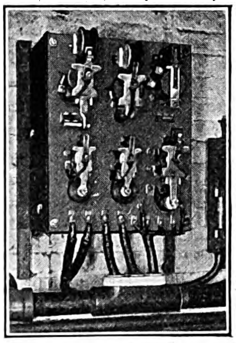
In the turbine room at the Lake Shore station of the Cleveland Electric Illuminating Co. is a system for handling the exhaust steam from the auxiliaries which I believe is rather unique. We have a separate but similar system for each turbo unit. The main feature of this system is a barometric condenser mounted above a large iron storage tank connected to the common feed pump suction header. The tank is the base of the barometric condenser tail pipe. All exhaust steam from the auxiliaries of that turbo unit are piped to this condenser, and the condensate from that turbo unit is pumped through this condenser to act as cooling or condensing water for the auxiliaries' steam. The original turbo condensate and the auxiliaries condensate, mixed together, then drop down the tail pipe into the heater tank. The results obtained are evident, for we are enabled to do away with the closed heater with its leaky tubes and repairs. There is no back pressure on the auxiliaries, and all the condensate and heat from both main unit and auxiliaries is returned to the feed water tank. A balanced relief valve is installed on the steam exhaust line to take care of the pressure when first starting up before the turbo condensate is available for condensing water.

New Appliances

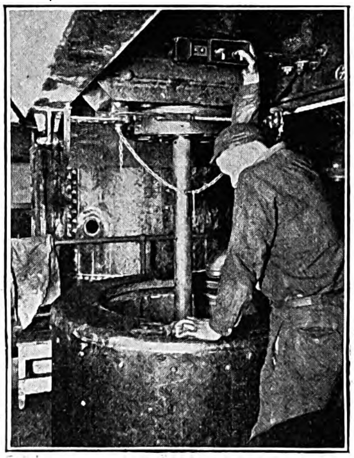
Unique and Economical Push-Button Control System—New Insulating Compound—Miniature Direct-Current Meter

Motor-Driven Centrifugal with Push-Button Control Increases Production 50%.

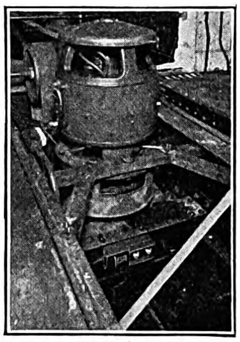
An interesting installation of a motor-driven centrifugal extractor entirely controlled by electric push buttons has recently been made at the plant of Kirkman & Sons, Brooklyn, N. Y. The centrifugal, which has a diameter of 40 ins., was built and installed by the S. S. Hepworth Co., and is direct-connected through a centrifugal clutch to a 25-hp., 220-volt vertical motor mounted on the floor above. While running at 500 r.p.m. the centrifugal is filled with 750 lbs. of glycerine salts. Four minutes are required for loading and the speed is then increased to 1000 r.p.m. for two minutes. After water has been supplied for washing the salts, the centrifugal is run for two minutes more at high speed, at which time all moisture has been thrown off, the complete cycle of operation requiring between nine and ten minutes.



Magnetic Control Panel for Two Speed Selection.



Through Convenient Push Buttons Operator Can Start or Stop Extractor and Run It Slowly or Fast Without Distracting His Attention.



Driving Motor Mounted on Floor Over Extractor.

Four push-button switches, placed convenient for the operator, allow complete and easy control of the centrifugal. Two buttons of the momentary-contact type are used for stopping and running, and the other two buttons provide the slow and fast speeds—500 and 1000 r.p.m.

The buttons open and close the circuits which actuate the magnetic contactors and relays on a special controller, manufactured by the Cutler-Hammer Manufacturing Co., Milwaukee, Wis. An explanation of the operation of the controller by means of the push buttons will illustrate how perfectly the control meets the demands required of the motor and centrifugal. To start the centrifugal and run it at slow speed for loading, first the "slow" and then the "run" button is depressed. The latter causes the main-line magnetic switch to close, starting the motor with three steps of resistance in series with the armature. As the speed of the motor increases and the armature current decreases, the three accelerating lockout switches close one by one, each switch cutting out one step of resistance. They will not close, however, until the current has fallen to a predetermined value. The final switch, which shunts out all the resistance steps, is provided with a shunt coil which keeps it from dropping out should the current drop or become reversed, due to the peculiar condition pertaining to this kind of installation. This condition is produced by a sudden drop in line voltage, which causes the motor to be driven by the rapidly revolving centrifugal and generate current back into the line. The field circuit has one step of resistance, which is instantly cut out by the closing of a field-strengthening relay when the "run" button is depressed, the relay remaining closed during the acceleration to 500 r. p. m.

When the "fast" button is depressed, the field-strengthening relay opens, placing the field resistance in circuit, and the motor commences to accelerate from 500 r.p.m. to 1000 r.p.m. However, if this resistance were left in the field circuit during the entire accelerating period, the continuous heavy armature current produced would cause undue heating of the motor and, therefore, a vibrating type of field-accelerating relay is used to alternately cut the resistance in and out of circuit until the motor has reached the maximum speed. It will be noted that the field resistance is never cut in circuit until the armature resistance has first been all cut out.

The motor can be accelerated directly from a standstill to the maximum speed by depressing the "run" button while the "fast" button is "on." Depressing the "stop" putton releases the magnetic main switch which opens the armature circuit and brings the accelerating contactors and relays back to their normal positions.

The complete and easy control obtained by the push buttons allows the operator to carefully watch each run of salts, hence the best results can be obtained. In this particular installation and in others where the manufacturing process requires two operating speeds, this type of controller has been found very desirable. It is not only an inexpensive means of securing two speed operations, but it also permits the operator to secure either the slow or fast speeds by the mere pressing of a button.

It therefore enables him to devote his entire attention to the work and does not necessitate his going to and from a field rheostat located on the control panel, or elsewhere, to secure each change in speed. Furthermore, the current is limited to a safe value, and the motor cannot be accelerated too rapidly, as is sometimes the case when speed adjustment is secured through the common type of manually operated field rheostats.

Production records at the Kirkman & Sons plant show that since this automatically controlled centrifugal has been installed, the production has been increased about 50% and only 1% of the glycerine remains in the salts, whereas with the former equipment about 8% remained.

Cumar—A New Synthetic Insulating Material.

There is now being marketed a synthetic resin known by the trade name of "Cumar," which is proving of exceptional interest to manufacturers of electrical equipment.

Cumar, otherwise known as "Paracoumarone Resin," is manufactured by a special chemical process from certain coal-tar distillates. In appearance, it resembles ordinary resin but its properties are radically different; it is unaffected by water or any of the ordinary chemicals; it is neutral in its action, and unlike resin, will not saponify. It is said to be absolutely nonoxidizing so that exposure to the air or weather will not change it. Cumar is soluble in practically all commercial solvents of insulating compounds, with the single exception of alcohol. It combines readily with vegetable oils and with many waxes.

In addition to these properties, its

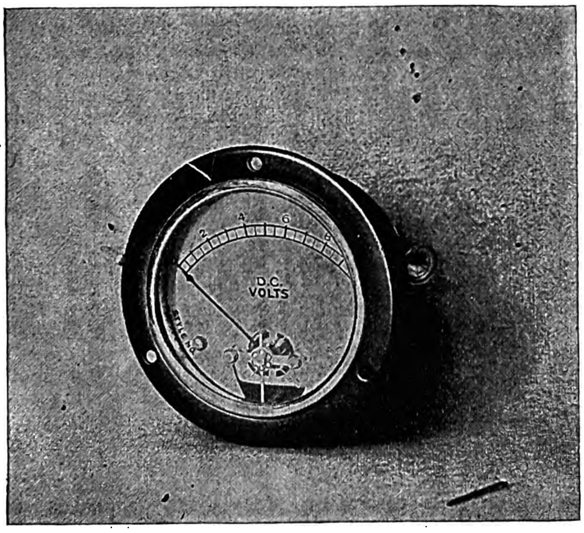
particular interest from the electrical standpoint is the fact that it has a high dielectric constant and is an excellent insulator. Resistance tests made by the Bureau of Standards on representative samples of Cumar show that in both volume and surface resistivity Cumar compares favorably with the more generally known insulating materials; in fact, the only common materials having a higher insulating power are paraffin and the ceresin waxes. A valuable property in this connection is the high surface resistivity of Cumar, particularly when exposed to moist air. In the Bureau of Standards tests, the surface resistivity dropped less than 10% when the humidity was increased from 30% to 90%. In molded insulation it is claimed that the surface resistivity is increased approximately 20% over a phenol condensation compound designed for similar uses.

The principal uses which Cumar has found so far in the electrical industry are as a base for insulating varnishes and lacquers, as a coil filler and in compositions for use in making molded insulation.

Cumar, which is manufactured by the Barrett Co., Chemical Department, 17 Battery place, New York City, is marketed in 9 different melting-point grades, ranging from a soft plastic material of melting point about 122 deg. F. to a hard brittle material with a melting point of over 302 deg. F.

Novel Type of Miniature Electrical Measuring Instruments.

With an over-all diameter of 2 9/16 in.—slightly larger than that of a gentleman's watch—and a weight of only 4 ounces, a novel type of miniature electrical instruments for the measurement of voltage and current is proving effective and reliable on small panels where economy of space, together with high accuracy and neatness of appearance, is imperative. It is especially applicable to the measurement of small direct currents, such as the filament and plate currents of radio communication sets, or those in connection with farm lighting and other small charging and lighting sets, or in use with dental and electromedical work.



Flush Type Direct-Current Voltmeter.

To meet the growing demand for instruments of small size, together with increased sensitiveness and greater accuracy, the Westinghouse Electric & Manufacturing Co. has developed this miniature type. It combines extreme delicacy of action with high sensitivity and ruggedness, and the design, construction, and materials are such that the instruments are permanently accurate.

A salient feature of design wherein these instruments differ from the other makes consists in the method of supporting the cylindrical core and movable element between the pole pieces of the magnet. Instead of providing for this purpose a casting supported at the back of the instrument independently of the magnet and pole pieces and therefore requiring, in order to secure accuracy, a high degree of machining, the new Westinghouse instruments make use of two simple, easily and inexpensively made bronze-alloy punchings securely fastened to either side of the pole pieces.

This departure makes the instrument more compact, greatly simplifies the construction, and lessens the amount of space required within the case, thereby making it practical to construct the instrument to miniature dimensions and secure at the same time a high degree of accuracy, reliability and sturdiness of design.

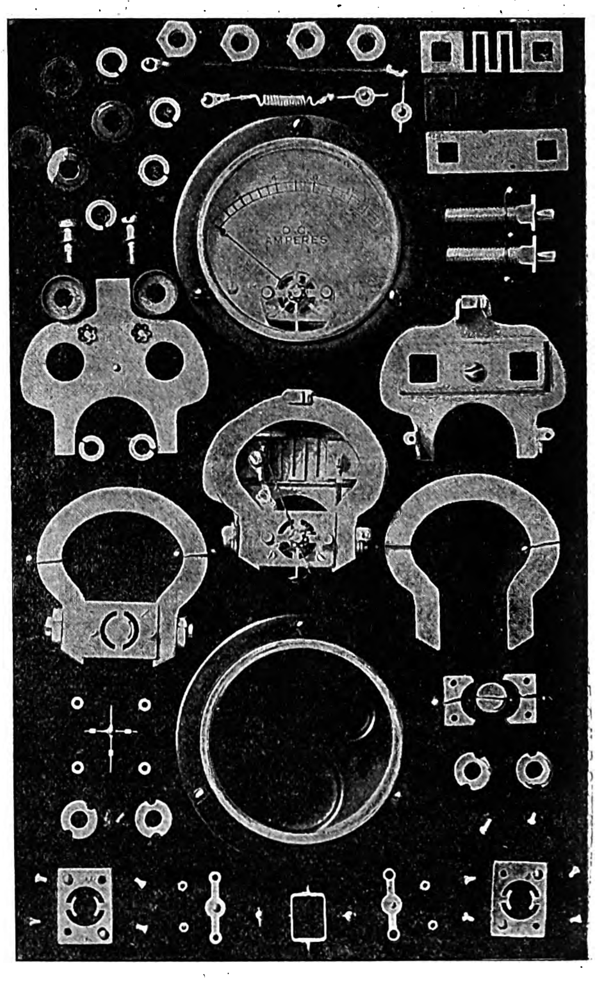
Another departure from a method in common use with other makes consists in the insulation, by oxidation instead of by paper, of the small aluminum frame which carries the coil of the movable element. The oxide of aluminum thus used is highly effective as an insulator and greatly facilitates the mounting of the coil.

The fastening of the pivot support of the movable element constitutes an additional departure from older practice. The base of the support, instead of being cemented directly to the coil, is elongated and clinched around either side of the aluminum frame of the movable coil. This gives a more accurate centering of the pivots.

By combining the millivoltmeter with a noninductive heater and thermocouple, it is made suitable for the measurement of high-frequency alternating currents, such as are encountered in radio communication. The same instrument can also be operated on alternating-current circuits of commercial frequency, provided they are not subjected to overloads.

The instruments can be furnished for mounting with the face flush with the panel, or for projection. They are arranged for rear connection. The standard finish is white dial, nickel bezel ring, and black marine case. Black-dial instruments can also be furnished, if desired.

All instruments are checked throughout their entire range for accuracy. The calibration at any point of the scale within 2% of full-scale reading on direct current and radio-frequency current of the frequencies now in use. These instruments are the smallest of the D'Arsonval (that is, moving coil and permanent magnet) type that are being regularly manufactured.



Miniature Instrument Disassembled, Showing Parts.

Trade Activities

Emerson Electric Lets Contracts for Large Factory Extension—Industrial Haulage Problems—Trade Literature

Electrical Sales Agency, with headquarters at 22 West 32nd street, New York City, would like to secure the representation of several manufacturers who are desirous of selling their product to the jobbing trade of New York, and surrounding territory. This concern would also like to entertain sole agency propositions.

Roller-Smith Co., 233 Broadway, New York, announces that its California representative, the Electrical Material Co., 589 Howard street, San Francisco, has opened a Los Angeles office in the Title Insurance building. The Los Angeles office is in charge of E. H. Bell, who has had extensive experience in marketing electrical products. The Electrical Material Co. handles the Roller-Smith lines of electrical measuring instruments, watt-hour meters and circuit breakers in California, Nevada and parts of Oregon and Idaho.

Central Electric Co., 316-326 South Wells street, Chicago, is making distribution of a new 16-page catalog dealing with Maxolite RLM standard dome diffusers, which are designed specially for use in machine shops, textile mills, woodworking plants and practically all other places where close work is done. It illustrates and describes various types of Maxolite reflectors and contains considerable technical data on industrial lighting. The Duplexalite fixture for residence ilghting, Alexalite system of illumination designed for both offices and residences, and Four-in-One lighting fixtures for store and office illumination are also illustrated and briefly described.

Hays School of Combustion, Chicago, announces that W. L. Abbott, chief operating engineer of the Commonwealth Edison Co., has associated himself with the staff of reviewing and supervising editors. Mr. Abbott is well known in the power plant field because of the responsible position he holds with the utility operating the largest power houses in the world. He ranks as one of the foremost operating and power plant engineers in the country and has contributed richly to the technical press. Mr. Abbott has always taken a keen and practical interest in young engineers and educational matters in general. For many years he was president of the board of trustees, University of Illinois, and is still on the board of trustees. He has been a prominent member of the A. I. E. E., A. S. M. E., N. E. L. A. and the W. S. E. of which latter he has been president. In matters pertaining to engineering and education, the collaborators working with Mr. Abbott are David Moffat Myers, Joseph W. Hays, Joseph Harrington, Prof. S. W. Parr, Fred Low and A. L. Rice.

Link-Belt Co., Chicago, has issued Booklet No. 421 containing an illustrated article by James Monroe on the subject, "Handling Coal and Ashes with Electric Hoists." It sets forth the marked economy in labor resulting from use of Link-Belt hoists for coal and ash handling in power plants of moderate size. In these plants many difficulties in the way of effective and economical mechanical handling were successfully overcome.

R. S. Mueller Partnership Dissolved.—The partnership of R. S. Mueller & Co., Cleveland, engaged in the manufacture of electric test clips and battery charging clips, has been dissolved as of Dec. 1, Ralph S. Mueller having purchased the interest of George G. Dusinberre. Mr. Mueller will consolidate the clip business with that of the Mueller Electric Co., and under that trade name will continue the manufacture of clips, attachment plugs, battery handles and other electric specialties.

J. L. Wolf, secretary of the Lighting Fixture Dealers Society of America, is issuing a series of letter bulletins on the advantages of carton packing for illuminating glassware and suggesting methods of putting this reform in operation. While these bulletins were prepared originally for confidential circulation to members of the fixture dealers society, it has been decided to send them on request to anyone interested in the improvement of fixture and lighting trade conditions. Copies can be secured from Mr. Wolf, care of Builder's Exchange, Rose building, Cleveland, O.

Emerson Electric Co., St. Louis, Mo., manufacturer of electric disk fans and motors, has let contracts for a new 8-story building to adjoin its present quarters, this will involve an expenditure of $600,000. The company announced about 2 weeks ago that $1,000,000 of 7% cumulative preferred stock had been issued for this purpose. The new building, which will provide employment for 1000 persons, will be equipped with an electric light and power system, a heating plant and five passenger and freight elevators. The general offices will be located on the sixth floor and the shipping rooms on the first floor. One portion of the building will contain an electric substation and there will be fireproof rooms under which will be installed gasoline and oil tanks. The remainder of the plant will be devoted to manufacturing purposes. The company has been literally inundated with orders for its products and is said to have refused orders totalin $3,000,000 during the last 4 months because its manufacturing facilities were inadequate to meet the demand for its products.

Dudlo Manufacturing Co., Fort Wayne, Ind., has recently issued a new folder, superseding all previous bulletins which includes tables giving outside diameters of its enameled, silk-covered and cotton-covered magnet wire, as well as additional data on bare copper wire.

Barkelew Electric Manufacturing Co., Middletown, O., manufacturer of Barkelew knife switches and specialties, is making distribution to the trade of a new bulletin (No. 24), 6x9 ins., giving dimensions of front connection switches for the selection of iron boxes and drilling dimensions of its knife switches. The bulletin is perforated to fit the binding strip in the back of catalog No. 22. This bulletin is also furnished in loose leaf sets, 8½x10 ins., and perforated to fit the Electrical Supply Jobbers Association binder. Any quantity of these bulletins will be furnished upon request to the company.

Lakewood Engineering Offers Unusual Inducement to Study Industrial Haulage.—As an inducement to industrial plant managers, engineers and others to study their interdepartment transportation problems and more fully realize how industrial tractors and trucks help to conserve labor and increase production, an offer of three awards for the three best analyses of the application of the new tier-lift truck is announced by the Lakewood Engineering Co., of Cleveland. To get increased production with present labor conditions is uppermost in the minds of business executives. The correct use of industrial haulage equipment will, in many cases, solve the problem. This truck is different, in every respect, from the equipment heretofore offered for plant transportation. It combines a tiering machine with a storage battery truck, thus making a load carrying unit that will, by electric power, elevate its 2-ton load to any height up to 76 ins. from the floor. Three awards—$1000, $500 and $250—are offered for the three best papers on the application of the new Lakewood tier-lift truck. The award committee, appointed by the Society of Industrial Engineers, consists of: A. Russell Bond, chairman, editor Scientific American Supplement, New York City; Professor Dexter S. Kimball, dean of the School of Engineering, Cornell University, Ithaca, N. Y., and Irving A. Berndt, president of C. E. Knoeppel & Co., New York City. All papers must be in the hands of Mr. Bond by Jan. 30, 1920. The awards will be made prior to Feb. 28, 1920. Details of the contest will be sent by the Lakewood Engineering Co., Cleveland, upon request. The contest is open to all except employes of the Lakewood Engineering Co.

Current News

Weekly Record of Construction Activities—Conventions

EASTERN STATES.

Otter Cliffe, Me.—The Bureau of Yards and Docks, Navy Department, Washington, has had plans prepared for the erection of a new radio station at this place.

North Stratford, N. H.—Warner Sugar Refinery Co., 70 Wall street, New York, has arranged for the erection of a 1-story power plant, 64x120 ft., at its local works.

Springfield, Mass.—New England Westinghouse Co., Chicopee Falls, is planning for the construction of an addition to its plant at East Springfield to cost about $150,000. The structure will be equipped for the manufacture of small motors.

Bridgeport, Conn.—Bryant Electric Co. has filed plans for the erection of a machine works and automobile service building for company cars, 1 story, 56x117 ft., to cost about $10,000.

Cranston, R. I.—United Wire & Supply Co., Auburn, will build a 2-story addition to its plant, 40x250 ft., to cost about $100,000.

Buffalo, N. Y.—Intervillage Electric Corp., Buffalo, has been merged with the Depew & Lancaster Light, Power & Conduit Co., Depew, N. Y., under the latter name.

Churchville, N. Y.—An electric power plant and transmission line will be erected by Alderman, Fairchild & Co., 367 Orchard street, Rochester.

Fillmore, N. Y.—Genesee Valley Power Co. is planning to extend its service by an electric line from Fillmore to Belmont, to allow lighting Belfast and Angelica en route. Work on the new line will begin early in the spring. The corporation now serves the villages of Fillmore and Pike.

Livingston, N. Y.—Livingston-Niagara Power Co. has increased its capital to $150,000 for proposed expansion.

Long Island City, N. Y.—Queens Electric Light & Power Co. has filed plans for the erection of a new 1-story automobile service plant for company trucks and cars, 38x200 ft., on Read street, near Jane street, to cost about $150,000, including equipment installation.

New York, N. Y.—Western Electric Co., 195 Broadway, has leased the 7-story building at 537-45 Greenwich street, 100x100 ft., for a term of years at an aggregate rental of $300,000. The company will use the structure for different features of business.

New York, N. Y.—Central & South American Cable Co. has entered into contract with the Government of Brazil for the construction of a new cable line from Rio Janeiro to Cuba. This assures a direct all-American line from the United States to Brazil.

New York, N. Y.—Vermont Hydro-Electric Co. has filed notice of authorization to operate in New York, with capitalization of $1,000,000. C. N. Wilson, 50 Pine street, is representative.

New York, N. Y.—Western Union Telegraph Co. has been granted permission by the Government of Peru to establish a new cable relay station at Pimentel, Peru, a point about midway of the projected cable line of the company, approved by the Government of Chile, on Nov. 27. Construction work will be inaugurated at an early date.

Schenectady, N. Y.—General Electric Co. is completing plans for the erection of a 6-story building at its local works, 54x219 ft., to cost about $400,000. Harris & Richards, Drexel building, Philadelphia, Pa., are architects.

Schenectady, N. Y.—Weber Electric Co. has increased its capital from $25,000 to $100,000.

Bayonne, N. J.—In connection with the erection of a large addition, the Bayonne Hospital, East 30th street, near the City Hall, will build a new power plant for service at the institution and a mechanical laundry works. The entire project is estimated to cost about $250,000.

Camden, N. J.—Eavenson & Levering, operating a wool scouring plant, have arranged for the installation of new boilers and auxiliary equipment for increased power capacity.

Dover, N. J.—Electrical and mechanical equipment will be installed by the Republic Steel Co., formerly known as the Wharton Steel Co., in connection with improvements and extensions at its blast furnaces and steel plant at Wharton. An electrically operated ore bridge will be constructed, new blast furnaces erected, coke ovens installed, and plans are under way for a new steel finishing plant and sintering works. The project is estimated to cost about $3,000,000. H. M. Roche is consulting engineer; the work will be carried out under the supervision of Arthur G. McKee & Co., Cleveland, Ohio.

Metuchen, N. J.—Large quantities of electrical apparatus have been sold by the Emergency Fleet Corp. at public sale conducted from its local warehouse. Among the different items and prices are 6000 Edison plug fuses, 4 cts. each; dry batteries, 25 cts. each; telephone line stations, $5 each. More than 1000 different items are being sold.

Newark, N. J.—New York Telephone Co. has perfected plans for the proposed extensions to its exchange plants in this vicinity to cost about $650,000. The main building at 281-285 Washington street will be increased in height from 9 to 13 stories, at a cost of about $300,000; an addition will be erected to the exchange plant at 59 Bloomfield avenue to cost $200,000; and an extension made to the exchange at 176 Avon avenue to cost $150,000.

Perth Amboy, N. J.—Considerable electrical and mechanical machinery and equipment will be required for the large addition to be constructed at the plant of the Perth Amboy Dry Dock Co., foot of Broad street. A new dry dock, mechanical and electrical shops will be constructed. Lockwood, Greene & Co., 101 Park avenue, New York, are architects and engineers.

Trenton, N. J.—Hildebrecht Ice Cream Manufacturing Co. will build a new ice and refrigerating plant to cost about $30,000. Considerable electrical equipment will be installed.

Trenton, N. J.—Crescent Insulated Wire & Cable Co., Olden and Taylor streets, has acquired additional property on Webster street for the erection of an addition to its works. The company will install oil-burning equipment in its power plant, changing from coal to such type of fuel for general operation.

Whitehouse, N. J.—The Readington Township Committee is planning for the installation of an electric light and power system in this section. A lighting district has been mapped out, and it is proposed to enter into negotiations with some of the neighboring power companies to extend their lines to this point. County Engineer Grant Davis will be in charge.

Wilmington, Del.—Plans have been filed by the Standard Kid Manufacturing Co., 4th and Monroe streets, for the erection of a new 1-story boiler plant, about 40x40 ft.

Wilmington, Del.—Unger Storage Battery Co., 12th and Madison streets, has filed plans for the erection of a 1-story addition to its plant.

Allentown, Pa.—The engine plant at the stone quarries of Herbine & Ziegenfus was destroyed by fire on Dec. 14. The plant will be rebuilt.

Allentown, Pa.—Electric Bond & Share Co., 71 Broadway, New York, has inaugurated construction work on extensions to its power stations and transmission lines in this section. The work is estimated to cost $3,000,000.

Freeburg, Pa. — Northumberland County Gas & Electric Co., Sunbury, is planning for the installation of an electric light and power system here.

It is proposed to have the new system ready for service by the coming spring.

Hazleton, Pa.—A new coal washery will be constructed at the Silver Brook mining properties, to be electrically operated. Service will be furnished by the Harwood Electric Co.

Johnstown, Pa.—To provide for its new power project, the Penn Public Service Co. has arranged for a bond issue of $4,000,000. The company has preliminary work under the way on a new steam-driven power plant at Seward, near Johnstown, to cost about $1,500,000. Operations are conducted in Cambria, Somerset, Indiana, Clearfield, Centre and Westmoreland counties and general expansion work is planned. The territory served has a population of about 400,000.

Philadelphia, Pa.—A new 1-story boiler plant, 42x66 ft., to cost about $25,000, will be constructed by the Continental Mills Co. at its plant at Armat and Lena streets.

Philadelphia, Pa. — Manufacturing Co. of America, 12th and Hamilton streets, will install new boiler equipment at its power house for increased capacity.

Philadelphia, Pa. — Construction work has been commenced on the boiler plant to be erected at the new factory of the American Preserve Co., 946 Beach street; the structure will be 50x70 ft. The entire plant is estimated to cost $400,000.

Philadelphia, Pa. — The largest shipbuilding crane ever constructed has been placed in operation at the League Island Navy Yard of the Government at Philadelphia. The crane is electrically operated throughout; it has a lifting capacity of 350 gross tons, and is equipped with an auxiliary hoist, operating on a horizontal trackway between the two main 175-ton hoist runways. It is of stationary pintle cantilever type. The crane was built by the McMyler-Interstate Co., Cleveland, Ohio, and will be used for fitting out work at the yard.

Pittsburgh, Pa.—Pittsburgh Reflector & Illuminating Co., a New Jersey corporation, has increased its capital from $15,000 to $50,000.

Pittsburgh, Pa.—Jones & Laughlin Steel Co. has filed plans for the construction of a new 1-story pumping plant on 2d avenue, near Bates street, to cost about $15,000.

Reading, Pa.—Metropolitan Edison Co. has closed a 5-year contract with the Eastern Pennsylvania Railways Co., operating at Pottsville and vicinity, for electric energy, providing for a minimum of 2000 kw. and maximum of 4500 kw.

Wilkes-Barre, Pa.—Kitsee Battery Co., 62 North Main street, will build a 1-story addition, 40x80 ft., to cost about $10,000.

Annapolis, Md.—The Bureau of Yards and Docks, Washington, has awarded a contract to the Levering & Barrigues Co., 552 West 23d street, New York, for the erection of a new power plant at the local navy yard. The contract covers the building work.

DATES AHEAD.

American Society of Civil Engineers. Annual meeting, New York City, Jan. 21-22, 1920. Secretary, Charles W. Hunt, 33 West 39th street, New York City.

Western Association of Electrical Inspectors. Annual convention, St. Louis, Mo., Jan. 27-29, 1920. Secretary, W. S. Boyd, 175 West Jackson boulevard, Chicago, Ill.

National Council of Lighting Fixture Manufacturers. Annual convention, Detroit, Mich., Feb. 9-13, 1920. Secretary-treasurer, Charles H. Hofrichter, Cleveland, O.

Oklahoma Utilities Association. Annual convention, Oklahoma City, Feb. 10-13, 1920. Secretary, H. A. Lane, 611 State National Bank building, Oklahoma City.

Central Electric Railway Association. Annual meeting, Louisville, Feb. 26-27. Secretary, A. L. Neereamer, Indianapolis, Ind.

American Electrochemical Society. Annual convention, Boston, Mass., April 7-10, 1920. Friday, April 9, joint session with American Institute of Electrical Engineers on "Electrically Produced Alloys." Secretary, Joseph W. Richards, Bethlehem, Pa.

National Electric Light Association. Annual convention, Pasadena, Cal., May 18-21, 1920. Headquarters, Hotel Huntington. Acting secretary, S. A. Sewall, 29 West 39th street, New York City.

National Association of Electrical Contractors and Dealers. Annual convention, Baltimore, Md., Oct. 6, 1920. Secretary, W. H. Morton, 110 West 40th street, New York City.

Baltimore, Md.—Consolidated Gas, Electric Light & Power Co., Lexington building, is planning for the erection of a 2-story factory, 53x100 ft., on Kloman street, to cost about $50,000. The structure will be equipped for the manufacture of gas appliances.

Salisbury, Md.—Eastern Shore Gas & Electric Co. has arranged for a preferred stock issue for general expansion. The company serves this section with electric light and power.

Bluefield, W. Va.—American Armature Engineering Co., recently incorporated with a capital of $25,000, is planning for the establishment of a local electric plant. A. A. Grant and A. D. Knight head the company.

Weston, W. Va.—Weston Milling Co. is planning for the construction of a new transmission line to Seebert to cost about $50,000. George I. Keener is president.

Weirton, W. Va.—In connection with the construction of the proposed new plant of the Weirton Steel Co., contracts for which have recently been awarded, arrangements have been made for the construction of a large extension to the blast furnace power station, providing for the installation of 5 600-hp. boilers equipped with underfeed stokers. The installation will comprise 2 7500-kw. turbogenerator units, as well as switchboard and auxiliary apparatus. Large quantities of electrical equipment will be required in connection with the construction of the mills proper, and contract has been awarded to the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa., for the furnishing of 2 4000-hp. motors; 2 1500-kw. motor-generator sets to be installed in the direct current substation at the blooming mill; contract has been let to the General Electric Co., Schenectady, N. Y., for switchboard equipment; the Power Specialty Co., New York, will supply a 600-hp. waste heat boiler equipped with super heaters; while the Vulcan Soot Cleaner Co., Chicago, has been awarded the contract for soot blower equipment. When completed, the new plant will have an annual capacity of about 400,000 tons of ingots, and the company is arranging for the completion by June, 1920.

Hertford, N. C.—The Board of Trustees has approved a bond issue of $125,000 for improvements and extensions in the municipal power plant and city water works.

Lakeview, N. C.—Electric Light & Power Co. has increased its capital from $75,000 to $300,000 and contemplates plant enlargement. J. R. McQueen is president.

Conway, S. C.—Conway Lumber Co. is in the market for a 25-kw. generator, 3-phase, 60-cycle, 240-volts, belted or direct connected.

Denmark, S. C.—American Telephone & Telegraph Co. will erect a $75,000 to $100,000 office building. It will be 3 stories high and used for lunch room, employment and operating room, etc.

NORTH CENTRAL STATES.

Dover, O.—The city voted bond issue of $100,000 to enlarge its municipal electric plant and to replace natural gas engines with steam engines.

Bad Axe, Mich.—A committee has been appointed to look into ways and means to improve water system. The committee also agreed that there are but two things in sight—either the sale of the present plant and a franchise to private parties or a new municipal plant, which it is estimated would cost at least $75,000. The committee is now working on the proposition.

Charlotte, Mich.—The city council is interested in the proposition of the advisability of installing an electrical equipment at the city water works station.

Muskegon, Mich.—Shaw Electric Crane Co. contemplates an addition to its plant which will double its capacity.

Colfax, Ind.—Colfax Electric Co. has petitioned for authority to issue $20,000 in bonds for extension to light system. Address general manager.

East Chicago, Ind.—Bates Expanded Steel Truss Co. of East Chicago and Savona, Italy, has opened its new plant at Savona. It was built by Walter Bates and is a duplicate of the one at East Chicago. The Bates company manufactures latticed steel poles and has had heavy contracts from the ministry of railways of Great Britain and from traction companies in Swedish cities. Large numbers of the poles are in use in Africa and India.

East Chicago, Ind.—In an application to the Indiana Public Service Commission for permission to issue bonds for $161,000 for the completion of its filtration plant at East Chicago, the East Chicago and Indiana Harbor Water Co. stated that construction work to date had cost $244,199. According to these figures the filtration plant when completed will cost the company $405,699. The original estimate was $225,000. The headquarters of the East Chicago and Indiana Harbor Water Co. are at Indianapolis, Ind.

Indianapolis, Ind.—Liquid Carbonic Co. of Chicago has purchased a site and will erect a plant for the manufacture of carbonic gas. J. B. Olwin, manager of the Liquid Carbonic Co. of Chicago.

Indianapolis, Ind.—The Indiana Telephone Association has been incorporated with the purpose of protecting investments in telephone properties. The organization is composed of all the telephone companies of the state. Among those interested are Claude R. Stoops, Napanee; William N. Bailey, Richmond, and Frank O. Cuppy, Lafayette.

Indianapolis, Ind.—Prest-O-Lite Co. will build a 2-story battery house, 100x400 ft. to cost $400,000.

Logansport, Ind.—The Cass County Chamber of Commerce will have a survey made of the Wabash river at Logansport with a view of using power of the river for an electric power and light plant.

Chicago, Ill.—A new plant 27x306 ft., is contemplated by the Federal Electric Co. and will involve an expenditure of $150,000.

Chicago, Ill.—The trustees of the sanitary district have decided to build a new hydro-electric plant at Lockport. Its construction will take "the major portion of two years," cost an aggregate of $2,000,000, of which the trustees agreed that $750,000 shall be spent next year, and increase the gross revenue of the district from electric energy "above $300,000 annually."

Bruce, Wis.—The sum of $12,000 in bonds has been voted for municipal lighting system. L. H. Stenson, city clerk.

Colfax, Wis. — Colfax Light & Power Co. will spend about $200,000 to increase the capacity of its hydro-electric plant.

Lancaster, Wis.—Farmers' Telephone Co. will erect telephone exchange and office building on East Maple street. The building will be 2 stories, and of brick construction. Work will be started in the spring. Estimated cost $50,000.

Milwaukee, Wis.—Mueller & Son Co. will completely electrify its plant by the installation of a large generator and 65 motors of various sizes.

Tomah, Wis.—Tomah Electric Light Co. contemplates a light plant. Louis W. Barnes, architect, Superior street. Superintendent has not yet been selected.

Waupaca, Wis.—Little Wolf Power Co. will construct power plant and dam on Little Wolf River. Dr. W. H. Finney, Clintonville, is interested. Engineer, L. A. DeGuere, Grand Rapids, Wis. Work is to start Jan. 1 and be completed June 1.

Washburn, Wis.—Wisconsin Telephone Co. has purchased the Bayfield County Telephone Co. New instruments will be installed.

Belview, Minn.—Northern States Power Co., Garrett, O. House, manager, 76 W. 3rd street, will extend its line from Belview, Minn., to Sacred Heart.

Bemidji, Minn.—A company has been formed to install Helga Twp. Telephone line from Bemidji to Helga, 13 miles southwest of here. Line will connect Northwestern Exchange line at M. & I., 2 miles southeast of here. Full metallic line. Adner Stone, secretary of the company.

Clearbrook, Minn. — Clearbrook Electrical Co. will build a power house.

Buffalo, Mo.—The proposition of installing street lights is under consideration.

Brunswick, Mo.—The sale of the Brunswick Light & Water Co.'s plant and lines to the Carrollton Water, Light & Transit Co. has been approved by the State Public Service Commission. The trade includes the sale of the local company's light and water plants here as well as the transmission lines extending from Brunswick to Dalton, Keytesville, Triplett and Mendon. In addition to the Chariton county towns, the Carrolton company will also furnish light to DeWitt, Wakenda, Bosworth, Bogard and Tina, in Carrol county. This will form one of the largest country lighting systems in the state.

Marshfield, Mo.—L. A. Reynolds and T. F. Bowers of Flat River, Mo., have made a contract to purchase the electric light plant from the city of Marshfield and in payment have agreed to furnish the city with lights for a period of 5 years which would amount to $7300.

Maryville, Mo. — Permission was granted by the county court to the Mound City Electric Light & Ice Co. to erect a transmission line from Clyde to Stanberry.

Shannondale, Mo. — Shannondale Light & Power Co. has been chartered with a capital stock of $6000.

Meridan, Kan.—A transmission line is to be rebuilt in the near future to Topeka, a distance of 15 miles. W. B. Rollins, 209 Railway Exchange building, Kansas City, Mo., consulting engineer.

Ness City, Kan.—Election to vote $50,000 bonds for the enlargement of the light plant carried at the recent election. A new 250 hp. engine and generator and other necessary equipment will be installed.

Preston, Kan.—Election to vote bonds in the sum of $31,000 for waterworks improvements is contemplated. L. C. Mosier, city clerk.

Havelock, Neb.—Omaha-Lincoln & Denver Railway will construct 3 interurban lines through the city.

McIntosh, S. D.—A new municipal light plant will be built in the spring. Address city clerk.

Ree Heights, S. D.—E. L. Hager will install 2-hour service electric light plant. L. A. Finnegan, city auditor.

Fargo, N. D.—An election was held by citizens' committee whereby it was voted to issue $150,000 in bonds for municipal lighting.

Mayville, N. D.—R. W. Richards, Western Equipment Co., 63 East 6th street, St. Paul, Minn., will submit estimates to the city council for a light plant.

SOUTH CENTRAL STATES.

Louisville, Ky.—Power and lighting plants and other utilities will be installed by the Country Home Power & Lighting Co. which applied for a charter, with a capital stock of $30,000. W. Ray, Owensboro, president.

Byron, Okla.—Bonds have been voted for an electric light plant.

Donna, Tex.—Donna Light & Ice Co. is understood to be arranging plans for the enlargement of its electric light and power plant, to increase the present capacity. The company has filed notice with the Secretary of State of an increase in its capital stock from $10,000 to $40,000, to provide for the proposed expansion.

Fort Worth, Tex.—C. O. Thorp of Fort Worth has made application to the state engineer of New Mexico for a permit to construct a reservoir and hydroelectric plant on the Pecos river about 5 miles north of the Texas line. The site of the proposed reservoir is near Red Bluff. The project will cost about $600,000.

Kennedy, Tex.—Fire on Dec. 11, which caused a loss of $75,000, destroyed the power plant of the Kennedy Light & Power Co. It is understood that the company is considering plans for immediate rebuilding.

Lufkin, Tex.—Final details are being worked out for the installation of the white way, which will begin about the first of the year, at a cost of approximately $6000.

McLean, Tex.—T. V. Webb, proprietor of the McLean Motor Co., has made arrangements to install an electric light plant of sufficient size to light the business section of the town.

Pittsburg, Tex.—Home Light & Ice Co. plans improvements to its plant involving an expediture of $30,000. Motor-driven ice-making equipment of 20-ton capacity, boilers, etc., will be installed.

Ranger, Tex.—Southwestern Telegraph & Telephone Co. will soon start the construction of a new building to cost between $50,000 and $100,000. J. A. Williams, district manager.

Rock Springs, Tex.—Rock Springs Light Co. will construct an electric light and power plant here. V. A. Brown is a stockholder.

Waco, Tex.—Central Texas Electric Co. of Waco, which plans to construct an interurban electric railway between Belton and Austin, about 50 mi., and between Waco and Temple.

about 60 mi., has appointed B. A. McCarthy, of the Central Texas Engineering & Construction Co., chief engineer. The survey for the proposed line between Belton and Austin is now being made. The project involves the construction of a large electric power station, which will be probably located at Austin.

WESTERN STATES.

Ryegate, Mont.—Montana Power Co. will erect power line to Ryegate for light and power.

Buhl, Ida.—City contemplates a bond issue for waterworks and municipal light system. James J. Chambers, Denver, Colo., interested.

Winnemucca, Nev.—George Wingfield is interested in a $200,000 hotel to be erected. The company also plans to maintain its own electric light plant in the hotel.

Ogden, Utah.—A large storage battery manufacturing plant is to be erected in this city by the Western D-G. Storage Battery Co. Estimated cost $200,000.

FOREIGN TRADE

[Addresses of firms referred to in these trade opportunities may be obtained by writing to the Bureau of Foreign and Domestic Commerce, Washington, D. C., or its branch and local co-operative offices. Request for each opportunity should be on a separate sheet and the file number given.]

Electrical Goods (31,542).—A firm of importers and general commission merchants in India desires to represent manufacturers of hardware, engineers' tools, boiler fittings, mill machinery, electrical fittings and accessories, dynamos and motors, motor cars, etc. Reference.

Material for Electrical Tramways (31,547).—An engineer in Belgium desires to secure the exclusive agency for the sale of machine tools, material for electrical tramways and for steel construction. Quotations should be given c. i. f. Antwerp. Terms, credit of 90 days. Correspondence may be in English. Reference.

Electrical Goods (31,583).—An electrical engineer in Spain desires to secure an agency for the sale in southern Spain of electrical goods, appliances and machinery. Reference.

Electric Light Apparatus (31,590).—A firm of importers in the Netherlands desires to purchase or secure an agency for the sale of automobile accessories, especially electric light apparatus, combined or not combined with electric starter. Reference.

PROPOSALS

Municipal Light Plant.—Bids will be received Jan. 5 for the construction of a $25,000 municipal electric light plant at McIntosh, S. D., to supply electric light, heat and power. L. A. Finnegan, city auditor.

Generating Equipment.—Bids will be received until Jan. 5 by C. L. Trueblood, city clerk, Whittier, Cal., for furnishing and installing 2400 tons 4-24 in. classes B and C c. i. water pipe fittings and equipment for pumping water and generating 200 kw. electric current. Alternate bids for pumping and generating will be taken as follows: (1) 12 x 36-in. high duty cross compound double acting crank and flywheel pumping engine, 2 150-hp. water-tube boilers and one 200-kw. steam turbine generator; (2) same as preceding, excepting generator; (3) 2 direct connected 2200 g.p.m. centrifugal pumps and motors.

NEW PUBLICATIONS

Determination of the Output Characteristic of Electron Tube Generators is the title of Scientific Paper No. 355 by Lewis H. Hull, assistant physicist of the Bureau of Standards, and issued by that bureau of the Department of Commerce, Washington, D. C. The author points out that owing to saturation and rectification effects in three-electrode vacuum tubes, the currents which they deliver to any type of output circuit, when used as a generator, are heavily loaded with harmonics. Experimental results indicate that the frequency of the oscillating currents generated is the natural frequency of the output circuit. Hence this circuit acts as a filter in series with the tube and the direct current power system, and the useful output current is approximately sinusoidal, whatever the distortion of the tube currents, depending in amplitude solely upon the fundamental constituents of the tube currents. General expressions are derived for the power and current output in terms of static characteristics of the generating tube, and are corroborated by experimental results obtained with a particular tube. The price of this publication is 5 cts. and copies may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C.

INCORPORATIONS

Indianapolis, Ind.—I. V. Zelander Manufacturing Co. has been incorporated with capital of $25,000 for the manufacture of electrical supplies. The directors are I. V. Zelander, R. A. Coombs and Elmer Kidwell.

Goose Creek, Tex.—Goose Creek Light Power Co. has been incorporated here with a capital stock of $75,000, and will construct an electric light and power plant. The incorporators are W. W. Sloan, R. S. Sterling and T. D. Joiner, Jr.

Lone Star, S. C.—Lone Star Telephone Co. has been incorporated with a capital of $1000. G. Keister, president, and P. C. Way, treasurer.

Tuskegee, Ala.—Tuskegee Light & Power Co. has been incorporated with a capital of $30,000 to operate electric light and power plants and ice plant. D. E. Laslie and others interested.

New York, N. Y.—Sherwood Motor Repair Co., Inc. Capital, $25,000. To operate motor repair works, etc. Incorporators: S. H. Doughty, H. R. Croley and P. A. Zizelman, 28 Park Row, New York.

Malone, N. Y.—Pond Electric & Battery Service, Inc. Capital, $20,000. To manufacture electrical goods, batteries, etc. Incorporators: F. O. Pond, F. R. Kirk and V. E. Maher, Malone.

East Orange, N. J.—Motor Starter & Air Pump Co. Capital, $200,000. To manufacture motor starters and other motor equipment. Incorporators: Gordon Grand, East Orange; E. O. Gordon Grand, E. O. Picking and M. V. McKenzie, East Orange.

Newark, N. J.—Hochbaum-Rylander Co. Capital, $100,000. To manufacture and deal in electric fixtures, etc. Incorporators: Fred and M. Hochbaum, and Ernest Rylander, South Orange.

Wilmington, Del.—Superior Spotlight Co. Capital, $100,000. To manufacture electric flashlights and other electrical goods. Incorporators: M. E. Doto, Horace G. Eastburn and Charles P. Colton, Wilmington.

Indianapolis, Ind.—Volta Battery Co. has been incorporated with a capital of $10,000 to manufacture electric batteries.

Koshkonong, Wis. — Koshkonong Light & Power Co. has incorporated with a capital of $75,000 to erect light and power plant. A. R. Hoard, Ft. Atkinson, John Hetts, Oval, Swart, R. F. D. Ft. Atkinson, interested.

Indianapolis, Ind. — Roll-a-Rocker Co., dealers in electrical specialties, has been incorporated with capital of $15 000 by J. M. Hunter, J. H. Hornstein and Harry K. Lange.

Caroline, Wis.—Caroline Electric Co. has been incorporated with a capital of $6,000. D. F. Breed, Gust A. Radtke, Roy E. Van Behaick, C. B. Hanson, F. R. Bust.

Marion, Ky.—Marion Light, Ice & Coal Co. Capital, $40,000. To operate a local electric and ice manufacturing plant. Incorporators: S. Gugenheim, T. H. Cochran, and O. S. Denny.

New York, N. Y.—East Coast Electrical Supply Co. Capital, $15,000. To manufacture electrical supplies. Incorporators: W. J. Fisher, T. Christianson, and J. V. Schraig, Richmond Hill.

New York, N. Y.—Cellokay Manufacturing Corp. Capital, $500,000. To manufacture special machinery for motor service, etc. Incorporators: Joseph Rucker, W. H. Peck, and A. E. Atherton, 510 West 124th street.

Philadelphia, Pa.—Ward Electric Co. Capital, $30,000. To manufacture electrical goods. Incorporators: Philip H. Ward, Jr.; Ralph P. Ward, 1421 Arch street; and M. L. Brown, Philadelphia.

W. R. Molinard Resigns—C. S. Beardsley Vacuum Cleaner Manufacturers' Association President—S. P. Brown Dies

FRANK H. BETHELL, formerly vice-president of the New York Telephone Co., New York, recently resigned, was tendered a testimonial dinner at the Telephone Club by his former associates on his retirement from the company.

W. CAMERON FORBES, of Boston, at one time Governor-General of the Philippine Islands, has been elected a director of the American Telephone & Telegraph Co. His father, W. H. Forbes, was president of the first Bell telephone organization.

W. C. BRIGGS, formerly New York district manager of the Shepard Electric Crane & Hoist Co., New York, has accepted a position with the Pennsylvania Crusher Co., Philadelphia. He is succeeded in the New York office of the Shepard company by R. W. Hurst.

ERNEST W. PELTON, for the past 16 years connected with Stanley Works, New Britain, Conn., as mechanical engineer, has become manufacturing superintendent of the hardware factory. He will retain supervision of the electrical and power, as well as the engineering, mechanical and transportation departments.

H. W. GRAEBER, assistant superintendent of construction of the Oklahoma Gas & Electric Co., Oklahoma City, has been promoted to the position of superintendent of construction, effective Jan. 1. He succeeds to the position of H. W. Reilly, who will on that date assume the office as vice-president in charge of operation.

R. DE VERE HOPE, recently discharged from the United States Army, where he was stationed at Edgewood Arsenal in connection with the manufacture of mustard gases, has entered the organization of the Duratex Co., as industrial engineer. Prior to entering the army he was for a number of years connected with the engineering department of the New York Telephone Co.

F. S. MONTGOMERY, for the past 6 years advertising manager of the National Metal Molding Co., Pittsburgh, has tendered his resignation, effective Dec. 31, to become associated with the Ivan B. Nordham Co., outdoor advertising, 8 West 40th street, New York. Prior to becoming advertising manager, Mr. Montgomery was for several years district manager in charge of the Atlanta office of the company.

W. R. MOLINARD, vice-president in charge of operation of the Oklahoma Gas & Electric Co., Oklahoma City, has resigned, effective Jan. 1, and will be succeeded by H. W. Reilly, superintendent of construction for the Oklahoma properties. Mr. Molinard has served the Byllesby organization in important capacities since 1912 and leaves the company to go to California on account of private interests there.

C. F. GRAY, electrical engineer, Winnipeg, Manitoba, has been reelected mayor of that city by more than 2500 majority.

HENRY L. LIDDELL has been appointed instructor in the civil engineering department of the Massachusetts Institute of Techonology.

J. L. HARPER, chief engineer of the Niagara Falls Power Co., Buffalo, N. Y., recently tendered an interesting address at the meeting of the Builders' Exchange at the Chamber of Commerce Club Rooms, Buffalo. Mr. Harper set forth that water power, in his opinion, could never entirely replace the use of coal, and spoke in a very entertaining manner on the latest power development project at Niagara Falls, whereby an efficiency of 90% is realized from the water used, which is said to be the highest efficiency ever attained in the world.

CHARLES S. BEARDSLEY, chairman of the newly organized Vacuum Cleaner Manufacturers' Association, is

Charles S. Beardsley.

general manager of The United Electric Co., Canton, O. He became associated with the company in his present capacity about 2 years ago and in this brief period has made a notable record in his administration of the company's affairs, and has introduced many novel ideas for the merchandising of household appliances which have been profitable to the industry as a whole. He has had a broad experience in merchandising and his sound training in advertising methods, coupled with the thorough mechanical knowledge which he possesses, accounts for the prominent position The United company occupies in the industry.

Obituary.

RALPH L. SHAINWALD, president of the Standard Paint Co., New York City, manufacturer of insulating paints and compounds, died on Dec. 10.

WILLIAM F. THOMAS, for the past 21 years connected with the Public Service Corp., and more recently manager of the New Brunswick, N. J., district of the company, died on Dec. 17.

STEPHEN PEARSON BROWN, a prominent eastern engineer, died in Sebec Lake, near Dover, Me., Dec. 13. He was pulling his 9-year-old son on a sled when the ice broke under him and he sank before the boy could summon help. Mr. Brown was born in Dover, Me., April 29, 1877. He attended the Foxcroft Academy, Foxcroft, Me., the Hotchkiss School, Lakeville, Conn., and graduated from the Massachusetts Institute of Technology with a B. Sc. degree in mechanical engineering in 1900. From 1900 to 1903 he was a junior partner of Collier & Brown, consulting engineers, Atlanta, Ga., and was engaged on hydroelectric developments, mill construction, municipal steam driven electric lighting plants, waterworks, sewage systems, etc. From 1904 to 1905 he was inspector for the N. Y.. N. H. & H. R. R. From 1905 to 1909 he was with the United Engineering & Contracting Co., of New York, in various capacities. From 1909 to 1912 he was chief engineer of the Tidewater Building Co., and T. B. Bryson, building section 11-A-3 of the Fourth Avenue Rapid Transit subway in Brooklyn. In 1912 he became chief engineer of the Mount Royal Tunnel & Terminal Co., Ltd., and managing engineer for Mackenzie, Mann & Co., Ltd., having charge of both the design and construction of the terminal development in Montreal for the Canadian Northern railway. This includes a double track tunnel over three miles long, elaborate freight and passenger terminals and an elevated double track viaduct across the lower town from the tunnel to the harbor. It involves an expenditure of $15,000,000. In 1916 he was vice-president and manager of Ford, Bacon & Davies, a well-known firm of engineering contractors of New York City. He continued to act in a consulting capacity in regard to the Montreal terminal work for the C. N. R., and was expected in that city this month on business in connection with the C. N. R. enterprise. From 1915 to 1917 he was a member of the council of the Canadian Society of Civil Engineers. He was a member of the American Society of Civil Engineers, of the American Society of Mechanical Engineers, of the American Railway Engineering Association, of the Canadian Society of Civil Engineers and of the Institution of Civil Engineers (British).

Financial News

Electric Railways Best Operated by Private Capital.

Only by the use of private capital and enterprise can the electric railways of the United States be made to function properly, Bentley W. Warren, counsel for the Committee of One Hundred of the American Railway Association, declared in a brief filed with the Federal Electric Railway Commission, which will probably report the result of its investigation made last summer to President Wilson some time this month.

In connection with this statement Mr. Warren declared that legal and financial obstacles in the way of government acquisition of public utilities and the great divergence of opinion as to the desirability of the plan prevented at the present time the successful operation of public ownership.

If private capital and enterprise is to continue to be used in the local transportation field, the brief declares, it is essential that the credit of the industry be re-established, since a continuing supply of new capital is necessary to permit these utilities to keep pace with the demands of the public.

Credit Extension to European Countries a Vital Need.

The importance of wide public support in the matter of supplying European credits is emphasized in the current issue of "American Goods and Foreign Markets," the semi-monthly review of foreign trade conditions issued by the Guaranty Trust Co. of New York.

The publication says that while manufacturers and exporters are thoroughly acquainted with the implication and inevitable effects on foreign trade if the drop in exchange is not checked, "it is not quite clear that it is understood by the general public, and particularly by those who have funds for investment, that their co-operation is essential if the present situation is not to continue indefinitely.

"Yet," the review continues, "it must be evident to the casual observer that Europe cannot produce the necessities of life in sufficient quantities until the means of production are there. For five years, the normal operation of industry gave way to the highly specialized and non-productive operations of war time. The means of transportation, except along those roads needed for the moving of munitions and troops, were allowed to deteriorate. Machinery, necessary to the production of goods for the consumption of the people, wore out and was not replaced. Stocks of raw materials were used up or diverted to uses which did not go to the satisfaction of the daily wants of the people. All this continued for five years. The resultant loss was almost incalculable. In coming back into production to an extent sufficient not alone to meet the needs of her own people, but also to sell goods abroad sufficient to pay the accumulated debt of years, the countries of Europe had a task almost as difficult as that of carrying on the war. In one sense it was more difficult, for during the war the energies of the people were stimulated by fear, or patriotism, or some other emotion, which made continued and uninterrupted effort a matter of vital necessity.

"At the end of the war, Europe needed, first of all, food and clothing. That was forthcoming from the United States in short order. To send it, however, put a new burden upon the credit resources of the people, and started the exchanges on their downward path. Next, Europe needed raw materials, for the factories and mills which were in condition to begin operations. These too were forthcoming, and exchanges sagged again, for as yet Europe was not in production, and could not pay in goods the enormous balances which were being piled up against her. Finally, and most of all, however, she needed capital goods—machine tools, rails, locomotives, electrical equipment, all that great group of products which are necessary for the existence of a modern industrial nation. These are the very vitals of industry, and until they are forthcoming, Europe cannot count industrially in the world market as she counted before the war. And, by the same token, she cannot produce the consumption goods upon which her export trade depends. Until it is possible for Europe to sell for export, the shortage of consumption goods in the world will be keen, and prices for the necessities of life will be high everywhere.

"To date, the arrangements made for the supplying of credit to European industry have not been of sufficient scope to meet the needs of the situation, as the constantly sagging exchanges prove in the most graphic manner. European exports to this country and elsewhere have not been of sufficient value to offset the demands for food and raw materials, and for the few capital goods which already have been shipped. The need, therefore, for a broad scheme of credit extension is more vital than ever."

Maryland-Virginia Utility Merger Approved.

Public Service Commission of Maryland, Baltimore, Md., has handed down its approval of the merger of a number of gas, electric light and power companies located in Maryland and West Virginia. The new corporation to be known as the Potomac-Edison Gas & Power Co., with headquarters at Grafton, W. Va. The properties to be taken into the merger are as follows: Grafton Light & Power Co.; Grafton Traction Co.; oil wells, plants and pipe lines of the Eastern Oil Co., Buffalo, N. Y.; Central West Virginia Gas Co.; West Virginia & Maryland Gas Co., operating in West Virginia and Maryland; a controlling interest in the capital stock of the Hartland Power Co., as well as the power plant electric light, traction and street car lines of the Cumberland Co., Cumberland, Md. Barstow & Co., 50 Pine street, New York, are interested largely in the new consolidation. It is said that the project is the largest in the history of the states of West Virginia and Maryland.

Local Utilities Merged.

It is announced that the Maryland Public Service Commission has handed down an order authorizing the merging of a number of local and nearby utility concerns. The companies affected are the Cambridge Gas, Electric Light & Power Co.; Salisbury Light, Heat & Power Co., both of Salisbury, Md.; Idlewild Electric Light, Heat & Power Co., Federalsburg; and the Peninsular Light & Power Co. into the Eastern Shore Gas & Electric Co. The new organization will issue stock for $315,000 in exchange for the aggregate stock of like amount of the merged companies.

Merger of Kansas City Companies Requested.

Application for the issuance of $9,998,000 in common stock and the flotation of $8,000,000 worth of bonds, has been filed with Missouri Public Utilities Commission by Kansas City Power & Light Co., Kansas City, Mo. Simultaneously, another application was filed by the Standard Electric Light Co., a Kansas City, Kan., corporation, for permission to transfer its plant and other property to the Kansas City Power & Light Co.

The merging of these two concerns will place much of the lighting and power for the Kansas City, Kan., industries, and residents in the hands of the Kansas City, Mo., firm. Extensive enlargements, improvements and service extension is contemplated by the corporation, according to the filing papers.

TROUBLE PROOF

In recent advertisements we have told you WHY the Westinghouse Small Motor IS trouble-proof. These trouble-proof features were referred to as Points of Superiority in Westinghouse Small Motor Construction.

The superior points of design, combined with our familiarity with the problems usually met with in the different appliance fields, guarantees that high degree of operating dependability that every progressive appliance manufacturer must insist upon.

Have you a copy of our new Circular No. 7300 describing the Westinghouse Trouble Proof Motor in its various applications? If not, send us your name and address.

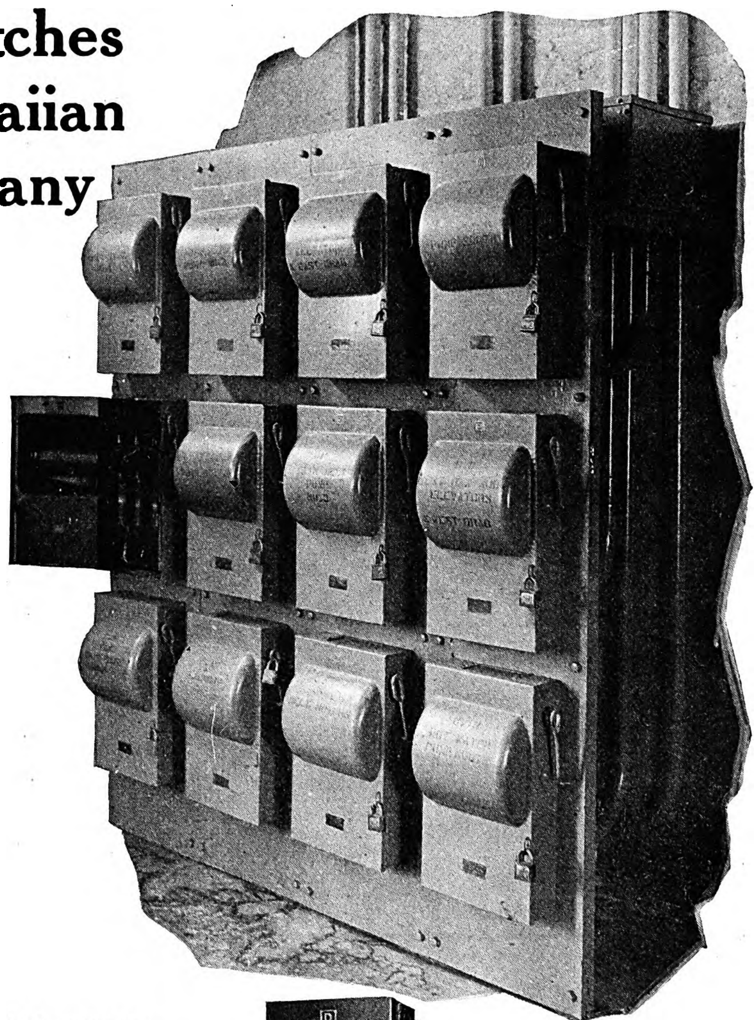
Square D Safety Switches for California & Hawaiian Sugar Refining Company



IT is interesting to note the type of organizations that install Square D Safety Switches.

Wherever you find Square D Safety Switches, there you will find an organization that regards the safety, contentment and happiness of its employees as of vital importance. And there, too, you will find an institution that wants nothing short of the best—in safety switches as well as in any other equipment or material.

Careless or ignorant hands and arms cannot come in contact with the live parts of the Square D Safety Switch—it is completely enclosed within a pressed steel box and operated by an outside handle. Cover of switch box can be locked. And the Square D Switch can be locked in the "off" position when work is being done on the line.

Made in two-, three-, and four-pole types in standard voltages of 125, 250, 500 a.c. and 600 volts, in capacities from 30 to 1200 amperes. Over 300 types and models.

Listed as standard for fire and accident prevention by the Underwriters' Laboratories of the National Board of Fire Underwriters. Meet the requirements of the National Electrical Safety Code of the Bureau of Standards.

No matter what your connection with the electrical industry, write for literature on the Square D Safety Switch today. We will promptly send you complete information.

SUNDH Can Solve Your Problem

Just As This One Was Solved

Two electrical sources were available—a main source and an emergency source. Both sources were to be used at all times for portions of the service. Provision had to be made for the utilization of one source for the total requirements in the event that the other source failed.

The SUNDH equipment automatically provides for the consumption of precisely the amount of Central Station energy contracted for, while also insuring the automatic switching of the entire load into either source of supply should the other source fail.

The value of such equipment cannot be overestimated.
Let SUNDH SOLVE YOUR PROBLEM.

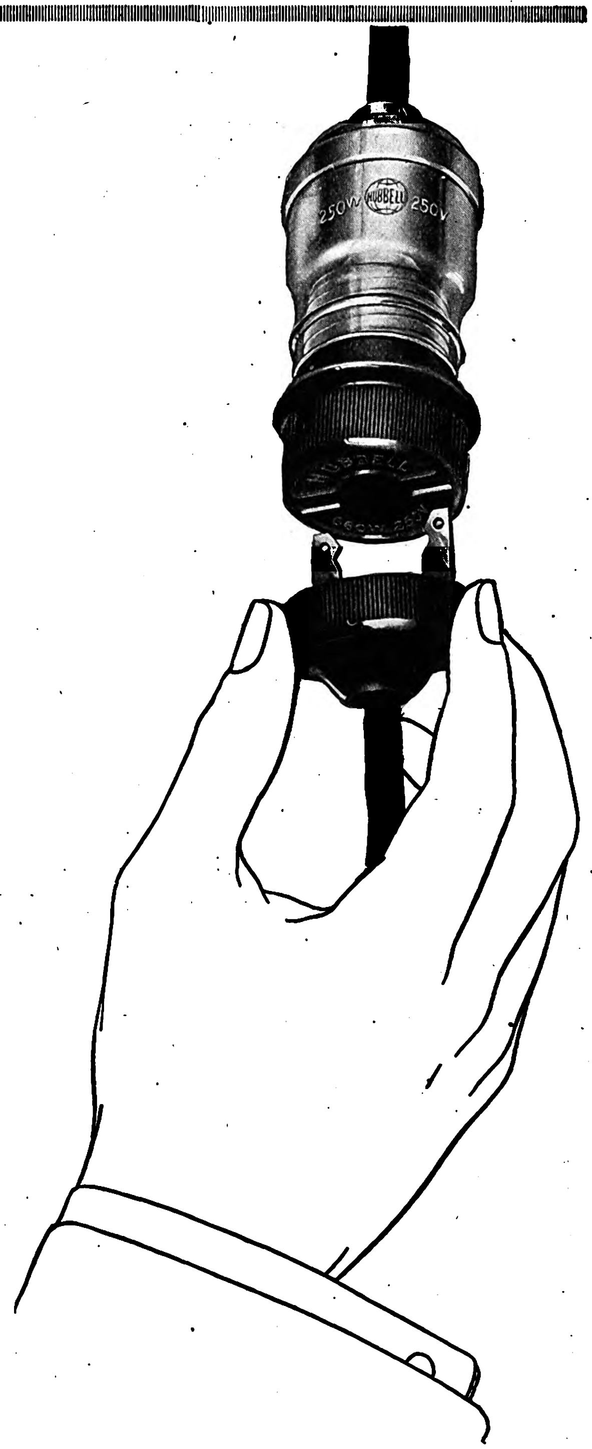
A better plug for a double purpose:



Your machine—in the retail store. Listen!

WOMAN: "Yes, I like it very much, but will that plug fit a wall plate? My vacuum cleaner has only the twisting kind, and it's a perfect nuisance. I have to screw it into a lamp socket every time, whereas if I had the other kind of plug I could use our wall plates, you know."

SALESMAN: "I'm glad you mentioned that, madam, because it is very important. This plug is a Hubbell. It has two parts, the body which screws into any lamp socket, and the cap which plugs into any wall receptacle or current tap. You can use this in any part of the house; it's a better plug for a double purpose."

WOMAN: "Oh, I'm so glad—then I'll take the machine. And can you sell me one of those plugs? I'll have my husband put it on our vacuum cleaner. Thank you."

This is a Hubbell Composition Attachment plug No. 5467 with Edison Base. Cap has Tandem blades. Contacts are made separate arcing chambers, preventing shock or short-circuiting.

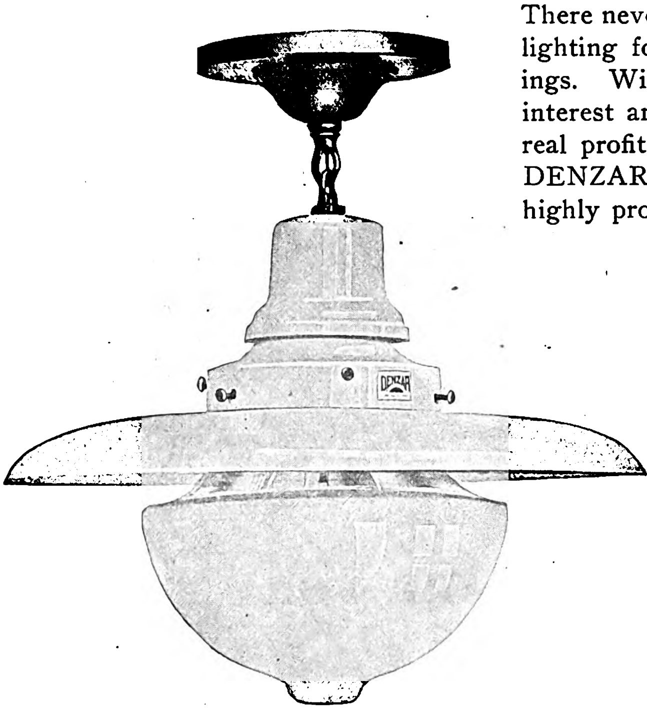
You could be making a good profit on DENZAR right now, as so many other dealers are doing



There never was a time when people were so interested in better lighting for offices, stores, schools, factories and public buildings. Wise dealers are taking advantage of this widespread interest and are making it pay them a profit. And there *is* a real profit in this business. Every bit of work you put in on DENZAR brings its results—helps to build up a permanent and highly profitable business for you.

It's easy to sell DENZAR

If you haven't tried it, you'll be surprised to see how easy it is to sell DENZAR. People who are interested in securing better illumination can see its points of superiority as soon as you explain them. It sells practically on sight.

You can't afford to overlook the profits you can make on DENZAR. Write now for the DENZAR catalog and details of our very liberal terms to established dealers.

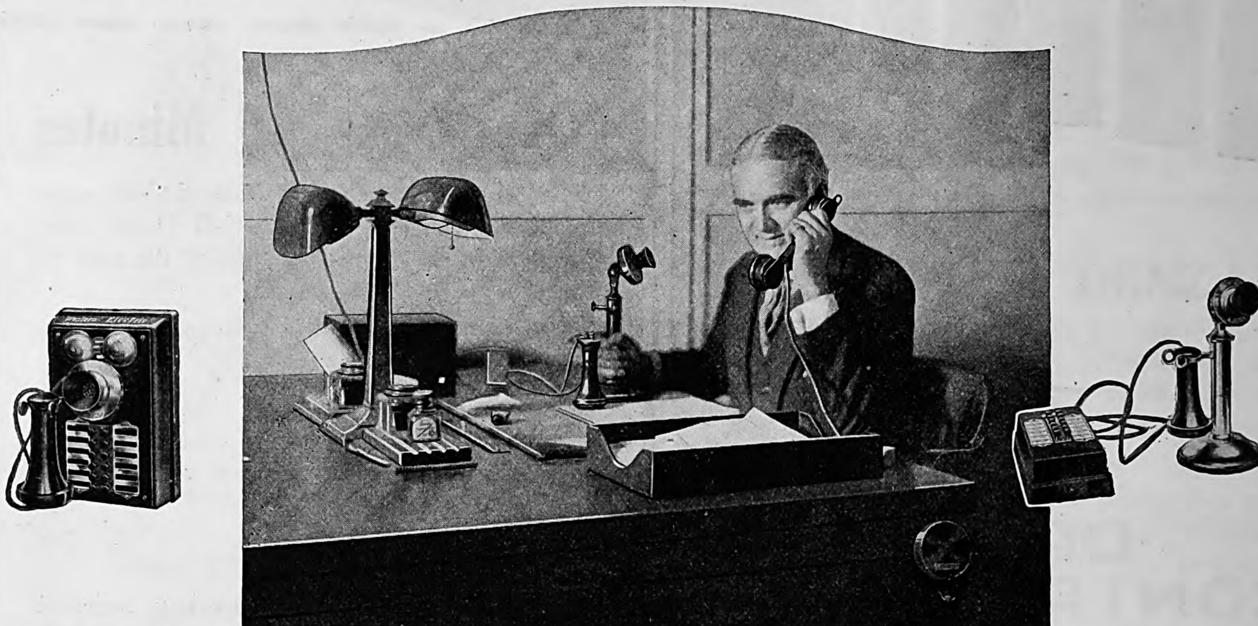
Getting Full Value From Every Minute



Western Electric

INTER-PHONES

Nowadays when everyone is confronted with the necessity of getting full value out of every minute, such a time-saver as the Western Electric Inter-phone is practically indispensable to the central station, electrical manufacturer and electrical shop.

The real value of using a Western Electric Inter-phone system is that it not only saves time for you and the other executives, but that it will save many minutes each day for every member of your organization.

The Inter-phone stands for instantaneous communication. Instead of sending a messenger to find the man to whom you wish to speak and then waiting until he reaches your office, you just pick up the receiver on your Inter-phone, and press the ringing button. Instantly he replies and you can speak your message or give instructions that carry the force of your personality.

The Inter-phone is economical—neither switchboard nor operator is required since the user makes his own connection. Western Electric Inter-phone Systems are available for use in the largest plant or in the smallest shop.

For more detailed information, consult the telephone engineers at our nearest house.

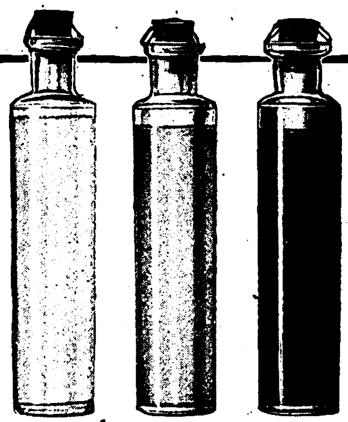
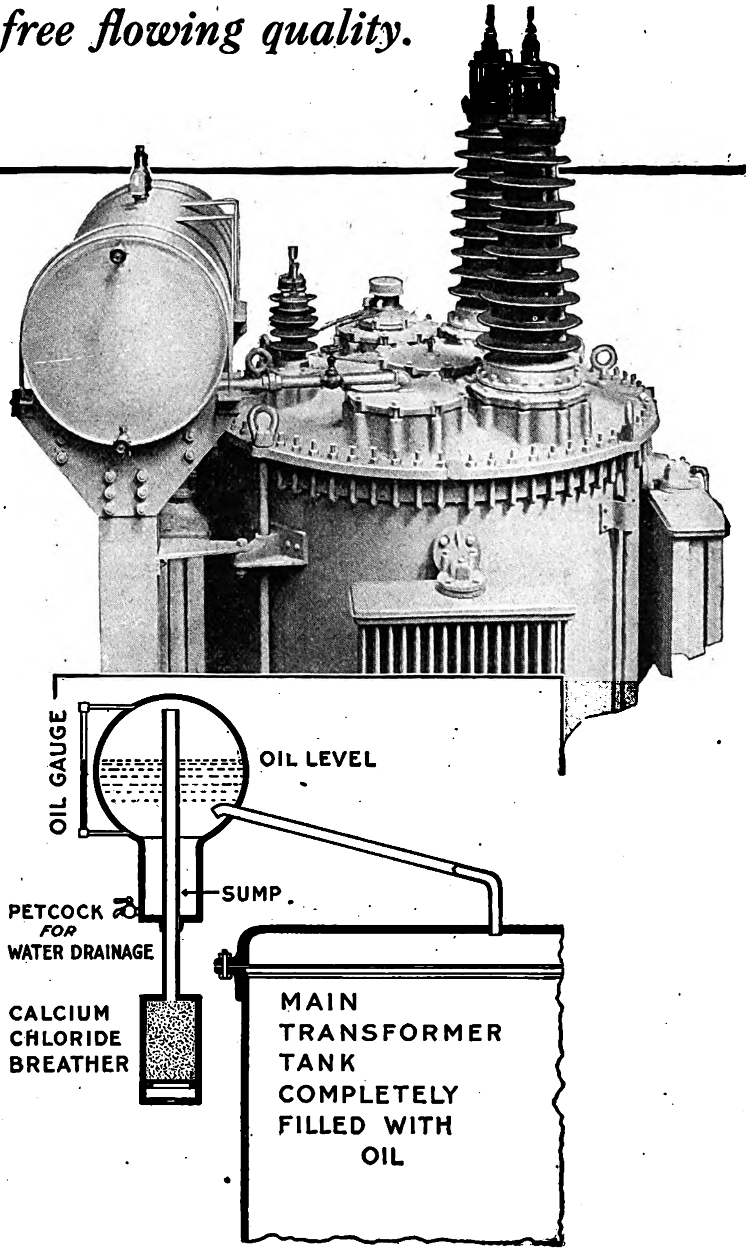
The Oil Conservator preserves the dielectric strength of transformer oil and its free flowing quality.



oil before being used — used with conservator — used without conservator



The Oil Conservator Transformer as developed by the General Electric Company consists of a main tank, containing the transformer, which is completely filled with oil, and an auxiliary tank for oil expansion. Connection between the two tanks is restricted so that there is no rapid interchange of oil and the temperature of the oil in the auxiliary tank is always relatively low. Any water that may be condensed in this auxiliary tank is collected in a "sump" and drawn off without coming in contact with the transformer, and main body of the oil.

What the Oil Conservator Transformer does

I. Eliminates "Breathing" and water condensation in main tank, thus maintaining the original insulating value of the oil.

II. Avoids the possibility of explosion by the ignition of a mixture of air and gas vapor from hot oil.

III. Practically eliminates oil decomposition or "sludging" as a result of exposure of hot oil to oxygen.

The General Electric Company offers the Oil Conservator Transformer as a standardized product with its value already fully established in the field and a factory equipment allowing of its economic application to practically all oil insulated "power" units of 500 Kv-a capacity and above.

CONDENSERS:

2—2000 sq. ft. Worthington Surface Condensors. Complete with all pumps, dry vacuum pumps and pipe, valves and fittings. All in excellent condition.
1—LeBlanc Jet Cond. 18,750 lb. steam per hr., turbine driven.

A. C. SWITCHBOARD PANELS:

A.C. Switchboard Panels, New, 1912. Spec. Westinghouse and G. E., 2300-v., 60-cyc., 3-ph., 16 panels, 2-in. Blue Vermont Marble, each built one section 32-in.x62-in. and one section 32-in.x28-in., including latest type rding watt-meters and other standard switch-instruments; oil switches; indicating and recoswitchboard equipment, horizontal edgewise board apparatus.

Including 10 300-amp. 3 P.D.T. Oil Lu. Type "F." Form "F."
8 100-amp. 3 P.D.T. Oil Lu. Type "F." Form "F."
Several 2 P.D.T. Oil Lu.
4 200-amp. Integrating Watt-Meters.
12 25 to 80-amp. Integrating Watt-Meters.
10 Indicating Watt-Meters.

A MESSAGE TO EMPLOYERS

In our SPECIALIZED Vocational service we endeavor to deal only with candidates who have personal equipment that is unusual because of training or experience; we come in contact with such people through confidential sources.

We can undoubtedly save you much TIME, WORRY and TROUBLE by intelligently sifting the chaff from the wheat and making it possible for you to interview ONLY LOGICAL applicants.

Our facilities are yours to command without charge or obligation to you. Let us know your wishes and we shall spare no effort to serve and please you.

POSITIONS WANTED, HELP WANTED, FOR SALE AND MISCELLANEOUS.

Advertisements will be inserted under these headings at the rate of three cents a word, minimum charge fifty cents for each insertion, payable in advance.

Tabulated or paragraphed advertisements will be charged at twenty cents a line.

If replies are in care of this office, allow five words for the address.

POSITION WANTED

ENGINEER—MARRIED, AGE 29, WITH ten years' of practical experience in installation and maintenance of all kinds of A. C. and D. C. generators and motors, high and low tension line construction, switchboards, and all kinds of light and power wiring. A man who can get results, is looking for an opportunity anywhere in the United States. Address Box 3357, % Electrical Review, Chicago, Ill.

HELP WANTED

LINEMEN—STEADY POSITION WITH utility company within 50 miles of Chicago. Address Box 3356, % Electrical Review, Chicago, Ill.

WANTED — METER DEPARTMENT manager for company with 50,000 electric consumers. Salary $100 per month. Address Box 3355, % Electrical Review, Chicago.

REPAIRS

on Electric Motors are promptly taken care of in our well equipped shop. Try us and be convinced of the quality of our workmanship.

OLSON-BOETTGER ELEC. MFG. CO.
St. Paul, Minn.

FOR SALE

On account of making room for turbine installation we offer the following machinery:

1—14x36 Heavy Duty Hamilton-Corliss Engine.

1—16x36 Heavy Duty Hamilton-Corliss Engine.

1—150 KVA. Belted, Type G. E., 2300 Volt, 600 RPM., 60 Cycle, 3 Phase Alternator.

1—180 KW. Westinghouse, 2200 Volt, 514 RPM., 60 Cycle, 3 Phase Alternator.

1 Direct Connected Engine Set, 17x21, 225 RPM., Erie City semi-Corliss Engine, direct connected to 185 KVA. G. E., 2300 Volt, 60 Cycle, 3 Phase Alternator.

All of the above apparatus is in good operating condition. For further information write the

WABASH VALLEY ELECTRIC COMPANY,
Clinton, Indiana.

LARGE PUBLIC UTILITY IN MIDDLE west requires services of electrical draftsman for power plant and substation work. State age, experience and salary desired. Address Box 3358, % Electrical Review, Chicago, Ill..

FOR SALE

D. C. GENERATORS FOR SALE—1 100 kw., 360 rpm., 125 volt, belted. 1 60 kw., 275 rpm., 125 volt, engine type. 1 60 kw., 275 rpm., 250 volt, engine type. All General Electric, in excellent condition, for immediate delivery. V. M. Nussbaum & Co., Fort Wayne, Ind.

A. C. GENERATORS FOR SALE—62½ kw., 900 rpm., 3 phase, Electric Machinery Co. 175 kw., 600 rpm., 2 phase, Allis-Chalmers. Both 2300 volt, 60 cycle, modern revolving field type. V. Nussbaum & Co., Fort Wayne, Ind.

FOR SALE

250 H.P. Slip-ring Motors, 600 R.P.M., 440 volts, 3 phase, 60 cycles. Two for immediate delivery.

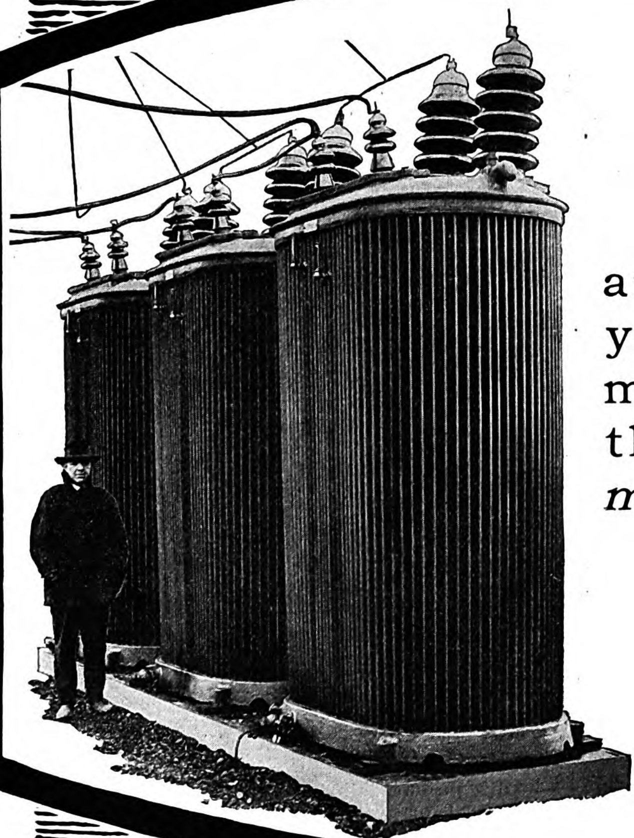
ALPHABETICAL INDEX TO ADVERTISERS



MOLONEY TRANSFORMERS

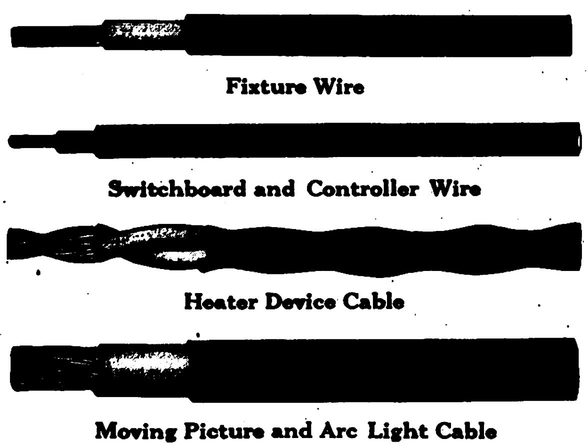
are the product of many years' experience, development and service—we know they are *good, because many users* are *satisfied.*

MOLONEY ELECTRIC CO.

St. Louis, Mo. Windsor, Can.

OFFICES:

New York	San Francisco
Pittsburgh	Los Angeles
Chicago	Seattle
Minneapolis	Salt Lake City
Rochester	Syracuse



SALAMANDER
PURE ASBESTOS INSULATED
MAGNET WIRE

The wire with the reputation in the great Central Stations. The wire that's made right and will stay right.

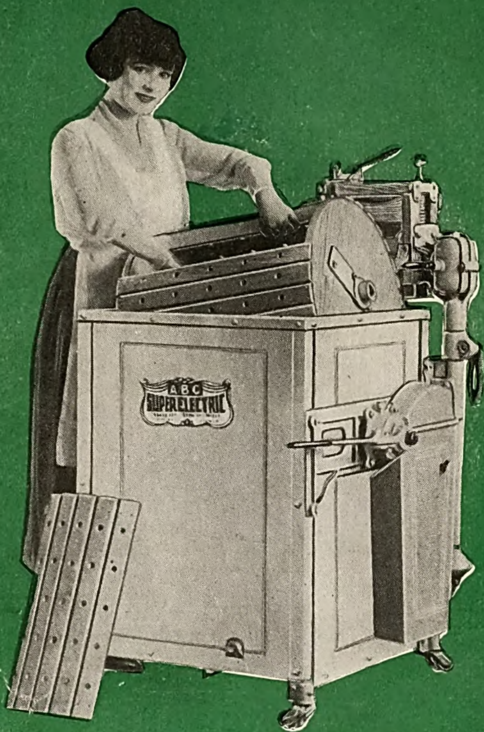
For Manufacturers and Electrical Engineers in Industry and Mines, we manufacture Asbestos Braided Solid Flexible Conductors for—Steel Mill Motor Connections, Search Lights, Controllers, Moving Picture Machines, Switch-Boards, Electric Ovens, Heaters, etc. Approved by Underwriters' Laboratory.

ENAMEL MAGNET WIRE

A new addition to the Salamander line. Highest grade. Plain or with silk or cotton covering. Write for samples and prices.

INDEPENDENT LAMP AND WIRE COMPANY, Inc.

Offices: 1737 Broadway, New York **Works: York, Pa., Weehawken, N. J.**



A-B-C
Super Electric
America's Leading Washing Machine

Starting with the issue of January 17th, A B C Electric Washing Machines will be advertised in The Saturday Evening Post in DOUBLE PAGE SPREADS.

This is in addition to our present campaign in the Leading Women's Publications, such as The Ladies' Home Journal, Woman's Home Companion, Good Housekeeping, etc.

One-half of the electrified homes in the U. S. will read A B C National Magazine Advertisements in 1920.

DEALERS: Our production facilities have been greatly enlarged by the erection of another new factory—the second this year. If you do not know of any active A B C dealer in your locality, write for particulars about the A B C Agency Franchise.
